Since the only large-scale repairs at this date were undertaken during the reign of Mahmud II, the paintings in the windows were probably introduced at this period. 'Ali Bey's mention of two rows of windows in the cupola suggests that the division of the windows into two parts may have followed an earlier precedent. Richardson visited Jerusalem during the renovations of Mahmud II and mentions the windows in the Aqsa dome:

The dome is painted of different colours, and lighted by windows in the side. The glass in these windows is also painted blue, yellow, red, and green. The light admitted through such a medium is softened and delightful, and calculated to inspire sentiments suited to a place of worship (Richardson 1822: 306).

It is not clear whether Richardson is describing the window-grilles installed by Mahmud II or those which they replaced, although the absence of any reference to the landscape scenes suggests the latter.

The paintings and the window-grilles associated with them seem to have disappeared in the restorations of 1342-6/1923-7. It may be that some of the early 13th/19th-century windows in the dome bore the *shahada*, for Sepp (who visited in 1278/1861) mentions a window-grille with such an inscription, although without specifying where in the mosque (1873: 416). When van Berchem visited in 1333/1914, he recorded the *shahada* in three of the window-grilles in the dome. A similar inscription was to be found in a window in the chapel of the Forty Martyrs (van Berchem 1927: 450). Wilson (who saw the mosque before 1299/1881) mentions that the southern window of the dome was particularly fine, 'of a delicate blue colour' (1881: 65). The fact that this grille stood out from the others suggests that some of the window-grilles may have been replaced during the restorations of 1291/1874.

Of the remaining windows in the mosque, little can be said. Van Berchem mentions that the window above the *mihrab* bore a quotation from Sura III: 32-37 executed in yellow letters against a blue ground (1927: 450). This *aya*,

with its reference to the *mihrab*, is obviously appropriate to such a context and may be found in the *qamariyyat* above the *mihrab* in Mamluk *madrasas* and tombs.⁶⁵ Although yellow is sometimes used for the letters of inscriptions in 10th/16th-century windows in Istanbul,⁶⁶ in the context of the Haram this detail is more likely to indicate that the grille dated from the time of 'Abd al-'Aziz. Before the restorations of 1342-6/1923-7 the rose window in the chapel of Zachariah was filled with crude stucco tracery, possibly also of 13th/19th-century date, from large parts of which the coloured glass was missing (Enlart 1925-7: fig. 355). Wilson (1881: 65) mentions a fine window in the same location, in which 'the colours are not so effectively blended as in the windows of the Dome of the Rock'.

It thus appears that even before the two major restorations of this century and the fire which followed them, few of the stucco and glass windows installed as part of the restoration of the Haram buildings ordered by Sulaiman were still in place. This fact appears to be acknowledged by van Berchem, who concluded that most of the window-grilles were modern and mediocre in quality (1927: 450). The impression that the decoration of the Aqsa was not as well-preserved as that of the Qubbat al-Sakhra is conveyed by several 13th/19th-century visitors. Beaufort (1861: 158) for example, states that while the latter is 'lovely and beautiful', the former is 'grand but triste'.

Despite this, it may be that certain details of the 10th/16th-century windows are preserved in the modern grilles. For example, in some of the *qamariyyat* now in the windows at the western end of the *qibla* wall, the main elements of the design are set against an imbricated background. This detail was found in the window-grilles executed in 1342-6/1923-7,⁶⁷ which presumably replaced earlier grilles, and may be seen in the *qamariyyat* which survive in the Church of the Coenaculum. One of the latter grilles (pl. 28.22) bears the date 1344 (1925) and it seems likely that the *qamariyyat* were installed by the same team which worked on the Aqsa restorations, at the time when the Coenaculum was still a mosque.⁶⁸ This type of background ornament appears in

⁶⁵ In the mausoleum of Aslam al-Silahdar (746/1345). Other quotations from the same *sura* appear in the window above the *mihrab* in the mosque of al-Salih Tala'i (rebuilt in the early 8th/14th century) and the Madrasa of Gani Bek (830/1426-7).

⁶⁶ For example in the windows of the Süleymaniyye and the Yeni Cami.

⁶⁷ Although they were created to replace *qamariyyat* destroyed in 1386-7/1967, one of these window-grilles bears the date 1347/1928.

⁶⁸ These do not appear to have replaced earlier coloured glass windows, for none are visible in photographs taken in 1340-1/1921-2 (Enlart 1925-7: fig. 340).

the windows depicted in Persian miniatures by the early 10th/16th century.⁶⁹ It is also found in the window-grilles of the Süleymaniyye and the later grilles in the Harem of the Topkapi.⁷⁰ It may be therefore that such a background was also used in the 10th/16th-century windows of al-Aqsa.⁷¹

8. Conclusion

The buildings of the Haram al-Sharif are architectural palimpsests on the surface of which successive generations, whether motivated by piety or by politics, attempted to make their mark. This phenomenon is nowhere more apparent than in the stucco and glass window-grilles of the Dome of the Rock and the Aqsa. Such grilles play at once a functional role—controlling the amount of light entering and ensuring the protection of the interior of the buildings—and an aesthetic one, transforming the quality of the light by which we perceive these interiors. The impact of such window-grilles on the interior space cannot be definitively quantified, for it too is part of a continuously evolving whole. The interior of the Dome of the Rock must have appeared quite differently when the colours of the light falling on its Umayyad mosaics and marbles were dictated by the aesthetics of 10th/16th-century Istanbul, than it did in the 12th/18th century when the same mosaics were whitewashed and many of the windows installed by Sulaiman replaced by cruder copies in which glass of harsher tones was set.⁷²

For this reason no attempt has been made to assess the qualitative aspect of changes to the windows over the past half-millennium. What has been attempted instead is a quantitative assessment based on stylistic and chronological considerations. Special emphasis has been placed on the restorations ordered by Sulaiman the Magnificent, for it was at this period that the most extensive changes to the windows of both the Aqsa and the Qubbat al-Sakhra were undertaken, with new window-

grilles being set in place in both. Although the designs of these window-grilles seem to have followed the fashions of contemporary Istanbul, there are technical and historical reasons for suggesting that they were manufactured by craftsmen brought from Syria or, more probably, Egypt.

The paucity of information about the Ottoman stucco and glass windows of the Aqsa precludes any firm conclusions. It is clear that new window-grilles were installed in the Aqsa as part of the campaign of restoration carried out at the behest of Sulaiman. At the end of the last century it appears that some of the grilles installed at this time may still have survived. In view of the numerous vicissitudes which the mosque has suffered subsequently, it seems unlikely that the modern system of fenestration preserves much of the 10th/16th-century arrangement.

Different problems arise in connection with the windows of the octagon in the Dome of the Rock and those in the drum of the dome. While most of the stucco and glass window-grilles found in the octagon today give some idea of the 10th/16th-century windows, they include at least one type which is likely to post-date this period (pl. 28.6; Appendix 28.2, windows 1, 4, 10, 13, 19, 22, 28, 31). Conversely, the form of at least one of the 10th/16th-century window-grilles is no longer represented among the modern windows (pl. 28.1). Some of the latter seem to be faithful reproductions of types introduced by Sultan Sulaiman (pl. 28.2; Appendix 28.2, windows 2, 3, 6). Others are based on the 10th/16th-century types, but with certain details altered. Sometimes an earlier inscription has been copied in the correct location and sequence, but on a grille of a different type to that on which it originally appeared (Appendix 28.2, window 1). There are also grilles which faithfully reproduce type and/or location, but on which the inscription has been altered (Appendix 28.2, windows 20, 23). While the arrangement of the window-grilles is in keeping with that introduced in the 10th/16th century, the colours of their glass do not adhere strictly to the 10th/16th-century scheme.⁷³

This is even more true of the grilles now in the windows of the drum, which seem to preserve the forms of window-grilles of several different periods. Even where the form of an earlier grille has been faithfully copied, the new grille has often been placed in a different window to that in which its prototype appeared (see Appendix 28.3, windows 12 and 13). Because no changes to the grille in a particular window have been documented, it does not mean that no changes have occurred. Conversely, in view of the discrepancies between documentary and material

⁶⁹ See, for example, a window depicted in an illustrated *Khamseh* manuscript, possibly produced in Sistan around 927/1520, in which an arabesque design is set against an imbricated ground (Soudavar 1992: 177, no. 67).

⁷⁰ For the Süleymaniyye windows see notes 19–20. For Topkapi see Anhegger-Eyüboğlu (1979–80: 59–60, figs 26a, 28); Bakirer (1985: 150, fig. 74). Of the Topkapi windows Rogers (1983: 250) concludes: 'Though the inherent fragility of the stucco panels makes it barely possible that any of these are original, they may well be faithful copies'.

⁷¹ Although it should be noted that, apart from what appears to be an intrusive late type (pl. 28.6), there is no evidence for the use of an imbricated background in the 10th/16th century windows of the Qubbat al-Sakhra.

⁷² The fact that the walls were whitewashed is mentioned by Horn 1962: 204. This was also the case in the early 13th/19th century; see Richardson 1822: 296.

⁷³ Creswell (1969: 221) comments on the windows installed in the 1340s/1920s, '... the colours of the glass are no longer what they were. This can be verified by the new stained-glass windows recently put into position, the tones of which are very crude.'

evidence, it seems unlikely that documentation of changes to, or replacements of, the windows should be taken as absolute proof that such changes were as far-reaching as claimed. It is to be hoped that the future publication of the documentation which concerns the restorations ordered by Ahmad III may resolve the issue, but for the moment one must conclude that it is highly unlikely that all the window-grilles in the drum were replaced at any point during the Ottoman period, for many Mamluk *qamariyyat* seem to have survived in this location until relatively recently. Even after the major restorations of the 1340s/1920s, Megaw (1952: 56) could identify as many as nine windows in the drum as likely to be wholly or partly, work of al-Nasir Muhammad's time. There are therefore reasons for thinking that, contrary to the practice employed in the windows of the octagon, not all the Mamluk window-grilles in the windows of the drum were replaced during the restorations ordered by Sultan Sulaiman.

Why this may be so, or what the relationship between the surviving Mamluk grilles in the dome and the new windows installed by Sulaiman was, is not clear, but perhaps the grilles installed in the dome in the 8th/14th century were in a better condition than those of the octagon. Even in the octagon, where the stylistic and epigraphic evidence leaves no doubt that all the stucco and glass windows were replaced by Sulaiman, the survival of metal gratings in some of the windows until the present century suggests that, in certain cases, the exterior grilles set in place during the Mamluk period may have been retained, hidden between the inner grilles and the outer grilles of pierced tiles (Megaw 1952: 88; Shafi'i 1970: 65; see note 6 above).

Fig. 28.1 The Dome of the Rock: key to the window numbers cited in the text and appendices.

The fact that any of the forms of the Mamluk or the 10th/16th-century grilles have survived serves to indicate that the process of copying early types continued in subsequent restorations. This was certainly the case with the post-Ottoman restorations, which entailed the replacement of some ruined window-grilles with copies of those removed (Appendix 28.2, windows 13-14). Over five centuries the process of copying earlier types, repairing damaged grilles *in situ* and replacing spoiled windows, often resulted in hybrid forms. The poor quality of some of the resulting 12th/18th- and 13th/19th-century pastiches—hard to appreciate from the window-grilles in place today—is witness to the lack of a vibrant, evolving tradition of *qamariyyat* manufacture in Jerusalem during the Ottoman occupation. Richmond (1924: 80) had suggested bringing craftsmen from Cairo to restore the windows. When major restorations of both the Qubbat al-Sakhra and the Aqsa were undertaken between 1342/1923 and 1346/1927, two master craftsmen had to be brought from Istanbul to teach the craft to local artisans (Anon 1928: 13). The present windows in the Dome of the Rock, which conform to the spirit—and sometimes to the letter—of the 10th/16th century, are largely products of the workshop established at this time. Its successor was responsible for replacing the *qamariyyat* in the Aqsa destroyed in the fire of 1386-7/1967 and continues to operate from a workshop adjoining the mosque (pl. 28.23).

Fig. 28.2 Detail of the central field of the window type seen in pl. 28.1, based on a window-grille in the Aqsa Museum, Haram al-Sharif, Jerusalem.

APPENDIX 28.1

The Dome of the Rock: Inscriptions in the windows of Sultan Sulaiman

This reconstruction of the inscriptions in the 10th/16th-century windows is based on the evidence published by van Berchem (1927: 329-31), who drew heavily on the unpublished notes of Sauvaire, and the inscriptions recorded by de Vogüé (1864: 96-7). The translations of Qur'anic verses are largely based on those of Yusuf 'Ali. Sometimes van Berchem indicates precisely where in an *aya* the quotation in a particular window begins and ends. Where this is not indicated, I have used the average length of Qur'anic quotation in the windows as a guide in dividing an *aya*. This is the case with the Qur'anic inscriptions which are continued across windows 4-5, 16-8, 29-31, and 32-4.

I have departed from van Berchem's reconstruction in one respect only. According to van Berchem, verse 1 of Sura XLVIII appeared in the first window of the southern side of the octagon (window 28). Verse 2 appeared in the next three windows (29-31), and verses 4 to 5 in the windows of the following, south-eastern, side (32-36). It seems reasonable to conclude, however, that the lengthy quotation from Sura XLVIII originally included all five of the first verses. The missing verse 3 would therefore have appeared in window 31, which would produce a scheme in which quotations of approximately equal length appeared in each window.

East

1. In the name of God, the Compassionate, the Merciful.
2. And your God is One God ... (continued on window following)
3. there is no God but He, the Most Merciful, the Most Compassionate: Sura II 163-64.
4. God! There is no God but He, the Living, the Eternal ... (continued on window following)

North-East

5. No slumber can seize Him nor sleep. His are all things in the heavens ... (continued on window following)
6. and on earth. Who is there who can intercede in His presence ... (continued on window following)
7. except as He permits? He knows what is before them or after or behind them. Nor shall they encompass anything ... (continued on window following)
8. of His knowledge except as He wills. His Throne extends over the heavens and the earth ... (continued on window following)
9. and He feels no fatigue in guarding and preserving them for He is the Most High, the Supreme: Sura II 255/256.

North

10. O God, aid and sustain the armies of the Muslims ... (continued on window following)
11. Prolong the days of our lord, the sultan... (continued on window following)
12. lord of the necks of the nations, the sultan ... (continued on window following)
13. Sulaiman, son of the Sultan Selim Khan, son of Bayazid.

North-West

14. In the Name of God, the Compassionate, the Merciful
15. The mosques of God shall be visited and maintained ... (continued on window following)
16. by such as believe in God and the Last Day, ... (continued on window following)
17. observe regular prayers, and practise regular charity ... (continued on window following)
18. and fear None but God: Sura IX 18/18

West

19. And these things were accomplished in ... (continued in window following)
20. the year nine hundred and thirty-five
21. Inscription unknown.
22. Inscription unknown.

South-West

23. Our Lord, the sultan, the great ... (continued on window following)
24. king and the honoured *khaqan* ... (continued on window following)
25. lord of the necks of the nations, sultan ... (continued on window following)
26. of the Arabs and of the foreigners, Sultan Sulaiman ... (continued on window following)
27. son of the Sultan Selim Khan, son of Bayazid.

South

28. In the Name of God, the Compassionate, the Merciful. Verily We have granted thee a manifest Victory: Sura XLVIII 1/1.
28. That God may forgive thee thy faults of the past and those to follow ... (continued on window following)
30. Fulfil His favour to thee: and guide thee on the Star-right Way: Sura: XLVIII 2/2.
31. And that God may aid you with powerful help: Sura XLVIII 3/3.

South-East

32. It is He who sent down tranquillity into the hearts of the believers ... (continued in window following)
33. that they may add Faith to their Faith; for to God belong the forces of the heavens and the earth; ... (continued in window following)
34. and God is full of Knowledge and Wisdom: Sura XLVIII 4/4. That He may admit the believers ... (continued in window following)
35. to Gardens beneath which rivers flow, to dwell there for ever, ... (continued in window following)
36. and absolve their evils—that is, in the sight of God, the highest achievement (for man): Sura XLVIII 5/5.

APPENDIX 28.2

The Dome of the Rock: Windows in the Octagon

The window numbers refer to the windows indicated in fig. 28.1.

East

1. Apart from its inscription (the *bismillah*), which follows that of the earlier window, the window now in place bears no relation to the 10th/16th-century window recorded by de Vogüé (1864: 96, pl. XXIV). This was removed in the 1370s/1950s and may be among the windows in the Aqsa Museum.
2. See comments for window 3. The inscription of the grille now in place follows that of the 10th/16th-century window (See Appendix 1).
3. The form of the window now in place follows that of the 10th/16th-century window recorded by de Vogüé (1864: 96, pl. XXV, my plate 28.2). The colours of the glass are quite different, with blue and yellow now the predominant colours and the red glass of the earlier window absent. This suggests that the glass either has been replaced, or that the grille is an accurate copy in which modern glass has been used.
4. The window-grille now in place is similar to that in window 1. It therefore seems to have been set in place at some point during the present century.

North-East

5. Megaw (1952: 55) suggested that this was a 10th/16th-century window.
6. Megaw (1952: 55) suggested that this was a 10th/16th-century window. The design and border of this window is not unlike one of those published by de Vogüé (pl. 28.2 above). The type is clearly related to one of the window-grilles of the dome (fig. 28.7), which is likely to preserve the form of a 10th/16th-century grille. Even if this grille is modern, it seems likely therefore that it copies a type installed in the time of Sulaiman the Magnificent.
7. On inspection in 1333/1914, van Berchem (1927: 330 n. 4) suggested that the grille filling this window may have been remade in 1291/1874, while preserving the form of the original 10th/16th-century window. The inscription which the latter window bore (see Appendix 1) is preserved in the window-grille presently *in situ*.
8. See comments for window 6.
9. The same type as window 5. Megaw (1952: 55) suggested that this was a 10th/16th-century window.

North

10. The window-grille now in place is similar to that now found in window 1. It seems that this was installed during the restorations of the 1340s/1920s, when the earlier grille was removed to the Aqsa Museum (Megaw 1952: 55). This differs from the type in place earlier, visible in Creswell (1969: pls. 15-16). The latter seems to have been a 10th/16th-century type, for it is similar to that recorded by de Vogüé in window 1. There is some suggestion that the vanished grille may have been remade at some time before 1333/1914 (van Berchem 1927: 332, n. 4), but if this was the case the form of the window installed during the restoration undertaken by Sultan Sulaiman seems to have been preserved.

11. The grille seen by van Berchem in 1333/1914 appears to have dated from the 10th/16th century, or to have copied a window-grille of this date (1927: 332, n. 4). It is not certain that the form of the grille presently *in situ* follows that of the grille which it replaced.

12. The grille filling this window was replaced during the reign of 'Abd al-'Aziz, for the window seen by van Berchem in 1333/1914 bore the name of this sultan (1927: 329). This was replaced in the 1340s/1920s (Megaw 1952: 55) and the inscription on the grille presently filling this window makes no mention of 'Abd al-'Aziz.

13. The grille filling this window was replaced in 1291/1874 during the restoration undertaken by 'Abd al-'Aziz (van Berchem 1927: 329-30). The replacement window, visible in a photograph published by Creswell (1969: pl. 16), appears faithfully to have copied the form of a 10th/16th-century grille, for it is of a type recorded by de Vogüé in window 1. This was removed to the Aqsa Museum in the 1340s/1920s (Megaw 1952: 55) and replaced by a grille of an entirely different type.

North-West

14. The grille filling this window was replaced during the reign of 'Abd al-'Aziz (van Berchem 1927: 329). Apart from the inscription, it may be that the grille installed at this time faithfully copied one from the time of Sultan Sulaiman. This appears to have been the case with the grille installed in 1291/1874 in window 13, and the border of medallions and cartouches (visible in Creswell 1969: pl. 17a) was used in the 10th/16th-century grilles. During the restorations of 1342-6/1923-7 this was in turn replaced (Megaw 1952: 55). The present grille has a simple border of cartouches with no intervening medallions, which indicates that it does not follow the form of the 10th/16th-century window exactly, if at all.

15. The grille filling this window was installed between 1342/1923 and 1346/1927 (Megaw 1952: 55). It replaces an earlier grille of a different type (visible in Creswell 1969: pl. 5b), similar to that now found in windows 11 and 12.

16. The grille filling this window was replaced in 1291/1874, for that recorded by van Berchem (1927: 329) bore the name of 'Abd al-'Aziz. This grille appears to have had its central field subdivided into two vertical rectangular panels (visible in Creswell 1969: pl. 5b), and was perhaps similar to the type which now appears in windows 1, 4, 10, 13, 19, 22, 28 and 31. It was replaced in the restorations of 1342-6/1923-7 by a window-grille of a different type (Megaw 1952: 55), similar to that now in place in windows 5, 7, 9, and 14.

17. See comments for window 15.

18. See comments for window 14. The grille removed between 1342/1923 and 1346/1927 is visible in Creswell (1969: pl. 18a).

West

19. In the period 1308-18/1890-1900 this window was filled with a grille of a type similar to those now in place in windows 11 and 12. The colours of the glass were, however, quite different, with the main lines of the hexagonal grid filled with red rather than yellow glass (Israel Antiquities Authority, Photographic Archive, Finn Collection P2619). To judge from the inscription recorded by Sauvaire in 1311/1893 (see Appendix 28.1), this was an original 10th/16th-century window-grille. At some time between 1311/1893 and 1333/1914 this grille was altered or removed, for van Berchem (1927: 329) recorded reading the *shahada* in this window. The grille in which this appeared is visible in Richmond (1924: fig. 7). Between 1342/1923 and 1346/1927 this was

replaced with a grille of a different form (Megaw 1952: 55), similar to those now in windows 1, 4, 10 and 13. During the restorations of the 1370s/1950s this was replaced with an exact copy of the latter grille, which is now on display in the Aqsa Museum.

20. In 1311/1893 Sauvaire recorded an inscription giving a date of 935/1528-9 in the grille filling this window (van Berchem 1927: 331). This suggests that the 10th/16th-century grille had survived until then. When van Berchem visited the Dome of the Rock in 1333/1914, this grille bore no inscription (1927: 329). A new grille was installed in the restorations of 1342-6/1923-7 (Megaw 1952: 55). The grille currently in place is similar to those in windows 2 and 3, which follow a 10th/16th-century design. Since no information is available regarding the form of the grille seen by Sauvaire, however, it is not possible to be certain that a grille of this type appeared originally in this position.

21. The grille in this position had been altered or replaced by 1311/1893, for Sauvaire indicated that it was anepigraphic (van Berchem 1927: 330). It was again replaced in 1342-6/1923-7 (Megaw 1952: 55) and presumably in the subsequent restoration, for Megaw (1952: 54) reports that it had disintegrated by 1372/1952.

22. The grille in this position had been altered or replaced by 1311/1893, for Sauvaire indicated that it was anepigraphic (van Berchem 1927: 331). The design of this grille (visible in Creswell 1969: pls. 19, 20a) appears to have been based on some of those in the dome. In the 1340s/1920s it was replaced by a window-grille similar to those which appear today in windows 1, 3, 13, 10 and 19.

South-West

23. Until van Berchem's visit in 1333/1914, the grille in this window bore its 10th/16th-century inscription and may have been original, or remade after the original (van Berchem 1927: 332, n. 4). For reasons of symmetry, one would expect here a grille of a similar type to that recorded by de Vogüé in window 27 (pl. 28.3). If so, the grille was subsequently removed; the window-grille now in place is based on that which de Vogüé recorded in window 3.

24. The grille filling this window was replaced in 1291/1874, for van Berchem recorded the name of 'Abd al-'Aziz in this window (van Berchem 1927: 330). Like the grille formerly in window 12, which bore the name of the same sultan, this was subsequently replaced with a grille in which the sultan's name does not appear. Both grilles are based on that found in window 19, which appears to date from the time of Sulaiman the Magnificent, and were presumably installed in the 1340s/1920s or later.

25. Until 1333/1914 the grille in this position appears to have been, or to have copied, a 10th/16th-century grille, for the inscription which it bore contained the titles of Sultan Sulaiman (van Berchem 1927: 331, n. 6; 332, n. 4). This appears to have been replaced subsequently, for the window-grille now in place bears a different inscription. No information is available concerning the form of the earlier grille.

26. Until 1333/1914 the titles of Sultan Sulaiman were continued from window 25 in the grille filling this window. No information is available concerning the form of this grille which was subsequently replaced by one now in place, which bears a different inscription.

27. The original 10th/16th-century grille was recorded by de Vogüé (pl. 28.3). Although this grille appears to have been repaired or replaced subsequently, the inscription was copied in the new grille (van Berchem 1927: 331, n.7). At some time after 1333/1914 a new grille which follows neither the form nor the inscription of the earlier window was set in place.

South

28. The grille in this position was remade between 1312/1894 and 1333/1914, but its inscription followed that of the earlier window (van Berchem 1927: 331 n. 8). The later grille appears to have been of similar form to that of the grilles which appear today in windows 1, 4, 13, 10, 22, and 19 and may have been the model for these grilles. That a grille of this form was in place by 1327/1909 is apparent from William Harvey's painting of the interior of the Qubbat al-Sakhra (Creswell 1969: frontispiece). In a photograph published by Creswell (1969: pl. 21a) it can be seen that the inscription is executed against a background perforated by random drilling. Since drilling also appears in the background of an inscription on a fragmentary window now in the Aqsa Museum which bears the name of 'Abd al-'Aziz and the date 1291/1874 (pls. 28.9-10), it may be characteristic of windows of this date. It seems likely therefore that grilles which now fill windows 1, 3, 13, 10, 19, 22, 28 and 31 copy a type introduced in the last quarter of the 13th/19th century.

29. Van Berchem (1927: 331, n. 8) could find no evidence for this grille having been replaced. No details of its form are available.

30. Van Berchem (1927: 331, n. 8) gives no evidence for this grille having been replaced. The form of the grille was similar to that formerly found in window 6, for it appears both in Harvey's painting of 1327/1909 (Creswell 1969: frontispiece) and in a photograph taken by Richmond in 1338/1919 (1924: fig. 6). Since this type of grille appears to be contemporary with the 16th-century restorations, it seems likely that the example in window 30 was original. The grille was subsequently removed and replaced with a type which formerly appeared in window 19.

31. The grille in this window was re-made or replaced before 1311/1893, for it repeated the inscription found in window 28 (van Berchem 1927: 331, n. 8). A grille of the type discussed in connection with window 28 was in place by 1327/1909, for it appears in Harvey's painting (Creswell 1969: frontispiece). A similar window-grille is *in situ* today.

South-East

32. Van Berchem considered the inscription in this window as being faithful to that of the 10th/16th-century grille (van Berchem 1927: 331 n. 9). Megaw (1952: 55) suggested that the grille may have been one of the originals installed during the restorations undertaken by Sultan Sulaiman.

33. Megaw (1952: 55) suggested that this may have been a 10th/16th-century grille. No information on subsequent alterations has been found.

34. See comments on window 33.

35. The grille filling this window appears to have been replaced before 1311/1893, for it repeated part of the inscription in window 33 (van Berchem 1927: 331, n. 9). No information on subsequent alterations has been found.

36. Megaw (1952: 55) suggested that the grille in this window was an original 10th/16th-century window-grille. Either this was not the case, or the grille seen by Megaw was subsequently removed, for the grille seen in a photograph taken before the restorations of 1342-6/1923-7 (Creswell 1969: pl. 12a) has a border of cartouches alternating with medallions. The intermediary medallions do not appear in the border of the grille in place today.

APPENDIX 28.3

The Dome of the Rock: Windows in the Drum of the Dome

The window numbers refer to those indicated in fig. 28.1.

1. Before the restorations carried out in the present century, this window was unique among those in the dome in being filled with an epigraphic grille (pl. 28.17, fig. 28.10). The lunette and the rectangular field of this grille were executed in different styles and clearly belong to different periods. Megaw (1952: 56) suggested that the lower part of the grille containing the epigraphic panel may have dated from the restorations carried out under Sultan Mahmud II in 1233-4/1817-8. However, the design of this lower panel appears to be based on the type of grille now in window 12, which seems to date from, or to copy a grille of, the 10th/16th century.

2. The type of grille currently in place bears little relation to that which appears in a photograph taken before the restorations of the 1340s/1920s (Creswell: 1969, pl. 5b).

3. Megaw (1952: 56) suggested that the grille filling this window may have been an original 8th/14th-century *qamariyya*. The window in place today is similar to that now in window 16, a later replacement which bears no relation to the earlier type of grille which it replaced.

4. Megaw (1952: 56) suggested that this grille was an 8th/14th-century creation. The one now in place appears to be later; the presence of a polylobed arch in the central field suggests that it is—or that it copies—an Ottoman grille.

5. Megaw (1952: 56) suggested that the grille in this window was an original 8th/14th-century one. This same grille appears to have been damaged at some subsequent time (visible in Shafi'i 1970: plate on page 20). The grille now in place is similar to the example published by Richmond (1924: fig. 68) which would support Megaw's suggestion. Whether the grille now *in situ* is the same as that seen by Megaw, or is a later copy, is not clear.

6. Megaw (1952: 56) believed that the grille in this window was, or was based on, a 10th/16th-century type. For reasons discussed above, I would propose an earlier date for the type, which continues to appear in this window today.

7. Comments as for window no. 4. A type of grille now no longer represented among the windows of the drum appears in a photograph taken in the first quarter of this century (van Berchem: 1927, pl. XXV).

8. Megaw (1952: 56) suggested that the grille filling this window antedated the renovations of Sultan Sulaiman. In a photograph taken before the restorations of this century (van Berchem 1927: pl. XXV) a grille with a large central *shamsa* is in place. The presence of both a polylobed arch and a pair of symmetrical cypresses in the central field of the grille now in place suggests that this grille is considerably later and is presumably not the one seen by Megaw.

9. Megaw (1952: 56) suggested that this window-grille dated from the renovations of Sultan Sulaiman. The form of the window now in place is similar to that of one of the grilles published by Richmond (1924: fig. 67), which, for reasons discussed above, suggests that it follows the form of a Mamluk rather than an Ottoman grille.

10. Remarks as for window 9.

11. To judge from Harvey's painting of 1327/1909 (Creswell 1969: frontispiece), the grille formerly in place in this window was of a type no longer represented among the types of window-grilles which have survived. The same grille is visible in one of Creswell's unpublished photographs (Creswell Archive, no. 56) and more clearly in a photograph published by van Berchem (1927: pl. XX). Megaw (1952: 56) believed that the tympanum of this grille may have dated from before the Ottoman period, but thought that the geometric tracery of which the rectangular field below was composed was of more recent manufacture.

12. A photograph published by van Berchem (1927: pl. XX, my pl. 28.18), a photograph in the Creswell Archive (no. 56) and the painting executed by Harvey in 1327/1909 (Creswell 1969: frontispiece) all show a grille of different type in the same position. Megaw (1952: 56) suggested that this grille was, or was based upon, one of the grilles installed in the 10th/16th century. For reasons discussed above, this assumption seems reasonable. That now in place copies a type of grille with a central *shamsa* which may date from the period of al-Nasir Muhammad. It appears that in the course of one of the renovations of this century, probably after Megaw's report was written, both types were copied. The order in which they appear in the windows of the dome was reversed, however, with the 10th/16th-century type formerly in window 12 being placed in window 13 and the 8th/14th-century type formerly in window 13 being copied and placed in window 12.

13. See remarks for window 12.

14. The grille which fills this window in the painting executed by Harvey in 1327/1909 (Creswell 1969: frontispiece) is of a similar type to that now in place in window 16. This was subsequently replaced, for the grille now *in situ* is similar but not identical to one published by Richmond (1924: fig. 67), a type which seems to date from the renovations of al-Nasir Muhammad.

15. The grille which fills this window has been put in place this century, for a grille of a type similar to that published by Richmond (1924: fig. 68) and to those which now appear in windows 1 and 14 is seen in a photograph published by van Berchem (1927: pl. XXV). At present one of a different type, similar to that which now fills window 12, is in place. Megaw (1952: 56) believed the earlier grille to date from the Mamluk period, which is not unlikely.

16. The grille now in place bears no relation to that which appears in a photograph in the Creswell Archive (pl. 28.20), a grille which was similar to those now in windows 1, 13 and 14, with a central *shamsa*. The evidence for considering this type to be based on an 8th/14th-century form of window-grille has been discussed in section 6 above.

Chapter 29

THE PAINTED WOODEN CEILING IN THE INNER AMBULATORY OF THE DOME OF THE ROCK*

James W Allan and Marwan Abu Khalaf

In terms of woodwork, the Dome of the Rock is an extremely rich building. The dome itself, the beams between the arcades, the doors, and the ceilings of the outer and inner ambulatories are all made of wood. The only woodwork of probable Ottoman date, however, is the ceiling of the inner ambulatory, that between the octagonal arcade and the rotunda (Richmond 1924: 15). An inscription carved in stone, which used to be under the western porch and is now preserved in the Islamic Museum of al-Haram al-Sharif (Creswell 1989: 30), records that the first identifiable Ottoman reconstruction of this ceiling was undertaken during the reign of Sultan 'Abd al-Hamid I, in 1194/1780 (van Berchem 1927: 343, no. 246). It reads:

قد جدد الملك التقي سلطاننا عبد الحميد
ذالباب والكاشان مع تسقيفها صحن الوصيد
تامين عبد صادق حقي محمد مير سعيد
سرّ الحميد مادح تعميرة بيتاً مجيد
كتبه [...] سنة ١١٩٤

The pious king, our Sultan 'Abd al-Hamid, renewed this door and the faience together with the ceilings of the Sakhra, encrusting them with Chinese porcelain bowls.

² Editor's note: This chapter was amplified by Professor James W Allan using material from the Creswell Photographic Archive in Oxford.

Confiding [the work] to a sincere servant, Haqqi Muhammad, a fortunate *amir*. The Praiseworthy One [i.e. God] rejoiced, praising [his work as follows]: 'His [the sultan's] restoration of a Sanctuary is excellent. Peace be upon you. Well you have fared. Enter in, to dwell forever.' ... wrote it. The year 1194 [1780].

Van Berchem discussed the meaning of the words *sahn* and *wasid* in some detail. The first could signify the terrace on which the Dome of the Rock stands, and the second the threshold of the door. However, he suggested that, grammatically, such an interpretation was impossible, and concluded that *sahn* was used here in the sense of a Chinese porcelain bowl, and *wasid* for the insertion of such bowls into the ceiling.

In addition to the numerical date at the end of the inscription, a date is also provided by the preceding words: 'His restoration of a Sanctuary is excellent,' which is a chronogram equivalent to 1195. Sauvaire proposed to drop the *alif* of the word *baitan* so that the date would then read 1194, and thus give the same year as the numerical date. Van Berchem, however, preferred to see 1194 as the date for the external repairs and 1195 as the date of the ceiling restoration.

The later date is certainly confirmed by two small *naskhi* inscriptions placed in two of the niches which form the cornice along the edge of the ceiling. They are opposite the south door on the exterior of the circular arcade, facing south. In addition to a date they also record the names of two of the workers. They read (van Berchem 1927: 347, no. 248):

يا شفاعت نبي الله سنة ١١٩٥ محمد بن سفيان

Oh intercession of the Prophet of Allah. The year 1195 AH Muhammad son of Sufyan.

يا شفاعت نبي الله سنة ١١٩٥ محمود

Oh intercession of the Prophet of Allah. The year 1195 AH Mahmud.

The 1194-5/1780-1 restoration was the last of the four 18th-century restorations of the Dome of the Rock conducted by the Ottoman sultans, and the only one, apparently, in which any work was done to the ceilings of the inner ambulatory. The others were in 1720-1, 1742, and 1753-4 (St Laurent and Riedlmayer 1993: 84, n.12, in which they quote Aslanapa 1989).

The two niches described above were originally contiguous, but in 1382/1963 they were separated and a new inscribed niche placed between them. This reads:

This frieze was renewed [in] the year 1382 of the Hegira.

At the same time the two original inscribed niches must have been repainted, for the date now reads 1295 instead of 1195. The later date is repeated elsewhere around the frieze.

There were two major restorations of the building in the 19th century. The first was undertaken by Sulaiman Pasha in 1232-4/1816-18. The tilework element of this restoration programme is recorded in a number of inscriptions in the Dome of the Rock (van Berchem 1927: 348-60, nos. 250-70), and the full story is recounted by Ibrahim al-Murat.¹ He describes how it was found necessary 'to replace the roofing (*suqufat*) of the three places [the Aqsa Mosque, the Dome of the Rock and the Haram] and the cornices (*rafayif*) all around, to replace the roofing (*suqufat*) of all the porticoes (*arwiqa*), and to replace the lead existing on all the roofs (*astaha*) because it was decayed from olden times, and to replace the tiles that were there, as they were no longer serviceable, and to renew all the parapets ...' He records that the timber was brought from the mountains of Lebanon to Jerusalem via Beirut and Jaffa, and many of the beams were of such length and weight that 270 camels were reported to have died in the attempt to transport the beams, as well as a large number of people. The largest of the beams were presumably destined for the Aqsa Mosque rather than the

Dome of the Rock. The work was encouraged by the Sublime Porte, which sent carpenters and painters, but left the payment for their labours to Sulaiman Pasha.

The precise difference between the Arabic terms *saqf* and *sath* is unfortunately unclear from Ibrahim al-Murat's text. However, the conclusion must be that work was indeed carried out on the ceilings of the Dome of the Rock in 1816-18.

The next inscriptions relating to the history of the ceilings, and hence the next specific information on their history, are those recording the second 19th-century restoration. This was undertaken in the year 1291/1874-5 by order of the Ottoman Sultan 'Abd al-'Aziz. The inscriptions are to be seen in seven of the domical caissons—three arranged symmetrically around the south east ceiling, and four arranged irregularly around the north west ceiling. In each the inscription reads (van Berchem 1927: 360, no. 271):

عز لمولانا السلطان الملك الناصر، ناصر الدنيا والدين

السلطان عبد العزيز خان ادام الله ملكه، سنة ١٢٩١ هـ

Glory to our Lord, the Sultan, al-Malik al-Nasir, Nasir al-Dunya wa'l-Din, Sultan 'Abd al-'Aziz Khan, may God prolong his reign. In the year 1291 of the Hegira [1874-5].

As van Berchem noted, this inscription is made up of two parts. The titles in the first part refer to the Mamluk Sultan Muhammad ibn Qala'un, who restored the ceilings probably in 1318. The reuse of these titles suggests that the idea of the domical caissons as used in the Ottoman ceiling goes back to a Mamluk ceiling of similar design, one in which the caissons were decorated with Muhammad ibn Qala'un's name and titles.² The second part of the inscription refers to the Ottoman restoration of 1874-5.

A third inscription is written in the four corners of the square around the central rosette on both the north and south ceilings. It indicates that the ceilings were also restored in 1382/1963 in the period of the late King Hussein's control of Jerusalem. This inscription reads:

جدد هذا السقف سنة ١٣٨٢ هـ

This ceiling was restored in the year 1382 of the Hegira [1963].

Megaw gives a detailed description of the roof over the inner ambulatory as he found it in 1947. This is worth quoting almost in full since the information is otherwise unpublished (Megaw 1947: 5-6, paras. 22-3).

¹ Ibrahim al-Murat 1926: 292-7. For inscriptions relating to this restoration, though none relate to the ceiling, see van Berchem 1927: 348 ff.

² For a history of Islamic ceilings, see Allan 1994.

The roof over the ... inner ambulatory is carried by eighty radiating trusses ... The tie-beams are in most cases 26 to 27cm deep and 22 to 23cm wide. They pass through to the outer face of the wall over the outer arcade. They rest on wall plates built into the two faces of this wall. At the drum end they rest on the top of a course of masonry and pass deep into the wall ... The principal rafters, 21cm by 21cm, are housed into the tie-beams at the lower end and at the upper hold a king-post of similar section. The king-post does not rest on the tie-beam, but the principal rafters are strutted from its lower end. The fourth main member of the truss extends from the top of the king-post where it is housed into the inner principal rafter, to the drum wall, forming a continuation of the outer principal rafter. These two timbers, which form the main rafter construction, were originally bound together across the top of the king-post by iron straps nailed at each end. At the outer angles of the trusses the principal rafters were bound to the tie-beams with similar iron strapping ... At the drum end, the masonry of the sixth and seventh courses above that on which the tie-beams rest has been cut to receive the ends of the upper members. The timber used in the trusses is oak, cedar, and *qatrani* pine. The common rafters, 11 by 9cm, which carry the boarding, cross from truss to truss. At the bottom end they rest on small wedge-shaped pieces of timber which have been added to the top of the trusses to ease the transition to the less steep pitch of the outer ambulatory roof. The joists to which the ceiling boards are nailed are hung from the tie-beams ...

It has required special care to accomplish an even transition between the circular plan and conical form at the top of the roof slope and the octagonal at the bottom. In the inner ambulatory roof it has been necessary to carry the king-posts up to different heights according to the span of each truss. Between the corner trusses the remaining 72 are disposed, 9 to each side. These vary in span and other details according to the points at which they rest in the drum wall and that over the outer arcade; with the result that trusses built to 6 different sets of dimensions have had to be used. 18 of the trusses have their actual span further reduced by reason of their being built into the buttresses attached to the

Pl. 29.1 Dome of the Rock. The upper side of the wooden ceiling during the restoration of 1963. (Courtesy of the Aqsa Mosque Restoration Committee).

Pl. 29.2 Dome of the Rock. The wooden trusses of the roof, before they were removed during the restoration of the 1963. (Courtesy of the Aqsa Mosque Restoration Committee).

drum or into the projecting masonry over the piers of the outer arcade. These reductions of span have not been taken into account in designing the trusses, with the result that in these cases a considerable part of the truss is built into the masonry.

From more recent observation it is clear that the

Fig. 29.1 Dome of the Rock. Sketch of part of the present wooden ceiling.

Fig. 29.2 Dome of the Rock. Sketch of the central medallion of the north west and south west parts of the present wooden ceiling.

ceiling is formed of wooden boards 20cm in width and 2cm thick. The wooden boards are joined to each other by the tongue and groove technique, and placed in longitudinal position between the walls of the octagon and the ring of the dome. The ceiling boards are nailed to the underside of the wooden beams, which form part of the wooden roof. The beams are 15cm wide and 5cm thick, and are placed in an upright position parallel to the sides of the octagon. These beams are supported by smaller ones set in a vertical position between them using the mortice and tenon technique (pl. 29.1). The iron hangers have now been replaced by stainless steel ones, attached to the underside of the trusses forming the roof of the Dome of the Rock (pl. 29.2).

Visually, the present ceiling is divided into eight parts, each part parallel to one side of the octagon. Six of these parts are ornamented with one particular design; the other two bear a second design (col. pl. XVII and fig. 29.1).

The commonest design is as follows. At each end of the panel there is a triangular area, with green painted background, divided by gilded wooden frames into small squares. Each square has an eight-lobed wooden star in the centre. The central part of each panel is of octagonal shape formed by a wooden frame painted red. Inside it is a

Pl. 29.3 Dome of the Rock. Detail of the wooden ceiling c. 1918-20. (Creswell Photographic Archive, Ashmolean Museum, Oxford no. C 45.)

square, also formed by a wooden frame painted red. The space between these two forms is filled with small squares on a green painted background similar to those decorating the triangles. The field inside the square is painted orange, and at each of its corners there is part of an inscription indicating the last renovation of the ceiling which, as noted above, was during the late King Hussein's reign. Inside the square there is a circle on a red painted background, enclosed by a gilded wooden frame. In the centre of the circle there is a gilded wooden rosette from which spring branches of gilded wood placed in fan shape. Between each branch there are two gilded wooden stars similar to those in the small squares.

The north-west and south-west parts of the ceiling are different. Here the central octagons have been replaced by large circular wooden forms. Each circle contains forty-four branches radiating from a central rosette. Between each of them there are two gilded wooden stars similar to those at the centre of the small squared, and fan-shaped, branches (fig. 29.2).

The field between the octagons and the triangular ends of each of the eight panels is covered with beige-coloured paint. It is decorated with slightly curvilinear,

Pl. 29.4 Dome of the Rock. Detail of the wooden ceiling c. 1918-20. (Creswell Photographic Archive, Ashmolean Museum,

Pl. 29.5 Dome of the Rock. Detail of the wooden ceiling c. 1918-20. (Creswell Photographic Archive, Ashmolean Museum, Oxford no. C 49.)

applied lozenge shapes, and with wooden domelets, the latter covering circular openings cut through the ceiling panels. The lozenges are painted white, and bear a central stylised tree.

Although this is the appearance of the ceiling today, it should not be concluded that it is identical to the latest phase of the Ottoman restorations (that of 1894). For photographs published by van Berchem (van Berchem and Ory 1982: 40), and others now in the Creswell Archive in the Ashmolean Museum, Oxford, taken c. 1918-20, show that the areas between the central circles/octagons and the triangular corners of each piece of ceiling, apart from their domical caissons, bore one of three designs, none of which is identical to that which covers them uniformly today. One consisted of slightly irregular squares with curved corners, with a painted flower in the centre of each square (pl. 29.3); the second of irregular pointed ovals, set at the diagonal, again with a painted flower in the centre of each oval (pl. 29.4); the third of a more elaborate ogival lattice design with alternating ground colours and applied roundels or florettes (pl. 29.5). Although all these three designs appear to have been thickly enough constructed to have been made of wood, their very irregular forms suggest

that they are more likely to have been constructed of thick plaster applied to the ceiling boards.

According to de Vogüé (1864: 98), who saw the ceiling of the Dome of the Rock in 1860, the ceiling's domelets were made of porcelain. This accords with van Berchem's reading of the 1194/1780 inscription given above, though, perhaps surprisingly, there are no material remains to prove it.

During the late King Hussein's restoration, many of the domelets dating from the 1291/1894 restoration were removed, presumably because of their bad condition, and were replaced by new ones. Some, however, were restored by covering the outside of the caissons with a plaster layer so as to consolidate their structure. The domelets of the wooden ceiling are not fixed and they are all of the same size—42cm in diameter. They cover holes which are also uniform in size—34cm in diameter.

A few dome-shaped caissons, and a large number of flat, rounded caissons, painted in a similar style, are preserved in the Islamic Museum of al-Haram al-Sharif in Jerusalem. One of the latter variety is decorated with the *tughra* of the Ottoman Sultan 'Abd al-'Aziz Khan (1861-76). These domelets and discs are of different sizes: 35cm,

Pl. 29.6 Dome of the Rock. Detail of the wooden ceiling *c.* 1918–20 (Creswell Photographic Archive, Ashmolean Museum, Oxford no. C 29).

42cm, 46cm, 47cm, or 56cm in diameter. Their stylistic similarity with those decorating the ceiling of the Dome of the Rock suggests that they could have come from the same ceiling. However, a well-known workman, Nadir Ishtayyah, who has been involved in the renovations of the Aqsa Mosque since 1958, maintains that they come from the Aqsa Mosque, and originally decorated the ceiling of the Mihrab Zakariyya. He claims that they were taken to the museum after the fire which took place in the mosque in 1969.

At first sight this conclusion is supported by the fact that the caissons are of varying size, for all those which decorate the ceiling in the Dome of the Rock today are of uniform size. However, that is not necessarily a valid argument, for photographs in the Creswell Archive indicate that prior to 1963 they varied in size, and also in form. Thus, in one particular photograph (pl. 29.6), at least three different sizes are to be seen. Moreover, the largest has two tiers of cusped work internally, resembling simple *muqarnas* work, and is topped by what appears to be a flat, painted disc. Thus, in principle, it is perfectly possible that many of these could come from the Dome of the Rock. That is not, however, to rule out the possibility of an Aqsa

Mosque source. Although van Berchem records no inscription to indicate an Ottoman restoration of the ceilings in the Aqsa Mosque, that does not prove that such a restoration never took place, and further investigation into the history of the Aqsa ceilings in appropriate archives may yet bring that information to light.

In the ceiling as it is today, the surviving domical caissons are formed of wooden circular frames, composed of several pieces of wood about 4.5cm wide and 3cm thick, spliced together and fixed by iron nails. The domed form is created by thin wooden pieces, triangular in shape, placed around the inner edge of the frame, which has been lowered to about 5mm so as to accommodate the bases of these triangles. The heads of these triangles are joined at the top by wooden pins. The domes were covered with glued fibres on both the outside and inside. The inner faces were then covered with plaster on which different decorative designs were carved. The designs are composed of a variety of vegetal, calligraphic and geometric decorative elements. These elements are all outlined in red and black, and then painted with different colours: gold, white, orange, light blue, etc. Technically and stylistically these domelets follow those in the museum of al-Haram al-Sharif, and many of them may indeed be of 19th-century date.

Along the edge of the ceiling there is a sloping cornice composed of niches. Each niche is formed of two turned wooden columns carrying a semicircular arch painted in brown and filled with dots painted in beige. The upper part of each niche is filled with a five-petalled rosette painted in orange, black and beige; the lower part is painted in green and contains a central star-shape. Between each arch there are five-lobed vine leaves, set within scrolls painted in gold (de Vogüé 1864: 98, pl. XXIIa; Creswell 1969: 90–1; Creswell 1989: 30) (fig. 29.3).

The construction of the domelets of the inner ceiling of the Dome of the Rock has already been described. Several techniques were used to construct and decorate this inner ceiling. They include tongue and groove, tenon and mortice, nailing, turning, splicing, plasterwork and painting.

The tongue and groove technique was used to join the wooden boards of the ceiling. Each board that was examined had a projecting tongue on one of its sides and a groove carved on the other side. The mortice and tenon technique was used for joining the beams and the crossbeams supporting the ceiling. This technique allows a projecting tenon from the two sides at each end of a cross beam to be fitted into cavities carved in the upright beams. The turning technique was used to form the wooden columns of the niches used in the sloping cornice placed along the edge of the ceiling. Splicing was used to join the wooden pieces forming the wooden frame of the domelets. The nails were used to fix the wooden boards to the

Fig. 29.3 Dome of the Rock. Sketch of the niches forming the sloping cornice surrounding the wooden ceiling.

Pl. 29.7 Nashashibi House. Part of the wooden ceiling dated to 1890 (Courtesy of Sharif al-Sharif).

underside of the wooden beams and cross beams. Plaster designs in relief are common, and painting was used throughout: the major colours are green, red, orange, black and gold.

A comparative study of this ceiling with other wooden ceilings in Ottoman Turkey, and more locally in Palestine, indicates that the style of the Dome of the Rock ceiling was familiar in both regions. For comparative purposes, the most important local wooden ceiling is that of the Nashashibi house, built by al-Hajj Khalil al-Nashashibi in 1890 outside the Old City of Jerusalem (Kroyanker 1985: 200) (pl. 29.7). The Nashashibi ceiling has a central octagonal shape on a green-painted background, covered with small squares formed of gilded wooden frames. Each square is filled by a gilded wooden eight-pointed star. In the middle of the octagon there is a square, within which there is a circle, containing a smaller circle from which spring branches of gilded wooden pieces placed in a fan-shape on a green painted background. Between each branch there is a gilded wooden star. The

square's corners are decorated with a crescent and star motif representing the national emblem of the Ottoman empire. The decorative scheme of this ceiling is thus very similar to the central part of each section of the ceiling of the Dome of the Rock.

A similar wooden ceiling is to be found in the 'Mamluk house', located in the 'Aqabat Shaikh Rihan in the Old City of Jerusalem, which was built by al-Hajj Sulaiman ibn 'Abdallah Agha al-Murali. The ceiling is painted light blue, and has a central rectangle within which there is an elongated octagon, formed by a gilded wooden frame, decorated with gilded wooden stars on a blue background. The field around the rectangle is decorated with wooden frames painted in black, white and gold, similar to those of the Dome of the Rock. This ceiling is mentioned in Chapters 25 and 30 of this volume.

A survey of 18th- or 19th-century buildings in Turkey reveals several wooden ceilings of a similar type. There are two wooden ceilings in the Topkapi Sarayi in Istanbul which are decorated with small squares divided by gilt frames with central rosettes. One of these is the canopy ceiling of the *valide sultan's* bedchamber, which is dated to the 17th-18th century (Koseoglu and Batur 1988: 39, pls. 31-2), and the other is the wooden ceiling of the Sofa Kiosk dated to the 18th century (Levey 1975: 115, no. 71). In a non-royal context, there is also a related wooden ceiling in the coffee house of the Istanbul bazaar. The ceiling of this latter building is decorated with lozenges formed by wooden frames, and is dated to the 19th century (Gezar 1983: 104, pl. 61).

There are other related wooden ceilings decorating houses in various towns throughout the north western Ottoman empire, such as the wooden ceiling decorating the Nerantzi Aibazi house in Kastoria. This ceiling is datable to the late 18th or the beginning of the 19th century. It is made of wooden boards painted red, and has four central octagons placed one within the other and divided by wooden frames into squares (Bammer 1982: 35 pl. 79). In Kutahya, the wooden ceiling decorating the house of Mustafazada Hasan Efendi is also divided by a wooden frame into geometric shapes. It is dated to 1139/1721 (Bammer 1982: 37, pl. 78). In Birgi, the house of Çakir Aga Konak, datable to the late 18th century, has a wooden ceiling divided by a frame into squares and geometric forms. Its vestibule, leading to the summer salon, also has a decorative oval ceiling (Goodwin 1971: 433, pl. 484). All these examples have similar motifs to those found in the Dome of the Rock.

The wooden ceiling of the Dome of the Rock is unique in its form, in that it was constructed to cover a particular octagonal space. On the other hand, its decorative scheme, and the decorative elements used, are a part of a more widespread 18th- and 19th-century Ottoman tradition, and are paralleled by decorated wooden ceilings in several buildings in the north-western Ottoman

empire and Palestine. For their restoration work in Jerusalem, Sulaiman the Magnificent (1545-66) and Ahmet III (1721-22),³ at least, included skilled labour from

³ St Laurent and Riedlmayer 1993: 78 note that the foremen and skilled labourers for this restoration project came from Istanbul, though the unskilled labourers were local. Some of the details of the restorations are given in Göyünç 1983: 328-9.

Istanbul alongside unskilled local labour. And the same is true of Sulaiman Pasha's work in 1816-18 under Sultan Mehmet II, as mentioned above. The close 19th-century comparisons provided by late Ottoman houses in Jerusalem suggest, however, that Muhammad ibn Sufyan and Mahmud were probably local craftsmen, and hence that Sultan 'Abd al-'Aziz, presumably for economic reasons, preferred to use local talent.

Chapter 30

CEILING DECORATION IN JERUSALEM DURING THE LATE OTTOMAN PERIOD: 1856-1917

Sharif M Sharif

The houses of the Old City are representative of the typical town house of the Palestinian hill country—built of stone with thick walls and a cross vault carried on strong supports at the corners, with either a domed or flat roof (Canaan 1933: 36).

Internal and external pressures following the Crimean War (1853-6) led to changes in the country in the second half of the 19th century, the results of which can be seen in Jerusalem as in the other towns of the area, both in the architecture and in its interior decoration. This period of flux, which began in the later 19th century, continued into the early 20th century. On 30 May 1856, the Treaty of Paris determined the status of non-Muslims within the Ottoman empire, the sultan issuing an imperial decree to grant equality to Christians and Jews (Ben-Arieh 1984: 114). Non-Muslims could now serve on local district councils and in the courts, and foreign nationals were even permitted to purchase Ottoman land and build on it (Ben-Arieh 1984: 114). The 1858 Land Law, set up by the government because of economic problems following the war, had the effect of creating wealthy families, 'the City Efendi', who controlled vast tracts of land which provided them with revenue (Kark and Landman 1980: 112). Due to foreign immigration as well as internal growth, the population swelled from 9,000 at the beginning of the 19th century to 70,000-80,000 by the First World War (Kark 1986: 47). Inevitably, this influx of newcomers to Jerusalem led to change—cultural and social, as well as economic and physical.

Development in the economic sphere resulted not only from a general world-wide prosperity but more particularly from improvements in technology, shipping

and transport, exemplified by the opening of the Suez Canal, the new Jaffa-Jerusalem road in 1869, and the Jerusalem-Jaffa railway in 1892 (Kark 1986: 50). Inevitably, the removal of restrictions on non-Muslims brought an increase in building by Christian sects, in the form of churches, monasteries and educational institutions. Improved building materials and new methods of construction were introduced inside—and later outside—the walls of the Old City. The walls of the new buildings became less massive, the rooms were covered with wooden beams and later with iron girders, while the roofs were finished with red tiles and the windows filled with coloured glass. Thus a new European style of house emerged side by side with the traditional Palestinian type.

The first Christian buildings were established in the Muslim quarter because of its relative emptiness. Infiltration of a non-Muslim element into this area was, however, only a stage in the general trend towards expansion outside the Old City (Ben-Arieh 1984: 179). The Austrian Hospice, built between 1856-60, was the first such institution. Others were the consulates to the south east of the Damascus Gate, which greatly enhanced the prestige of the neighbourhood (Ben-Arieh 1984: 178). Dixon, who visited Jerusalem in 1864, commented that several Europeans of high rank resided there among the Muslims. To the east of Damascus Gate lived the Turkish *pasha*, the Austrian consul and the British consul, as well as other members of the most aristocratic groups in the city (Ben-Arieh 1984: 180). The lack of space within the Old City, bad sanitary conditions and rent increases, allied to an improvement in security for persons and property, all favoured settlement outside the walls of the city in the

Pl. 30.1 A ceiling in the Afifi family house, Shaikh Jarrah Quarter, Jerusalem.

second half of the 19th century (Kark and Landman 1980: 119). While the Christians and Jews began their building of residential houses and institutions as early as the 1850s, the Muslim community only began in the 1870s. The delay can be explained by the fact that they already owned houses within the Old City and did not feel the need for new ones. In addition, their houses were *waqf* property and in consequence cost them very little. Another important factor was the high cost of building a new house and, unlike the Jews and Christians, the Muslims had no foreign financial aid. It was in particular this last reason that meant only rich Muslim families were able to build houses outside the walls (Kark and Landman 1980: 130). Thus it was members of the highest Muslim circles that moved to the new neighbourhoods—the Husaini, Nashashibi, Khalidi, Alami, Jarallah, Nuseibeh, Afifi and Dajani families.

The members of these families had positions within the religious trusts which gave them great power and influence; they served as members of the district council which, according to the *vilayet* (provincial) law of 1864 and the law on *vilayet* administration of 1871, authorised the administrative council to decide on matters concerning public works, agriculture, land registration, finance, tax collection and the police. Of these, collection of tax was the most important function. Thus Jerusalem families represented on the council acquired considerable fiscal and economic power (Schölch 1989: 241). In addition, it was from these families that members were elected both to be representatives in the Ottoman parliament before the First

World War and to serve as mayor. The control of—and revenue from—large areas of land, as well as various other economic activities, provided them with the wherewithal to build sumptuous houses (Schölch 1989: 112).

The most characteristic element of these houses was the decorated ceiling which reflected both the change in building technology and the style influenced by Turkish and European taste. The ceilings can be divided into three types—the first is constructed with a recessed area in the centre that can be either octagonal, rectangular or square in shape. The area is decorated with gilding or silvering as well as carved wood in the form of stars, crescents and stars, rosettes, shells and fans in the centre. Examples of this type of ceiling can be seen inside the Old City, in the house of Muhammad Salih Husseini to the east of Damascus Gate in the 'Aqabat al-'Asili,¹ and the house of the Queder family located in front of the Russian Church of Alexander, which consists of two crossed squares forming a star-like shape.

A simpler form of this first type can be seen in houses belonging to the Khalidi and Jarallah families. They were particularly popular in the new city houses in the Shaikh Jarrah and the Husaini quarters; one appears in the *liwan* of Sitt Hind Husaini, two in the Afifi house nearby, two in the Nuseibeh house next door, two in the Nashashibi house at 7-9 Ethiopia Street (Kroyanker 1985: 200-6) and one in Musrara (Aido-Hanavi Street). Others appear in Ha-Rav-Kok Street, Ben Serah Street and in the area close to the Jaffa Road (pl. 30.1). Another interesting type is found in the Nashashibi apartments at 5 Ethiopia Street. This has a flat wooden panel with a round radiating fan-like shape at the centre and four stars and crescents at the four angles; surrounding them are tens of stars filling the octagon constructed around the central square. The ceiling recalls the ceiling of the inner ambulatory of the Dome of the Rock, which consists of a thin covering of wood in the shape of an octagon and a fan-like device in the centre of each panel. The ceiling was seen by de Vogüé in 1860 and still bears the artist's signature and the date 1195/1781. Certainly, to judge by similar ceilings in Cairo, it dates to the 18th century and could well have been repaired in 1291/1874-5 during the period of 'Abd al-'Aziz (Creswell 1932: 90-1).

This means that this first type of ceiling is found dating from 1781 to the 1890s and even later. It is typically Turco-Islamic in style and construction, and is based on floral and geometric patterns found in Istanbul during the 17th and 18th centuries. It spread to other provinces in the Ottoman empire, such as Syria, within the same period

¹ I am grateful for this information to Sitt Hind Husaini, who told me that the house belonged to her uncle; the ceiling must have been decorated by the same artist who was responsible for the ceiling in her own house, because it is apparently identical. Unfortunately I was not able to enter the house myself.

Pl. 30.2 Ceiling in the Mamluk family house, 'Aqabat Shaikh Rihan, Old City.

Pl. 30.3 A grotesque from the small room in the Ismail Beg Hussaini house, 'the Orient house'.

(Duda 1971: 29-39) and arrived in the houses of Jerusalem only in the second half of the 19th century.

The second type of ceiling has a similar recessed area in the centre, but has, in addition to the wood-carving and gilding, panels of painted flowers, still-life motifs and acanthus leaves made of gold leaf. Examples are to be found in the Rabah Efendi Husaini house, one of the first to be built outside the walls of the Old City; it dates to 1865-76 (Kroyanker 1985: 179-82). Now the American Colony Hotel, it boasts not only the famous Pasha room, but three other small rooms on the same floor that have similar painted ceilings.

The Pasha room has a high internal octagonal dome at its centre, painted in the celestial blue which in Ottoman houses has mystical associations (Goodwin 1971: 433). Around the central octagon there is a border, with bouquets of flowers depicted inside linked oval cartouches which are surrounded by gilded acanthus leaves. This border is in turn framed by a band of the same acanthus. In the four corners of the large outer square, triangles contain similar posies of flowers² to those found in the oval cartouches (col. pl. XXXVII). The three smaller rooms in the American Colony have recessed panels with identical flowers and acanthus leaves.

A ceiling similar to that in the Pasha room is found in the 'Mamluk' family house within the walls in 'Aqabat Shaikh Rihan to the east of the Damascus Gate, behind the Austrian Hospice. This has a smaller octagonal dome,

painted in celestial blue, and gilded wooden stars. Around this there is a broad square frame filled with acanthus leaves on a red ground. A second rectangle, set at an angle, contains this square; triangles of flowers on a blue ground emerge from the sides of the central square, with a gold star marking the apex of each. The ceiling in the Mamluk house and the Pasha room must have been decorated by the same artists, for they are not only identical in style but also in method of construction, although the Pasha room is larger and the ceiling more sophisticated. It is not easy to decide which of the two is the earlier, but in my opinion it was the Mamluk house ceiling that was the first, before the expansion outside the Old City (pl. 30.2).

Another example of the type is located in the second floor of the Salim Beg Husaini house behind the American Colony Hotel. Salim Beg later became mayor of Jerusalem.³ Once again, the ceiling contains a rectangular recessed panel but this time it is painted without the carved elements of the smaller rooms, for example, in the American Colony. The decoration consists of still-life and flower elements in the form of garlands, and a gold-painted star and crescent surrounded by leaves. The flowers and acanthus leaves are derived from 18th-century European Baroque and Rococo modes which became fashionable in all Ottoman regions in that period.

The third type of ceiling has a flat ceiling with no recess; it is constructed with plaster on lathes, the colours being applied by mixing them with gum or water. They are then painted on the dry plaster. There are two examples in the Orient House, in the entrance and *liwan* (pl. 30.3). The house was built in 1897 close to the buildings already discussed by Isma'il Beg Husaini, who was then the head of the Education Committee. He was visited by the

² The ceilings of the Pasha room and the other three small rooms were restored in July-August 1991 by Mr Frederic Mondello and myself. The restoration revealed details of the techniques used—the wooden dome had canvas glued to the wooden panels and coloured blue. The acanthus leaves were made of thin gold leaf applied over red Armenian sand, called *bolo* in Italian. The panel painting was applied over a thin layer of gypsum.

³ This house is today part of the Dar al-Tifl al-'Arabi Museum for Palestinian Heritage.

German emperor in 1898. The paintings consist of flowers and geometric patterns, and imitation stucco. The centre of the ceilings have medallions, grotesques and acanthus leaves, all painted in a three-dimensional manner. The *liwan* contains many repetitions of the patterns and includes baroque cartouches. This kind of ceiling, with the decoration applied in paint on plaster, was not as popular in Jerusalem as it was in other cities in Palestine in the same period such as Acre, Jaffa, Nazareth and Haifa, although examples of it can be found in Christian institutions which had the necessary funds to commission the work. A flat wooden ceiling with painted decoration is to be found, for example, in the *liwan* of the Coptic Patriarchate in the Old City. It has an oval medallion of wood in the centre surrounded by baroque cartouches. Geometric and floral designs of typical European form are arranged as a frame round the ceiling and to either side of the central medallion there is a lobed quatrefoil with an internal octagon of imitation bamboo acting as a border⁴ (col. pl. XXXVIII).

There used to be a similar ceiling in the *liwan* of the Greek Orthodox Patriarchate but it was destroyed in 1992. However, in the house of Bishop Kerelios there is an example of a painted cross-vaulted ceiling which is comparatively rare. It has a central medallion of flowers of the type common in Acre and Nazareth, surrounded by symbols including heads of putti.⁵ Another example of a painted cross-vaulted ceiling is the entrance vault of the Imperial Hotel near the Jaffa Gate. The hotel was built by the Greek Orthodox Patriarchate in the years 1884-9 (Kroyanker 1993: 369-73). The decoration consists of a repeated grotesque based on acanthus leaves painted in three-dimensional relief. The shape is identical to the grotesque in a small room in the Orient House, which could well have been executed by the same artist in 1897-8 (col. pl. XXXIX).

Other important ceilings of this type are found in three guest rooms of the Greek Orthodox Patriarchate Convent of St Saba in the Judean desert. The two smaller guest rooms have identical ceilings. They have a three-dimensional stucco-like boss in the centre in the form of a medallion; around this there are two painted concentric fillets of leaves. In the four corners of the rooms there are painted baskets of fruit and flowers emerging from an acanthus leaf. A frieze runs round the upper part of the walls of both rooms and in one there is an inscription in

Pl. 30.4 Ceiling in small guest room, St Saba Monastery showing the signature of 'the priest Yohasef' in border.

Greek set within the parallel lines of the border reads 'the priest Yohasef' (in Greek), presumably the painter of the scheme (pl. 30.4).

The third guest room has a rectangular ceiling with a central medallion of grapes and vine leaves in three different colours. In the corners, four baroque roundels surrounded by acanthus leaves contain depictions of the four evangelists—to the north, Matthew with the customary angel and Mark with his lion and to the south John with an eagle. Unfortunately, Luke with the usual iconographic symbol of an ox has been destroyed. The three extant images are shown seated engaged in writing (Cavarnos 1980: 26) (col. pl. XL). Between each pair of evangelists there is a two-handled vase filled with roses, and the corners are linked by baroque acanthus cusps. The images of all three ceilings have been painted on dry plaster which was almost certainly applied on a lathe in the customary manner.

So far the ceilings described have been part of the fashion of the late Ottoman period, found not only in Palestine but also in the Lebanon, Syria, Bulgaria, Bosnia and other Ottoman provinces, all of which followed the initiative of Istanbul. The first style imitates traditional ceilings found in the houses of wealthy patrons in Turkey and the provinces during the 17th and 18th centuries of geometric and floral decorative motifs which are typically Turco-Islamic in character. The second type with its Baroque or Rococo ornament and still life elements also imitates Istanbul, where the first signs of an interest in the Baroque and Rococo modes appeared during the 'Tulip Age' in the first quarter of the 18th century in the so-called 'Fruit Room' of the Harem of the Topkapi Palace. Here bouquets of flowers and bowls of fruit were painted or carved on the walls (Gunsel 1988: 70).

The third type of ceiling represents a new kind of painting, not only of subject but also of technique for they

⁴ The bamboo motif is found on many ceilings of houses in Gaza Street and the 'Ajami quarter in Jaffa. In all there are some thirty examples here. It seems it was part of the repertoire of a certain group of painters, for the same motif is found in the Tuqan family house in Nablus and in other towns where artists from Jaffa were employed, such as Ramla and Gaza.

⁵ Identical medallion and putti dating to 1863 are to be found inside the Greek Orthodox bishopric church of Nazareth.

were executed on dry plaster in the Western fresco mode *a secco* (Gunsel 1988: 69). The subjects, usually framed in the customary Baroque motifs, consist of landscapes, topographical representations of Istanbul or other towns and cities, hunting scenes, flocks of birds in the sky, and boats floating on streams which run down to the sea (Gunsel 1977: 262-5). This change from the typical Turco-Islamic type of decoration to a more European mode occurred when the Ottoman empire was exposed to the West through political and economic relations. The experience of Yirmisekiz Mehmet Efendi, who went as ambassador to France in 1721, started a wave of westernisation in Ottoman royal circles. The European manner and style was taken up with enthusiasm, in particular the French mode (Kuban 1955: 149). The new style spread quickly to other regions of the empire during the second half of the 18th century, but only arrived in Palestine in the second half of the 19th century. It was the powerful notable families of the provinces who played a part in the diffusion of this new kind of architectural decoration just as they had in the capital (Gunsel 1988: 77-8).

It would appear that the new style of 'mural' was popular in Palestinian cities like Jaffa, Nazareth, Haifa, Acre and so on, where it is found in houses belonging to both rich Muslim and Christian families, and even to Jews and Druzes who belonged to the same socio-economic stratum of society. In Jerusalem it featured only in Muslim houses, the richest milieu of Jerusalem in that period. According to the list compiled by Yellin⁶ of the prices of buildings outside the Old City for March 1899-March 1900, the Muslims invested more money in their houses than wealthy Christians and Jews of similar status (Kark and Landman 1980: 132). In Jerusalem, the average is one to two ceilings in the majority of the houses that contain painted ceilings, while in other towns like Acre, Jaffa or Nazareth, the average is three to four ceilings per house.⁷ It is noticeable that the new iconography of hunt scenes, *trompe l'oeil*, cities by the sea and so on does not exist in Jerusalem houses, whereas in other towns the fashion from the capital was followed in every detail⁸ (col. pl. XLI).

⁶ David Yellin, a Jewish representative on the Council at that time, was also a journalist who wrote for a Hebrew newspaper abroad in which he described daily life in Jerusalem. As he was writing for a foreign paper in a language that no one in the country connected with the government could read, his information is regarded as highly reliable.

⁷ The number of ceilings per house in Nazareth is sometimes greater than in Jerusalem—for example, in the house of Salim al-Rais there are thirteen ceilings on two floors; another house built by al-Shaikh Amin Yusuf al-Fahoum has nine ceilings.

⁸ The city of Istanbul is found painted on a wall in the Khammar family house in Acre; this is a copy of many examples of the same painting found in houses in Istanbul. In Nazareth, towns by the sea such as Acre and Haifa are depicted in a frieze in the Azar family house. For more details, see Sharif Sharif 1994: 55-60.

In Jerusalem, the westernised decoration found in the houses of rich families arrived only after a long process of Ottomanisation. That is why Christian buildings, such as the French Hospital Church, or the Augusta Victoria, both of which were built in the same period and which were decorated in a truly Western style based on the eclectic mode of 19th-century painting in Europe, did not affect the local type of decoration. Even in Christian buildings of the Greek Orthodox Patriarchate the style follows the type of Ottomanised western decoration rather than showing any direct influence from Europe. It can be argued that the new technique—that is, painting on plaster *a secco*—is related to the new central-hall type of house imported from the Lebanon by Lebanese Christians who settled in the coastal towns like Jaffa, Acre, and Haifa as well as in inland towns like Nazareth from the middle of the 19th century. These Christian Lebanese were wealthy merchants with wide business interests and contacts abroad who owned land in the vicinity of Jaffa and Nazareth (Fuchs 1987: 95-9). It was they who first imported the new fresco technique into Palestine. It may be for this reason that the style is more widely found on ceilings in Christian institutions in Jerusalem than in Muslim houses.

Who were these artists working in Jerusalem in the late 19th century? There is no clear evidence in the city or the surrounding area in the way of artists' signatures or dates. The only names that have survived are those in St Saba, probably of a priest working in the area, and one other Greek. This last man was probably from an island near Turkey and his signature appears in the Mahd 'Isa in the so-called 'Stables of Solomon' under the esplanade of al-Haram al-Sharif.⁹ This small *masjid* was apparently redecorated at the time of the visit of the German emperor to the Haram in 1898 at the same time that the colonnades were painted with similar motives, as can be seen in old photographs. It is possible that the Orient House was decorated in the same year for the same reason. And, to judge by the style and motifs, the ceilings of the Imperial Hotel also date to that year.

It was unusual for artists to sign their work, but there are two signatures by the same artist in Nazareth, a man identified as 'Saliba Yohanna of Jerusalem', and there is a further signature in Jaffa by an artist signing himself 'Hanna Sagbini'. The first signatures indicate that the artist was a Christian Arab, an icon painter registered with the Antioch Patriarchate under 'the School of Jerusalem', a group active in Syria, Lebanon and Palestine in the second half of the 19th century (Agemain 1969: 122-3) (pl. 30.5).

⁹ I would like to thank Mr David Myres who was working from the British School of Archaeology in Jerusalem for this important piece of information on the artist and his signature. (Ed. See Chapter 34 by D Myres, *Mahd 'Isa* in this volume)

Pl. 30.5 Azar family house, an angel with the artist's signature—'the work of Saliba Yohanna, the Orthodox, painter of Jerusalem, 1889'.

Saliba Yohanna worked in many houses in Nazareth, Haifa and Acre. Another painter from the same school who was active in the area was a man called Nicola Theodor of Jerusalem who painted the icons of the iconostasis in the Greek Orthodox Church of Acre in 1871. He also painted icons in the Catholic Patriarchate Church in Jerusalem in the 1880s, but no signature is to be found on the ceilings that he might have been expected to have executed. A similar instance of icon painters who also decorated houses, mosques and churches in the new style is to be found in Bulgaria in the 19th century.¹⁰ In the area of Kayseri there are several examples indicating the presence of well-trained local artists. There is some evidence that these artists were Christian, but the houses follow the decorative scheme found in the capital and diffused throughout the empire, regardless of the religious affiliation of the owner of the house (Gunsel 1978: 711-31). It has been pointed out that the multi-ethnic and multi-regional

make-up of the skilled artisans recruited to work on important building sites supported the change in style, technique and craft, and perhaps even typological concepts. In the long run it also fed the syncretism that characterised Ottoman culture in the 18th and 19th centuries (Cerasi 1988: 90). Christian religious architecture and decoration borrowed freely from Islamic-Ottoman architectural forms and Christian masters designed mosques as well as churches, houses and ceiling decoration.¹¹

In conclusion, it should be stressed that the style of ceiling with recessed painted panels is typical only of the Muslim élite in Jerusalem¹² in the second half of the 19th century and the beginning of the 20th century. This taste betrays a certain conservatism compared to the other towns in Palestine in the same period, where the new style from Istanbul was preferred. The reason for this may lie in the fact that Jerusalem was a 'Holy City' and was thus seen as different to other Muslim cities in the area like Cairo, Damascus, or even Istanbul. Those families that were coming to power as the Muslim élite were keen to extend Islamic influence into areas like the arts, especially at a time when European tastes were penetrating in parallel with their economic and social interests, all of which threatened Muslim traditions and caused a religious reaction to them. There is no question but that rich Muslims were educated in the European manner in their lifestyle and in their contacts with non-Muslims; but at the same time it seems that their attitudes towards religion and the social fabric (and in particular the framework of the family) were conservative, and this was a source of their power. Ceiling decoration can be seen as fascinating visual evidence of this dichotomy between East and West.

¹⁰ For further information see Anna Roschowska, *Die Bajrakli Moschee*, National, Institut für Kulturdenkmäler, Sofia 1977.

¹¹ Al-Jazzar mosque was built by a Greek master at the end of the 18th century and the Mosque of Muhammad 'Ali was built by a Greek from Istanbul; the best example is the Armenian family of Balian, a group of court architects.

¹² To my knowledge, the only other town in Palestine to have an example of this type of traditional ceiling is Nablus, where an example is to be found in the house of the Qasim family.

Chapter 31

THE EAST WALL OF THE HARAM AL-SHARIF: A NOTE ON ITS ARCHAEOLOGICAL POTENTIAL

*Michael Hamilton Burgoyne**

In the familiar view of Jerusalem from the Mount of Olives (pl. 31.1) the focal point is, of course, the Dome of the Rock but in the foreground, rising from the sacred ground of the Bab al-Rahma (Golden Gate) cemetery, is another structure of considerable archaeological interest: the east wall of the Haram al-Sharif.

The present city wall was built between 1537 and 1541 during the reign of Sulaiman the Magnificent. According to Evliya Çelebi, who visited Jerusalem in 1649 and again in 1670-71, Sulaiman was inspired in a dream:

... Sultan Suleiman ... conquered the fortress of Belgrade and later on the island(s) of Rhodes and Malta(!) and accumulated thereby immense wealth. When he became an independent(!) king, the Prophet appeared to him in a 'blessed night' and told him '... You should spend these spoils on embellishing Mecca and Medina, and for the fortification of the citadel of Jerusalem, in order to repulse

the unbelievers, when they attempt to take possession of Jerusalem during the reigns of your followers. You should also embellish its Sanctuary...and rebuild Jerusalem.' ... Suleiman at once rose from his sleep and sent from his spoils one thousand purses to Medina and another thousand purses to Jerusalem. Together with the required material he dispatched the master architect Qoja Sinan to Jerusalem, and transferred Lala Mustafa Pasha from the governorship of Egypt to that of Syria. (The latter) having been ordered to carry out the restoration of Jerusalem, gathered all the master builders, architects, and sculptors available in Cairo, Damascus and Aleppo and sent them to Jerusalem to rebuild it ... (Stephan 1942: 96-7).

The local population of Jerusalem, as well as that of all other districts of Palestine, contributed their share of taxes to defray the cost of building materials and skilled labour (Cohen 1989: 2). The work was under the administrative control of 'the Superintendent of the Wall' (*al-amin 'ala al-sur*), Muhammad Çelebi al-Naqqash (Cohen 1988: 467-77). Two inscriptions in Jerusalem, dated 1527 and 1531-32, refer to Sulaiman as *al-thani*, 'the second Solomon', suggesting that he saw himself as rebuilding the pristine Jerusalem of the biblical King Solomon (van Berchem 1922 1: 146-9; 2: 167-8; Meinecke 1988: 257-83, 338-60).

Sulaiman's wall incorporates in many places the

* Acknowledgements

I should like to thank the Management Committee, in particular Dr Sylvia Auld and Professor Robert Hillenbrand, for enabling me to spend four days in July 1993 examining the east wall, and Mr Alistair Duncan and The World of Islam Festival Trust for enabling me to visit Jerusalem in March 1997 to photograph the lowest courses of masonry in the wall. I am grateful also to Mr Adnan Hussein, Dr Yusuf Natsheh and Mr Khadr Salameh for facilitating access to the site, and to Mr Mark Potter, who kindly lent me his notes on Jerusalem masonry types. Professor Hillenbrand generously offered helpful comments on an earlier draft of this chapter.

remains of earlier walls. In the south-east corner of the city, the wall enclosing the Haram al-Sharif serves also as the city wall. It still contains part of an old, pre-Herodian wall as well as substantial remains of the wall built two thousand years ago by Herod to support the platform of his temple, erected on the site of Solomon's. The range of subsequent repairs, discernible in the masonry, confirms that Sulaiman's builders simply made further repairs and raised the existing Haram wall, adding crenellations and gunports to bring it into character with the rest of the new Ottoman city wall.

At first sight, the wall's complex layering of texture and plane seems hopelessly confused. Excavation is not permitted within the Haram and so, if progress in understanding the sequence of rebuilding and repairs is to be made, other techniques must be adopted. I believe that through systematic observation and analysis it will be possible to make sense of the bewildering variety of masonries in the wall. This is not to suggest that the masonries in the city wall have not been studied before. Indeed, such studies were initiated by the intrepid investigators of the Palestine Exploration Fund in 1864 and are recorded in a series of beautiful drawings based on observations made both above and below ground level (Warren 1876; Wilson 1880: 9-65). The PEF investigations concentrated on the biblical history of Jerusalem and paid less attention to later periods represented by masonry in the upper parts of the wall. In the early 20th century the pioneering work of the Palestine Exploration Fund was augmented by new studies of the walls by two American scholars (Merrill 1908; Mitchell 1920: 28-50). Since then archaeological research has concentrated on excavation and little attention has been paid to the walls we see today, though archaeologists such as R W Hamilton (1940: 1-54) and C N Johns (1950: 121-90) included important comments on masonry types in their excavation reports.

Following on from these earlier studies I have attempted to identify areas of different types of masonry—thus my sketch of the wall (fig. 31.1, in folder) reveals a complex 'mosaic' of facing masonries representing a construction sequence in which periodic divisions and sub-phases can be distinguished. Various features are discussed in the Commentary (below, pp. 489-93). This, I hope, will provide a basis for future study. As more attention is paid to this and the other enclosing walls of the Haram,¹ it should be possible to establish a relative chronology of masonries, leading eventually to a datable sequence of construction. In the final paragraphs of this chapter I have taken the liberty of suggesting ways in which the study of the walls might progress taking account of recent advances in scientific techniques, which are beginning to be exploited in the archaeological interpretation of standing structures (see, for example, Morris 1994: 13-21).

Recording

In my assessment, the first requirement was to prepare an elevational drawing of the wall as accurately as possible (ICOMOS 1990, 1996). The combination of its enormous size and the need for minute observation makes the task difficult. The traditional and often the best way to prepare such a drawing is by 'direct' survey, hand-measured using tapes, plumb bobs, surveyors' levels etc. In this instance the size and complexity of the wall would have made direct surveying extremely time-consuming and would have required expensive scaffolding.

Modern 'indirect' techniques such as photogrammetry—whereby the outline of each stone is traced by an operative from stereoscopic pairs of photographs—and image-gathering by digital camera or electronic theodolite are developing rapidly in conjunction with computer-aided draughting (CAD) programmes. These are useful tools for the surveyor but both are expensive and they have inherent drawbacks.² The archaeological interpreter is deprived of insights to be made by actually producing the drawn record, such as recognising subtle changes in the colour or texture of stones or small variations in the size of the blocks. When looking at an image produced by someone else the eye tends to gloss over small irregularities, focusing instead on distinct features. The process of drawing, on the other hand, makes the draughtsman take notice of what would not normally be seen by less involved observers. Because it takes time to draw up a survey in the traditional way, inconsistencies gradually obtrude into the draughtsman's consciousness.

Without the resources to attempt any of the above methods of recording, I adopted another way, using 'rectified' photographs in which perspective distortions are minimised. In this method, it is essential that the photographs are of the highest quality and are reproduced to a standard scale. Joe Rock's magnificent photographs, on which my sketch (fig. 31.1, in folder) is based, show what can be achieved. Despite having photographs of the best quality, enlarged to a scale of approximately 1:100, there were substantial practical difficulties in producing the drawing. Executed at the same scale (reproduced here at about half size) it is almost 5m long, too long for any standard drawing board (and for most workplaces), making it hard in particular to keep

¹ I attempted a 'stratigraphical' analysis of the masonry at the south end of the west wall of the Haram in Burgoyne 1987: 263, fig 22.8.

² The problems and limitations involved in using this new technology are discussed by al-Asad in Grabar 1996: 175-83.

track of levels—and the long thin shape made it difficult to present for publication.

Rather than attempt the time-consuming exercise of drawing every single stone, I elected rather to plot breaks in the coursing of stones (which appear as staggered vertical lines) and ledges or changes in masonry types (which appear as more or less horizontal lines). These lines may indicate a change in the construction process. By plotting such breaks, the longitudinal (side-to-side) extent and the height of coherent segments of stonework are outlined. Horizontal ledges between two segments, one above the other, may indicate a change in construction where, for instance, earlier stonework was cleared during repairs to prepare a level surface from which to build up new stonework. Such breaks do not necessarily, however, indicate different dates of construction. They may be simply a feature of a particular construction technique, as in the Herodian masonry where each course is set back a few centimetres from the course below, or of two immediately sequential phases of construction that would occur following an interruption when scaffolding was moved or raised as the work progressed, or when work stopped during inclement weather.

Further clues to changes of build include variations in colour and texture of the stones. The colour of limestone usually darkens on exposure to the weather, often quite quickly, to reach a hue that remains stable in the absence of atmospheric pollution, which was negligible in Jerusalem until recently. Stones from a particular quarry will normally develop a surface colour peculiar to that quarry, though variations within individual quarries are not uncommon. The texture of a stone also changes over time on exposure to the weather as the surface is abraded by wind, rain and frost.

History

The history of the building, realignment, destruction and rebuilding of the city wall has been reviewed by many authors. For some reason, scant attention has been paid to the walls of the Haram, and they have received surprisingly little attention from archaeologists even though substantial excavations have been made along the south wall, particularly during the last thirty years.

It is worth looking at what we know of the history of the east wall of the Haram. The following list summarises that history since the construction of Herod's Temple (itself incorporating remains of earlier structures) two thousand years ago. Historians will doubtless be able to furnish more details of events that might have affected the structural history of the wall; those that seem most

likely to have made a significant impact are marked with an asterisk.³

AD 70	'Destruction' of Herod's Temple by the Roman general Titus (at least all four corners of the Temple precinct's enclosing walls survive).
70-614	Temple area lay largely in ruins; work on walls unlikely.
614	City walls damaged during Persian siege.
638	Arab conquest; Temple area cleared of debris, 'Umar's mosque erected.
c. 660	Further clearing of the Temple area; restoration of enclosure may have begun at this time.
*692	'Abd al-Malik's construction of the Dome of the Rock and, possibly, work on the Aqsa Mosque. Reconstruction of the Haram walls and gates is likely to have coincided with these works.
709-15	Completion of the Aqsa Mosque.
728-43	Rebuilding of city wall?
745-46	Reported 'destruction' of the city wall.
*746-749	Earthquakes.
*754-80	'Abbasid reconstructions of the Aqsa Mosque, probably including repairs to the Haram walls.
756-57	Earthquake.
808	Earthquake.
*961	Ikhshidid repairs of part of east wall (inscription).
*1016	Earthquake.
*1033-4	Earthquake.
*1033-36	Fatimid repairs to the Haram walls (inscription).
*1068	Earthquake and Fatimid repairs (inscription).
1070s	Saljuk strengthening of city defences.
1098	Fatimids strengthen city wall as Crusaders approach.
1099	Crusader conquest of Jerusalem.
1105	Earthquake.
1116	City walls restored and strengthened.
1117	Earthquake.
1177-78	Crusader repairs to city wall.
1187	Ayyubid recovery of Jerusalem.
*1191-92	Salah al-Din's repair of city wall.
*1202-14	Al-Mu'azzam 'Isa's major refurbishment of the Haram and city wall.

³ For the long history of the walls before the Ottoman period, see Wightman 1993; for the early Islamic period, see Raby and Johns (eds.) 1992 and Magness 1991: 208-17; for Sulaiman's walls, see van Berchem 1920-27; for a comprehensive bibliography, see Bieberstein and Bloedhorn 1994 3: 195-204.

- 1219 Al-Mu‘azzam ‘Isa orders dismantling of city walls, probably excluding the Haram.
- 1229 Rebuilding of city wall ordered by Frederick II (little work likely to have been done).
- 1244 Restoration of city wall ordered by al-Salih Ayyub.
- 1277 Further destruction of city wall.
- 1295-1310 Mamluk repairs to east and south walls of the Haram.
- 1310-1537 Walls neglected.
- 1458 Earthquake.
- 1483 Wall depicted in Reuwich’s drawing of the city (pl. 31.2).
- 1517 Ottoman conquest (no military action in Jerusalem).
- *1537-41 Sulaiman’s reconstruction of city wall including restoration of the Haram walls.
- 1546 Earthquake (Mayer 1931: 86-7; Burgoyne 1987: 42 n.32; Amiran, Ariei and Turcotte 1994: 260-305; Amiran 1996: 120-30).
- 1552 City wall damaged near the Golden Gate; report on cost of repairs ordered (Heyd 1960: 156).
- 1615 Repairs to the city wall ordered (Ze’evi 1996: 9, 99-100).
- 1717-33 Repairs to wall near Bab al-Asbat (St Stephen’s Gate) by ‘Umar al-Nimr [al-Nammar] (al-‘Asali 1989: 216).
- 1826 Bombardment of the city from the Mount of Olives (Spyridon 1938:68).
- 1834 Earthquake (Spyridon 1938: 92-93).
- 1839 Earliest photographs (daguerreotypes) taken.
- *1882 Rebuilding of the south end of the Haram east wall (Schick 1882: 171).
- 1927 Earthquake (Willis 1928: 78-103; Blanckenhorn 1927: 288-96).

The history of repairs to the Haram east wall includes three that are likely to have been more comprehensive than others: (1) the Umayyad development in the late 7th and early 8th centuries; (2) the Ayyubid refurbishment by Salah al-Din and al-Mu‘azzam ‘Isa around the turn of the 12th century following the recovery of Jerusalem from the Crusaders; and (3) Sulaiman’s reconstruction of the city walls in the mid-16th century. It would be reasonable to suppose that more or less substantial quantities of stonework dating from these reconstructions remain in the wall.

Interpretation

It is axiomatic that the lowest stones in the wall are the oldest. As it happens, the lower stones tend to be larger and

more carefully dressed; in other words, the better the masonry, the older it is likely to be (such is progress!). Also, where the wall stands above the level of the Haram platform (which is marked by a broken line in fig. 31.1, in folder) it is likely to be thinner (the thickness of the wall has not been established) since it does not need to resist the thrust of soil or substructures below that level, and so might be expected to have been more susceptible to wilful or accidental damage requiring more frequent repair. But in the event this does not seem to be the case. Reuwich’s drawing (pl. 31.2), by far the most accurate representation of Jerusalem before the 19th century, shows the wall south of the Golden Gate standing before Sulaiman’s restoration apparently not much higher than the level of the platform, and the wall north of the Golden Gate standing almost to its present height, well above the level of the platform.

Six types of masonry in the east wall are distinctive. The huge, protruberantly-bossed stones of the first of them predate the Herodian masonry that abuts on them towards the southern end of the wall.⁴ The large ‘panelled’ Herodian ashlar of the second type in the lower courses at either end of the wall, with their flat, squared bosses and drafted margins, are well known. The smooth, plain ashlar of the third type are found near the north end of the wall directly above what appears to be pre-Herodian masonry; this type may be Umayyad since it has affinities with masonry in the Umayyad buildings south of the Haram. The fourth type, consisting of alternately high and low courses, contains the inscription commemorating the Ikhshidid repairs in the 10th century. Masonry of the fifth type (stones marked ‘C’ in fig. 31.1 in folder) displays fine diagonal striations made by a fine-toothed comb-chisel or saw, occasionally also bearing masons’ marks, and is characteristically Crusader (Clermont-Ganneau 1899: 4-47; Pringle 1981: 173-99; Ellenblum 1992: 168-89). The Crusader stones do not occur in uniform, homogeneous segments of masonry but are dispersed through areas of differently dressed stones, suggesting that these stones are in re-use. Indeed, it would be surprising if stones from earlier collapses—an obvious and convenient source of building material—were not gathered and re-used in repairs, perhaps redressed, possibly using the best of them for facework and the remainder for consolidating the hidden core of the wall. Such continual recycling of materials makes interpretation more difficult but where stones with a distinct and identifiable character, like the Crusader stones bearing masons’ marks, are clearly in secondary use we can deduce that their re-use is likely to have occurred in a later period. The sixth type of masonry

⁴ The date of construction of this pre-Herodian masonry remains to be established. For two differing views, see Lapperousaz 1987: 34-44 [Solomonic], and Ritmeyer 1992: 24-65 [Hasmonean].

is found in the upper part of the wall (and throughout the city wall) and must belong to Sulaiman's rebuilding. It is distinguished by a pecked surface, often surrounded by a roughly tooled margin. The size of the stones is more or less consistent, suggesting that the benefits of simplicity of administration and economies of repetition were not unknown to the stoneyard. False joints cut in large stones to match the coursing of adjoining smaller masonry, such as those on the inside face of the Ottoman wall south of the Bab al-Asbat (St Stephen's) city gate (pl. 31.3), are not found in the Haram wall. Smaller stones laid in shallow courses above the 'Sulaiman' type indicate later rebuilding of the top of the wall, including many of the merlons. Other masonry types display different characteristics such as rough bosses, a feature that is sufficiently common in buildings of all ages in the region to be unreliable as a diagnostic criterion. (The specially distinctive bossed masonry of the Crusader period at the south-west corner of the Haram is not present in the east wall.)

Certain construction techniques, such as the use of columns built transversely into the core of the wall leaving only their circular ends visible—of which there are 56 altogether—or incorporated architectural features such as gates, windows, gunports and crenellations, which may in themselves be datable (see Commentary), all help to define the period of construction of a segment of masonry. For example, the technique of using columns let into walls as a bond between the rubble core and the outer face of dressed stone is relatively common in fortifications. The earliest example is thought to be at the harbour of 'Akka (Acre), built for Ibn Tulun around the year 880 by Abu Bakr al-Banna' (the Builder) and described about a hundred years later by his grandson, Shams al-Din al-Muqaddasi: '... he arranged that whenever he had built five courses he bound them together with stout columns.' The purpose of the columns was explained by al-Maqrizi (1441) in describing the Crusader walls of Caesarea in Palestine: '... the Franks had transported columns of granite to this place, which they placed transversely in the walls, so that they had not to fear sapping, and could not fall should they be undermined' (Creswell 1969: 359-60 and 1952: 168). Columns were also used to repair the walls of Istanbul by Byzantine and Ottoman builders (Goodwin 1971: 177). Marble and granite were very costly imports, however, and would have been used in this way only for important structural reasons (to give extra solidity against siege or, possibly, earthquakes) or when work needed to be done in a great hurry or when there was a plentiful supply. In Jerusalem, the Umayyads, following their defeat of the Byzantines, re-used extensively columns from Christian churches in the Dome of the Rock and the Aqsa Mosque. The earthquake in 1033 led to a number of churches being quarried for stones (probably including columns) by the Fatimids for rebuilding the city wall. After the defeat of the

Crusaders, the Ayyubids in restoring and strengthening the city wall are said to have utilised stones taken from Crusader monasteries. And the Mamluks in the late 13th century re-used quantities of Crusader columns in new buildings such as the Ghawanima Minaret (1297), which contains no fewer than 31, most set transversely into the shaft of the minaret.

Inscriptions may also be useful in attempting to date the adjacent masonry, whether they are *in situ* or in re-use (see Commentary). Other historical sources occasionally contain descriptions that are helpful. For instance, Shams al-Din al-Muqaddasi, a native of Jerusalem and a careful and reliable observer, wrote in c. 985 that the stones of the foundations of the Haram walls were 'drafted, finely faced and jointed [presumably describing the Herodian masonry, which he mistakenly ascribed to King David] on which the Caliph 'Abd al-Malik subsequently built, using smaller, well-shaped stones and added battlements (*shurrafuhu*)' (al-Muqaddasi 1906: 168, cited Le Strange 1890: 98). These Umayyad battlements seem not to have survived into the Fatimid period for Nasir-i Khusrau, writing in 1047, states that 'the summit of this [east] wall is perfectly level' (Le Strange 1890: 105).

Much more recent repairs can be identified in changes that have occurred since the wall was first recorded photographically in the middle of the 19th century.⁵

Another potentially useful clue is the extent of erosion or 'weathering' of a stone's surface but it is not a dependable indicator of age since the stones, though all limestone, will have come from different geological strata and from different quarries, and may have eroded at different rates. Moreover, in places stones have been laid not on their natural quarry bed, that is, not laid with their top and bottom faces lying as they did before being cut from the quarry. Failure to retain this natural bedding during construction leads to accelerated weathering. In other places hard and impervious Portland cement-based mortars, which are known to cause rapid decay of limestone, have been used for repointing. In several places stone surfaces have become soft and chalky, possibly because they are from inferior quarries or because hard mortars have been used in modern repairs.

Finally, comparison of particular masonry types with masonries of 'known' date in other structures can be of assistance in attempting to determine dates of construction. Care is needed, however, for differences in a stone's texture and finish may depend on the natural characteristics of the stone (varying from quarry to quarry or even within a quarry) and on the skills and techniques

⁵ Thus, for example, the disintegrating surface at the south end of the wall, repaired in 1882, is shown in Mitchell 1920: pl. 26.

Pl. 31.3 False joints cut in the masonry of the city wall south of Bab al-Asbat (St Stephen's Gate).

Pl. 31.5 Inscribed gable end of the tomb marker over the grave of Shaddad ibn Aws.

of the craftsmen involved. Besides, stones for different purposes often would have been cut differently: a royal palace, for example, might demand more smoothly dressed stone than that for a simple dwelling. Special techniques also appear to have been adopted for different sorts of buildings. In fortifications, for instance, where speed of construction is an important consideration, roughly bossed 'quarry face' masonry is common. None the less, further comparison of undated masonries in the wall with the masonries of dated structures will help to refine both relative and absolute chronologies.

Given how little we know of the building materials and construction techniques, I have not attempted in the drawing in the folder to assign masonries to a particular period, since to do so would run the risk of prejudicing the results of more scientific investigations in future. The one exception to this stance I have taken is to mark what I consider to be the lowest level of Ottoman stonework with a dotted line, which gives an indication of what Sulaiman's masons found and of what they and later builders added.

Prospect

The interpretation of the drawing in the folder is in many places speculative. For instance, I am conscious that I have discussed the wall almost as if it were two-dimensional when in reality it forms part of a three-dimensional structure. I have not yet examined the inside face of the wall, nor the substructures (Solomon's Stables) abutting against it at the southern end, nor the Haram pavements that extend in places to meet the wall. This note is presented not as a definitive statement but in the hope that it will stimulate further research. To this end, it should be possible in future to associate individual stones with individual quarries, but as yet no systematic mapping or historical or petrological analysis has been made of the quarries in and around Jerusalem.⁶

⁶ A gazetteer of quarries in and around Jerusalem based on survey and the collation of published evidence, which is considerable, would be a worthwhile exercise. See, for example, Shiloh and Horowitz 1975: 37-48; Shadman 1972; Merrill 1908: Ch. XLI. 'Stone mapping' whereby stones are identified petrologically with their original source, is becoming an established archaeological technique. Identifying individual stones with their source quarries does not necessarily provide a dependable dating criterion: stones from different quarries might well have been used in a single building campaign or the same quarry might have been used over a long period of time and, of course, stones were constantly recycled, sometimes re-dressed so that any distinctive tooling could date from a different time from the quarrying of the block. It would, nevertheless, be very useful to have a map of the various sources of stones used in the construction of the wall. Scientific analysis of building stone has developed rapidly in recent years since Ward-Perkins's pioneering study 'Quarrying

Clay, gypsum and lime mortars, too, have the potential to allow individual phases of construction to be identified. Though stones may be re-used, the mortar used to bind them is likely to have had a similar composition in a single campaign of repairs. Analysis of mortars is relatively straightforward and new techniques are emerging. Carbon dating, for instance, has been used successfully on some mortars.⁷ Even if it is unlikely that there will ever be sufficient funds available to analyse every stone and every mortar in the wall in one continuous research programme, it should be possible—through a series of field surveys, for instance, or during maintenance and repairs—to make carefully drawn records supplemented by scientific analyses of stones and mortars.

As research advances, so more and more information will be accumulated until a clear picture emerges to resolve, for example, the thorny issue of the date of the Golden Gate, and to confirm the true extent of each rebuilding from the time of one Solomon to that of another.

Commentary on fig. 31.1

Embrasure Numbering

In discussing various features of the wall, their location is given below by reference to the number (from 1 to 161) allotted to the embrasure above it.

Inscriptions

Two themes characterise the inscriptions (which are all Arabic) associated with the east wall: construction and burial. Of the former only one (dated 961-62) is positively associated with the construction of the wall; others may have some association but are no longer in their original locations. The funerary inscriptions are related to burials in the long-established Golden Gate cemetery covering the north slope of the Kedron Valley along the length of the eastern wall of the city. Modern inscriptions commemorate two Companions of the Prophet, 'Ubada b. al-Samit (died 654-55) and Shaddad b. Aus (died 677-78), whose traditional places of burial (observed by al-Muqaddasi in

in Antiquity: Technology, Tradition and Social Change' (1971: 137-58). See, for example, Fenton 1980: 37-47; Parsons 1986: 80-83; Middleton and Bradley 1989: 475-88; Hudson and Sutherland 1990: 1-15; Parsons 1990: 16-32; Parsons 1991: 1-27; and collected papers from the 1991 British Museum conference in *Archaeometry* 34.2 1992: 162ff.

⁷ See, for example, Kedar and Kaufman 1975: 35-8; Kedar and Mook 1978: 173-6; Malone, Valastro and Vanel 1980: 329-43. Other techniques of analysis are outlined in ICCROM 1982.

the 10th century) are covered by gabled grave markers enclosed within iron railings. On the gable of the grave of Shaddad is another commemorative inscription (see LXV below). None of these inscriptions is actually in the wall but another one is, tentatively ascribed to the 10th century (see LXIV below), as is an Ottoman graffito dated 1624-25 cut into the Golden Gate. A number of stones in the inner (west) face of the wall, about 16m south of the north-east corner of the Haram, are inscribed with various names including 'Allah', 'Ahmad', 'Muhammad b. al...'. The indifferent carving of the incised letters suggests that they are graffiti. The stones bearing the inscriptions appear to have been re-used after being inscribed for some are 4m above ground level, too high to reach without a ladder, and others are only just above ground level, too low to have been carved comfortably or to be seen easily. There are many late Ottoman and modern gravestones in the cemetery which, as far as I know, have never been studied.

In the following synopsis the number given to each inscription is the same as that used by van Berchem in his *Corpus Inscriptionum Arabicarum* and, in the case of the ones that have not been published before, a continuation of the numbering for a checklist of Arabic inscriptions not included in van Berchem's corpus devised by A G Walls and A Abu'l-Hajj (1980).

A. Construction

144 Date: c. 909

Cut in three blocks of stone in re-use built into the inside face of the east wall near the entrance door to the steps leading down to the Cradle of Jesus.

This is what was ordered by the lady ... and this (work) took place at the hand of Gharib and it (was completed) in Jumada II in the year 3.../9...[In the reign of Muqtadir bi'llah (908-32)].

This inscription has no proven connection with work on the wall (except for being re-used there). It may be connected with works at the Dome of the Rock undertaken by the mother of the Caliph Muqtadir, probably in 909.

146 Date: 961-62 (136)

Cut into several adjoining stones surrounded by similar masonry composed of alternately high and low courses that appear to date from the same period.

... ordered the construction of the Haram wall (*ha'it*) the Amir 'Ali Abu 'l-Hasan and the governor (*ustadh*) Abu 'l-Misk Kafur al-Ikhshidi ... and this work was at the hand of [that is, the responsibility of] Ahmad ibn

Ayyub ibn Jabir ... and the inscription was cut by 'Abdallah ibn Musa al-Sadafi ... and it [was completed] in the year 350 (961-62).

Van Berchem associated this inscription with the Ikhshidid family tomb 'very near the Bab al-Asbat', mistakenly assuming that the present Gate of the Tribes (Bab al-Asbat) is in the same place as the 10th-century gate of that name, which is the Haram gate now called Bab Hitta (Remission Gate) about 130m to the west. The Ikhshidid family tomb has not been discovered.

147 Date: 1034

On two stones in re-use built into the inside face of the wall in embrasure 29 in the base of the merlons on either side of the embrasure, one in each side.

... the Imam al-Zahir li-A'zaz Din Allah, the Amir of the Faithful ... and the vaults and the passage leading to them (?) and the south wall (*ha'it*) and the east wall (?) ... [in the month of Rabi' or Jumada] the Second in the year 425 (February to May 1034).

The vaults (*'aqba*) referred to in the inscription are possibly those of Solomon's Stables, presumably damaged in the earthquake of 1033-4.

148 Date: c. 1068

On a stone in re-use built into the inside face of the wall, beside those of 144 and ascribed tentatively by van Berchem to a date around 1068. Except for its place of re-use, this inscription has no apparent connection with the Haram wall.

212 Date: c. 1213 (47-8)

See fig. 31.1 folder drawing for its position in outer face of wall.

This place encloses building stones, placed [here] for the needs of the noble Haram.

Van Berchem noted that the distinctive epigraphic style is similar to the 'Coradin' style of inscriptions in the name of al-Mu'azzam 'Isa, but followed Clermont-Ganneau in concluding that it was actually from the time of Sulaiman. I believe that it really does belong to the reign of al-Mu'azzam 'Isa, for its elegant, careful, crisply incised bevelled cut *naskhi* script is typical of that period and is quite unlike that of Sulaiman's inscriptions. It appears, however, to be in re-use because the stone in which it is cut has rough edges and does not match the surrounding masonry.

B. Funerary

130 Date: 1624-25 (111)

In a steliform panel cut into the south jamb of the Golden Gate (see fig. 31.1).

This burial vault (*fisqiyya*) is a *waqf* in favour of the Maulawi *sayyids*. In the year 1034 (1624-25).

This inscription must refer to a burial vault built near the Golden Gate, perhaps the one exposed in a collapse in 1972 described by Fleming (1983: 24-37).

131 Date: 1720-21 (99-100)

On the front of a vaulted mausoleum built against the wall (see fig. 31.1).

This is the tomb of ... the Shaikh 'Ala al-Din Abu 'l-Hasan 'Ali al-Ardabili. He died in the year 832 (1428-29). Then this mausoleum, ruined by the passage of time, was restored by Wali al-Din, known as Ibn al-Kawakibi, Judge (*qadi*) of the Victorious Armies in the Ottoman Empire. The year 1133 (1720-21).

C. Unpublished

LXIV Date: 4/10th century? (124-25)

Built into Haram wall (see fig. 31.1). It appears to have been inserted into the wall and, if so, the surrounding masonry will be older. It is difficult to decipher and no attempt to do so has yet been made. To judge from the style of the script (pl. 31.4) it is early, bearing some affinities with epitaphs of the 4/10th century (see van Berchem 1920 3: pl. IV).

LXV Date: 15th or 16th century? (136)

In the gabled end of a grave marker (see fig. 31.1); undated but the style of script (pl. 31.5) suggests a late Mamluk or early Ottoman date.

God. This is the grave of Shaddad ibn Aus al-Ansari, Companion of the Prophet of God (blessings and peace be upon Him). He died [in 58/677-78].

(See al-Ansari 1986 for further information about Shaddad ibn Aus al-Ansari.)

Besides their historical content, inscriptions can of course be analysed to reveal more of the intentions of their sponsors in the use, for example, of specific Qur'anic verses (see Cruikshank Dodd and Khairallah 1981) but the re-use of old inscriptions has not been studied systematically. The

Ottomans made no effort to reassemble the three stones containing no. 144 in their correct juxtaposition in order to make the inscription more readily legible. It is possible that the builders endeavoured to preserve and display the inscribed surfaces even though they had neither the time nor the epigraphic skill to place them in their original order. Or perhaps they regarded the stones merely as building material, ignoring the fact that they are inscribed; if so, there may be other stones with inscribed faces hidden in the wall. Another Fatimid inscribed stone was built by the Ottomans in the city wall upside down, farther to the north near the Burj al-Laqlaq (van Berchem 1922 1: 70-1). A similar group of Fatimid inscribed stones was built higgledy-piggledy in the street wall of a building near the Haram, probably in the Ayyubid period (Burgoyne 1987: 458; van Berchem 1922 1: 68-70). A Marwanid inscription was re-used by Ayyubid builders who slipped it undamaged but unreadable, like a book in a bookcase, into the masonry of the outer porch of the Bab Hitta in the north wall of the Haram. It was as if they intended to preserve it, as indeed they did, because it was found again more than 750 years later (Burgoyne 1982: 118-21). Another inscription, this time of Salah al-Din from his rebuilding of the city wall, is also carefully preserved but this time in full view as the centrepiece of the Ottoman Qubbat Yusuf built in 1681 (cat. no. 39; van Berchem 1925 2: 23-31).

It would be useful to assemble a corpus of re-used Arabic inscriptions although it would not be easy to compile as their presence will only be revealed during major repairs or demolitions—for such inscriptions were often used indiscriminately as building stones with their inscribed face hidden.

Gates

There are no open gateways in the east wall. Only one blocked gate, the enigmatic Golden Gate, is generally recognised, but there are three other gate-like blocked openings. All these openings were recorded by the PEF explorers but were dismissed as not being gates or, in one case, not being earlier than the 15th century. It is a measure of the influence of the early explorers that virtually no scholarly attention has been paid to these openings after the initial dismissive comments. The historical sources mention gates which might correspond to one or more of the openings but their locations are not described in sufficient detail to be sure. The Christian bishop Arculf, for example, who visited Jerusalem shortly before 685, refers to a '*postula*, which is a small gate, from which one descends by a stairway to the Valley of Jehoshaphat' (Wilkinson 1977: 95). Ibn al-Faqih (c. 903)—who listed the Haram gates apparently in order—included between the Bab Tauba (the present Triple Gate) and the Bab al-

Rahma (Golden Gate), a Bab Mihrab Maryam (Gate of Mary's Place of Prayer) and a Bab al-Wadi (Gate of the Valley). Al-Muqaddasi included in his description a Bab Silwan (Siloam Gate), which he counted as a city gate rather than one giving onto the Haram al-Sharif. Nasir-i Khusrau described 'in the width of the Haram area' a gate 'opening towards the east, called Bab al-'Ain (Gate of the Spring) passing out from which you descend a declivity to the spring of Silwan.' Mujir al-Din mentions no fewer than three blocked gates in addition to the Golden Gate in the vicinity: Bab Turiyya (Mount [of Olives] Gate), Bab al-Buraq (see below), and Bab Ariha (Jericho Gate) which 'has disappeared long ago, and since the Frank occupation there is no trace of it' (for all these, see Le Strange 1890: 173-90).

1. Arch springing and paired gates (9-10)

Warren and Conder (1884: 147) described

two stones which form the springing of an arch extending for 18 feet [5.5m]. These stones appear to be *in situ*, and they would appear to have formed a portion of an arch to the east, but this is not probable. Immediately above this springing there is a passage in the wall, filled up, which appears to be of later date than the drafted stones. The course below the springing projects 18 inches [45cms], as it appears to do under Robinson's Arch. A search for traces of the [corresponding] pier was made below ground without result.

The springing and the remains of the jambs of two openings are surely Herodian masonry *in situ*. The PEF excavations did not descend to the rock surface and so traces of a corresponding pier may yet remain. It is possible, therefore, that a bridge existed here in Herodian times to give access to the undercroft of the Temple platform in the area now known as Solomon's Stables. At first sight it seems to fit Arculf's description of a *postula* but it is unlikely that a Herodian bridge and staircase here would have survived Titus's destruction.

2. Unnamed postern (27-28)

This postern, situated about 79m north of the south end of the wall, was opened briefly in 1882 and recorded by Lieutenant Mantell for the PEF. It is 0.91m wide and 1.85m high, opening to a vaulted passage 1.16m wide and 2.59m high through the thickness of the wall. Conder considered it to be 'probably not older than the 15th century at the earliest'. It cannot be Mujir al-Din's Buraq

Gate (see below), which he describes as being opposite the eastern ('Buraq') staircase to the Dome of the Rock. It should be associated rather with his Jericho or Mount of Olives Gates. Clermont-Ganneau expressed the hope that excavation inside the gate in 1882 would reveal the store of stones mentioned in inscription 212. No such store was found.

3. Buraq Gate (104-5)

Mujir al-Din wrote that the small blocked gate south of the Golden Gate, known as the Gate of Buraq, was also called the Funerals' Gate (Bab al-Jana'iz) because it was through it that funeral processions formerly went out to the cemetery. Wilson (1865: 25, pl. X6) correctly considered this superficially gate-like feature, which is 15.5m south of the Golden Gate, not to be a blocked gate for 'it has the appearance of a hole broken through the masonry and afterwards roughly filled up'. There is not enough symmetry in the lower masonry to allow an opening to be defined and there is not enough bearing at either end of the longest stone (see fig. 31.1) to have allowed it to function safely as a lintel. Yet there is no obvious explanation for this unusual arrangement of stones. The issue is complicated by the presence of a curious basin cut into the masonry immediately south of the 'gate', with an earthenware pipe leading to it apparently from the interior of the Haram. From its appearance, not dissimilar to drinking fountains of the late 14th century in Jerusalem (at the Qiramiyya, the Tashtamuriyya, the Turba of Barka Khan, and the Tomb of Sitt Tunshuq), the purpose of this basin seems to have been to provide water for passers-by visiting the cemetery. It is not known how water would have been fed to the basin but there are many cisterns within the Haram (Wilson and Warren 1871: 204-17) including one with its mouth not 2m west of the Golden Gate (not recorded by Wilson and Warren), which might have supplied it.

4. Golden Gate (111-14)

This, the most elaborately decorated of all Jerusalem's gates, was described more than a century ago as 'still a vexed question', and remains tantalisingly unexplained. What was its purpose? Who built it? When was it built? A good deal of the present gate is Ottoman (as indicated by the dotted line in fig. 31.1), for at least the superstructure of the gate was in ruinous condition by the late 15th century (shown in Reuwich's drawing pl. 31.2, among others). Sulaiman's builders appear to have removed stones from the returns of the gate jambs, buttressed the jambs and rebuilt the façade above the ornamental archivolt, including ornamental features similar to those found elsewhere in the city wall and gates. The blocking masonry matches that of the upper part of the façade and must have

been built at the same time, replacing earlier blocking masonry. A close examination of the masonry of the Golden Gate, which to my knowledge has never been made and is beyond the scope of this chapter, will be needed if the construction history of this gate is to be elucidated. One clue that would be worth pursuing is to be found in the cornice moulding on the Haram elevations, which appears to match cornice mouldings on the exterior south wall of the Aqsa Mosque and on the Great Mosque in Damascus, and so may be inferred to be Umayyad.

Windows and Gunports

Windows

Windows in the wall provide light to Solomon's Stables and the Golden Gate. The only other structure abutting the wall, the Kursi Sulaiman (Solomon's Throne), has no openings in the wall. A double-domed building, the Suq al-Ma'rifa (Market of Learning), once occupied the south-east corner of the Haram but had no openings in the east wall; it was demolished in the late 19th century.

Four windows open to Solomon's Stables. Two of them are Herodian, subsequently partly blocked to reduce the size of the opening. The left-hand (south) blocking (2) is of smoothly-dressed ashlar with chamfered jambs. The lintel is unusual. It projects and is designed as if to shed rainwater from a sloping 'roof' set within a squared frame. The design is sufficiently distinctive to suggest that if stylistically comparable examples could be traced, its date might be determined. Unfortunately, since it is wholly enclosed by Herodian masonry, it is of little value in establishing a relative chronology. The right-hand Herodian opening (3-4) is blocked with smaller stones. It is different from the left-hand one and contains a larger window of characteristically Ottoman construction with a semicircular arch composed of two rows of concentric voussoirs. The third opening (4-5) is a small window with a monolithic lintel undercut as a slightly pointed arch lighting the staircase to the shrine known as Mahd 'Isa (Cradle of Jesus). The fourth is a plain slit lighting Solomon's Stables.

The windows in the Golden Gate (111-14) obviously belong to Sulaiman's restoration. Two plain slits within pointed-arched recesses are surmounted by dumb-bell slits above the crowns of the ornamental archivolt.

Gunports

The gunports appear to be for small arms; they are scarcely big enough for ordnance. Cannons were used in places to defend the wall, however, generally at the city gates according to a late 17th-century account (Ze'evi 1996: 18-19). The gunports in the east wall are reached from walkways, on two levels south of the Golden Gate and on one level north of it. All are in Ottoman masonry. Where

the wall stood in good condition almost to its present height north of the Golden Gate, Sulaiman's builders will have contented themselves simply to add crenellations without dismantling sound masonry to insert gunports. Only five exist (115, 139-44) in this section of wall, of which four are plain rectangular slits coursing with the surrounding masonry. The small number of ports in this section suggests that the defensive trappings of gunports and battlements may be part of an empty military show, for if gunports were needed at regular intervals elsewhere, why were they not needed here? Other gunports have round or flat heads and stirrup bases like those in the city wall. They mostly give the impression, because the coursing is different, that they were built into an existing wall. This is a false impression, however, for the stones in which they are cut, and in many places those of the adjoining masonry, are of the distinctive 'Sulaiman' type. The likely explanation of this anomaly is that the gunport stones were dressed by specialist masons (some preferring flat heads and others round heads) and delivered to the builders for incorporation in the wall. In Ottoman times a distinction was made between different members of the construction team, including stone cutters (*hajjar*) and stone dressers (*nahhat*) who prepared stones for the builders (*banna'*) and labourers (*fa'il*) (see Hanna 1984: 39). Where offsets occur in the pre-Ottoman wall (see below), Sulaiman's builders have taken the opportunity to introduce gunports in the re-entrant to give a measure of flanking cover close to the wall. Within some merlons small rectangular slits, only one course high, offer protected firing positions from the parapet at the level of the upper walkway. These slits occur irregularly except south of the Sirat Bridge (see below) where every third merlon has one, suggesting that once there were more and that many have been lost in post-Sulaiman repairs.

Offsets and other shifts in alignment

Substantial offsets in the alignment of the wall occur at either side of the Golden Gate salient (110-11, 114-15) and at the southern limit (151-52) of the tower at the north end. They are clearly ancient; the former must date from the construction of the gate and the latter is Herodian as the lower masonry of the tower testifies. Another substantial offset (98-99), immediately south of the Ottoman vaulted mausoleum, also seems to be ancient but neither its purpose nor its date has been established. A small offset at 7-8 marks the northern limit of a Herodian tower at the south end of the wall. Other small offsets are not easy to explain. In some (138-39, 145-46) the masonry coursing continues across the offset suggesting that they were introduced by the builders to adjust the alignment, which is different from the adjoining masonry or,

alternatively, to allow new repairs to sit more securely on eroded earlier masonry below. The offset at 15 appears to belong to the latter category, having been introduced in the 1882 repairs. Masonry coursing does not continue across the offset in the lower part of the wall at 86 and here it seems that the offset marks the southern extent of a segment of masonry against which later masonry (incorporating many columns) was built during repairs.

Shifts in alignment, where the direction of the wall changes a little, are also intriguing. It has been suggested that one (44) represents a relic of the south-east corner of Solomon's temple, the east wall of which according to this suggestion followed a different alignment from the Hasmonean and Herodian extensions to the south (Ritmeyer 1992: 26-45, 64-65). Another, which extends between 73 and 80, appears to be the result of a repair made on a (presumably unintentionally) slightly different alignment from the rest of the wall. Aerial photographs reveal that the alignment is different on either side of the Golden Gate which would suggest that these sections of wall were rebuilt during or after the gate's construction, for if the gate was built into a pre-existing wall one would not expect the alignment to change.

Cornice

The high-level cornice at the south end of the wall (extending northwards as far as embrasure 23), which returns on the south wall, can be seen to be continuous in early photographs (for example Van Haaften and Manchip White 1980: no. 60—*Jerusalem from the Mount of Olives*, dating from 1857 or 1858).

Al-Sirat Bridge (27-28)

The present 'bridge' complex comprises two doorways, one above the other, at the level of the two wallwalks, with a column projecting about 2m from the face of the wall between them. The lower, pointed-arched doorway is reached from the Haram through a low vaulted chamber with a pointed-arched *mihrab* in its south wall. The upper, semicircular-arched doorway has a plain window alongside it. All the openings were blocked before the earliest photographs were taken in the middle of the 19th century.

According to Muslim eschatological tradition, the Bridge al-Sirat al-Mustaqim, the Bridge of the Straight

Path (Qur'an I: 5) which divides heaven and hell, will stretch across the Wadi Jahannam (Hell Valley) between the Haram and the Mount of Olives on the Day of Judgment. The souls of all mankind will assemble in Jerusalem to cross the bridge, which is thinner than a hair and sharper than the edge of a sword. The souls of the just will cross safely and ascend to paradise, but sinners will fall into the valley below. Evliya Çelebi describes it thus:

... the shrine of the Sirat bridge, protruding from the walls of the fortress [that is, the city wall]. It is a round polished reddish stone, well smoothed, so that a bird could only fly round about it without being able to perch on it ... This column which resembles the Sirat bridge was built into the wall already before the time of (the restoration of the fortifications by) Sultan Suleiman (the Magnificent). It was built over the foundation rock protruding from the wall. A culprit would be caused to walk over this column to its end, when he would be set free: if he fell, they would not worry about burying him, as he would anyway go to Hell; they would leave his corpse to decay in that valley. Ever since pre-Islamic times this column remained in its position. In the year [date not given], whilst the fortress was being rebuilt by order of Sultan Suleiman, the foundations of the fortification happened to be laid on the site of this column. It was removed from its position and built into the wall, but in a higher place than before, protruding from its course. It was therefore called the 'Bridge of Sirat' (Stephan 1942: 102-3).

Evliya Çelebi, then, considered the column (also known as 'Muhammad's Pillar') to be ancient and to have been rebuilt by Sulaiman into the wall during his repairs. His interpretation is supported to some extent by earlier descriptions, for though the Sirat Bridge is mentioned by Ibn al-Faqih (c. 903), Ibn 'Abd Rabbihi (c. 913) and al-Muqaddasi (c. 985), by the 14th and 15th centuries it was no longer included in the descriptions of writers like al-'Umari (c. 1345) and Mujir al-Din (1496), and the present structure is not shown in Reuwich's drawing of 1483 (pl. 31.2).

Chapter 32

THE CITADEL (*QAL'Ā*) IN THE OTTOMAN PERIOD: AN OVERVIEW

Mahmoud Hawari^{*}

I Introduction

The great medieval citadel (*qal'ā*) of Jerusalem has not apparently received any serious attention from archaeologists and art historians. Most research devoted to it is concerned principally with its biblical history, yet the Citadel of Jerusalem is a monument to Islamic military art and architecture. A fortress of such magnitude and in such a remarkable state of preservation requires not merely a limited one-period study, but rather a thorough examination, perhaps equivalent to those undertaken on

the great medieval citadels of Cairo, Damascus and Aleppo.

The earliest studies by Robinson (1841), Tobler (1853/54), Wilson (1865), Schick (1878), Smith (1907/08) and Merrill (1908), which consist primarily of brief and sketchy descriptions of the Citadel, and later studies by Amiran and Eitan (1970), Bahat (1981), Geva (1981, 1983), Sivan and Solar (1984, 1994) all emphasise its ancient biblical history. Studies focusing on the medieval and later Islamic periods are very scarce. Van Berchem's monumental and excellent study, published in 1927, records most of the Arabic inscriptions found in the Citadel and puts them into their historical context, with reference to a wide range of Arabic historical texts. A later study undertaken by Johns (1950) is the first, (and perhaps the last) full-scale treatment of the Citadel. Based on his systematic archaeological excavations between 1934 and 1939, and 1947 and 1948, Johns presents a detailed analysis of the fortress and its architectural development from the Hellenistic until the Ottoman period. He also examines the epigraphic material, as well as some selected Arabic historical accounts, most of which have been used for the first time in a study of the Citadel. Unfortunately, the results of the excavations carried out by Geva (1976-80) and those by Solar and Sivan (1980-88), which were part of a large restoration scheme aimed at the transformation of the whole Citadel into the Museum of the History of Jerusalem, were not fully published. More recent studies by Cohen (1989, 1990) make use of the registers (*sijillat*, pl. of *sijill*) of the Shari'a Court of Jerusalem, an extremely important and hitherto inadequately exploited historical source for the

**Acknowledgements:*

I wish to express my sincere gratitude to all those who have given me their assistance in this work including the following: my colleagues Mrs D Riks at the archive of the Tower of David, Architect G Solar and Mrs R Sivan, with whom I worked on the excavations of the Citadel during the years 1981-82 as site supervisor, for allowing me to use and publish several of Solar's drawings of the Citadel; Dr S Gibson of the Palestine Exploration Fund for giving me access to the PEF photographic archive, as well as the private archive of C N Johns who excavated the Citadel of Jerusalem during the 1930s and 1940s; Professor J W Allan and Ms T Fitzherbert for assisting me in consulting the Creswell photographic archive at the Ashmolean Museum, Oxford; the staff of the Department of Islamic Heritage of the Auqaf in Jerusalem for allowing me to study the *sijills* of the Shari'a Court of Jerusalem; the staff of the documentation department in the Tower of David Museum (Citadel) of Jerusalem for showing me photographs and plans of the Citadel; my colleague Dr A Manna' for reading the historical part of the manuscript and offering valuable suggestions. Mr H Auld and Mr R Wardill, the British School of Archaeology in Jerusalem, for preparing the final drawings after G Solar. My friend J Leith for editing the final text of this chapter; and, finally, Mrs M Murray for her excellent typing and hard work.

understanding of the history of the Ottoman walls of Jerusalem, as well as the Citadel.

Despite the great improvement that these studies have made to our knowledge of the Citadel, most of them suffer from the serious disadvantage of limited use of the related historical sources and the absence of a full-scale architectural analysis of the various phases and components of the Citadel.

The objective of this study is to present an overview of the Citadel during the Ottoman period. The historical survey which is an integral part of the study seeks to provide a background to the subsequent architectural analysis of the Ottoman components of the Citadel. Following Cohen's lead, it utilises the *sijill* documents in order to provide a fuller picture of how the Citadel functioned. Indeed, these documents indicate beyond any doubt that the Citadel played a vital role in the political, economic and social life of the city of Jerusalem during the Ottoman period.

The general conclusion reached by Johns—that the Citadel as it stands today is a Mamluk fortress reconstructed in the early 14th century, with Ottoman additions (Johns 1950: 171-72)—should be regarded with caution. A close look at what Johns terms as 'Mamluk uniform construction' reveals numerous phases, possibly Ayyubid or Crusader, which should be separately examined and dated, an objective beyond the scope of this study. Rather this study investigates the components of the Ottoman citadel, built by Sulaiman the Magnificent (Johns 1950: 172, 173, 180, 182; figs. 25, 31a, 31b, 35; van Berchem 1922-3: 129-31, 146-68; Wilson 1865: pl. III), and other later works.

The Site and Present Condition of the Citadel

The Citadel is one of the most significant landmarks in the topography of Jerusalem. It is situated at the western entrance to the city immediately to the south of Bab al-Khalil (Jaffa Gate). It is also strategically located at the saddle joining the south-western and north-western hills. Standing at an elevation of 2,560 ft. (780m), it commands the deep Valley of Hinnom (Wadi 'l-Rababa), to the south-west and a shallower valley, which was filled with debris in antiquity, to the north. The location of the Citadel was determined by the earlier fortifications forming an elbow of the city wall, in an area where a defensive strength was greatly needed.

There has been some form of fortification on the site from pre-Islamic times and the Citadel we see today is essentially the 14th-century Mamluk fortress. Nevertheless it incorporates earlier elements, as well as later Ottoman additions.

The Citadel is of an irregular rectangular plan built south and west of Herod's tower astride the existing city wall (figs. 32.1 and 32.2). Three of the sides are approximately straight, but the fourth, the south side, zigzags, probably following the course of earlier fortifications.

The structure consists of curtain walls connecting five massive towers at each of its four corners and a fifth tower near the middle of the east side, round an inner courtyard. It also comprises two outworks, one on the east side and the other on the west, while the whole is surrounded by a ditch or moat.

The present main eastern entrance of the Citadel is set in an outer gateway (fig. 32.1: 1) reached by a double flight of steps. Above the vaulted portal there is an Arabic inscription marking the restoration of the Citadel by the Ottoman Sultan Sulaiman (938/1531-32). On crossing the wooden bridge (fig. 32.1: 2), which evidently replaced the older drawbridge that once spanned the outer moat (fig. 32.1: 3), one enters the barbican (fig. 32.1: 4). An open-air mosque (fig. 32.1: 5), with a free-standing prayer niche (*mihrab*) occupies its southern section, while an open space, as well as a narrow wall-walk above the glacis (fig. 32.1: 6) occupies its northern section. The outer barbican is crowned all around by battlements. From the barbican, one passes through to the main entrance over a stone bridge (fig. 32.1: 7) spanning the inner moat (fig. 32.1: 8). The main entrance (fig. 32.1: 9) comprises a deep recess in the curtain, vaulted over and defended by a wide slot machicolation (now blocked). Inside there is a guard room with stone benches along its south and west walls. The inner gate, with a pair of vertical slots for a sliding portcullis, was placed in the north wall, thus creating a right-angle turn. The vestibule beyond is lit by a pair of loopholes. The way then leads through into an extraordinary hexagonal inner hall (fig. 32.1: 10). This finely built chamber is covered by a domical vault and lit by an opening in the centre of the dome. The dome is surmounted by a small aedicule, also domed. Of the two doorways leading out of this hall, one leads south to the inner courtyard of the Citadel and the other north and up by means of a staircase to the roof of the hall. From there, a flight of steps lead to the upper storey of the north-east tower (A) which gives the Citadel its alternative name, the Tower of David, and which, along with two other towers, was built by King Herod (1st century BC). It consists of two storeys; the lower built with typical large Herodian masonry, the upper with smaller masonry. The parapet above, including gun-ports made with smaller masonry, crowns the tower.

From the roof of the hexagonal hall one can pass through the eastern tower (B), also of two storeys, with its top open to the rear. The wall-walk along the eastern curtain wall (fig. 32.1: 11) leads to the south-east tower (C).

This tower has a single floor with a double parapet above.

The south-west tower (D), reached by the wall-walk along the south curtain wall (fig. 32.1: 12), is actually a cluster of three towers. A small tower (fig. 32.1: 13) has only two detached sides and a raised parapet. The minaret tower (fig. 32.1: 14) is also small and narrow and has a double parapet with machicolation on each corner and at each side. The minaret itself, which is of a cylindrical shape, has a dedication inscription in Turkish dated 1065/1655. The mosque tower (fig. 32.1: 15) is of an elongated plan and was built at the level of the curtain walls. The complex between all three towers is filled with various vaulted structures on different levels. The mosque, which occupies the upper floor of the tower, consists of a vaulted elongated hall with an ornamented prayer niche (*mihrab*) and pulpit (*minbar*). According to the inscriptions in it, the mosque was built by the Mamluk Sultan al-Nasir Muhammad in 710/1310-11, restored by the Ottoman Sultan Sulaiman the Magnificent in 938/1531-32 (when the *mihrab* and *minbar* were added), and repaired by Sultan 'Abd al-Hamid II in 1326/1908-9 when the entrance porch was added. The lower floor of the tower is occupied by a large vaulted hall reached by a passageway from the courtyard.

The wall-walk along the western curtain wall (fig. 32.1: 16) leads to the north-west tower (E). This tower has two storeys and a double parapet, and three machicolations on its façade. A postern gate (fig. 32.1: 17) with grooves for a portcullis is located at the basement of the tower. This gate leads out of the Citadel onto a large terrace (fig. 32.1: 18) with battlements above the glacis and western ditch, which no longer exists. Both the north-west tower and the north-east tower are connected with the north curtain wall (fig. 32.1: 19) and north-eastern curtain wall (fig. 32.1: 20), both of which consist of two tiers of loops set in vaulted recesses and surmounted by battlements.

The courtyard (fig. 32.1: 21) consists of archaeological remains and a jumble of masonry belonging to different periods. The east and south-east moat contains various excavated remains attributed to various different periods.

II The Pre-Ottoman Development of the Citadel

Although the Citadel acquired its final shape during the Ottoman period, its structure is the result of a long historical process. In order to identify the Ottoman 'phase' in this complex development, therefore, it is necessary first to identify the earlier elements which were incorporated into it.

Literary sources and, for earlier periods, archaeological excavations have been used to reconstruct

the evolution of the Citadel. The biblical history of the Citadel has received particular attention, while its medieval history is still largely unexplored. The bulk of the historical evidence and the archaeological and architectural exploration is published in an enormous body of literature. The following account is a brief summary of the historical evidence including the architectural remains which were unearthed as a result of archaeological excavations.

The earliest remains found on the site of the Citadel rest on bedrock, and comprise the foundations of buildings and a segment of a broad wall with associated ceramic material, all dating to the 8th century BC (Amiran and Eitan 1970: 9-10, 16; Geva 1983: 56-58; Wightman 1993: 49; Geva 1994: 157-58; Sivan and Solar 1994: 176). Such remains indicate the expansion of the city to the western hill during the Iron Age.

In the centre of the courtyard of the Citadel, a section of a wall with two massive towers, dated to the late 2nd-early 1st century BC, has been unearthed (Johns 1950: 135-40, figs. 15, 23; Sivan and Solar 1984: 169-73; Wightman 1993: 112-19, figs. 27-30; Geva 1994: 158-60). These portions of fortifications, which are attributed to the Hasmonean kings, testify to the first effort on the part of the rulers of Jerusalem to fortify this strategically vulnerable part of the city.

King Herod is said to have reinforced these fortifications shortly afterwards by adding three large towers, named Hippicus, Phasaël and Miriamme, to defend both his royal palace situated immediately to the south and the unprotected western entrance of the city (Josephus V: 176). Only the north-east tower has remained, though it has survived to a considerable height. Although its Herodian date is widely accepted, scholars still disagree over its identification, whether it is the tower of Hippicus or Phasaël (Schick 1878: 226-37; Bahat 1981: 399; Geva 1981: 65). Excavations in the courtyard of the Citadel have shown that Herod also repaired the existing wall, known as 'the First Wall', and its towers (Johns 1950: 140-48, fig. 23; Wightman 1993: 119-27, figs. 31-35; Sivan and Solar 1994: 169-75; Geva 1994: 158-65).

Following Jerusalem's destruction by the Roman army in 70 AD, the site of the Citadel became a camp of the Roman garrison (Josephus 1927 7: 1-3). Remains dated to this period are rather scarce. Numerous round clay pipes and roof tiles bearing the seal of the Roman 10th Legion were found in the courtyard of the Citadel (Johns 1950: 152-53, fig. 23; Geva 1983: 64, 67; Wightman 1993: 195, 200). The same Hellenistic-Roman 'First-Wall' was probably restored and incorporated in the western fortifications of the Byzantine city. Remains of a new wall, underneath the line of the east curtain to the north of the north-west tower, as well as residential structures with mosaic floors dating to the early Byzantine period, were uncovered (Johns 1950: 153-58, fig. 19; Geva 1983: 67, 69;

Wightman 1993: 225; Sivan and Solar 1994: 112). During this period, the Herodian tower is mentioned for the first time by the name 'Tower of David' by the Italian monk Antoninus of Piacenza (c. 570). He states 'Christians climb this tower to spend the night in prayer' (*PPTS* II: 13ff).

The first citadel of the city was erected on this site during the early Islamic period. Remains of a three-quarter round corner tower (with a diameter of 9.80m) and of two walls attached to it were found in the southern part of the courtyard (Johns 1950: 160, fig. 23; Geva 1983: 69-70, figs. 6-7; Sivan 1983: 26, fig. 31, Geva 1994: 165, 168). These are presumably part of a fortress which may have incorporated the Hellenistic-Roman wall line as well as the Herodian tower. According to the archaeological evidence this citadel was founded in the Umayyad period around the end of the 7th century or the beginning of the 8th century (Sivan 1983: 25). It probably functioned both as the centre of the provincial administration as well as a military stronghold (Wightman 1993: 234, fig. 74, n. 15). Muqaddasi, the famous Arab geographer, wrote towards the end of the 4th/10th century that the city had 'a fortress, part of which is on a hill and the other surrounded by a ditch' (1906: 167). This citadel was probably being constantly repaired through the early Islamic period. In 492/1099, the Fatimid garrison fought their last battle in the citadel against the Frankish onslaught and from it negotiated their surrender (Ibn al-'Arabi 1958: 1586; Ibn al-Athir 1979 9: 19; al-Dhahabi 1979: 54; Fulcher 1969: 124).

The Citadel of Jerusalem appears in many historical travellers' accounts and illustrative maps. During the first seven decades of Frankish rule the Citadel, though thoroughly fortified, greatly resembled its early Islamic predecessor. A drastic change, however, occurred in the 1170s, when the Citadel, which had been called *Turris David* (Johns 1950: 163-64, fig. 24), seems to have been extensively rebuilt. Theodoric stated in 1171 that the Citadel included a royal palace and was defended by ditches and outworks (no. 9: 6). William of Tyre, writing about the same time, mentions the Citadel as being strongly built with 'towers, walls and forewalls attached to it' (Babcock and Krey 1943 1: 324).

The excavations of Johns showed that the present outline of the Citadel was established during the 12th century (1950: 165, fig. 25). Though it is possible to identify various remains associated with the Crusader structure, it is still not clear how much of it has survived intact. It seems that a system of defensive outworks was constructed to the west and south of the main early Islamic core of the Citadel. According to the archaeological evidence, the Citadel may have also been expanded to the east and south with the addition of a series of towers, curtains and posterns, as well as a strong bastion at the south-western corner (Johns 1950: 166, 171, 177, 179-80,

fig. 25; Geva 1983: 70, fig. 6; Wightman 1993: 271, fig. 84, n. 49).

After the Ayyubid conquest of Jerusalem in 583/1187, Salah al-Din began an extensive programme to rebuild the city's fortifications, in conjunction with the effort to transform Jerusalem into an Islamic city. He was reported to have restored the Citadel and vulnerable stretches of the city walls, and to have dug a moat, in the year 587/1187 ('Imad al-Din 1902: 289-90; Mujir 1973 1: 383). However, he did not alter the Crusader Citadel substantially. 'Imad al-Din, the court secretary and chronicler, states that Salah al-Din restored the old mosque on top of the Tower of David and opened the inner courtyard of the Citadel for Muslims to pray (1902: 53). The extent of such restoration is not clear. But the plan and structure of the interior of the upper story of the north-east tower (A) resemble those of contemporary Ayyubid buildings (Johns 1950: 175, fig. 27). Al-Malik al-Mu'azzam 'Isa, Salah al-Din's nephew, who ruled southern Syria and Palestine from Damascus, undertook a large scheme of architectural projects, including the reinforcing of Jerusalem's defences. No less than ten inscriptions from his reign, most of which were unearthed in archaeological digs, refer to the construction of various segments and elements of the fortifications during the years 599/1202 and 610/1213-14. An inscription in the Citadel mosque (fig. 32.1: 16) dated 610/1213-14 refers to the construction of a tower in the Citadel (van Berchem 1922: 131-132). The location of this tower, as well as the other parts of the Citadel which were constructed in the Ayyubid period, is still uncertain. The Citadel and the city walls were subsequently dismantled by al-Mu'azzam 'Isa in 616/1219 (Ibn Wasil 1972 4: 32; Mujir 1973 1: 402), and later by al-Nasir Da'ud, who specifically 'demolished the Citadel and the Tower of David,' in 637/1239 (Ibn Wasil 1972 5: 246; Mujir 1973 2: 5). Such drastic action was undertaken to prevent the Franks from consolidating their rule in Jerusalem.

The Citadel remained in ruins until the early 9th/14th century when it was completely rebuilt by the Mamluk Sultan al-Nasir Muhammad. In fact, the present structure of the Citadel is principally Mamluk. A dedication inscription dated 710/1310-11 and placed over the main entrance (fig. 32.1: 9), was recorded as recently as 1894 by Max van Berchem (1927: 141, no. 44). Another inscription bearing the name of the same sultan is found, though not *in situ*, in the mosque of the south-west tower (fig. 32.1: 15) commemorating its construction in the same year (van Berchem, 1922: 160, no. 51). Al-Qalqashandi (died 821/1418), who also mentions this restoration work, gives the date as 716/1316 (1914 4: 101). As it stands today, the outer wall of the Citadel, which comprises the towers and curtains, predominantly belongs to a consistent style of construction. Johns assigns this style, including

various architectural features, such as internal plans of towers, loopholes, looped arcades and machicolations, to Ayyubid and early Mamluk work, but finds their parallels in the later period (1950: 171). However, further examination needs to be undertaken in the Citadel, particularly in respect to the amount of Ayyubid work in the fabric, which Johns greatly underestimates. Al-Nasir's reconstruction work included erecting new towers at the south-eastern and south-western corners (C and D respectively); reducing the west side of the Citadel by building the west curtain further east (fig. 32.1: 16); blocking off the western postern in the south-west tower; enlarging the north-west tower (E) towards the south-east (fig. 32.1: 17); and fitting an enormous double entry system with an outer gateway and inner complex entrance with a monumental hexagonal hall and a drawbridge in between them, on the eastern side of the Citadel (Johns 1950: 174-81, 184-85, figs. 26, 28, 30, 31, 34; Wightman 1993: 287-88, fig. 89). These modifications resulted in the creation of a semi-rectangular enclosure with four massive towers at each corner and a fifth in the east side, all surrounded by a ditch. The only entrance into the Citadel was through the outer gateway and drawbridge. The German Dominican monk Felix Fabri, who visited the Citadel in 885/1480, in describing this bridge and the awesome walls and towers, concluded, '... yet there is no place so strong and so well fortified as this castle in all Jerusalem' (*PPTS* IX: 211; VIII: 324). By contrast, the city walls and gates were allowed to fall into ruin during the Mamluk period. A traveller's map of Jerusalem, known as 'the München map' and dated 884/1479, shows the walls of the city in ruins, while the Citadel seems to be intact (Röhrich 1895: 181). This reflects the fact that when the Muslim-Frankish wars ceased, Jerusalem lost its military importance. Instead, internal intrigues and struggle for power continued under the Mamluks. Thus the city no longer needed strong fortifications, but a small though formidable Citadel instead.

With the arrival of the Ottomans in the early 16th century, Jerusalem witnessed a revival of building activity. In an attempt to gain glory and fame, Sultan Sulaiman the Magnificent set out to build the walls of the city and refurbish the Citadel.

III The Citadel in the Ottoman Period

I Historical Survey

I.1 The Restoration Project of Sultan Sulaiman the Magnificent

The Ottoman army of Sultan Selim I entered Jerusalem on 4 Dhu'l-Hijja 922/28 December 1516, without

encountering any resistance. The notables of Jerusalem surrendered the city, including the Citadel, after the departure of its Mamluk garrison.

During the long reign of his son, Sultan Sulaiman the Magnificent (927-74/1520-66), Jerusalem enjoyed a great deal of prosperity and architectural development reminiscent of the apogee of the Umayyads and the Mamluks. Extensive restoration of religious, civil and public welfare, as well as of military structures, began.

Sulaiman the Magnificent is well remembered for rebuilding the walls of Jerusalem but is less known for repairing the Citadel. The new Ottoman ruler's initiative to restore the city's fortifications had a three-fold purpose: to protect the city from potential European invaders and Bedouin incursions; to assert the presence of the Ottomans and their political prestige in the eyes of the local population; and to undertake a pious act in the 'third holiest city in Islam' (Schur 1987: 19-15; Cohen 1989: 469; 1992, 52-64, al-'Asali 1989: 200). Unlike the city walls which had been in a dilapidated state for nearly three hundred years since they were systematically demolished by al-Mu'azzam 'Isa in 616/1219, the Citadel was in good condition having been completely rebuilt by al-Nasir Muhammad in 710/1310, and it had continued to serve the Mamluk garrison until the arrival of the Ottomans in 922/1516, as already described above.

The repair and improvement of the Citadel were intended to adapt the structure to the needs of the new conquerors of Jerusalem, and in particular to provide a suitable garrison for the new army units stationed in the City after the Ottoman conquest. The actual repair works began in 938/1531, as noted in the dedication inscriptions over the portal of the outer gateway of the fortress. The rebuilding of the city walls was undertaken a few years later between the years 944/1537 and 947/1540 (van Berchem 1922: 443-44), or 945-48/1538-41 (Cohen 1989: 468; 1990: 33). Although the outer wall of the Citadel is incorporated into the city wall along the west side near Bab al-Khalil, on the whole it remained an independent structure with separate gates and its own defence system.

While the rebuilding of the city walls is recorded in substantial contemporary documentation, no such evidence is preserved in Jerusalem about the financial and practical aspects of a campaign to restore the Citadel, which began as early as the year 938/1531, when the outer gateway was erected.

Nevertheless, the registers (referred to here as *sijills*) of the Shari'a court of Jerusalem, reveal a great deal of information concerning the Citadel, the bulk of which is dated to the late 1530s until mid-1560s. One exceptionally early *sijill* document does mention repairs undertaken in the Citadel at the end of Muharram 938/mid-September 1531. One of its curtain walls, which 'faces the street along the moat' had some stones missing and the quality of

mortar was poor. The city builders, who inspected the site, found that a high percentage of sand had been used and recommended instead a mortar with a higher lime content (Sijill 1: 400).

The name of Muhammad Çelebi al-Naqqash recurs in a number of *sijill* documents dealing with court proceedings concerning tax collection (V: 386; VI: 68) during the course of the year 943/1536. He was apparently a high-ranking Ottoman official who was sent to Jerusalem to collect the *miri* taxes due to the sultan. His name then appeared with the title *al-amin 'ala al-amwal al-sultaniyya* ('the superintendent of the sultan's finances') (Cohen 1989: 470). Later in the same year his name is attached to another title, *al-amin 'ala al-sur* ('the superintendent of the wall'). These titles testify to al-Naqqash's function: to provide funds for the project of reconstructing the city walls. One year later, in 944/1536, a *sijill* document reports that the governor (*mutasallim*) of Jerusalem, Mustafa Beg, accompanied by the chief *qadi* and Muhammad al-Naqqash, arrested the Franciscan monks in the monastery of Zion on instructions from Istanbul after a war had broken out with Venice. Part of a sum of 190 golden pieces extracted from the monastery was spent on the restoration of vital parts of the Citadel (Sijill 6: 671; Cohen 1982: 62-63).

A later *sijill* document mentions a court hearing dealing with the *duzdar* (commandant) of the Citadel, who converted a room for storing oil into a residence for two Janissaries (soldiers). The court, which convened on 22 Sha'ban 948/end of December 1541, in the presence of the same Muhammad al-Naqqash, the chief builder (*mu'allim al-mi'mariyya*) of Jerusalem, Husain ibn Nammar, and the *duzdar* himself, found that no other structures in the Citadel were damaged (Sijill 14: 98).

Restoration works in the mosque, ammunition stores and 'the Tower of David' were undertaken in 949/1542 under the charge of the same chief builder of Jerusalem, Husain ibn Nammar at a cost of 15,000 *akçe* (Sijill, 14: 561).

The scattered information in the *sijills* helps to shed some light on the various changes and restoration works that were undertaken inside the Citadel. It does not, however, offer any evidence as to restoration work to the outer structure. It is quite possible that the outer gateway, the barbican and the western terrace were added in the first stage of construction around the year 938/1531 to provide protection for the Ottoman garrison in the city, and the inner renovations carried out a few years later when sufficient funds were available.

1.2 The Citadel during the 17th Century

Towards the end of the 16th century the Ottoman empire began a long era of decline. The central government in

Istanbul gradually lost control over remote provinces, which resulted in the rise of rival incompetent and corrupt officials. The Janissaries, who formed the military garrisons in the fortresses, were transformed from a genuine military force into a privileged caste. As a result their interests often conflicted with their loyalty to the sultan and their allegiances shifted between local rival officials. The garrison of the Citadel in Jerusalem was no exception. In 1034/1625, the *mutasallim* (governor) of the *sanjaq* of Jerusalem, Muhammad ibn Farrukh, expelled from the Citadel the Janissaries, who were loyal to the sultan, and killed their *duzdar*. He then appointed his brother-in-law 'Uthman as *duzdar* and refortified the Citadel's defences (Manna' 1979: 196-224). During the reign of Sultan Muhammad IV (1058-1099/1648-1687) the minaret (fig. 32.1: 14) of the Citadel was restored by Muhammad Pasha, as noted in a Turkish inscription on its base dated 1065/1655 (van Berchem 1927: 165-167, no. 53).

The famous Turkish traveller Evliya Çelebi, who visited Jerusalem in 1082/1672, describes the Holy City, the Haram and the Citadel. In his *Siyahatname*, he gives the following detailed description of the Qal'a:

Within the Gate of Jaffa the Citadel is connected on one side with the main fortress. It is another small, inner fortress, four hundred paces in circumference with three exposed iron gates giving to the large fortress. From the first gate one crosses a wooden bridge leading to the Citadel. This building, grey with age, has a *divan-khaneh* (council chamber, or a court of justice), embellished with very many war implements, situated within the Citadel. In the Citadel live the commandant (*duzdar*), the agent of the governor (*kehya*), an *imam*, a preacher, a muezzin and soldiers. There are altogether seventy stone built rooms within, and exceedingly small ones at that ... (Stephan 1938: 154).

In 1101/1689-90, the Arab traveller 'Abd al-Ghani al-Nabulsi visited Jerusalem. He described the Citadel as 'a well fortified castle within the city wall', adding: '... We entered the mosque which is situated inside the Citadel, in which there is the *mihrab* of Da'ud ... then we ascended to a high place by a flight of stairs which is known as the place where Da'ud, peace upon him, used to sit ...' (al-Nabulsi: 1990 313-314).

1.3 The Citadel during the 18th Century

The Citadel and its garrison played an important role during the popular rebellion in Jerusalem (1114-18/

1702-06) led by Naqib al-Ashraf Muhammad b. Mustafa al-Husaini against the *mutasallim* of Jerusalem, Jurji Muhammad Pasha, who had imposed heavy taxes on townspeople and peasants alike and applied harsh measures in collecting them (Manna' 1989: 50-57; al-'Asali 1989: 215). The rebels captured the city and expelled the *mutasallim*, but the Janissary garrison of the Citadel did not intervene. The *wali* (governor) of Damascus, Muhammad Pasha, sent a force of about 2,000 Janissaries in 1117/1705 which captured the city, impounded the weapons from the city's residents and stored them in the Citadel (Manna' 1989: 69). Al-Husaini escaped but was caught and executed in Istanbul the following year. The arrival of a large number of Janissaries and other soldiers caused havoc in the city. Since the Citadel was too small to absorb all of them, many houses in the vicinity of the Citadel were evacuated in order to accommodate them (Manna' 1989: 70). Soon after that fighting broke out between the city residents and the Janissaries whose cannons in the Citadel shelled the Dome of the Rock (Manna' 1989: 71-72). A truce was finally reached between the two sides after the intervention of the Ottoman authorities.

Learning the lessons of the rebellion, Istanbul decided to appoint Palestinian family notables to various influential posts. Several members of al-Nimr family, who were governors of Nablus in the 18th century, co-operated with the al-'Alamis and 'Asalis of Jerusalem. Members from the al-'Asali family were the *duzdars* of the Citadel (al-Nimr 1974 2: 206).

During the reign of Sultan Mahmud I, the glacis of the ditch on the north-west side of the north-west tower (fig. 32.1: E) was restored in 1144/1731-32 (van Berchem 1927: 156-57, no. 49) and the Summer Mosque (fig 32.1: 5) in the Citadel was constructed by the commandant of the Janissaries, 'Ali Agha, in 1151/1738 (Stephan 1933: 132-34).

In 1153/1740, Elzear Horn, a German Franciscan monk, who lived in Jerusalem from 1137-57/1724-44, described the Citadel (1153/1740), which was then known as 'the castle of the Pisans'.

It [Jerusalem] has an ancient fort, to which to this day the name Pisan is attached, on account of its structure which is strong enough; yet for want of fortifications and ramparts the city can easily be taken from every side without the explosion of the instruments of war ...

A special commander is appointed for it who lived there with his Janissaries, without whose permission or *gratis* no one was given access to it. It contains many convenient habitations ... It has many cannons projecting from the walls, but they are not carefully

guarded, because they know well that the Christians neglect its recovery owing to dissensions among themselves. It is indeed surrounded by ditches, which, however, do not contain water (Horn 1962: 33).

1.4 The Citadel during the French Invasion

In the late 18th and early 19th centuries, the Ottoman empire faced two major military campaigns, those of Napoleon and Muhammad 'Ali, which would have a profound effect on Jerusalem and particularly its Citadel.

In 1213/1798, Napoleon Bonaparte invaded Egypt and the following year marched along the coast into Syria. Although the French expedition ended a few months later after failing to take Acre, it was viewed in Jerusalem with great concern. The Ottoman rule and the Muslim community of Jerusalem regarded it as a renewal of the Crusader campaigns and began taking defensive measures. An order (*marsum*), which arrived in the city on 7 Safar 1213/21 July 1798, was sent by the *wali* of Damascus to the 'ulama' of Jerusalem; it warned them that the aim of the advancing French troops was to take Jerusalem and the Holy Places, and urged them to take all necessary precautions (Manna' 1986: 2, citing Sijill 279: 151). On the same day, another letter sent by the 'ulama' of Cairo arrived in Jerusalem. It informed the people of the city that the French had captured Alexandria and alerted them that the 'infidels' objective is Jerusalem' (Manna' 1986: 3, citing Sijill 279: 152).

According to one document, dated 15 Safar 1213/19 July 1798, the *wali* of Damascus sent a military force equipped with cannons to reinforce the garrison in the Citadel of Jerusalem. He also promised he would arrive soon afterwards at the head of an army to defend the city (Manna' 1986: 139, no. 77, citing Sijill 280: 4). The people of Damascus, responding to the call of *jihad* (holy war) donated a large quantity of gunpowder. The people of Jerusalem too donated much gunpowder and several cannon, all of which were stored in the *jabah-khaneh* (ammunition depot) in the Citadel (Manna' 1986: 140, no. 79, citing Sijill 280: 18).

According to another document, dated 16 Jumada II 1213/15 November 1798 the Janissaries of Qal'at al-Burak (fortress near Solomon's Pools), were paid four years in advance as a bonus so they would participate in the defence of the Citadel of Jerusalem (Manna' 1986: 135-136, citing Sijill 280: 48).

1.5 The Citadel during the Uprising of 1242-43/1826-27

Between 1223/1808 and 1247/1831, Jerusalem witnessed a series of disturbances and rebellions. In 1223/1808, the

Janissaries of the Citadel incited the Muslim population of the city to obstruct the repair work in the Holy Sepulchre Church after it was partly destroyed by fire (al-'Asali 1989: 223, n. 173). The insurgents expelled the *mutasallim* and fortified themselves in the Citadel. The *wali* of Saida, Sulaiman Pasha, sent a military force to Jerusalem which laid siege to the Citadel until the insurgents surrendered (al-'Asali 1989: 223, n. 173).

A few years earlier, in 1221/1806, the German pilgrim Seetzen reported that the 'Citadel of Jerusalem was a small fortress ... Several cannons were stationed at the entrance, with a Turkish officer and a few soldiers doing guard-duty inside' (Ben-Arieh 1984: 16). In the early 1820s, the German topographer Tobler wrote that there were 100 Albanian soldiers in Jerusalem (Ben-Arieh 1984: 16).

During 1242-43/1826-27, another major popular uprising broke out in Jerusalem in response to the large increase of taxation imposed by the new *wali* of Damascus, Mustafa Pasha. The Greek monk Neophytos of Cyprus reported that when the *fallahin* (peasants) of the villages around Jerusalem and Bethlehem rebelled, the *wali* sent a detachment of 100 soldiers to the Citadel. He himself followed at the head of a large force (Neophytos 1986: 38-39). Although an agreement was reached under the terms of which the insurgents were forced to pay a heavy fine, the uprising was resumed as soon as the *wali* left for Damascus. The *duzdar* of the citadel, Ahmad Agha al-'Asali, was at the head of the insurgents who took over the city and its citadel and expelled the *mutasallim*. The *wali* of Saida, 'Abdallah Pasha, responded by sending a force of 2,000 soldiers which besieged the city and bombarded it with artillery from the Mount of Olives. After stiff resistance the insurgents agreed to end the uprising and were allowed safe exit from the city (Neophytos 1938: 40-42; Manna' 1986: 33-38; al-'Asali 1989: 224).

1.6 The Citadel during the Egyptian Occupation

In 1247/1831 Egyptian troops led by Ibrahim Pasha, son of Muhammad 'Ali, marched into Syria. Jerusalem capitulated on 3 Jumada II 1247/23 December 1831 but the garrison of the Citadel continued to resist. The German monk Marie Joseph de G ramb, who visited Jerusalem in the same year, reported, 'The commandant of the Citadel announced that his soldiers would prefer to die and would never surrender unless their salaries were paid by the pasha of Acre ...' (Schur 1987: 615-616). It is not clear how the garrison surrendered.

A few years later, in 1250/1834, the *fallahin* of the villages of the Nablus and Hebron areas began a popular uprising in response to the military conscription declared by Ibrahim Pasha. Neophytos writes that the rebels besieged Jerusalem but were repelled by the Egyptian garrison (Neophytos 1938: 75). Once again the Citadel was

at the centre of events. The city changed hands twice while the Egyptians held the Citadel until the arrival of Ibrahim Pasha with his forces. Further skirmishes persisted in and around Jerusalem for several weeks and resulted in heavy losses on both sides. Only when Muhammad Pasha himself arrived at Jaffa with a force of 15,000 soldiers was a settlement with the leadership of the uprising reached. The peasants dispersed and the Egyptians returned victorious to Jerusalem (Neophytos 1938: 90-95).

During the Egyptian era, Ibrahim Pasha constructed the *qishlaq* (winter barracks) as a military camp near the Citadel and to its south. In 1253/1837 the Jewish scholar Schwartz reported: 'By the order of the Pasha they are now putting up a massive building on an empty plot about 90 *amma* square, next to the Tower of David Citadel. Breaking ground for the foundations began in April of this year' (Sivan 1983: 41). It is quite possible that from this time on, the main part of the Ottoman garrison was posted not in the Citadel but in the newly built Qishla.

1.7 The Citadel from the mid-19th century until 1336/1917

When Ottoman rule was resumed in 1256/1840, a British expedition arrived in Jerusalem and prepared the first detailed maps of the city including a detailed plan of the Citadel. The head of the expedition, Colonel Andersen, reported that the Citadel was equipped with artillery and vulnerable only to the heaviest of artillery attacks (Ben-Arieh 1984: 17). Although the Citadel continued to serve as a military stronghold for the Ottoman authorities, the main garrison was stationed in the adjacent Qishla. Travellers' accounts repeatedly mention cannons in the Citadel and that entry for foreigners into the site was forbidden without special permits.

Wilson, who surveyed and mapped Jerusalem in 1864-1865, prepared a detailed plan of the Citadel and the adjacent Qishla army camp (1865: 46-48, pl. III). He wrote that 'the interior of the Citadel is a confused mass of buildings in a very ruinous state ...' (1865: 48). Based on Wilson's map, Stephan Illes, a Hungarian artist, was commissioned by the Ottoman governor of Jerusalem in 1873 to build a model of the city for an exhibition in Vienna. This model, which is displayed in the museum at the Citadel, gives a unique impression of the appearance of Jerusalem and the Citadel in the second half of the 19th century. In this period, too, Schick visited and explored the site, particularly the Tower of David (1878: 226-27, figs. 1, 2).

In 1316/1898, the ditch north west of the Citadel near Bab al-Khalil (Jaffa Gate) was filled and the wall breached to open a new entrance for the state visit of Kaiser Wilhelm II and his escort. Remains of this ditch, which is dated to the 10th/16th century, were unearthed (Maeir 1994, 305). About the same time, a *sabil* (water

fountain) was constructed south west of the north-west tower in the area of the filled ditch. A clock-tower was also built on top of the adjacent Bab al-Khalil (Sivan 1983: 40). Both structures were demolished in the early 1920s by the British Mandate authorities.

2 Function of the Citadel

Symbolically, the Citadel's primary role as a military stronghold came to an end on its outer steps on December 11 1917, when General Allenby proclaimed the British conquest of Jerusalem. It had been modified even during the Ottoman period, however, to serve other secondary functions. The historical sources record the construction of various domestic, religious and economic structures. Unlike the citadels of other cities such as Cairo, Damascus, and Aleppo, the Citadel in Jerusalem did not have an administrative and residential compound for the city's ruling élite. This function was fulfilled by the *sarai* at al-Jawiliyya compound (now called Madrasa al-'Umariyya), the area at the north-west corner of the Haram al-Sharif. It continued to serve as the seat of provincial Ottoman government until 1287/1870 (Burgoyne 1987: 205, 207).

In rebuilding the Ottoman Citadel, the defensive works, such as the outer gateway and outer defensive works, preceded the additions to the interior. The *sijill* documents of the Shari'a court of Jerusalem once again provide an abundance of information with regard to how the Citadel functioned and the composition of its garrison and military equipment.

2.1 The Garrison

One of the essential functions of the Citadel was the garrisoning of the military forces needed to guard against internal unrest as well as outside threats. Reinforcing and repairing defences was generally undertaken in preparation for, or in response to, attack. Although the historical sources mention such attacks, they provide little information on details of the improvement of the fortifications. As already noted, however, defensive measures in the Citadel were undertaken in anticipation of Napoleon's offensive in 1213/1798.

The earliest available details about the numerical strength of the garrison of the Citadel go back as far as 952/1545. The garrison then consisted of 64 Janissaries, 12 soldiers as *bawwabs* (literally 'gatekeepers', porters) at the city gates, two soldiers at the Citadel gates, 10 soldiers serving in maintenance and administration, 5 soldiers as an artillery unit, one soldier as a prison warden, one carpenter, one baker, one soldier in charge of the ditch and one responsible for the water aqueduct. At the head of the garrison forces stood the *duzdar*, the *kirkhuda* (deputy) the *katib* (secretary), the *imam*, the *mu'adhdhin* and the butler.

The total number of the garrison was 104 soldiers (Sijill 17: 583). In 961/1554, nine years later, Jerusalem's garrison, according to another document, consisted of 92 soldiers (Cohen 1990: 38, no. 21).

In 1082/1672, Evliya Çelebi reported that the garrison of the fortress of Jerusalem consisted of 200 men (Stephan 1938: 150). Towards the end of the 18th century, the Ottoman rule in Bilad al-Sham (Syria and Palestine) faced serious political and military challenge both from within (as a result of Dhahir al-'Umar's expansion and rivalries among local officials) and from outside (Napoleon's campaign). As a result, the number of soldiers stationed in the Citadel was increased and by 1198/1784, the number of soldiers was 440: 200 Janissaries, 61 *jabahajiyan* (arsenal), 48 *taffiiyyan* (artillery), 20 *arabijiyan* (supply), 91 *mustahfizan* (guards) and *yerliyan* (locals) (Manna' 1986: 217, citing *Sijill* 264: 189). In 1241/1825, according to the Greek monk Neophytos, however, there were only 60 soldiers in the Citadel (32, 36). Another 100 soldiers were sent to protect the Citadel and Jerusalem by the *wali* of Damascus, Mustafa Pasha (Manna' 1986: 164).

Probably because of its religious and historical significance, the Jerusalem garrison was the largest in Palestine, almost twice the size of those in Gaza or Hebron (Cohen 1990: 38). The most important figure in the Citadel was the *duzdar*. He was the commandant and was responsible for both the garrison and the military equipment and arsenal housed in the Citadel for the defence of the city. In comparison with the *mutasallim* of the city who was answerable to the *wali* of Damascus, the *duzdar*, appointed in Istanbul (Stephan 1933: 108-114), enjoyed considerable independence and was occasionally used by the Ottomans to subdue rebellious governors (Manna' 1986: 135). In the 18th century and early 19th century there was apparently some confusion between the *duzdar*, the *agha* (chief) of Janissaries and *muhafiz al-qal'a* (the official responsible for the guards); sometime the *agha* was also the *duzdar* and at other times the posts were filled by two different people. The *duzdar* was also responsible for appointing guards for the city walls and the city gates (Manna' 1986: 137, n. 62, citing *Sijill* 292: 95). According to a document dated 2 Jumada I 950/2 August 1543, he actually kept the keys of the city gates and had to hand them over when his term came to an end (Cohen 1990: 39, citing *Sijill* 15: 524). A sort of commission of enquiry was usually set up to compile a detailed inventory of all the contents of the Citadel stores (Cohen 1990: 39, citing *Sijill* 40: 149, 163; *Sijill* 48: 72; *Sijill* 51: 132, 215, 355).

One of the *duzdar*'s responsibilities was to collect the *khass sultani* (monies due to the sultan), which were generally imposed on village land known as *miri sultani* (Manna' 1986: 137, n. 63, citing *Sijill* 296: 95). Holding both military and economic authority substantially enhanced the *duzdar*'s status. The al-'Asali family managed to keep this desirable post during the late 18th and early

19th centuries. A certain Ahmad Beg al-‘Asali occupied both the position of the *duzdar* and that of *alai beg* (the commander of *sipahis*—feudal cavalry) of the *sanjaq* of Jerusalem (Manna’ 1986: 137, n. 64). Ahmad Agha al-‘Asali, who was also a *duzdar* and an *alai beg* during the third decade of the 19th century, later became a *wakil* (deputy) of the *mutasallim* of Jerusalem (Manna’ 1986: 138, n. 72-3).

The *ojaq* (Janissaries), led by their *agha* were the main component of the garrison stationed at the Citadel which was manned by *sipahis* and other soldiers. Official complaints about absenteeism were frequent (Sijill 14: 108), and even involved about half of the Janissaries of the garrison in 952/1545 (Sijill 17: 583). Orders were sent from Istanbul to prevent such occurrences (Sijill 14: 108). Janissary soldiers from the Citadel were increasingly involved in collecting taxes from villages around Jerusalem (Cohen 1990: 43, citing Sijill 40: 405) and were also reported to have mistreated the residents of the city (Cohen 1990: 44, Sijill 45: 318). High ranking Janissaries regarded their official positions as a means of increasing their profits which were in turn invested in promoting private businesses, such as the rental and sale of lands, houses, shops and other properties (Cohen 1990: 45). Ordinary soldiers were compelled to work in civilian occupations to supplement their wages. For instance, in the year 963/1555 the daily wage of a soldier was between two and eight *akçes* or ‘*uthmani*’; the *duzdar* meanwhile, received 30 *akçes* and his deputy 15. A daily labourer received four *akçes* and a builder 12 (Cohen 1989: 48-49). The soldiers’ positions were inherited by their children who continued to draw government wages even if they were unfit for military duty.

In time the strict regulations governing the Janissaries were relaxed and new recruits were drawn from the native population. Soldiers were allowed to marry and establish households outside their Citadel barracks (Cohen 1990: 48, n. 61). Eventually they began to integrate with the civilian population and were soon identifying with local interests which often conflicted with their loyalty to the sultan. In time, the Janissaries of the Citadel and their *duzdar* joined the *fallahin* uprising of 1242/1826. In the same year, they were liquidated in Istanbul by Sultan Mahmud II.

2.2 Arms and Ammunition

The Citadel comprised large storage of arms and military equipment, as well as an arsenal for the manufacture of cannons. A detailed inventory of arms, ammunition and other military equipment in the Citadel is listed in several *sijill* documents. These included bows (more than 150), arrows, rifles (around 170), exploding grenades, gunpowder, wicks for cannons and rifles, large quantities of lead, copper and iron, steel, helmets and armour, axes,

picks and lances. The weapons were stored in several places in the Citadel including ‘the store inside the Tower of David’, ‘the store near the tower of the *kikkhuda*’, and ‘the great store with two gates’ (Cohen 1990: 39-40, citing Sijills 40: 149, 163; 48: 72; 51: 132, 215, 355). Towards the end of the reign of Sulaiman the Magnificent, an arsenal for the manufacture of, and a store for, cannons (*top-khaneh*) was established.

Cannons were the most important and effective weapon for the defence of the Citadel. The earliest reference to cannons in the Citadel is dated to the 970s/1560s. There were 60 cannons, half of which were out of use. 20 cannons were in good condition, 7 of which were large cannons (Cohen 1990: 40). In year 964/1556, a manufactory for cannon was ordered by the sultan to be constructed in Jerusalem (Sijill 33: 276) and for this purpose, red bricks were prepared to build the casting kilns (Sijill 31: 576). The site designated for this task was opposite the courtyard of the Holy Sepulchre. It is not clear whether the manufactory began operating since it was destroyed by an earthquake the following year. However, new instructions were soon sent from Istanbul to establish a manufactory for arms in the Citadel (Sijill 33: 287). Perhaps the new ‘store of *top-khaneh*’, which was added to the Citadel in the 970s/1560s, was the above-mentioned manufactory.

From the beginning of the Ottoman period until the end of the 18th century the city’s fortifications, including the Citadel, were not put to a serious test. The Ottoman authorities were aware of the limitations of the garrison in the face of any outside invasion, but took few precautions (Cohen 1981: 229-230) although, as noted above, gunpowder and new cannons were brought in to strengthen the Citadel’s defences in preparation for a French attack.

In 1228/1813, repair work was undertaken in the courtyard of the *jabah-khaneh* by the *mutasallim* of Jerusalem (Manna’ 1986: 141, citing Sijill 295: 207). Another detailed inventory of the ammunition found in the Citadel was carried out in 1223/1817. There were 121 barrels of gunpowder, another 189 half-full barrels, 10 boxes of pellets and about 2,500 small grenades (Manna’ 1986: 141, citing Sijill 301: 21). In 1237/1821, the *wali* of Damascus ordered the undertaking of restoration works in the Citadel, including the battlements on top of the walls. These works lasted for two months (Manna’ 1986: 141, citing Sijill 305: 135).

2.3 Other Functions

Beyond its essential military role, the Citadel served other minor functions, including that of a prison. According to Orelli, who described the Citadel in the 1870s, prisoners were kept in extremely disagreeable cells (Ben-Arieh 1984: 19). Although the historical sources of the period,

including the *sijills*, provide little information regarding the housing and provisioning of troops, it can be assumed that the Citadel was provided with barracks for the stationing of its garrison and other soldiers. More affluent residential and domestic quarters for the *duzdar*, the *imam*, the *mu'adhdhin*, etc., were built in the Citadel. A Friday mosque—the only one in the City apart from al-Aqsa Mosque—was also constructed within the Citadel so the soldiers did not need to leave their posts for Friday prayers.

Architecture

Outer Gateway (fig. 32.1: 1; pls. 32.1-32.4)

The Citadel is entered from the east via a raised stepped platform through a well-built gateway. The main entrance (pl. 32.1), with iron-plated double doors, is set in a recess spanned by a pointed, slightly horse-shoe shaped arch and flanked by stone benches and deep niches of varying size. The portal is surmounted by a sharply pointed arch (pl. 32.3), of which the two lower voussoirs are marked by two carved decorative medallions. The schemes of both medallions are very similar and consist of intricate arabesque motifs creating a pattern of strapwork enclosing small octagons (pl. 32.2). Similar medallions, one of them almost identical, adorn the contemporary city walls; (Ben Dov 1989: 287, top left). Another comparable panel with two medallions is found in the Auhadiyya, dating to the Mamluk period (Burgoyne 1987: 170).

The restoration inscription has been preserved and is situated in a band above the arch of the entrance portal (pl. 32.3). It consists of two lines of *naskh* in Ottoman Arabic:

The order to restore this blessed fortress was given by the Great Sultan and the Magnificent Emperor, the Possessor of the necks of all Nations, the Employer of the People of the Sword and Pen,¹ the Servant of the Two Harams and of the Holy Land, may God sanctify the holy souls of his fathers, the Source of security, faith and hope, the Sultan, son of 'Uthman, Sulaiman the Second, may God prolong his existence as long as the Dome above the Rock! In the year: Goodness Happened [Chronogram = 938/1531-32] (van Berchem 1922: 146-147, no. 45).

On each side of the inscription two slabs of stones with foliate motifs and palmettes are discernible. Traces of

red and blue plaster survive around the whole inscription. Immediately above that, two additional square slabs with inscriptions are found (pl. 32.4). The upper one is the *bismilla* which is written in *naskhi* script. The lower one, written in *kufic*, is hard to decipher. A similar one is to be found at the Turba of Sitt Tunshuq and is regarded as the only square kufic inscription dating to the Mamluk period (Burgoyne 1987: 507, 509, fig. 49.11). The apex of the arched recess is pierced on both sides of the keystone with a double-hole machicolation, a fairly common feature in the gates of the city walls. One course above the outer face of the arched recess, a double-tiered frieze of shallow *muqarnas* runs across the front of the gateway. This decorative element appears in many Mamluk buildings in Jerusalem, as well as on the Ottoman city gates.

The parapet of the gateway has a foliated crenellation which runs around it. The roof, which is now flat, once had a typical shallow Ottoman dome, as can be seen in a photograph taken by Creswell in the 1920s (Ashmolean Museum, Creswell Archive, no. 4920). The entrance leads into a short passage with a pointed vault (pl. 32.5). A niche with a bench is set in the north wall of the passage and vaulted by stonework radiating from a central hub, a feature which can be seen in a Mamluk building in Jerusalem, the Auhadiyya, endowed in 697/1298 (Burgoyne 1987: 170, pls. 9.3, 9.4). On the south side of the passage, a vaulted opening leads into a staircase which ascends to the roof of the gateway.

The gateway is connected with the barbican by a drawbridge (fig. 32.1: 2, pls. 32.6-32.8). The modern bridge rests over the original slots which can still be seen in both the scarp and counterscarp walls of the main ditch. Late 19th- and early 20th-century photographs show a pitched-roof wooden structure with windows on the drawbridge. Although this structure does not seem to be earlier than the 19th century, it is not certain when the drawbridge went out of use. In 1258/1842 the scholar Edwald mentioned that on both sides of the wooden bridge there were benches on which the Pashas of Jerusalem often sat with their officers and smoked (Sivan 1983: 37). This perhaps explains the finding of a large quantity of clay pipes which were apparently thrown into the ditch below.

The accounts of pilgrims from the 8th/14th and 9th/15th centuries, particularly that of Felix Fabri (885/1480), refer to both a gateway and drawbridge. No substantial archaeological evidence remains to suggest a pre-Ottoman combined system of a gateway and drawbridge. The only visible evidence of any earlier construction is a foundation of a wall, in the ditch below, running north to south, parallel to the line of the ditch scarp over which the drawbridge was constructed (pl. 32.6). While the Ottoman gateway and drawbridge are slightly to the north of the line of the Mamluk main entrance, the earlier structures may have been built in a

¹ This is a variant of van Berchem's translation '*celui qui servent*'; the Arabic word *mustakhdim*, from the verb *istakhdama*, to use, to employ, is better translated as 'user', or, more correctly, as 'employer'.

straight line (Wightman 1993: 269, fig. 84; 287-288, fig. 89).

Barbican (fig. 32.1: 5-8; pls. 32.9, 32.10)

This barbican, surrounding the north-east tower (A) and extending south until the corner of the east tower (B), was clearly intended as a principal outwork to defend the main entrance of the Citadel. It is separated from the perimeter ring-wall of the Citadel by an inner arm of the ditch (fig. 32.1: 7) and linked to the main entrance by a stone bridge (fig. 32.1: 8).

The barbican comprises three parts: (1) the northern arm of the barbican; (2) the southern part of the barbican, which can be called 'the Summer Mosque'; and (3) the stone bridge.

(1) The Northern Arm of the Barbican: (pl. 32.11)

The northern arm surrounded the north-east tower from the north and east and includes the part of the barbican to the right of the drawbridge, most of which was excavated in the early 1980s. Here, the parapet of 'the sentry-walk' is loop-holed for firearms (Johns 1950: 173).

Abutting the north-east tower from the south, the remains of a wall, dated to the Byzantine or early Islamic periods, has been uncovered (Solar and Sivan 1994: 112, plan).

(2) The Summer Mosque (fig. 32.1: 5; pls. 32.12-32.14)

This open-air mosque is surrounded by a low wall to the west and north, and barbican battlements to the south and east. The entrance of the mosque is a doorway measuring 1.90 x 0.90 m. An eight-line Turkish inscription above the lintel mentions the repair of 'the Summer Mosque' by the *agha* of the Janissaries, the Khassaki 'Ali Agha, in the year 1151/1738 (Stephan 1933: 132-134).

The main hall of the mosque has an irregular form, which was modelled according to the alignment of the barbican. A concave pointed-arched *mihrab* occupies one of the battlements in the south wall of the barbican (Johns 1950: 173, fig. 15). On the keystone of the *mihrab*, a circular cartouche is set within a circular frame which contains the following Arabic inscription:

Sultan Sulaiman, may God render his victory
glorious (van Berchem 1922: 149, no. 46).

A cavetto moulding is found above the *mihrab*, which is in turn crowned on both sides by two crenellations.

At the west side of the mosque hall, there is a well-head where water could be drawn from a cistern below. At the north-eastern corner is another, smaller cistern. During repairs and renovation work in 1980-86, the remains of a

water fountain in the centre of the mosque hall were removed and replaced with a modern fountain.

(3) The Stone Bridge (fig. 32.1: 7; pls. 32.15-32.16, 32.18)

This bridge, which abuts both the ring-wall of the Citadel and the western wall of the barbican, connects the barbican with the main entrance. It rests on two pointed arches spanning the inner ditch (fig. 32.1: 7). It is constructed of small ashlar stones which are clearly distinguishable from the rusticated masonry of the Citadel wall. Johns (1950: 173) suggested that the bridge replaces a former wooden bridge. Although no lifting-slots are visible in the face of the wall beside or above the entrance, they may well be covered by the bridge itself. On the bridge, between the two arches, there is a *naskhi* Arabic inscription set within a cartouche, similar to, but bigger than the one above the *mihrab* in the Summer Mosque. It reads:

Glory to Our Master, Sultan al-Malik al-
Muzaffar Abu 'l-Nasr Sulaiman Shah,
descendant of 'Uthman (van Berchem 1922:
149-150, no. 47).

The Mosque (figs. 32.1: 15, 32.3-32.7; pls. 32.17, 32.19-32.23)

No less than three different phases of construction are discernible in the present building. Of these, one is Mamluk, datable by inscription to 710/1310-11, and two are Ottoman, datable to 939/1532 (during the reign of Sultan Sulaiman), and 1326/1908-9 (during the reign of Sultan 'Abd al-Hamid), respectively. The full extent of these constructions is not fully known, for only some structural features can be identified.

First Phase

This comprises a hall with a symmetrical arrangement of six deep recessed loopholes in the west wall facing six openings, which represent alternating doors and windows, in the east wall. Two other deeply recessed loopholes are in each of the south and north walls (figs. 32.3-32.5). An inscription on a limestone slab, on the east wall near the south-east corner of the hall recording the construction of a mosque by the Mamluk Sultan al-Nasir Muhammad in 710/1310-11, seems not to be in its original location (van Berchem 1922: 141-42, no. 44). No structural features of this Mamluk mosque can be recognised in the hall. Johns regards this structure as an integral part of the south and south-west towers, which are characterised by a single large work, attributed to al-Nasir Muhammad (Johns 1950: 180, fig. 31a).

Second Phase

This phase represents the conversion of the tower hall into

a mosque. The west recess in the south wall was blocked accordingly to house the *mihrab*, next to which a *minbar* was erected. The eastern recess was partially blocked, as was the adjacent doorway, in order to follow the line of the east wall of the mosque. A rectangular structure raised on four columns, a *dikka*, was added next to the pier between the second and third recesses from the south in the west wall (figs. 32.3-32.5).

A dedicatory inscription, which is written in Ottoman *naskh*, records the structural refurbishment of the *minbar* by Sultan Sulaiman in 939/1532. It was carved on the lintel over the door leading up to the *minbar* (van Berchem 1922: 164-65, no. 52). The inscription, which is no longer *in situ*, includes Sultan Sulaiman's usual titles and the date is written as a chronogram. Another inscription, consisting of verses from the Qur'an (Sura IX: 18) written in similar Ottoman *naskh*, runs around the north and east canopy of the *minbar* (van Berchem 1922: 165).

Third Phase

The third phase involved further structural changes and alterations to the building, which continued to serve as a mosque. A dividing wall was erected between the second and third piers, thus reducing the hall of the mosque by one third (van Berchem 1922: 159, fig. 20). The floor level was raised by adding a new plastered floor. A new monumental entrance, with an outer porch resting on columns, was added (figs. 32.3, 32.7; pl. 32.17). A six-line inscription in *naskhi* script and in Ottoman Turkish above the lintel of the entrance records the work of Sultan 'Abd al-Hamid II in 1326/1908-09 (Stephan 1933: 134-35) (pl. 32.23).

During the 1986 renovation works, which were undertaken to transform the Citadel into a museum, the mosque was once again remodelled and turned into an exhibition hall. The *dikka*, the dividing wall and the later floor were removed, and the *mihrab* and *minbar* were stripped of their thick blue plaster.

The Minaret (fig. 32.1: 14; pls. 32.24-32.26)

The cylindrical stone shaft of the minaret, divided into three 'storeys' by moulded string courses, rests on a masonry base which is square in shape and rounded on its edges. A door in the south side of the square masonry base gives access to a spiral staircase which ascends within the shaft to the gallery for the *mu'adhdhin*.

A four-line Turkish inscription, on the north face of the base, commemorates the restoration of the minaret by Muhammad Pasha, in the reign of Sultan Muhammad IV in 1066/1655 (van Berchem 1922: 165-166, no. 53). The base of the minaret, including the entrance portal, which is built of large masonry, was apparently constructed before the shaft which is built from much smaller masonry. Moreover, the battlement of the wall of the tower abuts the

base from the west, which means the base is either contemporary with the wall or predates it. It is therefore reasonable to suggest that the shaft of the minaret may be a restoration of 1065/1655. The base of the minaret, including the entrance portal, which is built of large masonry, was apparently constructed before the shaft which is built from much smaller masonry. However, the battlement of the wall of the tower abuts the base from the west, which means the base is either contemporary with the wall or predates it. It is therefore reasonable to suggest that the shaft of the minaret may be a restoration of 1065/1655, while its base may be attributed to Sultan Sulaiman or even to the Mamluk period.

Western Terrace of Battery (fig. 32.1: 18; pls. 32.27-32.28)

A three-line Arabic inscription, which was found in the revetment wall of the western terrace near the north-west tower E, records that the construction of the *rabad* (glacis) was undertaken by Sultan Sulaiman (van Berchem 1922: 150-51, no. 48). It is quite possible that the adjacent ditch and the battlements along the terrace were built at the same time. Judging from Sultan Sulaiman's titles, which appear in the inscription, it should be dated between 940/1533 and 945/1538 (van Berchem 1922: 152-5; Johns 1950: 172). Furthermore, the style of construction and the masonry suggest that the terrace is contemporary with the restoration works of Sultan Sulaiman the Magnificent.

Glacis (fig. 32.1: 6)

An Arabic inscription, commemorating the construction of a glacis (*rabad*) by order of Sultan Sulaiman was found on the outer side of the north-west tower (van Berchem 1922: 150-51). Although the date is missing, van Berchem dated it on the basis of the style of the script and the content of the text itself to between 940/1533 and 945/1538 (1922: 152-56). It seems that in the course of Sulaiman's repair work, other portions of glacis were restored at various locations: (1) the north and east sides of north-east tower (A) (pls. 32.5, 32.6), (2) the west and south sides of western terrace (pl. 32.7), and (3) the east side of the minaret tower.

During the reign of Sultan Mahmud I, a portion of the glacis at the west side of the north-west tower (E) was restored. An Arabic inscription testifying to this was found on the site. The inscription consists of six lines of *naskhi* script as follows:

The renovation of the wall of this ditch was executed after it collapsed during the caliphate of the Sultan of Islam and Muslims, persecutor of the heretics and polytheists, Sultan Mahmud, son of the late Sultan

Mustafa Khan from the family of 'Uthman—may God support his reign—by request and report from His Highness the Honourable Minister 'Abdallah Pasha, the governor of Syria (Damascus), the *anur* of the sacred pilgrimage, when he visited Jerusalem. And the high order (*faraman*) was received by his deputy the pilgrim Mustafa Agha, son of Parwanah, and he executed it himself and completed its restoration—may God reward him with goodness—in the months of the year 1144 (1731–32) (van Berchem 1922: 156–57, no. 49).

Ditch (fig. 32.1: 3)

The line of the Ottoman ditch of the Citadel probably follows the general line of its predecessor (Wightman 1993: 287, fig. 89). Modifications were introduced by Sulaiman as follows: (1) expanding the ditch eastwards in order to make way for the outer gateway and the barbican; (2) incorporating the ditch with the city's fortifications at the north-west and south corners by building a connecting wall across the ditch; and (3) widening the west and south-west portions of the ditch (Wilson 1865: pl. III).

Many photographs from the 19th century show the ditch north west and west of the Citadel, with its scarp and counterscarp. However, this was subsequently filled up, starting in the year 1316/1898. This may have been due to its state at the time. Various travellers and pilgrims describe the ditch of the Citadel during the 19th century as being full of rubbish or being used as a garden for growing vegetables. It should be noted that the east and south parts of the ditch were excavated down to bedrock during the restoration works in the early 1980s.

Conclusion

As previously noted, the structure and the perimeter of the Citadel as it stands today is essentially the work of the Mamluk sultan, al-Nasir Muhammad. Both textual and epigraphic evidence indicate that the Citadel underwent some physical changes and alterations during the reign of Sulaiman the Magnificent which exhibit a well co-ordinated and interdependent system of defence reflecting the advances made in ballistic techniques and strategy, and the introduction of firearms and artillery. The most important new element in warfare was the extensive use of artillery mounted on platforms built on defensive outworks and towers.

Historical accounts throughout the Ottoman period frequently mention the existence of cannons and gunpowder stores as part of the defensive system in the Citadel. Moreover, the structure of the Citadel itself—the considerable height and thickness of the walls inherited from the Mamluks—served to deflect the incoming missiles. Paradoxically, the Ottoman craftsmen used homogenous small ashlar and well dressed limestone in their repair works in the Citadel. This had apparently become a characteristic of both public and vernacular Ottoman architecture in Jerusalem and throughout the region.

Towards the end of the 19th century, the Citadel was in a dilapidated condition, as we learn from travellers' accounts and from contemporary photographs. Fortunately, much of what was dismantled has been reconstructed in recent years. This allows the modern visitor to experience firsthand the Citadel of Jerusalem as it has been passed down to us by the Ottomans, a testimony to a major work of Islamic military architecture.

Chapter 33

THE *HAMMAMS* OF OTTOMAN JERUSALEM

Martin Dow

For much of the Ottoman period, there were six functioning public baths, *hammams*, in the city: Hammam al-'Ain, Hammam al-Shifa', Hammam al-Batrak, Hammam al-Sultan, Hammam al-Sayyida Maryam, and Hammam al-Jamal (Çelebi 1935: 488; Horn 1962: 210). The necessity for a nearby supply of water, whether from an aqueduct or from a pool, and for adequate drainage, meant that the site remained the same even when the buildings themselves were reconstructed, which has happened more than once in some cases. While Hammam al-'Ain and Hammam al-Shifa', in Suq al-Qattanin, are still essentially Mamluk buildings (Burgoyne 1987: 282, 287), at least two of the others were rebuilt at or near an earlier site during the Ottoman period.

Hammam al-Batrak, on the opposite side of Harat al-Nasara from Birkat al-Batrak, was described in 1920 as an 18th-century building (Ashbee 1921: 16). However, there are references to Hammam al-Batrak in the 16th-century Ottoman land registers (İpşirli and Tamımı 1982: Quds 26), and there had been a *hammam* near to Birkat al-Batrak for a long time before this, certainly since the time of the Crusades (Abel 1924: 39). The present building of Hammam al-Sayyida Maryam dates from 1878 AD (al-'Asali 1982: 201), but Muqaddasi wrote about how a *hammam* was built in the area in the 10th-century AD (Grotzfeld 1970: 54). Horn's 18th-century description of Jerusalem (Horn 1962: 212) includes an illustration of Hammam al-Sayyida Maryam as it was then, with Sulaiman the Magnificent's *sabil* built into the front (Rosen-Ayalon 1989: 600). The *sabil* still exists, but the *hammam* is completely new, and its position has been shifted slightly to the north (Williams 1849: 1 City Plan).

Less is known about the early history of the other two *hammams* as the first unambiguous references to them are in the Ottoman period. Hammam al-Sultan, at the corner of Tariq al-Mujahidin and Tariq al-Wad, was built around 1557, along with a second *hammam* on the same site, under the patronage of the wife of Sulaiman the Magnificent (Stephan 1944: 184). It seems to have been a new site for a *hammam* as there was previously a church in the locality. The *hammam* was derelict by 1840 (Williams 1849: 1 City Plan) and by 1874 construction of the Armenian Catholic church had begun on the site (Stephan 1933: 242). The only trace of the *hammam* now is the small building, with three arches on the front wall and three cupolas above, which can be seen in front of the *hammam* in Horn's illustration (Horn 1962: 213), and which now forms the Polish Catholic Chapel.

Hammam al-Jamal used to be in Tariq al-Nabi Da'ud, and was identified at the time of the Ordnance Survey in the mid-19th century, although by that time it was in use as a soap factory (Sandreczki 1882: 54). It has now completely disappeared.

Despite the relatively conservative nature of the locations of the *hammams*, their names changed much more frequently. Hammam al-Jamal, the Bath of the Camel, or Camels, was said by Horn to have been so named because a spirit in the form of a camel once appeared there (Horn 1962: 214). It was known in the earlier Ottoman period as Hammam Sayyidi Da'ud because it was in the neighbourhood of the Tomb of David on Mount Zion (Heyd 1960: 149; Cohen and Lewis 1978: 104). Evliya Çelebi referred to it as Hammam al-Sakhra, the Bath of the Rock (Çelebi 1935: 488), apparently

because it was endowed on the Dome of the Rock.

Hammam al-‘Ain, the Bath of the Spring, seems to have been known as this throughout the Ottoman period, although when built it was called the New Hammam, or the Hammam of Tankiz, after the person who built it (Burgoyne 1987: 287; Cohen and Lewis 1978: 97). Hammam al-Shifa’, the Bath of Healing, also built by Tankiz, was sometimes known in later years as Hammam ‘Ashura, after the popular belief that the waters of Zamzam overflowed and mixed with those of Hammam al-Shifa’ on the 10th day of the month of Muharram (Canaan 1929: 65). It was believed that Job was cured from his skin disease there, hence its reputation for healing (Canaan 1929: 66). The name of Hammam al-Sayyida Maryam, the Bath of the Virgin Mary, or Sittna Maryam colloquially, comes from the legend that she took a bath there (Horn 1962: 212; Canaan 1927: 66). However, it was often known as Hammam Bab al-Asbat, after the gate near which it was situated, the Gate of the Tribes.

On the other hand, Hammam al-Batrak, the Bath of the Patriarch, was called by that name since at least the 12th-century (Abel 1924: 39). It has been suggested that it was also known as Hammam al-‘Amud, whose name appears in the early Ottoman land registers (Cohen and Lewis 1978: 97), although there is no obvious evidence to connect the two *hammams*. In later years, there are no further records of Hammam al-‘Amud.

In common with much other property, the *hammams* were owned as part of a *waqf*, an endowment. All the Jerusalem *hammams* belonged to a charitable endowment, at least during the early Ottoman period, although there was a tendency for the ownership to pass to a family endowment in the 19th-century (al-‘Asali 1982: 192). Three of the endowments were originally in favour of the Dome of the Rock and al-Aqsa Mosque, partly in the case of Hammam al-‘Ain and Hammam al-Shifa’, or wholly in the case of Hammam al-Jamal. Hammam al-Sayyida Maryam and Hammam al-Batrak were endowed in favour of the Khanqah al-Salahiyya and Hammam al-Sultan was endowed in favour of the Khassaki Sultan *takiyya*. *Hammams* were one of the revenue-producing parts of the endowment, which created the money for the upkeep of the religious foundation itself. Given the importance of the religious buildings in Jerusalem, it is only to be expected that the *hammams* were part of charitable, rather than family, endowments.

The *hammam* was rented to the *hammam* keeper, the *hammami*, for a fixed rent, in what was often a yearly contract (al-‘Asali 1982: 178). Long-term contracts were a major cause of the liquidation of an endowment (Gerber 1985: 180) and put the endowment at a grave disadvantage during times of high inflation. They were thus discouraged. In addition to the rent stipulated in the contract, the *hammami* was also responsible for hiring servants, buying

fuel and arranging for the water if this had to be carried to the bathhouse.

None of the three *hammams* which still exist in Jerusalem is an early Ottoman building, but we know that the layout of *hammams* throughout Palestine changed very little from the Mamluk age until towards the end of the Ottoman period. This was indeed the case throughout Greater Syria. The only significant development was the simplification of the series of washing rooms into a single main hot room with a number of chambers opening from it (Ecochard and LeCoeur 1943: 2 13). The warm room, which in the Ayyubid and early Mamluk age had been the main washing room, grew smaller and finally disappeared.

Hammam al-Batrak, Hammam al-Sultan, the original Hammam al-Sayyida Maryam, and Hammam al-Jamal are likely to have resembled the two Mamluk *hammams*, Hammam al-‘Ain and Hammam al-Shifa’, quite closely. The main room was always the undressing room, *mashlah saifi* or *mashlah barid*. It was here that guests undressed and wrapped a bath cloth around themselves, before entering the *hammam* proper, and where they relaxed with food and drink after the bath. The tradition of drinking coffee after bathing is at least as old as the 18th century (Horn: folio 124a). The undressing room had a stone basin in the centre with a fountain. The one at Hammam al-Batrak had a typical octagonal outer shape and a circular pool in the top (Ashbee 1921: 17). Stone benches, *mastabas*, around the sides of the undressing room were spread with soft furnishings (Golvin 1967: 114).

The *hammams* also included a second undressing room, the *mashlah sukhun* or *mashlah shitawi*, which was heated by the hot smoke of the furnace in the same way as the washing rooms. This room was smaller than the main undressing room, and in the mountainous regions of Palestine was used for changing in winter.

While the earlier *hammams* included both warm and hot rooms, the warm washing room later tended to disappear, and the exact arrangement favoured in the Ottoman period is not certain. The main washing room was undoubtedly the hot room, surrounded by several small chambers, *khilwas*, which opened off it. Hammam al-‘Ain shows some indications of having been modified during its lifetime from a Mamluk layout to a more typical Ottoman pattern. The present hot room seems originally to have been a warm room, with a further hot room beyond it in the position of the present service area (Burgoyne 1987: 291). The two Mamluk *hammams* possessed a tank, *maghtas*, used as a plunge bath. It is not known if the later *hammams* in Jerusalem possessed one, although this is probably the case.

The furnace, *qammim*, of all *hammams* was located behind the hot room, and a duct carrying the smoke passed under the floor of the heated rooms to terminate at a

chimney on the far side of the heated winter undressing room. Brass or copper cauldrons, *qudur nihasiyya*, were built in over the furnace, and allowed the reservoir of water above to be heated.

The late Ottoman building of Hammam al-Sayyida Maryam, which dates from the latter part of the 19th century, shows several features which are not traditional. While it has been extensively modified recently, following its closure several years ago, enough remains to see that the way in which the building was constructed was very different from the earlier vernacular building methods, although the layout still retains many features in common with earlier *hammams*.

The summer undressing room and the service area are both in the lower part of a two-storey building joined to the Church of St Anne, and are located next to each other. The inclusion of living quarters over part of the *hammam* is a new feature, although the internal arrangement of the *hammam* in a loop, with the furnace entered from the same side as the undressing room, is similar to that of Hammam al-Shifa'. Such an arrangement is not common in other parts of the region, and its presence in the earlier *hammam* in Jerusalem would undoubtedly have influenced the local conception of a suitable layout. The arrangement allowed access to the service area from the street, to bring in fuel and remove ashes. Entrance to the undressing room can be made from above using a spiral staircase in the front corner of the room. There is a large basin in the centre of the room.

The washing rooms are contained in a single storey extension to this main block. While windows from the street overlooked the undressing area, which presumably would have been screened in the same manner as in Hammam al-Shifa' (Golvin 1967: 114), the washing rooms were lit from above with the traditional small apertures in the domes, covered by glass, in a manner which ensured the privacy of the bathers.

Having undressed, the bather would have passed along a corridor which ran the length of the washing rooms, to arrive at what may have been the winter undressing room, up the wall of which rose the chimney. However, the presence in the adjoining room of a large basin, of the type usually found in the middle of both summer and winter undressing rooms, indicates that this room, rather than the end room, might have been the winter undressing room. Neither room has the stone benches which are a feature of the undressing rooms in the other *hammams*, but the summer undressing room of Hammam al-Sayyida Maryam does not possess these either. Bathers must have relaxed on movable wooden couches.

The latrines, which normally would have been located between the summer and winter undressing rooms, are here next to the hot room. They are immediately

alongside the reservoir which held the hot water over the furnace, but the exact arrangement of cauldrons can no longer be seen. A passage through which gives direct access to the internal rooms has been built recently, in order to allow the building to function as a shop. The hot duct which would have run to the far end of the building can also no longer be seen, and the chimney is the only visible indication of its former presence.

Two small chambers are positioned on one side of the hot room, and there are a further two small rooms at the other end of the *hammam*. There is no plunge bath.

In assessing the reasons for the importance of the *hammam*, not only in Jerusalem, but in the whole of the Arab and Islamic world, due note must be taken of religion. Washing the body is an important part of the Islamic religion. The head, hands and feet must be washed before prayer, and ablutions places where people can wash are found around the major mosques. In addition, anyone who is in a state of *janaba*, uncleanness, must purify themselves (Qur'an: Surat al-Ma'idah 5: 6).

The *sunnas*, the traditions associated with the life of the Prophet, give guidance on how the purification must be carried out. The whole body, including the head must be washed ('Ali 1978: 59, from Bukhari). More specific explanations and interpretations of what was required arose in the early Islamic period, and by the time of the Ottoman empire the four Sunni schools of Islamic jurisprudence represented the body of orthodox thought. The Hanafi school enjoyed official recognition throughout the Ottoman empire, and had many followers among the local population of Syria (Schacht 1964: 65). However, in the interpretations relating to washing, all four Sunni schools were in substantial agreement about what was necessary to make washing ritually correct, and, indeed, Shi'ite beliefs were similar. An exception was the Maliki view that an unclean person bathing in a small tank of water did not necessarily make the water impure, always provided that the water's essential qualities of taste, colour and smell were not altered (Grotzfeld 1970: 8; Khallaf 1939: 4). The Maliki school was not numerically important in Ottoman Palestine.

While the usual stricture is that all ritual washing must be done in running water, in fact bathing by immersion is acceptable according to all schools of law, provided that the quantity of water in which the body is immersed is large enough (Khallaf 1939: 1-6, gives details of what defines pure and impure water according to the Sunni schools. See Maghniyya 1965: 17, 19, for Shi'ite beliefs). A small bathtub is not sufficient, as the water would be made impure by any uncleanness coming into contact with it. Even the size of tank found in the two Jerusalem *hammams* which possess one is not large enough for the tank to be used for ritual bathing as opposed to relaxation. The way in which washing was carried out was

by taking hot and cold water run into a stone basin, *jurn*, and pouring it over the body. Two of the stone basins can still be seen in the courtyard of the Armenian Catholic church, and are the only remains of Hammam al-Sultan which can still be positively identified as part of a *hammam*.

Everyone needed to wash themselves after sexual activity, and women were required to wash after childbirth, and once a month after menstruation (Khallaf 1939: 78). It was judged desirable, while not absolutely necessary, to wash once a week (Khallaf 1939: 85), several religious traditions indicating that people should wash before going to the mosque ('Ali 1978: 58-9, from Bukhari). The *hammam*, then, was of the utmost importance in fulfilling the religious requirements. However, it was obviously possible to wash without the *hammam*, which merely made the experience more convenient and more enjoyable. Although the religious sanction for its use preserved the importance of the *hammam*, it was a major social institution as well, and all religious groups in the city, even the Western visitors, used it.

They would mix in the *hammam*, although there was a tendency for people to use the one in their own quarter. Hammam al-Batrak was patronised mainly by Christians (Çelebi 1935: 488). In one of the cases of the religious court, *mahkama shar'yya*, the *qadi* ruled that the excuse of the *hammami* at Hammam al-Batrak for using worn-out bath cloths, that he only gave them to peasants, to Christians and to Jews, was unacceptable. He was told to provide new bath cloths and to distinguish clearly between them (Cohen 1984: 138). Hammam al-Sayyida Maryam was visited by both Muslims and Christians, both religions venerating Christ, who was popularly supposed to have been brought to the *hammam* by his mother (Horn 1962: 212).

The *hammam* was a meeting place and the social centre where important stages in the life of a member of the community were celebrated. It was particularly important for women, for whom it was one of the few public places where they could meet outside the family circle. In order to maintain strict segregation of the sexes, the *hammams* were reserved for men at certain times, and for women at other times, although Hammam al-Shifa' was used by men only. In the 18th century, the men's time ran from two o'clock in the morning until midday, and the women's time ran from midday until night (Horn: folio 123b).

Not only washing took place during visits to the *hammam*. Men used to have a massage (Horn: folio 124a). Women were not massaged, but they would dye their hair with henna while at the bath. They also used special ointments, known as *zarnikh* according to Horn (Horn: folio 124a), a pitch-like mixture of syrup and other substances according to Klein (Klein 1883: 95), to remove their body hair. This took place in a special room in Hammam al-Shifa', *bait al-dawa'*, and one of the small

chambers in Hammam al-Sayyida Maryam would have served the same purpose.

One of the most important events in which the *hammam* played a part was marriage. It was customary for the bride to have a bath the day before her wedding, for which the bathhouse would be hired all day. She was led there by women and girls with singing, clapping and drumming, and a large bundle of washing things and linen was brought along. The bride was washed in the *hammam*, and her body hair removed. At the end of the day she was then led back to her home with shouting and cheering (Klein 1883: 95).

Thus in Jerusalem, as elsewhere in the Middle East, the *hammam* was an important feature of civilised living in the city, and it would have been inconceivable for the city not to have possessed a number of functioning *hammams*. It was only the increasing Western influence which finally reduced their number, and even by the end of the Ottoman period, at the beginning of this century, four were still working.

Chapter 34

RESTORATIONS TO MASJID MAHD 'ISA (THE CRADLE OF JESUS) DURING THE OTTOMAN PERIOD

David Myres

Masjid Mahd 'Isa (the Mosque of the Cradle of Jesus) and the small painted domed structure enclosed within it (Qubbat Mahd 'Isa, pl. 34.2), with which this chapter is principally concerned, are located below the south-eastern corner of the lower esplanade of the Haram al-Sharif adjacent to the great substructures called 'Solomon's Stables'. Today unused, the mosque is under the care and protection of the General Administration of Islamic Waqfs in Jerusalem. The drawings here were amended and redrawn for publication by the author in 1994 for the Ottoman Jerusalem Project, from survey drawings carried out by the Department of Islamic Archaeology (DIA) in 1987.¹

Introduction

Since at least the early 4th/10th century, Masjid Mahd 'Isa² has been venerated by Muslims, and later by Christians, for its associations with the Virgin Mary and the infant Jesus. Biblical and Qur'anic traditions also link it with other periods in the life of Jesus and it remains probably the sole pilgrimage site to be associated in chroniclers' accounts with the birth, early childhood, ministry, temptation and ascension of Christ. Only his death is not connected to it.

In spite of these important associations—and,

indeed, the considerable interest paid by 19th-century Western investigators into Solomon's Stables (access to which was probably only through the mosque)—almost nothing of substance has been written about the mosque, the 'Cradle' (which is, in reality, a large marble niche laid on its back on the ground (pl. 34.3) or the Qubbat Mahd 'Isa which surmounts it. This account sets out to document the *qubba* and the restorations carried out to the mosque during the Ottoman period.

The foundation date of Qubbat Mahd 'Isa is unknown. However, as will be seen, the documentary evidence leaves little room for doubt that it was indeed founded during the period of Ottoman sovereignty over the city. The combined documentary and architectural evidence suggests that it may have been the last in a long line of such structures built by Muslims in the city—and in particular in the Haram—both before and during the Ottoman period. In addition, documentary evidence suggests that it may have been a replacement for a similar construction that existed on the same site during the 5th/11th century.

If the foundation date of the *qubba* is unknown, the decorative painting that covers much of it can be very precisely dated. A previously unpublished inscription dates this to August 1898, which is particularly significant because it is only a few months before the historic visit to the city by the German Kaiser Wilhelm. Contemporary accounts leave little room for doubt that the work was carried out for the occasion and it remains as one of the few examples of its type on the Haram. For this alone, it deserves its own niche within the context of the present study.

¹ Acknowledgements are to be found at the beginning of Chapter 23, 'An Overview of the Islamic Architecture of Ottoman Jerusalem'.

² Otherwise called *Sarir Sayyidna 'Aisa* (Wilson 1865: 37) or *Marghareet 'Aisa* (Fetellus 1892: 3).

In an effort to rectify in part the paucity of documentation on the site, and to place Qubbat Mahd 'Isa in context, a brief description of the mosque is included. First, however, it is necessary to look briefly at the historical traditions associated with the mosque.

History

*Pre-Ottoman History*³

The site is principally associated in biblical and Qur'anic traditions as the place where Mary hid, with the infant Jesus, from the purge of Herod before fleeing to Egypt (Prag 1989: 142; see also Stephan 1941: 153, n. 6 and 1942: 101). In fact, the earliest accounts of the place by Ibn al-Faqih (291/903) and Ibn 'Abd Rabbihi (c. 301/913) speak only of the 'mihrab Maryam' (Le Strange 1890: 161ff; see also van Berchem 2: 447, n. 4; al-Muqaddasi 1886: 47). Al-Muqaddasi, writing in 375/985, mentions 'the mihrab Maryam and Zakariyyah' (Le Strange 1890: 165). The earliest account of the mosque in which the 'Cradle of Jesus' is specifically mentioned by name comes in 438/1047, significantly only a few years after a major restoration to the south-east corner of the Haram al-Sharif was carried out by the Fatimid Caliph al-Zahir in 425/1034 (van Berchem 1925: 7-19; see also Le Strange 1888: 279 and 1890: 99-101; Besant and Palmer 1899: 118-9). In a relatively detailed account, the Persian traveller Nasir-i Khusrau described it as '... an underground mosque to which one had to descend by many steps ... and the chamber has a roof of stone supported on marble columns.' He goes on to note that 'they say that Jesus ... was born in the place where this mosque stands' and that it was the place where Jesus was laid 'during his childhood', and where 'he later held converse with the people' (Le Strange 1890: 160).⁴ This latter tradition appears to have given rise to the naming of one of the five *mihrabs* in the mosque 'al-Makam al-Hawariyyun' ('The Place of the Disciples'). By Qur'anic association the place is also linked with the Prophet Zachariah, John (the Baptist), and (the Angel) Gabriel (Le Strange 1890: 166; Qur'an Sura XIX; al-Muqaddasi 1886: 47).

The Crusader occupation of the city after 492/1099, and the accompanying Christian impact on the city, predictably saw the chamber converted into a chapel

under the guardianship of the Templars (Vincent and Abel 1926: 844) when the Zachariah-related traditions attached to the place appear to have been forgotten or discarded.⁵ However, if one tradition was lost, other associations were reinforced by the Christian chroniclers. Saewulf (495/1102) describes the 'Cradle of Jesus' and his 'bath', and the 'bed' of Mary (1892: 16) as does Fetellus in 524/1130 (1892: 3).

During the Crusader period the site was also remembered as the biblical location of the house of Simon, to whom Jesus is said to have been presented by Mary when still a baby (Luke 2: 25-34; Saewulf 1892: 16). In 572/1180, it also became linked to the so-called 'Pinnacle' of the Herodian Temple where Christ is said to have been tempted by the Devil (Luke 4: 9-13; Jacques de Vitry 1896: 44; see also John of Würzburg 1890: 13).

After the re-occupation of the city by the Ayyubid Salah al-Din in 583/1187, the chapel reverted to a mosque and once again Muslim pilgrims were being entreated to recite the Sura of Mary there.⁶ However, by the end of the 9th/15th century, during the Mamluk period, Mujir al-Din referred to it as the place that is 're-named', and where pilgrims also read the account of the Ascension of Jesus from the Qur'an (Mujir al-Din 1876: 103).⁷

Ottoman Period

Nothing is known about the site during much of the first two centuries of the Ottoman period in Jerusalem. However, a few years before Sultan Selim I conquered Jerusalem in 923/1517, Francesco Suriano, a Franciscan monk based on Mount Zion, notes with sanctimonious enthusiasm that Muslims continued to venerate those sites in the city traditionally associated with the Virgin Mary. It can perhaps be presumed from this that the 'Cradle of Jesus' and the mosque continued to be one of the holy sites visited by Muslim pilgrims at the beginning of the 10th/16th century. This is confirmed by the later accounts of al-'Ayyashi (1074/1663), al-Madani (1081/1670), al-Siddiqi (1122/1710), and al-Luqaimi (1143/1731), all of whom are known to have visited the place (for these chroniclers, see al-'Asali 1992: 210, 292, 304). Al-Madani is the only writer, however, to provide a brief description which notes the 'Cradle' and, to its left, a 'fine *mihrab* ...

³ For full accounts of the documented history of the south-eastern corner of the Haram al-Sharif see Vincent and Abel 1926: 841-5, 924; van Berchem *CIA* 2 (Haram), vol 1: 2, 7, 15-16, 51, 112 and *CIA* 2 vol 2: 447-9.

⁴ See also Nasir-i Khusrau, (trans.) Le Strange 1888: 33-4; Khusrau is the only early chronicler to have associated the place with the birth of Christ. However, Evliya Çelebi during the latter half of the 11th/17th century also seems to allude to the tradition (Stephan 1941: 146).

⁵ It emerged again during the Ayyubid period in the form of an exquisitely designed *mihrab* in al-Aqsa Mosque. For a full discussion of the migration of sites in the Haram associated with the Prophet Zachariah see van Berchem 1925-7: 447-8.

⁶ Sura XIX. See also Ibn al-Faqih, *Ba'ith al-Nafus ila Ziyarat al-Quds al-Mahrus*, (trans.) Matthews 1949: 80; Besant and Palmer 1899: 471. See also Ibn Battuta (trans.) Gibb 1971: 80.

⁷ Sura XXXVIII. See also Khalid ibn 'Isa Balwi (737/1387) in al-'Asali 1992: 195.

which is said to have been the place where Mary prayed' (al-'Asali 1992: 210).

More specific references to the site during the early Ottoman period are few. However those that do exist provide fuller accounts of what the place looked like. Evliya Çelebi, writing after 1083/1672, provides the first useful description. It is worth quoting in full:

A stone staircase of twenty steps leads down to the shrine of Mary where she lived. Here she took refuge from the comments of people that offended her. This cave has a small prayer niche facing east [*sic*]. In it is the Cradle of Jesus, a nest-like, polished, shining stone. Within the cave is another shrine to commemorate the followers of Jesus, called his Disciples (*Hawariyyun*), and further off that of Gabriel. These five shrines are in these caves yet the amazing thing about them is that one has to descend twenty steps on a stone stairway, where not even the slightest gleam could penetrate. It is a dark room (Stephan 1942: 101).

Seventeen years later the place was still being frequented by many pilgrims according to al-Nabulsi, who goes on to note the 'place' of Gabriel and that of Jesus' disciples. He adds that, to the left of the 'cradle' as one looks towards the *qibla* (south), there was a 'pulpit' (al-Nabulsi 1111/1689: 73b).

Later references to the site are limited to the 13th/19th century when, with the gradual rise in Jerusalem's importance, particularly after the short Egyptian rule under Ibrahim Pasha (1247-55/1831-9) and the subsequent influx of European influence in the city, western visitors and scholars were given some, albeit limited, access to the Haram. As a result, many of the holy sites were examined and published in detail for the first time (for a full summary of the activities of western travellers in the city and the Haram, see Ben-Arieh 1984: 141ff.). Throughout the 19th century, Solomon's Stables were a high priority for these 'explorers' and yet, despite the fact that the stables could only be reached by way of the mosque, little attention appears to have been paid to it. Catherwood (Bartlett 1842: 158), Wilson (1865: 37) and Schick (1887: 87-9) are the notable exceptions but even they do not dwell on it at length.

Prior to the 19th century there is no documentary evidence of any kind that indicates the existence of Qubbat Mahd 'Isa. The earliest account of it comes in 1249/1833 by Catherwood, one of the first western travellers to be allowed into the Haram to document the sites within it. His description is brief but is evidence enough for the existence of the *qubba*:

At the southern end of the chapel are four columns supporting a small dome, under which is a sarcophagus, in the Roman style of workmanship, called ... 'the tomb of our Lord Isaa' or Jesus, an object of great veneration to them (Bartlett 1842: 158).⁸

Wilson simply (and rather unhelpfully) describes it as 'a sort of shrine' (1865: 37) while Schick copies Catherwood's description almost word for word (1887: 87-9).

Small domed structures (*qibab*) are known to have been built in the Haram at least since the beginning of the 10th century.⁹ The Ottomans continued the tradition by building a number of them on the upper esplanade of the Haram including Qubbat al-Nabi, Qubbat al-Khadr, Qubbat al-Arwah and Qubbat Yusuf (cat. nos. 10, 30, 38). The general form of the structures consisted of a dome supported on a series of columns with an intermediary zone of arcading; Qubbat al-Nabi and Qubbat al-Arwah are octagonal in plan while Qubbat al-Khadr is six-sided. Prior to the Ottoman period the standard form of such foundations appears to have been four-sided (see note 9). During the Ottoman period a number of four-sided structures were built. Qubbat Yusuf is supported on its south side by a solid wall and two columns to the north. A further—unnamed—example of a four-sided structure of the same genre is located in the south-west corner of the Crusader hall of the Coenaculum. Evliya Çelebi, writing at the end of the 11th/17th century, records another example evidently dismantled or destroyed at a later date, located on the site of the present day Qubbat al-Nabi. He describes it as 'a small dome ris(ing) over four slender columns' (Stephan 1942: 96).

While Qubbat Yusuf appears to have been built as a monument to the piety of its founder, others generally seem to function as the visual markers of small holy sites. Qubbat al-Nabi, for example, is located on the site traditionally regarded as the place at which the Prophet Muhammad prayed before ascending to heaven during his

⁸ The structure is clearly indicated on Catherwood's plan of the Haram al-Sharif of 1833 in the Palestine Exploration Fund Archives.

⁹ See Le Strange 1890: 153-5; al-Muqaddasi (trans.) Le Strange 1886: 42-3; Nasir-i Khusrau describes Qubbat Jibra'il (the Dome of Gabriel)—the present day Qubbat al-Nabi—as a 'dome that surmounts four marble columns' and Qubbat al-Rasul—the present day Qubbat al-Mi'raj—as being 'likewise set upon four marble piers' (Nasir-i Khusrau (trans.), Le Strange 1888: 49. For a discussion of the naming and re-naming of Qubbat al-Mi'raj and Qubbat al-Nabi, see van Berchem *CI4* II (Haram I) 1925: 37-49 and Suyuti in Le Strange 1890: 155-6.

Night Journey. The *qubba* located in the Coenaculum stands over the staircase leading down to the chambers of the Tomb of David (Nabi Da'ud, cat. no. 1) and Qubbat al-Khadr is sited over a chamber known as Maqam al-Khadr. The structures in the Haram would have also served the practical function of partially protecting pilgrims from the elements during their prayers.

Although restoration work on one of the structures, Qubbat al-Nabi, can be dated to 1261/1845 (van Berchem 1925: 173), the only *qubba* where the date of its foundation can be identified with any degree of certainty is Qubbat Yusuf (1092/1681).

Although no dates are known for the restoration to the Mosque of the Cradle of Jesus during the latter half of the 19th century, the painting of the *qubba* can be precisely dated, as already stated, to August 1898. The date is known from three inscriptions, written in Greek and Arabic, hidden away on the south side of the dome, painted in yellow by the artist and in white, perhaps by his dragoman or assistant. The inscriptions read:

1. 'August 1898, ... , ... , Callipolites' [in Greek]
2. 'Theofanis, Zographidis,
3. 'Faraj ibn Ibrahim, 1898, Faraj ibn Ibra ... [in Arabic].

The information contained in the first two inscriptions, as well as the fact that Theophanes was writing in a mixture of Greek and Latin script, suggests that in all likelihood he was a Christian. This might appear to be curious, for it is known that Christians were barred from entering the Haram during much of the 13th/19th century. However, as the following account suggests, contemporary political events in the city perhaps provide an answer as to why an exception was made.

The commission for the restorations was carried out at the moment when the rapidly declining Ottoman empire, ruled by Sultan Abdul Hamid II (1876-1909) was actively courting the political influence of Germany against what were perceived as the imperialist motives of Russia, France and Britain (Mansfield 1991: 83-4). The historic visit of the German Kaiser Wilhelm to Jerusalem in October 1898, following a previous visit by the Archduke of Mecklenburg in 1871 (Schick 1887: 87-9), was highly important to the Ottoman authorities and they went to extraordinary lengths during the autumn of that year to make the city presentable for the occasion. It is interesting to note that, among the works carried out, a number of buildings on the Haram were plastered and painted in oils, including the arcades on the upper esplanade and the façade of al-Aqsa Mosque, which, according to Schick, was 'painted fantastically ... and now looks yellow as if gilded and has a very strange appearance.' Unfortunately, Schick

is not more specific; however, he also notes, with a certain cynicism, that 'other buildings were done with better taste' (1899: 118).

A project such as this would have required skilled artisans perhaps not immediately available in the local workforce. It is known that there were Christians trained primarily in the painting of religious icons (perhaps in Europe) who were operating in the region during the latter half of the 19th century. They were being commissioned by wealthy people throughout the region to paint the ceilings of their new houses. The work is typified by the use of extravagant architectural elements and floral decoration, and was often accompanied by a keen sense of how these elements could be shown in three dimensions, with the use of painted shadows and/or perspective; all of these features are found in the decoration covering Qubbat Mahd 'Isa. Typical examples can be seen just outside the Old City of Jerusalem in the houses now known as the American Colony Hotel and the Orient House, and within the walls the Dar al-Mamluk in the old Consular quarter.¹⁰

All of the painted decoration applied to the buildings in the Haram was apparently removed some time after the German Kaiser's visit; however, contemporary photographs as well as the following description of the painting of the *qubba* show that there is little doubt that the work to the *qubba* and restorations to the chamber of the mosque were done specifically for that visit.¹¹ If this is indeed the case, it remains one of the only surviving examples in the Haram of work carried out for the occasion.

Architecture

Mosque

The mosque chamber is located in the south-eastern corner of the Haram al-Sharif adjoining the vast subterranean vaults known as Solomon's Stables. The mosque, which occupies a broadly rectangular area measuring 10.3m from north to south and 5.5m from east to west, is built on a platform constructed of large boulders raised approximately 3m above the ground level of Solomon's Stables to the north and west (fig. 34.1). It is enclosed to the south and east by the massive supporting walls of the Haram, and to the north and west by later walls

¹⁰ I am grateful to Mr Sharif al-Sharif of Nazareth, who is currently carrying out research into this subject, for providing me with this information.

¹¹ For a sense of what these paintings were like see van Berchem and Ory 1978: 72-3 for contemporary photographs of the painted arcades.

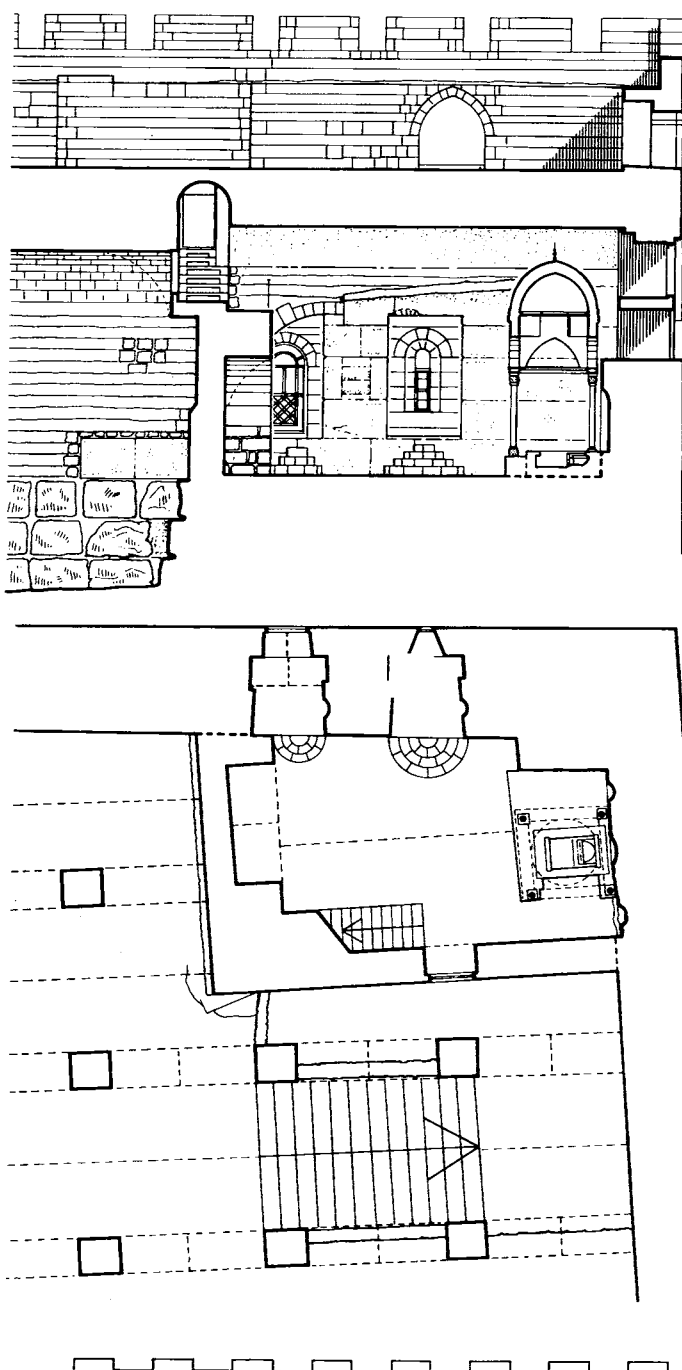

Fig. 34.1 Mahd 'Isa, mosque section and plan.

built along the edge of the platform.¹² The whole space is covered by a barrel vault with a slightly pointed profile.

Entry to the mosque chamber is from the lower

esplanade of the Haram (pl. 34.1). A low doorway is set in the north wall of a small lean-to structure located against the east wall of the Haram and a few metres to the north of the south-eastern corner. Inside, a dog-leg staircase descends to the south and turns, through a low-arched doorway, to the west and continues south down to a balcony supported on a recessed archway situated against the north wall of the chamber (pl. 34.5). A further twenty steps lead down the north and west walls, by way of a landing in the north-west corner of the chamber, to a point 4.9m north of the south wall. On the right at the bottom of the steps there is a doorway, 1.22m wide, which leads through to Solomon's Stables. While a large, plain, monolithic lintel covers the opening in the east (mosque) face of the wall, a massive sculpted lintel, perhaps of Byzantine origin, faces onto Solomon's Stables (Schick 1887: 87-9).

Two large, raised recesses dominate the east wall of the chamber. Each is reached by a flight of semicircular steps built against the east wall. While the south recess is covered by a flat ceiling of monolithic stones (see below), the front face of the north recess is covered by a half arch springing from the north side of the recess. Within each recess, and providing much of the lighting for the space, there is a single window overlooking the Kidron Valley to the east. The southern opening is narrow (0.37m wide) and set back into a secondary recess covered by a splayed arch constructed of specially shaped stones that widen to the inside face of the wall. The opening in the north recess is a larger, flat-faced, semicircular arched window.

Two further recessed windows are located, one above the other, in the south wall. The lower, smaller, one is all but blocked up; the opening above is rectangular. In the west wall above the landing on the stairs, a single small slit window looks out into Solomon's Stables.

Until very recently the walls of the mosque were covered by a thick layer of whitewashed plaster which prevented any real investigation of their construction. The recent removal of the plaster, during the 1980s, reveals that, for the most part, they are constructed of large smooth-faced ashlar blocks measuring between 0.7m and 2.45m long, and 0.9 to 1.23m high. A study of the external face of the south-eastern angle of the Haram shows that these are the inside faces of the 'Pinnacle' of seven courses of Herodian masonry probably left *in situ* after the destruction of the Herodian Temple in 70 AD (Wilson 1865: 26). The two recesses in the east wall appear to have been part of the original Herodian structure since the masonry between them, and to the south of the southern recess, is shaped to accommodate them (Schick 1887: 88).

The north and west walls, and the northern end of the east wall, are all constructed of dressed ashlar blocks averaging 0.34m deep. The west wall appears to have been remodelled at a later date, since there are two vertical slots

¹² Wilson suggests that these formed the base of a Herodian tower that once stood in the south-eastern corner of the Haram (1865: 37-8); Schick, on the other hand, thinks that it is of Constantinian origin (1887: 87-9). A tower is shown in this position in *Visits to the Holy Places of Egypt, Sinai, Palestine and Syria in 1384*, Frescobaldi, Gucci and Sigoli (trans.) Bellorini and Hoade 1948: 72, fig. 6. The reference is taken from Terra Sancta Vercelli, Martorelli 1865.

Fig. 34.2 Qubbat Mahd 'Isa: section, elevation and ground plan.

filled with roughly dressed masonry on either side of the door. The north wall abuts the east wall in front of the northern window niche, indicating that the opening was of an earlier date.

At its southern end, the east wall thickens 0.9m at a distance of 2.2m from the south-eastern corner of the chamber up to a height of 5m from ground level. The return is carved into at least one of the monumental ashlar, which reinforces the suggestion that they are all *in situ* and that they, and the thickening of the wall, formed the upper levels of the massive support built into the corner of the Herodian platform (Burgoyne 1992: 105). High up on the north face of the same return, a curved groove some 200mm wide and 30mm deep slopes up to the west.

A huge, apparently monolithic, arch springer extends 4.25m from the north end of the same return, along the top of the fourth course of ashlar stones over the south window recess. Its size and location suggest that it may once have been the springer of a vault which supported the Herodian temple platform above (Wilson 1865: 26; Schick 1887: 87-9).

The 'cradle', a large semicircular niche with a fluted, 'cockleshell' hood laid on its back on the ground, is positioned against the south wall (pl. 34.4).¹³ It has been cut from a single block of white marble and measures 1.75m long (high), 1.2m wide and 0.67m deep. Because its underside (back) is semicircular, it is supported to the east and north by a platform which has been paved with grey marble stones and raised 0.57m above ground level. The platform does not continue to the west of the 'cradle'; the floor on that side is covered with a concrete screed and not with the same tiling as the rest of the mosque, suggesting that the platform may once have continued around to the west side of the niche. Standing over the 'cradle' and positioned against the south wall of the mosque is the Qubbat al-Mahd 'Isa itself (pl. 34.2; fig. 34.2).

The mosque accommodates a total of five *mihrahs*—or six if one includes the 'cradle'. A large semicircular *mihrab* is located centrally in the south wall at the head of the 'cradle' and is flanked by two smaller ones to the east and west. Although the *mihrab* to the west end of the south wall is badly damaged, it can be seen that it is raised above the ground to the level of the platform on the

east side of the 'cradle', which reinforces the suggestion that the platform once extended further to the west. Another smaller niche is located in the south wall of each of the window recesses in the east wall.¹⁴

The windows in the east wall and the upper recess in the south wall are filled with 13th/19th-century wooden lattice frames. The design of the frame in the north window is particularly fine and incorporates a series of circular and cigar-shaped sub-frames around its perimeter (pl. 34.6). The main frames of the windows are fixed in position; ventilation to the chamber is, however, possible through two smaller, hinged frames set within that of the larger north window. While the frame in the south wall now has clear glass, those in the east wall are filled with a colourful variety of green, blue, red, orange and purple stained glass.

An exquisitely designed and crafted wrought-iron balustrade runs along the edge of the balcony and down the stairs (pl. 34.5). The design, which is typical of work found in many late 19th-century buildings in the city, incorporates a repeated scroll pattern within a main frame that terminates with a free-floating leaf- and-stem design at the bottom of the steps (fig. 34.3). Unusually, green glass beads (approximately 20mm in diameter) are incorporated into the ironwork; they are slipped over dowelling rods just below the handrail. Two wrought-iron gates, probably made at the same time as the balustrade, close off the mosque area from Solomon's Stables. Crescent and star-shaped plates on them attest to their Ottoman origin.¹⁵

Qubbat Mahd 'Isa

In contrast to other *qubba* structures situated on the exposed platforms of the Haram, where stone work has suffered the effects of time and weather, and where mouldings and other stone decoration articulate the surfaces, here the smooth surfaces and uncluttered detailing present an air of refined simplicity. This aspect, together with the location of the dome chamber inside another building, combine to give an impression of a large piece of furniture pushed against the wall rather than an architectural monument.

Structure

The form of the structure appears to have been governed by its location, surrounded as it is on three sides by the walls of the mosque chamber. In essence, the *qubba* consists

¹³ Various theories have been put forward about the origins of the niche and its function; Stephan considers that it is Byzantine (1942: 101) while Wilson suggests that it was taken from a Roman gateway (1865: 37). Clermont-Ganneau thinks that it probably originated from the time of Aelia Capitolina and perhaps housed a small deity statue (1926: 139). Ritter suggests that it came from the temple dedicated to Jupiter built by Hadrian in the Haram (1866: 112). Close inspection, however, reveals no visible signs of anything having been fixed to the base of the niche.

¹⁴ Wilson identifies these last two *mihrahs* as Maqam al-Hawariyyun ('Place of the Disciples') and Makam Yahya wa Zakariyya ('Place of John and Zachariah'; 1865: 37).

¹⁵ The crescents on the gates and on the finial of the *qubba* are no longer extant, but were still there when the Department of Islamic Archaeology surveyed the site in the late 1980s.

Fig. 34.3 Mahd 'Isa: baluster detail.

of four columns which are positioned at the four corners of the 'cradle' (pl. 34.2, and fig. 34.2), and which support a four-sided box, with a slightly pointed arch to each side. The dome surmounts the whole structure. The *qubba* measures 5.15m from base of column to apex of dome and is 2.2m square in plan. Although it is otherwise constructed of stone, there is a wooden tie beam spanning the space between the tops of the columns, which braces, and supports, the dome above. The reasons for the use of wood to carry the full load of the structure are not entirely clear. However, mindful of the effects of earthquakes on this part of the Haram, the builders may have decided that providing a 'soft' support would cushion it from the worst effects of such tremors.

Each of the column shafts is of grey marble, averaging 170mm in diameter. While the two eastern columns stand firmly on the dais platform to the east of the *qubba*, the western columns are positioned at the end of extensions to the dais running in front of and behind the 'cradle'. Of the eight capitals and bases, all of the capitals and the two northern bases are of a similar basket-weave design with deeply carved gaps between the warp and the weft (pl. 34.7). The design of these two bases suggests that all six of the capitals and bases are re-used from an earlier structure. Running around the bottom of the capitals and immediately above the bases there is a simple, incised cable moulding. Although these bases are now covered in a layer of paint, it is possible to make out that they were carved from blocks of the local limestone. The two remaining bases to the south are made from the same material and are today quite worn. It is possible to distinguish, however, a petal-and-leaf design carved around their circumference.

Above each of the capitals, there is a square box plinth, measuring 250mm by 250mm by 75mm, with recessed panels in each side, that serve as flat pads to support the structure above.

The wooden bracing beams that span the distance between the tops of the columns measure 300mm by 150mm in section. A detailed inspection of the exposed west end of the south beam reveals that a wooden carcass encloses a laminated beam composed of four planks of wood laid on top of each other.¹⁶ While the core planking has suffered from insect attack, the outer cladding is free from damage. Further examination shows that the cladding is cut to fit around the corbels of the stone structure above and the plinths of the columns below, suggesting that it was fitted after the building of the structure—perhaps for the restorations of 1898. A simple convex moulding, which has been shaped into the edge of the top plank, runs along the outside face of each beam, while on the inside edge there is a more complex *cyma reversa* moulding which projects 40mm from the face of the planking.

Above the tie beams, the sides and arches of the masonry structure are completely plain except for the painted decoration. Running around the top of the walls and projecting some 40mm from their face, there runs a steeply raked cornice. The construction is only apparent in the south wall. Given its proximity to the south wall of the mosque, Theophanes must have decided that it was neither practical nor useful to paint that side of the structure. It is fortunate that it remains unpainted, for it is possible to identify five courses of dressed masonry, with chisel marks running diagonally in both directions; there are ten voussoirs around the arch. The arches spring from corbels resting on the tie beams below. Closer inspection suggests that the two arches adjacent to each individual column are supported on a single right-angled corbel stone that projects in two directions along the line of the sides of the main structure. The upper part of the west end of the south wall and the cornice of the *qubba* have been broken to fit around a large stone that projects from the south wall of the mosque—although one does wonder why they did not simply remove the offending stone.

The dome springs from a base course (or very low drum) with a bevelled edge, 130mm high, which projects 30mm out from the surface of the dome (pl. 34.8). A similar arrangement can be seen on the drum of the early Mamluk Kubakiyya dated 688/1289 (Burgoyne 1987: 141). Perched rather precariously on top of the dome is a very loose-fitting wooden finial. It is not possible to deduce how the dome itself was constructed, for it is painted both inside and out.

¹⁶ How the four separate beams meet over the column capitals is not clear since it is only one side of the south-west corner of the structure that is exposed.

The transitional zone between the main structure and the dome above is handled internally in the form of stepped squinches of a rather unusual design (pl. 34.9). In the front face is an outer pointed arch which is stepped back into a trefoil arch with small triangular intrusions at the junction between the lower and upper arcs of radius. Within the trefoil arch there is a small shell-like conch with seven convex flutes radiating out from its base. Similar designs of squinches are found in the earlier Mamluk and Ayyubid foundations, as for example in the Ayyubid Bab al-Silsila and the Mamluk foundation of al-Kubakiyya (688/1289). This, however, is unique among the Ottoman buildings on the Haram.

The rest of the interior of the structure is plain except for a simple, raked string course at the springing line of the dome. At the apex of the dome there is a metal hoop from which a lamp would once have been suspended.

Decorative painting

The most striking aspect of Qubbat Mahd 'Isa is the decorative painting which covers the entire surface of the main structure except the south side which, as has already been noted, was probably too close to the south wall of the mosque for it to be worked on by Theophanes. Although the effects of time—and pigeons—have taken their toll, it can clearly be seen that, when newly painted, the *qubba* must have presented something of a spectacle, particularly in the context of the freshly whitewashed mosque and brightly lit with lamps. The stone facing of the structure would not have provided a suitable surface for the painting. Theophanes consequently first rendered the surfaces with a smooth layer of fine, white plaster 2-3mm thick.¹⁷ Without proper analysis, it is difficult to know what type of paint was used but an oil-based medium is suspected (see comments made by Schick 1899: 118). The colours used on the vertical sides of the structure, although still fresh, are muted shades of grey-green and yellow-green. Those used on the dome are, however, brighter blues, white, reds, oranges and yellows.¹⁸ A close examination of the exterior of the planking on the tie beams shows that it was first painted in a rust-red colour. It is not clear whether this was an undercoat or whether it represents an earlier colour scheme.

The three sides of the structure are all painted with the same design, which combines classical Baroque

architectural motifs and elegant designs typical of the period (pl. 34.10). There are two panels at the end of each side, placed one above the other, which continue the visual line of support of the columns up to the dome. The two panels are joined by a simple floriated spindle motif and are terminated at their top and bottom by a split figure-of-eight design. Similar motifs are also found on the underside of the wooden tie beams and on the soffits of the arches. The remaining space on the walls is taken up with framed spandrel 'panels' on either side of the arches, within which a secondary panel has been painted to imitate marble.

A particularly interesting feature of the decoration, which again is typical of the period, is the attempt to give it a three-dimensional effect in a simple form of *trompe l'oeil*. This can be seen most clearly in a 'corbel' set above the apex of each arch, which is painted to appear to the viewer at ground level as it projects forward in front of the main face of the structure (pl. 34.10). A free-ranging floral design that perhaps imitates stone sculpture is positioned immediately below the corbel and extends down to hang 'in front of' the hood mould surrounding the arch. Shadows are also painted around the mouldings which surround the spandrel panels and the panels at the end of the elevation. The three-dimensional theme is carried through to the cornice above, where a series of twenty-three red and orange tassels apparently 'hang' down from the raked surface of the moulding.

Simple geometry is introduced along the outside face of the tie beam in the form of what can only be described as a series of dots and horizontal and diagonal dashes, arranged in a repeated diamond-shaped pattern. Similar repetitions of these motifs are ranged along the front face of the cornice moulding above the painted tassels.

The painting on the drum and the dome is both brighter and more organic in design. It is best viewed from the window ledge in the south wall where the natural light is brightest. From this position it is possible to see that the dome is divided into a number of white and sky-blue segments.¹⁹ Superimposed over these, at the base of the dome, there are a series of overlapping 'arches' painted in pale yellow and peach. The spaces between the arches are filled with exquisitely painted flower- and leaf-designs that appear to be flanked by scrolls. Above each of the junctions between the arches 'floats' a single, unattached six-pointed star. The painted arches do not extend around the full circumference of the dome but terminate close to its south side, where they would not anyway be seen. This allowed

¹⁷ The plaster is for the most part in quite good condition.

However there are large areas, particularly on the under-sides of the arches and on the dome, which are in desperate need of specialist attention.

¹⁸ This seems to reflect Goodwin's notion that square forms are symbolic of 'earthliness' while domes are symbolic of the 'heavens' (1971: 178).

¹⁹ The dome is currently covered in a thick layer of cement that resulted from a recent 'restoration' of the vault over the mosque chamber and which makes an accurate assessment of the number of segments difficult. However, I think that there are probably sixteen.

enough space for the painter Theophanes and his assistant to add their signatures.

The decoration does not continue inside dome, where the surface is covered throughout in a rust-red tone.

Discussion

Apart from the building of the *qubba*, and its decoration in 1898, the recorded restorations to the fabric of the mosque seem to have occurred in the main in the latter half of the 19th century. Their prime concern seems to have been to allow access to Solomon's Stables and to light the interior of the mosque. Evliya Çelebi alludes to the doorway through to the Stables as a 'small hole' through which some people 'dared' to enter (Stephan 1942: 101). Al-Nabulsi states that the same opening was destroyed (1111/1689: 73b). However, by 1871, when the Archduke of Mecklenburg visited the site, the opening had been blocked up and the illustrious visitor specifically requested that it should be opened so that he could enter the Stables (Schick 1887: 88).

Al-'Ayyashi (1663) notes that the windows in the east wall were open to the (Kidron) valley (al-'Asali 1992: 201). But by 1865—and probably until 1870—they appear to have been blocked up again.²⁰ Schick (1891: 222), on an amended copy of the earlier Ordnance Survey plans published in 1891, notes the existence of a 'new window' at the north end of the east wall, and this probably refers to the arched window currently in use. Although the upper window in the south wall is clearly visible in drawings from 1865, Schick, again writing in 1887, states that it was 'modern'. He explained that it had been opened because the lower window (which had not, in any case, been providing any light to the chamber) was blocked up (1887: 87-9).

Further work to the mosque was done apparently in an effort to make the place presentable for pilgrims. Given that so much time must have been spent on the decoration of the *qubba*, it seems likely that the rest of the mosque would have been refurbished at the same time. The iron-work of the balustrades and gateway, as has already been noted, is typical of the middle to late 13th/19th century. However, it contains a number of flourishes such as the glass beads, crescents and stars that suggests that the work was done for a special occasion. It is likely that it was either for the visit by the Archduke of Mecklenburg in 1871 or, perhaps more likely, the German Kaiser seventeen years

later. As there are no photographic records of the place, without further evidence it is impossible to know when exactly these works were completed. This is equally true of the frames in the east windows.

The Qubba itself

The question remains as to when the *qubba* was built. It has already been noted that documentary evidence suggests that it was built between the visits of Evliya Çelebi and/or al-Nabulsi at the end of the 11th/17th century and that of Catherwood in 1249/1833. If al-Luqaimi's account is reliable, the period in which it was built can be narrowed down to the hundred years between 1144/1731 and 1249/1833. Al-Luqaimi, however, only mentions the *qubba* in passing and perhaps his word should not be taken as definitive.

Comparative studies of similar structures built during the Ottoman occupation of the city, which are almost all undated, do not offer much help in providing even a tentative foundation date for the Qubbat Mahd 'Isa, although they do provide information about the type of small domed edifice being built at the end of the 17th century and perhaps the beginning of the 18th century.

The architectural evidence provided by the structure itself is not conclusive. The column capitals all appear to have been re-used from earlier structures. Squinches, although used in a number of other Ottoman Islamic structures dating from the 10th/16th century, do not occur in buildings dating from the later centuries of the Ottoman occupation of the city. Indeed, in general, as has already been noted, the design of these particular squinches can only be compared to those of buildings dating from periods before the Ottomans, notable the Mamluk and Ayyubid periods.

The use of a heavy wooden tie beam to support the upper structure is perhaps the only piece of useful evidence, for it is unique. It was probably only possible because the structure is located inside another building away from the effects of the weather. It was probably for this reason too that a wooden finial was used. Where tie beams are used in other structures in the open-air environment of the Haram, they invariably consist of simple metal tie rods.

It is perhaps worth noting the intriguing similarity between Evliya Çelebi's late 11th/17th-century description of Qubbat al-Nabi as it existed before the present-day *qubba* was built and his comments on the Qubbat Mahd 'Isa. The parallels are increased by the shared similarities between the type of *mihrab* under Qubbat al-Nabi (built in 945/1538-9) and likely to have been in existence beneath the *qubba* described by Evliya Çelebi, and the 'cradle'. The *mihrab*, as described by Evliya Çelebi, consisted of a low wall which enclosed a conventional *mihrab*-shaped area on the ground, which was described by van Berchem as a

²⁰ Warren 1884: pl. 19, an elevation of the south-east angle from the east, shows that the edges of the two recesses in the east wall of the mosque, although they were completely blocked, were then visible on the outer face. Photographs from the same year confirm this (Schiller 1978: 20-1). Later photographs suggest that the recesses had still not been opened in the 1870s (Schiller 1978: 23).

'baignoir' (1925: 169—see cat. no. 10). Apart from a simple version of the same idea situated close to the north of the Aqsa Mosque, the *mihrab* is unique in the city.

It has already been noted that the four-sided form of the structure was not unique to *qubbas* of the period. In this particular case, the form was probably governed as much as anything else by the fact that the site was surrounded on three sides by the walls of the chamber. However, there may be another reason for its location and form. As has already been explained, the structure is curiously close to the south wall, so much so that the south side of the structure had to be broken out to fit around an already existing stone which projected from the wall of the mosque. This is very strange. One possible explanation may be that the builders of the *qubba* mistakenly positioned the bases of the columns too close to the wall, and only discovered their error after having begun to build the upper arches and walls. A second, and arguably more likely, explanation is that the positions of the bases of the columns were already in existence and that the builders simply re-used them in setting out the position of the new *qubba*. This would explain the necessity of breaking out the south wall of the structure and its subsequent form. Sufficient evidence exists to suggest that there may indeed have been an earlier structure in existence towards the middle of the 5th/11th century.

The documentary clues for such a hypothesis lie in Nasir-i Khusrau's description in which, to repeat, he states there was a 'roof ... supported by marble columns.' Since there is no evidence to suggest that the roof of the mosque was ever supported by anything other than the surrounding

solid masonry walls, there is every reason to believe that those to which he was referring supported another 'roof'—perhaps a dome—within the mosque. Later on in his description, Nasir-i Khusrau observed 'on the shaft of one of the columns there is impressed a mark as though a person had gripped the stone with two fingers.' The mark was evidence to him of the story that Mary had endured the labours of birth in this location (Le Strange 1890: 166). If Nasir-i Khusrau is to be believed, one could suggest from this evidence that the diameter of the column must have been quite small to have been 'gripped' and, although the idea is speculative, it could suggest that this provides evidence of a small structure supported on four columns of narrow diameter.

As has already been mentioned, *qubba* structures of the type built during the Ottoman period are known to have existed during the 5th/11th century; Nasir-i Khusrau again describes the Qubbat Jibra'il (the Dome of Gabriel), on the site of the present day Qubbat al-Nabi, as 'a dome that surmounts four marble columns,' and the Qubbat al-Rasul, located on the site of the present day Qubbat al-Mi'raj, as being 'likewise set upon four marble piers' (Le Strange 1888: 49).

Apart from these general comments, it is very difficult without further documentary evidence to suggest a definitive answer to the question of when this *qubba* was built. A more conclusive answer will only be possible once a complete search of the *sijills* in the Shari'a court records has been completed, for it is likely that the answer to the riddle will lie buried within those pages.

Chapter 35

AL-‘IMARA AL-‘AMIRA THE CHARITABLE FOUNDATION OF KHASSAKI SULTAN (959/1552)

David Myres

Introduction*

The Khassaki Sultan complex—al-‘Imara al-‘Amira—is the largest of the 10th/16th-century Ottoman foundations in the Old City of Jerusalem. An imperial undertaking, it was built around 959/1552 under the patronage of Khassaki Sultan-i Khurrem, the favourite wife of Sultan Sulaiman.

* Acknowledgements

The survey of the Khassaki Sultan complex and the primary research for this chapter were carried out over a period of six months from July 1993 to February 1994. During that time many people helped both me and those directly involved in the survey to gain access to the site and provided answers to numerous questions. Some I cannot name but their help is nonetheless gratefully acknowledged with the people who are named below. First, my thanks to Mr Adnan Husseini (Director of the Administration for Islamic Waqfs in Jerusalem, the Auqaf) who throughout my stay in Jerusalem supported and aided the project work; to Dr Yusuf Natsheh (Director of the Department of Islamic Archaeology, the DIA) for his advice, help and for sharing with us his own important discoveries; to Mr Khadr Salameh (Director of the Islamic Museum and al-Aqsa Library) for his support and friendship; to Mr ‘Issam Awwad (Chief Architect to the Committee for the Restoration of al-Aqsa Mosque); to the staff of the DIA—Mr Ahmad Tahir, Mr Kamal al-Munayyar, Mr Wa’il al-‘Inani, Mr Hussain Katibi, Mr ‘Umar Hijazi, Mr Taufiq al-Sharif and Mr Khalid Marur; to the management and staff of the Islamic Industrial Orphanage, who were always patient and generous with their time; to Dr Beatrice St Laurent who for nearly two years I valued as a mentor and friend; and, last but not least, to Mr Richard Harper (Director of the British School of Archaeology in Jerusalem).

A great debt of gratitude in particular is owed to Hamish Auld, Sofie Skoug, Euan Miller and Elizabeth Jackson, all then students of architecture, who in six weeks during July

The complex is located in the heart of the Old City on the eastern slope of al-Wad between the streets of ‘Aqabat al-Takkiyya and ‘Aqabat al-Saraya. The term *al-‘imara al-‘amira* is the correct one for the foundation and is found both in the *sijills* and in a 12th/18th-century repair inscription found in the upper courtyard of the Mamluk Dar al-Sitt Tunshuq. The expression literally means ‘the flourishing edifice’ or, more appropriately, ‘the Imperial Charitable Foundation’ (Burgoyne 1987: 487 and n. 13, 14). The word *‘imara*, as used in the context of the largest charitable complexes, was later replaced by the Turkish word *küllîye*, meaning the educational or charitable dependencies of a mosque. *‘Imara* thereafter usually only referred to the kitchens themselves (Goodwin 1973: 459). Today the complex is simply referred to as ‘al-Takiyya’. The etymology of this term, in the context of the complex, is not absolutely clear. The term, perhaps better known in its Turkish form *‘tekke*’, denotes a convent or monastery where Sufis would be accommodated, and would also study and worship (Stephan 1944: 172 and n. 5). It did not however normally apply at the time the foundation was being built—or in the early Ottoman period as a whole—to

and August 1993 surveyed and drew to a remarkable degree of accuracy what is possibly the most complex site in Palestine; to Dr Michael Burgoyne who aided and supported the team at the beginning of the survey; and to Mr Martin Dow for providing valuable information at the twelfth hour. Above all my very great gratitude goes to Professor Robert Hillenbrand and Dr Sylvia Auld for their support and patience in waiting for this chapter. This was a team effort—however, for his friendship and unstinting willingness to help (at almost any time) I reserve my final thanks for Abu Kifah.

an entire *küllîye* complex, either in Ottoman Turkey or in the provinces. Another complex, the Süleymaniyye, which was built in Damascus by Sinan at almost the same time (962-3/1554-5) is also usually referred to as 'al-Takiyye'. It too had facilities other than those devoted to the Sufi community, including a soup kitchen and caravanserai. To confuse matters further, in Cairo another almost contemporaneous foundation built in 950/1543, and exclusively intended for the Sufi community as a place in which to live, worship and study, is called Takiyya al-Sulaiman Pasha (Behrens-Abouseif 1989: 158). The confusion is compounded by the discovery that other foundations in Jerusalem, which were devoted exclusively to the use of the Sufi community—for example Zawiya al-Qadiriyya (cat. no. 35) and Zawiya al-Naqshbandiyya (cat. no. 33)—were, according to Natsheh, also referred to in documents as 'takiyya'.

Within the constraints of the surrounding urban environment the foundation is a rationally planned socio-religious complex of the Ottoman *küllîye* type. Its function was, and to a limited extent still is, to provide sustenance and shelter for the poor, the Muslim religious community, and pilgrims to the Holy City. The main components of the complex consist of a *khan*, a small mosque, a soup kitchen, a bakery, a water fountain, rooms for the Sufi community and associated storerooms. In addition there were the many splendid rooms and halls of the Mamluk palace Dar al-Sitt Tunshuq (790/1388) which were incorporated into the new complex at the time of its foundation. Today the site functions primarily as a school and as the Industrial Islamic Orphanage (Dar al-Aitam al-Islamiyya al-Sina'iyya) with its associated training workshops, a school, and a small house. In addition, after nearly four and a half centuries, the kitchen still provides the poor of the city with food.

The site was surveyed *in toto*, for the first time, during the summer of 1993 by the Ottoman Jerusalem Project, for the British School of Archaeology in Jerusalem, and in association with the Department of Islamic Archaeology (DIA) of the Administration of Islamic Waqfs in Jerusalem (The Auqaf). Additional work was done by the author during 1994. These new surveys complemented those already undertaken on the adjoining foundation of Dar al-Sitt Tunshuq, which had been completed for the Mamluk Jerusalem Project (Burgoyne 1987: 485-504). It should be noted that some corrections to peripheral areas in the earlier survey have been made—for example, the ground plan of the south gatehouse.

The main purpose of this account is to provide a detailed description of the organisation of the complex and to identify, on the basis of the survey, the principal architectural components included in its *waqfiyya*. Detailed accounts of Dar al-Sitt Tunshuq (c. 790/1388), which was incorporated into the complex at the time of the complex's

foundation, and Ribat/Maktab Bairam Jawish (947/1540) which was incorporated at a later date, have already been presented, either elsewhere in this book (cat. nos. 11 and 12) or in *Mamluk Jerusalem* by Michael Burgoyne which was published in 1987. The following account will therefore limit itself to providing an account of the 10th/16th-century complex.

Founder

The foundation was established by—and is still today named after—the favourite wife of Sultan Sulaiman (902-74/1495-1566), Khassaki Khurram al-Sultan (Turkish—Hasaki Hürrem-i Sultan) or, as she is more commonly referred to in the West, Roxelana. The name *khurram* has several meanings—'joyous', 'cheerful', 'blossoming', 'happy' and 'the fortunate one' (Stephan 1944: 171). The sultan's admiration for her is stated in no uncertain terms in an imperial document dated 967/1560: 'the quintessence of the queens amongst women, the Zobeida of her time and age . . . who is unique and to whom there is no second queen in prosperity and good luck . . . the light of the eye of the resplendent caliphate . . .' (Stephan 1944: 171 n. 2). Roxelana was born in 938/1500 and died in 996/1558 (Alderson in Goodwin 1973: 204 n. 40; Faruqi 1994: 203 n. 85). It is generally accepted that she was from the area covered by the term 'Russia'. There is, however, no clear consensus as to her country of origin other than she was probably of Slavic or Ukrainian extraction. Stephan implies that the name meant 'Red Haired Russian' but he goes on to suggest that the name Roxelana actually derives from 'Roxolani', the name given to a people inhabiting the country between the Don and the Dnieper (Stephan 1944: 171-2). Other sources refer to her as a 'blonde' who was kidnapped by Tartars in Rinjartino and sold in the markets of Istanbul to agents of the sultan (al-'Asali 1981: 14; see also Lybyer 1966: 57 n. 3). She was, in any case, noticed and brought to Istanbul where she was enslaved into Sulaiman's imperial harem. She rapidly became the sultan's favourite and subsequently gave Sulaiman five of his ten children—four sons and a daughter. Sulaiman is said to have been faithful to Roxelana after he made her his wife (Lybyer 1966: 56). According to Stephan (1944: 172) the four sons were Mehmet, Jahangir the Crooked, Selim II and Bayazid. The daughter was the princess Mihrimah. After giving birth to the future Selim II, Roxelana was declared free and was married to Sulaiman in 927/1520, and thus, according to Lybyer (1966: 58) became the last woman to be formally married to an Ottoman sultan. Published accounts give the impression of a remarkable, ambitious and, some might say, ruthless character who used her position and influence to further her own power and that of her offspring. It is widely accepted that she

actively sought the succession of her sons ahead of Sulaiman's other children; Mustafa, for example, was executed in 949/1543 after she had 'poisoned the mind' of Sulaiman (Stephan 1944: 171; Cook 1976: 96-7).

With the permission of her husband, her position enabled her to be patron and benefactress of a number of important imperial foundations (Peri 1984: 47). Indeed, she was a prodigious sponsor of charitable foundations, particularly in Istanbul; amongst others she built mosques (Jami' Hasseki Hürrem) in Istanbul and Adrianople, two *madrasas* (known as Hasseki Hürrem and Qahriyye), a hospital (Tab-hane Hasseki Hürrem) and two public baths (Hammam Hasseki Hürrem in 1556; for details of Roxelana's foundations see Goodwin 1971: 204; Stephan 1944: 172). While the building of such foundations was certainly a demonstration of power and influence, it also appears to reflect a side to her character which showed a genuine concern for the welfare and well-being of the lower, or socially disadvantaged, sections of the populace; the Hasseki Hürrem Külliye (1539)—at least in part designed by the great Ottoman architect Sinan—included kitchens for the distribution of food to the poor, a health clinic endowed for sick women who were, according to Goodwin, of 'any colour or creed', and a medical school (Goodwin 1971: 204). The devotion felt by Sulaiman for his wife is made clear in his endowment of foundations in her name after her death. These included the two soup kitchens ('Imarat Khassaki Khurram) founded in Medina and Mecca (Farouqi 1994: 80). The 'imara in Mecca was subsequently destroyed and nothing is known about it other than it was close to the Ka'ba (Farouqi 1994:106).

Architectural Context

Large foundations which incorporated a number of different functional components had been built in Jerusalem during the Mamluk period. One notable example is the Tashtamuriyya of 784/1382-3 located on 'Aqabat al-Silsila (Burgoyne 1987: 460). This followed the long-established Islamic tradition of grouping mosques and *madrasas* together (Vogt-Göknıl 1966: 47). However, the complex founded by Khassaki Sultan in Jerusalem must be seen within the wider context of the Ottoman architectural tradition. Large ensembles of buildings, or charitable foundations ('imara—or, in Turkish, *külliye*), were being founded from the end of the 8th/14th century not only by sultans, but also by other patrons of power and wealth close to the centre of the Ottoman empire. Perhaps the earliest example of a *külliye* was built by Bayezit II in Bursa (801-6/1398-1403) and the genre reached its zenith with the building of the Süleymaniyye complex in Istanbul (1550-7) by Sultan Sulaiman. (For an informative explanation of the *waqfiyya* [*vakfiye* in Turkish] and the

'imara system, see Goodwin 1971: 455-7; see also Stephan 1944: 173-4).

As in earlier Islamic foundations, the 'imara complexes invariably centred on a mosque with associated *madrasas* (in Turkish, *medrese*) where, among other rites, religious observants and/or students of Islamic law would read suitable verses (*sura*) from the Qur'an in the name of their benefactor. The *vaqfiye* of Kara Ahmet Pasha, for example, included a *zawiya* of sixteen cells; the document stipulated that each cell was to have a man praying for the soul of the pasha (Goodwin 1971: 457 and n. 15). There was often a *maktab* (in Turkish, *mekteb*) in which children learned the Qur'an by heart. They were also seen as fitting memorials to the power and social standing of those who built them, and as a consequence usually incorporated the mausolea or tombs of their founders. The most famous examples are the two mausolea in the Süleymaniyye complex, which house the tombs of Sulaiman and his wife Roxelana.

The innovation, however, that firmly sets these complexes within the Ottoman architectural tradition was the change in function. Originally they were built solely for the benefit of religious communities, but under the Ottomans they were also founded for the benefit of the civil population of an urban centre. Travellers (often pilgrims) were permitted to stay in the complexes for three nights free of charge and were provided with food and accommodation. The complexes frequently incorporated a guesthouse (in Turkish, *tabhane*), kitchens ('imara), caravanserai (or *khan*) and stables (*istablat*). The poor of the city were catered for from the kitchens which gave out free meals, while their health and welfare needs were also met with the inclusion of asylums (in Turkish, *timarhane*) and hospitals (in Turkish, *darüssifa*), as in the Hasseki Hürrem Külliye. The endowment documents were invariably very detailed in their provision of these facilities, listing the staff to be employed, their duties and their salaries, even to the extent of giving detailed lists of the exact weights and ingredients for the food, as well as the different meals to be served by the cooks (Goodwin 1971: 456). In the *waqfiyya* for the Khassaki Sultan, for example, it is recorded that '... On the nights preceding Fridays, a *zerde* rice dish should be cooked and on all other nights a rice soup for the (following) morning should be cooked with ... butter and for the evening (meals) a *burghul* soup . . .' and so on (Stephan 1944: 191).

During the first half of the 10th/16th century, Ottoman imperial charitable works of this kind were widespread, particularly in the main provincial capitals of the Levant. In Damascus, at about the same time that the Jerusalem complex was being erected, Sulaiman in 962/1554 built a mosque, a *tekkiye* and a law school, and also provided food for the poor and the Sufis (Bakhit 1982: 116; Blair and Bloom 1994: 220). Later, he also founded

similar complexes in Mecca and Medina in the name of Khassaki Sultan. Lala Mustafa Pasha, the powerful governor of Damascus (971-5/1563-7), built an *'imara* in Qunaitra which included a caravanserai, a school and lodges for the poor and travellers. In addition the ensemble provided stables, a bath and a kitchen (Bakhit 1982: 117 and n.158).

Cohen has argued (1984: 8) that in Jerusalem the political and economic context in the mid-10th/16th century enabled the Ottoman authorities to demonstrate similar social consciousness for the benefit of the lower strata of civic society. It can be seen as a time of great revitalisation and confidence after the neglect of the latter years of the Mamluk period, and before the general decline of the city (and the empire) during the next two centuries (Peri 1984: 49). Such a positive underlying confidence was the result, in large part, of the imperial benevolence of Sulaiman who had ordered the 'rebuilding' of the Holy City after its conquest in 1517 (Evliya Çelebi in Stephan 1939: 86). The security of the city was restored as a result of the work undertaken on the city walls (944-7/1537-40) (van Berchem 1923 2: 431-43) and the repair of the aqueducts (from 938/1532) that led from Solomon's Pools, which had ensured a regular water supply to a city notoriously lacking in its own natural resources (van Berchem 1923 2: 412-30). These works had an immediate effect on what had become a declining economy and population. There was a large increase in building activity throughout the city and commercial confidence was, for example, reflected in the restoration of various markets within the city (Cohen 1989: 2,6-8). Such a vibrant social and economic context allowed the government to provide facilities not just for the benefit of the general population but also for the poor.

Even if the Ottoman central government in Istanbul, by building such foundations, aimed to show their subject peoples that they did care for their bodily and spiritual welfare—particularly in the outer reaches of the empire—such foundations cannot be seen simply as marks of charity. The 8th/14th-century historian Ibn Khaldun wrote that 'the monuments of a given dynasty are proportionate to its original power' (Necipoğlu 1993: 170). It can be argued that the foundations were important as symbols of wealth and, more pertinently, as a means of demonstrating and consolidating the power of central governments and thus sovereignty over subject peoples (Peri 1984: 47). The size of such multi-purpose complexes and the funds required for the building of them, as well as the additional necessity for large tracts of land, villages and even towns made *waqf* in foundation deeds to provide for their upkeep, were of such a scale that, almost invariably, they were imperial undertakings sponsored either by the sultans themselves or by their mothers or wives, or by grand viziers. Thus when a complex of the size of the

Süleymaniyye in Istanbul, or those of Bayazid I/II in Bursa and Edirne, or in the smaller outlying provincial capitals, were built, they were potent and tangible reminders to the local populations of not just the generosity of the central ruling authority (at least in the eyes of Islam) but also of their power and rank. The building of such a large and important foundation in Jerusalem, which was far removed from the centre of power, was a clear demonstration of that potent combination of altruism and power.

As a consequence, often some relatively small provincial towns and cities with a symbolic or strategic importance—like Jerusalem—benefited from imperial sponsorship on a scale that was disproportionate to their size or that of the local population. Some scholars have concluded that the donor's prestige and ambition manifested in these foundations outweighed the more practical implications of servicing them (Farouqi 1994: 94). This seems to be confirmed, in the case of Roxelana's beneficence in Jerusalem, by documents which indicate that soon after the complex was built the local administration realised that the *'imara* was consuming half of the city's entire water-supply. To correct this dire (and one assumes, embarrassing) situation, a further section of the existing water conduit from Solomon's Pools was restored, again with the sponsorship of Roxelana: 'As half of the said water is now taken for the imperial *'imaret* built at Jerusalem. It does not suffice. It has (therefore) been ordered to join the water (from a place) named Wadi Abyar to the water (of the aqueduct) mentioned above, and 2,000 *floris* have been given to cover its expenses,' document 94 dated 2 Receb 959/24 June 1552, order to the Beglerbeg and the Qadi of Damascus (Heyd 1960: 146-7 and n.8).

Historical Documentary Sources

The Waqfiyya

As far as the *foundation* of Roxelana's complex is concerned, there is a lamentable lack of any original building inscriptions—neither of the two foundation inscriptions that were (probably) located in the niches above the two gatehouses into the complex have survived. Van Berchem too makes no mention of any from the Ottoman complex. All other inscriptions now found within the complex, that relate to building activities, date from later centuries (see below).

For an understanding of the original extent of the Ottoman foundation we are therefore left to rely on primary written sources, specifically the foundation document or *waqfiyya*. Three copies of the document survive. Two are to be found in Jerusalem; the first, written in Turkish and in all probability a draft copy, is dated 30 Jumada I 959/24 May 1552. The final endowment deed is

dated 15 Sha‘ban 964/13 June 1557, but this has a further imperial *firman* attached to it dated 29 Shawwal 967/23 July 1560 in which Sulaiman endowed a further four villages and farms in the neighbourhood of Sidon (Stephan 1944: 171ff). Peri also notes that there is a further copy of the draft which is dated 20 Sha‘ban 1203/15 May 1789 (Peri 1984: 48, n. 3).

In the published accounts it has generally been claimed that the foundation of the complex itself dates to 959/1552. It can, however, be assumed with a fair degree of certainty that the project was not completed until some time later. The fact that the final endowment document is dated to 964/1557 (with the later addition dated 967/1560) suggests that the completion of the complex may have been closer to that date. Al-‘Asali, referring to the *sijill* records, has by his own research confirmed this suggestion by stating that ‘the pilgrim hostel’ was completed shortly before the document was drafted in 959/1552 but did not begin to be used until 964/1557 (al-‘Asali 1983: 125-44). Further evidence is found by examining the census documents relating to Jerusalem from the middle of the 10th/16th century which have been published by Cohen. The census of ‘Aqabat al-Sitt (today called ‘Aqabat al-Takiyya) for 945/1538 records that thirty-four households and one bachelor lived in the area; fifteen years later, in 961/1553-4, there were thirty-nine households, four *imams*, two attendants and a doorkeeper (*bawwab*). However, it is not until the census of 970/1562-3, a decade after the foundation date, that one finds real evidence for the operation of the complex. The census then records that there were now fifty households, which included one *shaikh ‘imara*, one *na‘ib ‘imara*, one *bawwab ‘imara* and one *katib ‘imara* (Cohen 1984: 83-9).

For the purposes of this investigation, it is worth quoting fully the sections of the document which refer to the provisions of the *waqfiyya*:

The aforementioned illustrious Mandator (Roxelana) has built in ... Jerusalem ... a well-founded edifice with strongly built pillars, a lofty vaulted mosque, and a high praying place with firm domes ... Seeking the pleasure of Allah she has gratuitously built and embellished (a building) with fifty-five doors (opening) to high domed rooms and pleasant dwelling places of firm structure and strong construction. She has set them aside for the use of those devotees who dwell in the holy precincts and for those pious (ones of the) faithful who follow the orthodox practice of traditional law ... Near this noble mosque, connected with the said rooms, she has caused a public building of good structure to be erected, an enclosure and several roof(ed

building)s, of high construction with a spacious courtyard ... and beside it an exquisite model of a (public) kitchen, a bakery, a cellar, a woodshed, privies, a room for provisions (or refectory), and a storeroom ... she set them aside (for the use of) the poor and the needy (dervishes) and the weak and the distressed ... In the vicinity she has also caused a clean and fine caravanserai to be built as well as a spacious hall and stable for the use of travellers and those who alight and arrive ... (from a journey) for the wayfarers and in general for those who travel and journey (Stephan 1944: 183).

It was not possible at the time of writing to obtain a translation of the document in Istanbul and this account therefore relies on the translation by Stephan. According to both Stephan and al-‘Asali some details of the documents vary between the Turkish and Arabic versions.

As will be evident from the following description of the complex as it stands today, the *khan*, mosque, public kitchen, bakery and courtyard can be identified with reasonable certainty. In addition, other listed rooms (storerooms), although not typologically identifiable from an architectural perspective, can be associated with a number of chambers located around the bakery and the kitchen, evidence for which can be gleaned from the detailed inventory of staff and their wages included in the document. There are provisions for a keeper of the storeroom and for the ‘pantry’, two master cooks and bakers (both with apprentices), two dish-washers, transporters of water and flour to the kitchen and mill respectively, doorkeepers for the kitchen and refectory, three millers, a master repairer and an innkeeper (Stephan 1944: 190-2).

The reference to ‘a spacious hall and stable’ appears to be a direct reference to the huge ‘main hall’ located at ground level in the Dar al-Sitt Tunshuq. As already mentioned above, the Mamluk palace was incorporated into the foundation at the time of the building of the complex.

Listed in the document are stores and ‘a larder’, ‘a pantry’, ‘a refectory’ and ‘mill’. According to Stephan’s translation there were also ‘three windmills’ (1944: 190). Whether or not the mill included three wind-driven mills is not made clear. However, Nabulsi—writing towards the end of the 11th/17th century—describes quite clearly a mill operated by a horse (or camel). Nabulsi actually stayed in the complex. With regard to the operation of the mill he describes it as being worked by a horse to which a man was tied—presumably this was a reference to the operation of a millstone and the grinding of wheat grain by a horse which was guided by a miller (Nabulsi 1699 from copy made in

1150/1737, 98B-99A; al-'Asali 1981: 86).¹ Today there is no evidence of a mill anywhere in the complex, but Nabulsi's description suggests that it may have been located in the 'south courtyard'—perhaps on the site now occupied by the 13th/19th-century Ottoman courthouse (*al-da'irat al-'adliyya*).

Two major questions arise from the inventory in connection with the 'high praying place with firm domes' and the 'fifty-five doors'. Until the present survey, the 'high praying place' remained unidentified. However, the following description suggests that it was probably located on the upper level of the south gatehouse, and that it is today hidden among later additions and adaptations (see below: South Gatehouse—upper floor). The second question, the matter of the fifty-five rooms, could be interpreted as being a general statement referring to all the buildings and structures. Alternatively it could refer to the amount of space to be allocated for the accommodation of Sufis (the cells are after all referred to as 'dwelling places'). As will be shown, the south side of the complex—the area around the south courtyard—appears to have been the hub of the Sufi community, for it was here that the main communal hall and a substantial mausoleum, perhaps of the founding *shaikh*, were located. The organisation of the hall and mausoleum and the *khan*, finds parallels—perhaps coincidentally—with the 8th/14th-century Mamluk Khan al-Askar in Tripoli where, as here, a large Sufi community was accommodated (Salam-Liebich 1983: 181-6). In Tripoli there are a large number of cells grouped around a courtyard and it is perhaps not going too far to suggest that around the south courtyard of the Khassaki Sultan, on the site of the existing 13th/19th century courthouse (*al-da'irat al-'adliyya*), a number of cells were originally sited, though whether there were fifty-five or not is open to question. This is perhaps in part confirmed by the curious layout of a small house in the south-east corner of the courtyard, which has a series of rooms arranged along a corridor. Although the house is today entered from the street to the south, there is some evidence to suggest that there was a door leading from the north room into the courtyard. In addition, a medium-sized hall space at the north end of the house, with a raised area at one end, could perhaps legitimately be seen as a reception room, although it could also have been a place for study or meditation. A detailed description of the house would provide little further evidence to support the hypothesis that this may have been an element of the 10th/16th-century foundation. However, it is perhaps worth bearing in mind.

¹ My thanks to Mr Khadr Salameh and Mr Khalid Murar for kindly translating the relevant sections of these references.

Later Accounts of the Complex

Little seems to be known of the history of the complex until the middle of the 18th century, and even then the evidence is sketchy. An inscription in the south wall of the upper courtyard of Dar al-Sitt Tunshuq dated 1167/1753 records repairs to *al-'imara al-'amira*, which of course included the Mamluk palace. A number of structures in the palace, particularly around the courtyard, are thought to be from this period. It appears, however, that the plaque has been re-used, or at least re-positioned, making the attribution of it to the building difficult (Burgoyne 1987: 487, 504 n. 19).

For the next century no adaptations or major repairs to the complex appear to have been carried out. A brief overview of the historical context at the time goes some way to explaining the reason for this. According to travellers visiting Jerusalem during the latter half of the 12th/18th century, the city was in a poor condition, uncared for and, in areas, in a ruinous state; François Chasseboeuf, later the Comte de Volney, writing in 1784, described its 'destroyed walls, debris-filled moat ... its ... circuit choked with ruins' (Peters 1993: 203). The condition of the city was symptomatic of the general decline of the empire as a whole. A characteristic of that decline was the conspicuous corruption of the Ottoman administration in the region, and particularly in Jerusalem; important *waqf* foundations, which under Islamic law are inviolate from any interference by the state, began to be administered by Ottoman officials—including the governors—which allowed them to control the *waqf* revenues. The Khassaki Sultan *waqf* was the largest endowment in the region and thus an obvious prey for a corrupt administration (Peri 1984: 47; see al-'Asali 1989: 202 and n. 14, 15, 16). Further insight into the political context during the latter half of the 12th/18th century is given in Cohen (1973: 1-29 and 169-72) and Peters (1993: 217-18).

Maladministration and corruption were part and parcel of an unstable and changing political context. Bitter power struggles were taking place, notably between the governors of Palestine and those in Egypt, in which the control of the lands around Gaza and Ramla were crucial. At the same time (1789) Napoleon was invading Egypt and making his way up the eastern Mediterranean via Gaza. The significance of these events, in the context of the present discussion, lies in the fact that the territory around Gaza and Ramla contained a significant proportion of the land and towns endowed to the Khassaki Sultan complex (Peri 1984: 54-5). The properties endowed for the complex which were located in this region were not included in the draft document of the *waqfiyya* but were added to the later Arabic version (for a full list see Stephan 1944: 184, n. 1; see also Peters 1993: 217; Heyd 1960: 143-4). Peri's study of the subject suggests that the revenues from the lands and

urban areas endowed for the foundation (taxes, tithes and other dues), revenues that should have been used for the maintenance and upkeep of the complex, were in fact increasingly siphoned off by successive Ottoman governors for the enhancement of their own power and influence. The greatly reduced revenues available to the administrators of the complex during much of the century could well explain the lack of any building activity during this period.

During the early 12th/19th century similar historical events, within the context of an already troubled city, continued to prevent the revenues from the endowed lands reaching the complex (see al-‘Asali 1989: 222-4). After the Egyptian occupation of Jerusalem under Ibrahim Pasha and Muhammad ‘Ali, in 1830-1, all the revenues from the *waqf* were confiscated. When the Ottomans repossessed the city in 1839, however, the revenues did not revert back to the foundation. After 1839, according to Stephan, the Ottoman administration and government of Palestine had to subsidise the resultant shortfall in revenue (Stephan 1944: 175). A review of Egyptian rule in the city during this period is given by Ben-Arieh (1984: 107-11). Despite the lack of funds, a number of alterations may have in fact taken place. Turner, writing in 1815, states that ‘the Turks divided the structure into several rooms; some served as stables, others contained ovens. They built a mosque and bath-house over it’ (in Ben-Arieh 1984: 161).

By the middle of the 13th/19th century, the foundation seems to have been in a serious state of neglect. Williams writing in the mid-1840s states that the foundation was ‘a conglomeration of ruined buildings’ and Schultz in 1851 notes that it was in a state of ‘neglect ... and that everything was covered in dirt, rocks and ashes’ (Ben-Arieh 1984: 161). Bartlett, writing in 1867, provides a view of the complex immediately prior to its last major restoration a decade later, stating that the place had ‘fallen greatly into decay in almost every respect; the magnificent edifice is crumbling in heaps and the vaulted chambers are mostly tenanted by horses of the irregular cavalry service’ (1867: 88).

Around 1288/1872, Nasif Pasha decided to move the official residence of the Ottoman governor from its location close to the Mamluk monument of al-Jawiliyya (dating to 715-20/1315-20 and now the ‘Umariyya School in the north-west corner of the Haram al-Sharif) to the complex (Burgoyne 1987: 201-10). Further details about this seat of the Turkish governor during the 13th/19th century have been published by Ben-Arieh (1984: 158-60). The Khassaki Sultan complex was subsequently to become the centre of Turkish district rule with the incorporation of a courthouse (*al-da‘irat al-‘adliyya*) (Ben-Arieh 1984: 160). The ‘ruined Queen Helena building’ (the old Dar al-Sitt Tunshuq) was also renovated to become the governor’s residence. The reference to ‘Queen Helena’, the mother of the Byzantine emperor Constantine, is an allusion to the

tradition that she had a pilgrim hospice built on the site. Further details of this identification are outlined below. On the south side of the complex, amongst other repairs, at least three new buildings were constructed for use as the municipal civil courthouse and administrative offices (Ben-Arieh 1984: 161-2). They are easily distinguished from the neighbouring buildings by the strong influence of the ordered European classical tradition which had, by the late 13th/19th century, percolated into most secular Ottoman architecture in the city. Inscriptions found in the south gatehouse record that building work was carried out in 1286/1869-70. It is not however clear whether the new structures were built at the same time as the renovations to the gatehouse. Either way, Nasif Pasha must have given the orders two or three years prior to 1288/1872. There is a second inscription located in the gatehouse which records work carried out in 1342/1923. The extent of the work is unknown and is in any case outside the scope of this chapter.

Despite these changes, the soup kitchen appears to have functioned as it was originally intended right into the 13th/19th century. Bartlett writing in 1867 states that ‘food ... is still distributed there daily to the poor. A gruel made of flour, wheat, oil and salt was distributed twice a day from huge cauldrons in the kitchen to the employees of the Haram al-Sharif, the Tartar and Indian houses for Muslim pilgrims, besides any poor who may ask for it’ (1867: 88). The copper cauldrons clearly became something of a curiosity which ‘strangers ... would go to see ...’ Turner (1815) talks of the cauldrons that ‘may be seen’; Schultz (1851) notes that there were five cauldrons ‘some of which were still usable’, while Reicher (1867), who visited the place several times, notes that there were only three (Ben-Arieh 1984: 160). Today only two of these splendid cauldrons remain, unused, in the kitchen. Two others, however, have been rescued and can be seen in the Aqsa Islamic Museum in the Haram al-Sharif. The place and origins of their manufacture are unknown; however Mr George Hintlian says that a considerable portion of copperware was brought to the city from the main copper-producing manufacturers in Erzerum, Van and, specifically, Tokat, particularly during the 11th/17th century.²

Who built the Complex?

To date the identity of the architect responsible for the foundation remains a mystery. There is nothing in the

² I am grateful to Mr George Hintlian for drawing my attention to other copper cauldrons on display in the Armenian Museum, some of which bear close resemblance to those in the Khassaki Sultan complex. Further information concerning the origins of the copper coming to Jerusalem during this period can also be found in the museum.

published documentation to suggest who he might have been and the absence of any contemporary foundation inscription on the buildings themselves does not make the undertaking any easier. Nonetheless the foundation, under the patronage of the favourite wife of the sultan, was an imperial enterprise and as such was undertaken within the highly centralised organisation of the Empire. It would have been the responsibility of the office of the imperial chief architect (*ser mi'maran-i hassa*) at the court in Istanbul and the organisation of the imperial architects (*cema'at-i mi'maran-i hassa*) (Bates 1985: 122). The planning of imperial projects in the provinces of the empire would also have come under the control of the office and its chief architect (*bash mi'mar*), who was, for much of the 10th/16th, the greatest of the Ottoman architects—Sinan (897-8/1491-2-997/1588) (Bates 1985: 124).

It has been suggested that Sinan drew or supervised the plans of every important building not only in Istanbul itself but all over the empire (Goodwin 1971: 108). It is known that, amongst the many projects with which he was directly involved, there were a total of seventeen kitchens (*'imara*) (Kuban 1982: 64). However, despite the fact that the Jerusalem complex is listed in the catalogue of works attributed to him, there is no evidence to suggest that he was ever directly involved with its construction.³ Cerasi points out that such was the prestige of Sinan that all projects throughout the Ottoman empire have been directly attributed to him, but he could not have been in all the places that these projects were being undertaken (Cerasi 1988: 87-8). Jerusalem was (and remains) the third holiest city in Islam and, therefore, of prime symbolic and religious importance to the sultan. It was however a small provincial city in the outreaches of the empire, an administrative centre in the province (*sanjak*) of the *eyalat* of Damascus (Peters 1994: 207). Thus any major works that were to receive the direct attention and 'mark of Sinan' (Kuban 1982: 64) were more likely to be found in the larger, more prominent cities where the status and rank of the architect, and by inference of the patronage of the sultan—or of his wife—were of more than token importance. Be that as it may, Evliya Çelebi, writing a century later, says that Sinan was sent by Sulaiman 'together with the required material' to 'embellish the Rock of Allah and rebuild Jerusalem'. Evliya Çelebi also claims that, on his way to Mecca, Sinan stopped in Jerusalem to organise the architects and artisans for the restorations to the Dome of the Rock (quoted Stephan 1939: 86; Peters 1993: 204). Evliya Çelebi was in Jerusalem on two separate occasions in 1059/1649 and 1071/1660-1 (see Evliya

Çelebi in *QDAP* 1942 ix: 81-104; Peters 1985: 479). The date of his reported visit to the city is not known. In any case Sinan would have been hard pressed to have had time to supervise the building of the complex. Between 957/1550 and 965/1558 he was at the height of his career and directly engaged in a large number of projects spread over the area of modern-day Turkey and the eastern Mediterranean, the most important of which was the Süleymaniyye complex (957-64/1550-7) which occupied much of his time (Necipoğlu 1985: 94-5 n. 4).

The architectural evidence also suggests that even if Sinan was ultimately responsible for the complex, the job must have been passed over to a lesser architect who was familiar with the region. Husrev Pasha, for example, in 1545-6, commissioned Sinan to build a mosque and *madrassa* in Aleppo but it was probably built by one of his students. The chief architect is known to have kept registers of provincial architects and craftsmen (Bates 1985: 122-3, 125). Cerasi notes the later (11th/17th century) existence of 'town architects'; these were men professionally midway between the imperial architect and the master mason, and their responsibility was to oversee imperial building sites in provincial towns. Prior to that time, according to Evliya Çelebi, local architects and master builders had rarely taken part in important projects (Cerasi 1988: 88, n. 9, 10). As with much early Ottoman architecture in the city, the buildings in the Khassaki Sultan complex display nothing of the virtuosity of the Ottoman monuments found closer to the centre of power. Rather, in direct contrast to the elegance and lightness of the 'imperial style' adopted by the central imperial office during the period, the buildings in the complex are generally of a solid, functional type in keeping with the local and regional tradition, confirming perhaps Cerasi's statement (1988: 89) that local/regional techniques in the building trades were incorporated into the wider Ottoman 'urban culture'. That it was a provincial architect who undertook the work is perhaps best intimated by a slightly later document dating from 987/1579. In it the chief architect (*mi'mar bashi*) of Damascus, a man called Da'ud, agreed to undertake the restorations of the Dome of the Rock, which had been delayed since the time of Sulaiman's reign (Heyd 1960: 157). The fact that the restorations to the Dome of the Rock—an undertaking of great symbolic and religious importance—were passed over to a provincial architect seems to suggest a degree of confidence in their work by the central authorities. Further proof that Sinan is unlikely to have been involved is provided by the Süleymaniyye complex in Damascus, built at the same time as the complex in Jerusalem. Here Sinan is known to have been the mind behind its planning, which explains why the architecture is considerably more accomplished than in Jerusalem, although he is thought to have left the construction to a local architect (Blair and Bloom 1994: 200).

³ *Tuhfat al-mi'marin*, in: Rifki Melul Meriç, *Mimar Sinan. Hayati eseri I: Minar Sinan'ın hayatani, eserline dair metinler* 1965: 25, n. 130 *jami' sharif, madrasa, 'imaret in al-Quds*. My thanks to Mr Mahmud Hawari for this reference.

If the known documentary evidence does not indicate the identity of the designer of the complex, it is possible to find a clue in the complex itself. As will be seen, a close study of the *khan* and kitchen reveals a similarity between the details of construction and decoration and those of the gates (and walls) surrounding the city, and the six *sabils*, which had been rebuilt during the preceding decade. Indeed, the style and proportions of the coursed stonework—and the decorative details in particular—occur only in these three projects in Jerusalem. Hood-moulds on the south gatehouse leading into the *khan* are elaborately *muqarnas* in design and are almost identical to those found around the outer gateway of the Damascus Gate (Bab al-‘Amud). They are the only ones of their type in the city dating from the middle of the 10th/16th century and should not be confused with the simpler, more geometric designs found in other monuments such as those on the cornice of Qubbat al-Khadr (cat. no. 31, perhaps 10th/16th century). In addition, the *khan* and the kitchen both have a number of projecting circular bosses, carved with geometric designs, on their most visible elevations. There are no other examples to be found in Jerusalem of the same scale or fineness which have been used in the same manner, except on the gates and walls of the city. There are similar medallions on the north elevation of Ribat Bairam Jawish, a few yards to the east of the complex, which at first sight seem similar. However, on closer inspection these do not bear a sufficiently close likeness to the medallions found on the walls and gates of the city. Similarities can also be discerned between the construction and stonework of the north elevation of the kitchen and the main north elevation facing onto ‘Aqabat al-Takiyya, and similar work recurs on the other important imperial project carried out by Sulaiman, the six monumental water fountains (*sabils*) (see cat. nos. 5-10). The best way to appreciate the congruencies between the masonry of the buildings and the subtleties of both medallions and *sabils* is, of course, to stand in front of them. (For more on Sulaiman’s fountains see Rosen-Ayalon 1989 and van Berchem 1923 2: 412-3). Was the architect responsible for the rebuilding of the city walls and gates, or at least someone close to that work, the same person who had been commissioned to build the Khassaki Sultan complex? Tantalising as this hypothesis is, it is difficult to take it much further, for little is known from the documentary evidence about the identity of the architect (or architects) for the city walls. Tradition has it that there were two men and that both were executed on completion of the work, after the sultan discovered that they had failed to include Mount Zion within the walls. Tradition also says that two tombs located inside Jaffa Gate are the graves of these unfortunate people (Stephan 1938: 151 n. 3), who were also believed to be responsible for repairs to the aqueducts and six *sabils*. Some credence for the linking of the projects is given by the architectural

similarities between the two principal imperial projects undertaken in the city during the third and fourth decades of the 16th century and the next imperial project (leaving aside the restorations to the Dome of the Rock), as well as by the results of Cohen’s research into the city walls. Cohen has concluded that a senior Ottoman official, Muhammad Çelebi al-Naqqash, whose task was to collect taxes to fund the building of the walls (*al-amin ‘ala al-amwal al-sultaniyya*), and who latterly seems to have become involved in the building works themselves, was the same official who superintended the restoration of the water supply to the city (Cohen 1989: 470-1). Unfortunately, no indisputable connection has so far emerged from the documents to enable links to be forged between the builders of the sultan’s projects and those of his wife’s foundation. Until such a discovery is made, any further conclusions will continue to be speculative.

One can only make a guess at the identity of the architect(s) for the complex. However, more information can be found about the craftsmen and builders. A document dating from 959/1552 records that the Beglerbeg of Damascus was asked to send ‘builders, carpenters and others for the construction of the *‘imaret*’ (Heyd 1960: 143). It is also likely that there were further craftsmen involved from other areas of the Levant. Evliya Çelebi writes that Sulaiman ordered Mustafa Lala Pasha, the governor of Damascus, to Jerusalem to carry out the restoration of the city, and that the latter ‘gathered all the master builders, architects, and sculptors available in Cairo, Damascus and Aleppo and sent them to the city’ (Stephan 1939: 87; 1938: 151). Stephan in fact does not think that Mustafa Lala Pasha had any part in the work (1938: 151, n. 3). By 959/1552, when the new imperial project was started, there would presumably have been a large number of craftsmen and builders in the city from within and around the Levant, if the postponement to the restorations to the Dome of the Rock, and the completion of the rebuilding of the city walls and restoration of the water supply are taken into account. All in all, these works represent a gigantic undertaking. The presence of craftsmen from various regions is perhaps confirmed by the curious dissimilarity between the design of the two entrances to the complex. The north gatehouse, a portal covered with a trefoil arch, seems to have its origins in the Mamluk tradition, and is comparable, for example, to the entrance portal of the Madrasa of Sulaiman Pasha (950/1543-4) in Cairo. By contrast, the solidity of the south gatehouse is more akin stylistically to Syrian architecture. The combined effect of the arch and the hood-mould bears close parallels to, for example, the Mamluk Khan al-Askar in Tripoli (Salam-Liebich 1983: 184, fig. 170), Qaisariyyat Miru in Aleppo (1983: 212 fig. 18), or Jami’a Taubah, also in Aleppo (1983: 209 fig. 187) (for more on the organisation of itinerant craftsmen and their companies see

Cerasi 1988: 88-91; Bates 1985: 124-5).

Even if the dissimilarity between the two gatehouses is suggestive of the involvement of masons and builders from 'Cairo, Damascus and Aleppo'; the comparisons with Cairene architecture should not be taken too far. This was a project initiated from Istanbul and Damascus. The overall impression given by the design of the complex is that it was primarily influenced by the architectural traditions found to the north of the city, say in Tripoli, Damascus and Aleppo, rather than to the south in Cairo. Further evidence for this is found above the *mihrab* in the mosque adjacent to the *khan*, where there is a moulded frieze with decorative *muqarnas*-like arches running along it which is unfortunately very difficult to photograph. The only other example that the author has found in the city is above the *mihrab* inside the small monument of Kursi Sulaiman (cat. no. 42) situated against the east wall of the Haram, but its closest parallels are in the north, for example in Aleppo above a side entrance in the Qaisariyyat Miru (Salam-Liebich 1983: 212, fig. 188).

Overview of the Site

Site Boundaries and Topography

A question that has not been satisfactorily answered concerns the real extent of the buildings founded by Roxelana. After its completion the boundaries of the 10th/16th-century complex were diffused by the annexation, or incorporation, of other neighbouring foundations, which were built both before and after 959/1552. Indeed, in all four—or perhaps five—important monuments are now known to have been brought within the remit of the complex's administration (fig. 35.2).

The largest of these, located on the west side of the complex, was the palace known as Dar al-Sitt Tunshuq. As will be seen, the building played a significant role in planning the 10th/16th-century work. The Ribat and Maktab Bairam Jawish (cat. nos. 11 and 12), built in 947/1540 and located a few metres to the east of the foundation, were incorporated sometime after Roxelana's complex had been built (see van Berchem 1923 2: 429-30). Al-'Asali, paraphrasing an Ottoman document, states that the foundation was 'entrusted to the neighbouring people in 'Aqabat es-Sitt where the Tekkiye is' fairly soon after the foundation of the complex (1981: 20). At the time of writing the author was unable to obtain further information concerning the date of the incorporation of the Bairam Jawish foundation into the complex, which is a pity since such a date would provide the last significant piece of information needed to establish the full extent of the imperial complex at the time of the final *waqfiyya* (1557). With the Bairam Jawish complex came an undated

foundation located between it and the eastern boundary of the north courtyard of the 'imara. Until the present publication, this building was known as 'Madrasa al-Rasasiya', a reference to the use of lead sheeting between the lower seven courses of masonry on its northern elevation—probably used as a sign of prestige as an expensive substitute for the more common mortar (see Natsheh cat. no. 28; Burgoyne 1971: 23-4 where the wrong date is given; Bourgoin *Les Arts Arabes*: fig. XIV). The architectural evidence suggests that the building had probably been built into the *ribat* at the time of its foundation. This has recently been confirmed with the discovery of documentary evidence which positively identifies it as the (as yet undated) Mamluk Madrasa al-Mawardiyya.⁴ Al-'Asali states also that legal documents refer to the 'Madrasa Khassakiyya' (1981: 25).

From a study of the boundaries of the above foundations, the known routes of the roads to the north and south, and the evidence of the latest survey, it becomes possible with a degree of certainty to give the extent of the works built to stand alongside Dar al-Sitt Tunshuq. The core of the 10th/16th-century foundation can be broadly described as occupying a rectangular plot of land measuring 65-67m from north to south and 50-55m from east to west. The north and south boundaries are clearly defined by the street of 'Aqabat al-Takiyya to the north and 'Aqabat al-Saraya to the south. Al-'Aqabat al-Takiyya is the usual name current today. In the past it has also been known as al-'Aqabat al-Sitt—that is, the street of Sitt Tunshuq al-Muzaffariyya who built Dar al-Sitt Tunshuq. Mujir al-Din records that prior to this it was also called al-'Aqabat al-Suq (Market Street) (Burgoyne 1987: 485; Bartlett 1867: 89) or al-'Aqabat al-Sudan (Stephan 1944: 173). As recently as the last century it was also known as al-'Aqabat al-Malika Hilana, after Queen Helena, the mother of the Byzantine Emperor Constantine, who was thought to have built a pilgrim hospice on the site (Stephan 1944: 173). Indeed, during the 13th/19th century, the complex, as well as being called al-Takiyya (Seetzen 1806 in Ben-Arieh 1984: 160) was often referred to, by western travellers at least, as 'Queen Helena's Palace' (see Reicher [1867], Williams [mid-1840s], and Turner [1815], all in Ben-Arieh 1984: 160-1). Documents dating from the Mandate period, now lodged in the Rockefeller Museum, call the present day 'Aqabat al-Takiyya the "Aqabat et-Tekiyye I", and the present 'Aqabat al-Saraya is called the "Aqabat et-Tekiyye II". The southern end of the western boundary is bordered by a large residential complex (*haush*) while Dar al-Sitt Tunshuq is located to its north end. The southern end of the eastern boundary can be defined by neighbouring residential buildings, while to the

⁴ I am very grateful to Dr Yusuf Natsheh for making this information available to me so soon after he had discovered it.

northern end it is defined by the western side of Ribat Bairam Jawish.

The site rises quite steeply to the west, with a further rise to the south west giving those buildings in the upper reaches of the site some opportune views of the Haram al-Sharif and more particularly the Dome of the Rock—which was the focus of the lives of pious travellers and pilgrims who came to stay in the city. This observation was first made by Burgoyne with reference to the positioning of Dar al-Sitt Tunshuq (1987: 485 and 501, fig. 48.13). If the foundation is fortuitously located for that reason, it is more likely that a more conventional factor played a role. Not least were the practical considerations of attempting to accommodate the substantial provisions of the *waqfiyya* close to the Haram in an already densely built-up city. Most of the immediate vicinity of the Haram had been heavily built up during the Mamluk occupation and it seems as though Dar al-Sitt Tunshuq (whose founder had died more than 150 years earlier), and the area immediately to the east of it, provided an easily accessible and appropriate setting for the imperial foundation.

General Arrangement

Broadly speaking, the complex is divided into two distinct groups of buildings ranged around courtyards. The areas are situated to the north and south of each other with their own entrances from ‘Aqabat al-Takiyya and ‘Aqabat al-Saraya respectively. The southern area functioned primarily as accommodation for travellers and for the pious community living in or passing through the complex. It contains the *khan*, plus living and congregational areas for the Sufis. The main function of the northern area was to produce food for the poor of the city and the pious community. It thus contains the kitchen, the bakery, a water fountain and associated storerooms. The complex was required to provide food for all the residents including its staff and that of the Haram, the poor, and the religious community. As a result it was located centrally between the two areas.

The buildings in both north and south areas are ranged around a courtyard (hereafter known as the north courtyard and south courtyard). On the southern side of the complex, situated to the west of the south courtyard and divided from it by a high stone wall, there is also the courtyard of the *khan*.

South Courtyard and Khan al-Khassakiyya (fig. 35.1)

The southern side of the complex is entered through a gatehouse located on ‘Aqabat al-Saraya. To the north west

at ground level there is a small mosque reached from the *khan*. The gateway emerges immediately to the north into the courtyard of the *khan*. Ranged around it, to the north, west and east, are a series of vaulted bays which are today used as print shops. The east end of the courtyard is bounded by the dividing wall separating it from the south courtyard, access to which is through a low arched opening at the south end of the wall. To the north, immediately opposite the gateway, a wide arched opening leads through to the ‘main hall’ of Dar al-Sitt Tunshuq. Since the late 1960s, half of the courtyard has been walled in and roofed over to provide extra work space. A stone staircase rises up the east and south walls to an expansive open-air terrace over the vaults of the *khan* below. The façade of the Ottoman extension to the upper level of Dar al-Sitt Tunshuq forms the boundary to the terrace to the north, while to the south there is a small cluster of eight rooms which forms the upper level of the gatehouse. These rooms of mixed age are currently used as accountants’ offices, a music room and stores. The upper level of Dar al-Sitt Tunshuq, meanwhile, is mainly used as dormitories for orphans living in the complex.

The south courtyard (pl. 35.2) is broadly speaking a rectangular space. The north façade of the late 13th/19th-century al-Da’irat al-‘Adliyya (the ‘house of justice’ or courthouse) occupies much of the south side of the courtyard and is situated against the east side of the gatehouse. It extends to the south to ‘Aqabat al-Saraya and is today used as a print shop.

The east end of the courtyard is terminated by a cross-vaulted chamber located at lower ground level. Above it is another late 13th/19th-century room now used as an office by the director of the schools. The mausoleum, which is today employed to store cane used in the furniture-making workshops, fills the north east corner of the courtyard. To the west and on the opposite side of the courtyard from the courthouse there is the single-storey building. Its interior was once a large hall, which, as will be seen, probably functioned as the main communal space for the Sufi community. In modern times it has been divided by a modern concrete wall into a now abandoned classroom and refectory. A narrow vaulted space immediately to the west has been converted into a kitchen.

North Courtyard and Kitchens (fig. 35.3)

The north courtyard (pl. 35.3) is reached from ‘Aqabat al-Takiyya through a gatehouse located immediately to the east of the exquisite façade of Dar al-Sitt Tunshuq. The courtyard is roughly rectangular and bounded to the west by the three-storey high east elevation of the Mamluk palace. Directly ahead—to the south—at the top of two semicircular steps, there is a high arched doorway leading

through to an as yet unidentified hall (see below—kitchen) which has been rebuilt in modern times. A barrel-vaulted chamber, adjacent to the gateway to the east, houses latrines.

The courtyard extends east to a lower, narrow area via a steep flight of steps stretching across its full width between the kitchen on the south side, and the bakery building on the north side. The bakery building also fronts onto 'Aqabat al-Takiyya to the north. At the east end of both buildings, the lower courtyard widens to the north and south and is bounded at its east end by a three-storey 'tower building' which accommodates a single vaulted classroom on each floor. These rooms are reached from the double courtyard of Madrasa al-Mawardiyya via neighbouring roofs further to the east. The now disused *sabil* occupies this end of the lower courtyard. The lower level of the courtyard has been raised artificially to a level plain above the natural slope of the site. This is primarily indicated by a flight of steps which leads down to taps at the base of the west face of the *sabil*. A second flight, located on its south side, leads up to its roof.

To the north of the *sabil* two doors give onto three small chambers, two of which are abandoned and full of debris. The third, adjoining the east elevation of the bakery building, is used as a wood store. A fourth chamber, located to the north of this last one, is reached via a small tunnel leading from the east vault of the bakery building.

Returning to the upper level of the courtyard, one encounters a wide staircase in the north-east corner which leads up to the first floor of the bakery building. Today this floor accommodates three classrooms and a small house occupied by two widows. In point of fact, the house extends from the bakery building across a small courtyard to a small chamber on the upper floor of the north gatehouse with a large number of niches in its walls.

Architecture—South

South Elevation (pl. 35.4)

The south elevation of the complex—as it exists today—is 33m long and stretches from a point 12m to the west of the corner of 'Aqabat al-Saraya, up the slope of the street. A neighbouring house adjoins the east end of the elevation while at its upper (west) end, the eastern part of a second house has been built in front of the gatehouse façade. To date the hidden extent of this end of the elevation remains unsurveyed.

The elevation comprises two distinct components—the south front of the 13th/19th-century courthouse (Da'irat al-'Adliyya) dominates the east end, and, to the west, the 10th/16th-century gateway leads through into Khan al-Khassakiyya. At a distance of 5.3m from the west

end, the façade of the gatehouse changes direction to the north by approximately 3 degrees.

An arched, double height, gateway 4m wide (pl. 35.5) dominates the 10th/16th-century elevation. The arch is constructed of voussoirs 0.3m deep and springs from double corbel stones on each side; the stones extend up to 70cm into the surrounding masonry. On their inside edges there are three registers of *muqarnas* carved in heavy relief. An elaborately decorated cavetto hood-mould, which terminates at the springing line of the arch with horizontal extensions, surrounds the arch. The curved underside of the mould is carved with a repeated leafy *muqarnas* motif. The moulding bears a striking resemblance to a hood-mould around the north arch of the Damascus Gate (Bab al-'Amud). Four small foliated carvings in relief—two on each side of the arch—project from the *muqarnas* motif up over the front edge of the mould; these seem to be the only examples in Jerusalem. A deeply incised hemispherical basket-weave boss is positioned at the apex of the arch. Further decoration is provided in the form of circular medallions located in the masonry around the gateway. On each side of the arch there is a single medallion—measuring approximately 0.35m in diameter—incorporating a twelve-pointed star design. Above the apex of the arch one of similar size is carved with a series of radiating petals in high relief.

The double window at first floor level, immediately above the gateway, is surmounted by two pointed arches with finely drafted voussoirs of alternate orangey-brown and a darker reddish-brown colour. In place of a mullion, the arches are supported on, and separated by, a single round white marble column with a capital of incised triangular design that is typically Ottoman. Again the author has found no other examples of this design in other monuments from the period in Jerusalem. However, clear comparisons can be made, for example, with the capitals found in the asylum colonnade in the Bayazid II complex at Edirne (Goodwin 1977: 82, pl. 26). An almost identical window design can be seen in the east elevation of an unidentified 13th/19th-century building immediately to the north west of Jaffa Gate adjacent to the south side of the newly constructed Dan Hotel. An exquisitely carved hollow-square hood-mould, carved into the surrounding masonry, surrounds the arches. The mould terminates on either side of the window with volutes of the same design, and, at the apex of the arch, it forms a circular loop which surrounds a small ventilation hole. Positioned between the arches there is a single medallion in the shape of a flower with ten petals.

The remaining fenestration in the façade is unremarkable. Two pairs of rectangular windows, set to the left and right of the double window, light the rooms on the upper floor of the gatehouse. Above the pair on the left-hand side there is a single star-shaped ventilation hole. The

usual horizontal ventilation slits are located above the lintels—however, rather unusually, they vary between the curved and flat types. Located at ground level on either side of the gateway, there is a single semicircular arched window, which lights the chambers to each side of the gateway portico. An inspection of the masonry surrounding the windows suggests that both were either remodelled or inserted at a later date. A small rectangular ventilation window is located above the window to the left of the gateway. Above it there is a stone with a carved motif that has the appearance of a mason's mark (fig. 35.4).

Discussions with Dr Yusuf Natsheh and Dr Beatrice St Laurent have not produced a consensus as to whether, in fact, the elevation is entirely of 16th-century origin. Certainly there is little doubt that the gateway and the decoration around it date from the 10th/16th century. However, there is a suggestion that its first floor level may have been rebuilt at a later date. Unfortunately, the survey team were unable to undertake a drawn survey of this elevation which would have shown the jointing more clearly. The inscriptions inside the gateway give no clue as to the extent of the restorations and no other documentary or pictorial evidence that describes them has yet appeared. As will be seen, the first-floor rooms above the entrance portico were probably built (or rebuilt) during the 13th/19th century. While the stonework in the lower half of the elevation is weathered and includes changes in the coursing around openings, as well as a number of re-used stones, the upper half of the elevation is evenly coursed and in good condition. This suggests that it could have been rebuilt at a later date. However, it seems more probable that the extent of re-building was limited to the east end of the elevation perhaps at the time of, or before, the building of the courthouse. A careful examination of the stonework close to that end of the façade reveals a vertical joint that meanders up the full height of the elevation, along the length of which the general coursing of the stonework changes. This feature is treated more fully below under the description of the upper floor of the gatehouse. The quality and design of the central double window, and more particularly the moulding around it, resemble closely those of the earlier Mamluk foundations—for example, al-Uthmaniyya, which dates to 840/1437 (Burgoyne 1987: 544). The general conclusion must therefore be that most of the upper level of the elevation was probably retained in the restorations of the 13th/19th century.

South Gatehouse

The gatehouse consists of two floors with a mezzanine level in the north-east corner. At ground level, double-height inner and outer porticoes, separated by heavy wooden doors, lead through to the *khan* to the north. Following the

Syrian model (Hillenbrand 1994: 350), on each side of the outer portico there is a single vaulted room shaped to suit the exigencies of the site. A blocked-up opening in the east room suggests that there was once access to the east of the gatehouse. The mosque, entered from the *khan*, is located in the north-west corner (see below). A dead-end intramural passage in the east wall of the inner portico represents the remnants of a staircase that once gave direct access to the upper floor.

The first floor of the gatehouse comprises a cluster of six rooms ranged along the south front of the gatehouse (fig. 35.5). All of the rooms are entered from the roof of the *khan* and are today used as offices and a music room. The spaces have been considerably altered and rebuilt since the foundation of the building. Two large, decoratively vaulted spaces—on the south and west—dominate the group and are the earliest in date. The other spaces were the result of later restorations or rebuildings.

Outer Portico (pl. 35.3)

The double height outer portico is almost square in plan, measuring 5.8m by 5.1m. The space is covered by a plastered cross vault between which there are wall arches. The walls of the portico are solidly constructed of regularly coursed and finely drafted stones measuring on average 0.4m deep. Although accurately cut, the masonry is deeply incised with regularly spaced markings often used as the 'keying' for plaster. There is also evidence that the stonework was once painted a light blue colour. A photograph taken as late as 1971 shows that the whole portico was at least painted if not plastered (Burgoyne 1971: 28, pl. XVIIb). Evliya Çelebi, writing at the end of the 11th/17th century, states that 'the houses are covered with lime as are all the prayer places' (in Peters 1985: 494). At the springing line of the vault, the ribs split to form a rather unusual decorative petal-shaped incision in each corner of the space. This rather pretty feature seems to be unique to this monument in Jerusalem.

On each side of main gateway is a single niche that was probably used as a cubby-hole for doormen or guards. The west niche measures 0.7m deep and is covered with a cloister vault, while the niche on the east side of the gateway measures 0.95m deep and is covered by a vault, which incorporates a split pendentive in the centre of the back wall. Two diamond-shaped lozenges carved in low relief are also incorporated into the vault. These lozenges were quite a common feature in Mamluk monuments in the city. The closest example to the complex is to be found in the ceiling vault of al-Madrasa al-Rasasiya/Mawardiyya in Ribat Bairam Jawish.

The north wall, which appears to have been repaired after its foundation, is dominated by the gateway

into the *khan* courtyard. The opening is 3m wide and 2.3m deep and is covered by a solidly built arch. Projecting from the impost blocks at each end there are mouldings which extend to the ends of the north wall. An inspection of the stones above the moulding at this point suggests that the moulding may originally have continued up the face of the wall around the line of the wall arch. On either side of the arch there is a single projecting medallion with a pattern of radiating petals. The curved hinge stones for the wooden doors, which are hinged at the back of the stone jambs of the arch, are in the vault above. Carved into each of the northern jambs of the opening there is a single triangle that may possibly be a mason's mark (fig. 35.4).

Positioned above the same gateway there is a large, recessed panel, the ends of which are terminated with a trefoil-shaped frame. Originally the panel probably housed the foundation inscription, but, as with the inscription above the gateway into the north courtyard, the plaque has since been removed. The two inscription panels that are now fixed over the recess record restorations to the complex during the late 19th and early 20th centuries. The larger one located over the recess is dated to 1326/1923 and is in Arabic; the second, immediately below the first, is dated 1286/1869-70. It is, rather unusually, written in both Turkish and Arabic and records the restorations carried out by Nasif Pasha. The other, later, inscription appears to record work done during the period of the British Mandate. No reference to this work was found in the records from the British Mandate open to the public and now located in the Rockefeller Museum in Jerusalem.⁵

High on the east and west walls there are two further panels with Qur'anic inscriptions carved in relief. Each panel is surrounded by a cartouche with chevron-, scallop- and star-shaped designs, and are today painted in dark green and rusty-red colours. On either side of all of these recesses there is a single projecting medallion with a geometric design carved in low relief. A further medallion is located above each of the inscription panels, below the apex of the vault.

In the north-west corner of the gatehouse at mezzanine level there is a small cross-vaulted chamber, access to which is from a staircase in the south-west corner courtyard of the *khan*. The room is currently used as a store for oil and is closed off with a heavy iron door (fig. 35.7). Officials working for the orphanage say that the door in the entrance to the room was incorporated during the mandate period and that the room was used as a holding cell for

prisoners awaiting trial in the courthouse. It is today an unimpressive chamber. It is, however, the only space from which one can identify the now blocked-up staircase that led from ground level to first-floor level at the time the complex was first founded. In the west wall of the room there is an arched window that opens into the stairwell. Access to the stairwell is almost impossible. A close examination, however, reveals that it is covered with a rising barrel vault constructed of finely crafted ashlar. The bottom five or six steps were removed when it was closed up. It is possible to see despite this that at its upper end it turned to the west, and would have emerged, probably into the open air, on the roof of the gatehouse.

Upper floor (pl. 35.7 and fig. 35.5)

The upper floor of the gatehouse consists of a cluster of chambers built on a raised podium above the level of the rest of the roof terrace over the *khan*. Broadly speaking the rooms form a shallow rectilinear C-shaped configuration, with the top and bottom extensions projecting to the north. Three steps spanning the intervening space rise to a landing along the north elevation. Three main chambers are ranged along the south elevation of the gatehouse. A large central chamber projects to the north of two similarly sized square-shaped rooms to the east and west. The central chamber is divided into two areas. To the south there is a large space which is raised approximately 0.5m above a narrow antechamber to the north, which is at the same level as the external landing. The southern space is roughly the same size as the two flanking chambers. While the antechamber is covered by a stretched cross vault, the raised area is covered by a high, folded cross vault. In the east and west walls of the antechamber there is a deeply recessed niche which stretches from ground level up to head height. On each side of the recess openings there are projecting stone jambs, which suggests that one or both of them are blocked-up doorways. This seems to be confirmed by the plans which show the rear wall of the western recess to be unusually thin.

The two flanking chambers were probably very similar to each other. The east chamber, however, has been heavily altered and repaired (probably at the end of the last or the beginning of this century). It is now covered by a flat ceiling and has a high wide window in its east wall with a wide, flat, dressed-stone architrave around the external surface of the opening. The west chamber, however, has survived to a large extent unaltered. It is entered via a tiny external lobby to the north and is covered by an elaborate cross vault with a domelet at its apex. The areas between the pendentives of the vault are incised to create an elaborate geometric pattern that is very similar to the one in the vault in an antechamber in the exquisite cell

⁵ Mr Giora Solar, formerly of the Israeli Antiquities Authority, informed me that there are considerable quantities of archival material from the period in the museum which are still largely undocumented. Future scholars may find records of the extent of the Mandate period restorations in the complex in those records.

commonly known as ‘the Mamluk cell’, but more correctly the North Western Khalwa of Ahmad Pasha (see cat. no. 22), which is located on the north side of the upper esplanade of the Haram. In the south wall a bay window, which incorporates a pair of window openings separated by a stone mullion, opens into ‘Aqabat al-Saraya. There are a number of niches located at both a high and a low level in the east and west walls. A niche in the north wall reveals itself in plan to be a blocked-up window. A similarly positioned niche in the north wall of the flanking chamber to the east suggests that it too once had a window. Both seem to confirm that the smaller rooms to the north are later additions.

The north elevation of the main central chamber has three openings—a door flanked by a window on each side. Around and above the openings, a broad relieving arch of alternating cream and grey stones spans the area from one side of the elevation to the other. The use of different coloured stones—or *ablaq* technique—is of course typical of Mamluk monuments and continues in some Ottoman foundations. In this case, however, it is almost certainly a ‘revival’ technique used in imitation of the earlier monuments. Indeed it is fairly safe to say that the elevation as a whole is a later, perhaps 13th/19th-century, addition to the building. The evidence for this is to be found in the decorative keystone at the apex of the arch where there is a floral motif typical of the last century.

A careful examination of the location of the blocked-up staircase, which survives at ground and mezzanine levels, reveals that it would have risen onto the podium terrace through the floor of the existing lobby at the east end of the external landing.

What seems to emerge from the survey of this cluster of rooms is that the 10th/16th-century upper level of the gatehouse consisted of a central chamber flanked by two rooms, that the central chamber had a raised area to the south and that it was, possibly, open to the north. Such evidence strongly suggests that the arrangement of the rooms was that of a *qibla iwan* with two flanking chambers (fig. 35.5). Confirmation for this idea is found in a strikingly similar arrangement, in both plan and location, that occurs not far away in the Mamluk foundation of al-Jawiliyya (715–20/1315–20)—which happens coincidentally to be the site of the former Ottoman barracks in the north west corner of the Haram (Burgoyne 1987: 201–10). In the Mamluk complex, the central *qibla iwan* has windows in its south wall and a door at the north end of each of the side walls of the space leading through to the two flanking chambers in the same configuration as the chambers in the Khassaki Sultan foundation. In addition, the *iwans* in both complexes are located on podia and approached via a short flight of steps. The suggestion gains further credence when one considers that it was in this area of the complex that the pious residents were primarily based. Indeed, if this

supposition is correct, one could venture to suggest that the main unidentified component in the list of provisions in the *waqfiyya*, namely the ‘high praying place’, may in fact be these three rooms.

Khan (*Khan al-Khassakiyya*) (fig. 35.1 and pl. 35.8)

The *khan* lies immediately to the north of the gatehouse, positioned against the south side of the main hall of Dar al-Sitt Tunshuq. Despite the irregularities of the site, the architect has managed to insert a rectangular courtyard in the same way that the Mamluk Suq al-Haraj in Tripoli (14th century) has been planned to fit the exigencies of its site (Salam-Liebich 1983: 187, fig. 172). The courtyard measures 9.2m by 14.3m, surrounded by walls extending up to a height of 5.78m. On the north, south and west sides two broad, pointed arches supported on five solid piers measuring some 1.32m square face onto the courtyard. The south-eastern arch—which is, in point of fact, the portal arch of the main gateway—is supported on the east wall of the gatehouse at its north end. The pier in the north west corner is slightly larger, with its inside corner shaped to define the corner of the courtyard space. The arches spring from slightly projecting raked corbel stones some of which—specifically those in the west bay of the south elevation leading through to the mosque—have simple *muqarnas*-type arches incised into the raking surface. The masonry in the walls is roughly dressed. Decorative features are however provided by a series of projecting medallions located at a high level between each of the arches. The medallions are each carved with radiating petals or floral designs.

There seems to be no indication that there was ever a second floor to provide accommodation for travellers. It is more than likely that the existing first floor of Dar al-Sitt Tunshuq and the main hall provided copious space for them. In any case the roof terrace also provided extra space for those who wished to pray; this was near to the *qibla iwan*.

Seven vaulted bays, shaped to absorb the irregularities of the surrounding buildings, are ranged around the north, south and west sides. The northern portico was built against the south side of the main hall of Dar al-Sitt Tunshuq which provided easy access from the reception area of the courtyard to the stabling facilities and accommodation of the hall. While the undersides of the vaults and enclosed outer walls of the *khan* are plastered, the transverse arches separating each of the bays are constructed of fine ashlar. In the north east corner of the *khan* there is a smaller bay measuring 2.7m by 4m which houses four lavatories.

The east end of the courtyard is bounded by a

wall—measuring 1.4m thick—that rises to the same height as the other three sides of the courtyard. A walkway runs along the top of the wall. The north end of the wall abuts the south east corner of the Mamluk palace and, at its southern end, the north-east corner of the gatehouse. Through the wall, a shallow arched opening measuring 2m wide, with chamfered jambs facing onto the courtyard of the *khan*, gives access to the south courtyard to the east. A flight of steps in the south-east corner rises up the wall, above the archway, via a landing at mezzanine level to the roof above. The steps were clearly constructed at a later date to the wall, for they are built in front of one of three medallions set into the masonry at the same level as those in the other three elevations of the courtyard.

The east wall probably existed in a similar form in the original foundation. This is indicated by the small vaulted space in the north-east corner of the courtyard, as well as the close proximity of the refectory in the south courtyard. However, there is considerable evidence to suggest that it has been rebuilt at a later date. In the first place, an inspection of the east side of the wall shows that the upper two-thirds of the wall is built with a rougher masonry than that of the lower third. This may indicate a substantial reconstruction of the wall. In the second place, the medallions in the east elevation appear to be in re-use. Whereas the medallions in the other walls of the courtyard are the same size as the surrounding masonry, here they are not. Finally, there is a large door jamb in the south-east corner of the archway, but there is no reciprocal jamb on the other side of the opening. The jamb extends to a height equal to the upper level of the first building phase of the surrounding masonry. This seems to suggest that there was a large opening, perhaps similar to the other arches of the courtyard, in the wall which once led through to another courtyard on the site that is now occupied by the 19th-century courthouse.

Mosque (pl. 35.9)

The *waqfiyya* stipulates that ‘... a virtuous *imam* should be appointed for the aforementioned noble mosque ... He should be a Sunnite, following the school of Abu Hanifa. He should lead the Moslem congregation in prayers as prescribed, and also serve as *mu’ezzin*, calling for prayers’ (Stephan 1944: 188). The mosque referred to here is located immediately to the west of the gates between the inner and outer porticoes of the gatehouse, and is today partly enclosed and filled with modern partitioning. It is, however, easy to make out that it was a simple rectangular space measuring 4.2m by 4.9m and that it was covered by a rendered folded cross vault with a shallow domelet at its apex. The north end of the space is entirely open to the south bay of the courtyard of the *khan*. It is spanned by a

pointed arch supported on raked corbels. As a result, the mosque spatially reads as an extension of the *khan*—making it visible and easily accessible to those staying at the place. Like the walls of the south-western corner of the *khan*, the east and west walls are constructed of rough stonework, although it has been well coursed.

Modern partitioning covers the south (*qibla*) wall to about three metres above ground level. A hole has been cut into it to reveal a large, plain, semicircular *mihrab* constructed of curved ashlar stones located centrally in the wall behind. Built into the wall above the niche—but, because of a modern ceiling, now almost inaccessible—there are three decorative features, one above the other. The lowest is a stone plaque, currently painted dark green and with a Qur’anic inscription carved in relief. The inaccessibility of these features made any close inspection of the inscription impossible. It was however clear that it contained no further information but was restricted to a quotation from the Qur’an. Above the plaque is a short—about 2.5m long—frieze consisting of a cavetto moulding, painted green. The raked surface of the moulding is sculpted with a repeated foliated *muqarnas* motif, similar (though simpler) to that found in the hood-mould over the main gateway. Finally, above the moulding and projecting from the wall, there is a circular medallion carved with a floral design.

Refectory (pl. 35.10)

This building is referred to here as the ‘refectory’ for the sake of convenience since part of it today functions as the dining hall for apprentices and staff of the Islamic Industrial Orphanage. It seems probable that the refectory originally served as the principal meeting place of the residential Sufi community. The primary evidence for this conclusion, as will be seen, is the striking similarity between it and an almost identical space built for that purpose in the later foundation of al-Zawiya al-Afghaniyya (1043/1633) (al-Zawiya al-Qadiriyya, see cat. no. 35).

The building is a single storey structure enclosing a large hall space. In plan it is exactly square, measuring 13.4 by 13.4m. It is enclosed to the north, west and east by neighbouring structures with only the south elevation exposed to the courtyard. Immediately to the west, the building abuts vaulted chambers which formed part of Dar al-Sitt Tunshuq (Burgoyne 1987: 486, fig. 48.2). It appears, indeed, that the orientation of the refectory was dictated by the line of the east wall of the earlier vaulting. A cross-vaulted portico, opening onto the courtyard, fills the space left between the south end of these rooms and the north end of the east wall of the *khan*. A closer inspection of the stonework at the west end of the south elevation clearly shows that the vault was built after the main (Ottoman)

hall. The north side of the refectory abuts the south side of the first floor of the unidentified hall in the north courtyard. This graphically illustrates the change in levels across the site. A level survey was not carried out to ascertain the exact difference in levels between the north and south courtyards. The approximate difference at this point today, however, is 3m. But there will be further discussion in this section concerning the probable levels of the interior of the building when it was first founded. The eastern side of the building is enclosed within a narrow vaulted passage running between it and the mausoleum.

The exterior was considerably altered during the 13th/19th century—probably at the time of Nasif Pasha's restorations—and again in the early 20th century. A simple four-sided building surmounted by a pitched roof of clay tiles, and built in the same 'classical' style as the courthouse, was built at roof level. In addition, the exposed south elevation seems to have been remodelled at an even later date with the incorporation of two doors and three round-headed doors and windows. The suggestion is that these openings were incorporated at the time that the hall inside the building was divided into two separate rooms. The style of the openings, which are surrounded by flat-fronted architraves, could date from any time in the latter half of the 19th century to the first two decades of the 20th century. However, judging by the thinness of the dividing wall, the likelihood is that it was inserted during the 20th century. This raises still unanswered questions concerning the position of the original opening into the hall. The rest of the elevation is roughly constructed of rubble masonry, in contrast to the more massive stonework of the east elevation.

Accordingly, the main architectural interest, so far as the 16th-century foundation is concerned, is to be found inside the building (pl. 35.10). Despite the dividing wall, one can easily discern that the hall was rather grand, composed of four equal bays covered with plastered, folded cross vaults. The vaulted bays are supported at the centre of the space on a single pier measuring 1.2m square, and on engaged piers set against the outside walls. Between each of the engaged piers there are wall arches which give added strength to the structure. Impressive transverse arches separate each of the vaults. All of the arches spring from elaborately moulded corbels located on the central and engaged piers less than one metre above ground level. Situated at the apex of each vault there is an eight-sided cupola surmounted by a shallow saucer dome; the dome in the south east vault has been removed in modern times to allow extra light into the space.

The wall surfaces in the western bays have recently been rendered with a thick coat of plaster. However, the walls in the eastern bays have been stripped to reveal rough, undressed masonry which would suggest that they were intended to be rendered at the time of their

foundation. In contrast, the voussoirs of the arches, which are also exposed, are constructed of finely drafted ashlar of a similar quality to that of the arches in the *khan* and the soup kitchen.

There is an interesting array of blocked-up openings ranged around the north and east walls. To the east there are two pairs of deeply recessed openings which once opened into the passage between the mausoleum and the 'refectory'. Both are covered by slightly curved, roughly built vaults. An inspection of the exterior of this wall in the passage adjoining the mausoleum confirms that these consist of four rectangular openings with grille windows. Two extend to ground level in the passage which suggests that they may originally have been doors. Officials of the orphanage say that 'a long time ago' there had been a means of access from the space to the north of the mausoleum through a (now blocked-up) door to the balcony overlooking the soup kitchen (see the description of the kitchen) which had been used by a supervisor to oversee the workers there. This might confirm the need for doors from the 'refectory', but otherwise there is no further evidence for this arrangement. At a high level, at the north end of the wall, there is a single, similarly recessed and blocked window opening into the (now enclosed) space to the north of the mausoleum. It is not possible to tell whether this was a later addition or part of the original foundation (see below in the description of the mausoleum for further discussion of this point).

In the north wall of the north-east bay there are two openings positioned one above the other. Low down there is a shallow arched niche, springing from ground level, measuring 1.32m wide, 0.5m deep, and no more than 0.6m high. Higher on the wall there is a blocked-up window measuring 0.82m wide that once opened into a narrow chamber located to the north of the 'refectory', at the level of the roof of the soup kitchen.

The largest of the openings is located centrally in the north wall of the north-west bay (pl. 35.11). It measures 1.85m wide, rises to the full height of the room, and is surmounted by a pointed arch on the inside face of the wall. Behind the arch, within the thickness of the wall, the soffit of the opening is approximately 0.15m higher than the apex of the arch. Close to ground level, the sides of the opening are chamfered, narrowing the width of the opening to 1.5m at floor level. The opening is today blocked up. It is clear, however, that it opened to the north of the building, perhaps onto a roof terrace, or into another enclosed space over the rebuilt hall to the west of the kitchen (see below). This recess/opening bears a striking resemblance to a recess in the north-east bay of the hall at the Zawiya al-Afghaniyya (al-Qadiriyya) which has already been mentioned, both in its size and in the fact that it has the same chamfered protrusions at ground level. On either side of the opening, at ground level, there is a small arched

niche, measuring 0.7m deep. The sills of the niches are buried below floor level.

The west wall has been considerably altered over time to allow better access from the vaults to the west. Although previous surveys indicate that there were once two openings, perhaps a window and a door, these have now been opened up to allow freer access between the kitchen and the refectory (Burgoyne 1987: 482, fig. 48.2).

The present-day floor level inside the building is clearly markedly higher than it was originally. As has already been noted, the springing lines of the arches and vaults are low down on the walls. The floor was up to 50cm lower, perhaps at the level of the passage between this building and the mausoleum. This is also confirmed by the fact that all the internal sills of the blocked-up recesses in the north and east walls are today either below ground floor level or are uncommonly low down.

Mausoleum (pl. 35.12 and fig. 35.1)

No documented evidence has so far been found that states clearly who was buried in the mausoleum, or when. However, officials working in the complex at the end of the 11th/17th century told Nabulsi that a person by the name of Shaikh Sa'd al-Din al-Rusafi was buried there (al-'Asili 1984: 26). No published information has been found to confirm or disprove this identification. As Nabulsi admits, this is second-hand information and would need further verification (see also Nabulsi, 1101/1699 from a handwritten copy dated 1150/1737 located in the Islamic Library of the Haram al-Sharif, Jerusalem). Tombs were often built in large charitable complexes and Sufi religious foundations to house either the original benefactor or the founding administrator (the *mutawalli* or, in Turkish, *mütevelli* or *nazir*) to whom the management of a complex was passed in trust, after the founder's death. After the death of the founder, the responsibility for the administration of the trust would then remain in perpetuity with the founder's hereditary descendants until such time as the direct line of inheritance was cut. The trust would then be passed into the hands of 'manumitted' slaves of the family (*'utaqa va 'atiqat*) (Goodwin 1973: 455 and n. 1). The *waqfiyya* of Khassaki Sultan makes provision for a 'trustee ... renowned for his ... appearance of integrity and honesty ... a religious, acceptable, and religiously minded person who would not deviate ... and whose hands are clean from committing sins ...' (Stephan 1944: 187). A *shaikh* was also appointed 'to be in charge of the said imperial building. He should be of pure character traits, God fearing, conforming to the canonical law, content, trusting in Allah, piously scrupulous and not greedy' (Stephan 1944: 188). Without access to the relevant *sijill* documents (which perhaps have yet to be found)

confirmation of whether Shaikh Sa'ad al-Din al-Rusafi was indeed the *mutawalli* of the complex, or the *shaikh*, and whether he is buried here, will have to wait. Of course, this assumes that the tomb was built after the complex was finished and not before; this question too has yet to be resolved satisfactorily.

What can be gleaned from the architecture, however, is that the person must have been a man of either wealth or position, or both. Unusually for a mausoleum sited within the walls of the city, it was clearly planned as an independent unit, and this in itself reflects considerable social status of the occupant. Indeed, if this is an Ottoman foundation, as seems to be the case, it is the only independent mausoleum built within the walls of the Old City during the whole Ottoman period. All other tombs built during the period—for example, Maktab Bairam Jawish (947/1541, cat. no. 12) and al-Zawiya al-Maulawiyya (the date of the conversion into a mosque is unknown, but the minaret and main chamber of the second level date to before 995/1586-7, cat. no. 19)—are often located in humble chambers integral to the rest of the building, and they are thus in direct contrast to both the number and the elaborate style of mausolea during the Mamluk period. Although the architect of this mausoleum may have been fortunate in having the space to build an independent structure, the monument was nonetheless intended as a prestigious building.

Today neighbouring structures both surround it and are built against it on all sides except the south. A narrow, tapering vaulted passage runs between the west elevation of the mausoleum and the refectory from the south courtyard and an enclosed space to the north. This latter space lies between the building and the south wall of the kitchen. Until quite recently the space was open to the roof terraces above, but it is now covered by a flat ceiling made of steel beams and concrete. A cross-vaulted chamber located immediately to the east abuts the east elevation of the structure.

Exterior

The mausoleum is square in plan, measuring 6.3m by 6.3m, and is covered by a dome supported on an eight-sided transitional drum. On the north side there is a portal arch built against the main body of the structure. There are four openings into the chamber located centrally on each side. The structure is generally constructed of finely chiselled ashlar masonry built in narrow courses in contrast to the broad, solid coursing of the kitchen or the *khan*.

The portal is 0.98m deep to the main face of the north wall and extends up to the top of the sides of the main structure. Covering the recess is a pointed arch, the voussoirs of which are finely carved with a gadrooned

(‘pillow’) moulding. A number of the voussoirs have collapsed near the apex of the arch. The door into the tomb chamber is a simple rectangular opening which has been made more elaborate by the addition of alternating courses of cream-coloured and black basalt stone to each side of it. Above the recessed doorway a small rectangular window opens into the interior of the mausoleum.

In the south side of the chamber there is another large arched opening, which this time is built into the thickness of the wall. The opening is 3.15m high from the internal floor level of the wall to the apex of the arch. On each side of the opening, there is a narrow stone bench set within the thickness of the wall. In addition, there appear to be the remains of a short flight of steps leading down through the opening from the outside to the interior of the chamber. Both suggest that the opening may have been built to function as a door, or in imitation of one. In the east and west elevations a single rectangular opening is set back by 0.18m into a recess which is covered with a gadrooned arch. The east opening is today incorporated into the west wall of the neighbouring chamber to the east where the gadrooned arch has been left visible. As at the north door, the wall on either side of the west (and presumably the eastern) opening consists of alternate courses of black and cream-coloured stone. Both openings rise from a sill at floor level. From the inside of the tomb chamber, it is possible to see that the east opening is closed with a grille that has been built into its jambs, sill and lintel, which would suggest that it was designed as a high window. In contrast, the opening in the west wall has no grille and there are no obvious signs that it ever had one; this in turn suggests that it was intended to act as a side door.

A raked cornice runs along the exposed sections of the north and south elevations. In both locations the moulding extends over the vault which covers the passage between the mausoleum and the east front of the ‘refectory’. A change in the jointing and the type of masonry at the top of the south and north elevations where they meet the vault clearly indicates both that the vault was inserted at a later date, and that the sections of cornice running over the exposed faces of the vault were re-used from the west elevation.

On the roof, the eight-sided drum (pl. 35.13) is constructed of good-quality ashlar. Unlike the masonry of the enclosed elevations below, the stonework on the drum has become rougher with weathering. There is a single rectangular window on each side of the drum, which provided light to the interior of the tomb chamber. Today all of them are blocked with concrete. The top of the drum has been dressed with a raked cornice moulding. On the south west side of the drum, almost hidden from view between it and a neighbouring building, a single corbelled stone projects at the level of the cornice. There seems to be no obvious function that can be directly attributed to it. The dome is clad in modern white stone paving and is

surmounted by a finial of unusual design with barley-sugar fluting around the main shaft.

Interior

Entering from the north, under the portal arch, two steps lead down approximately 0.4m into the stone-paved tomb chamber. The interior of the chamber measures approximately 7.6m from floor level to the apex of the dome. The dome and drum are supported in each corner on pendentives (pl. 35.14). Wall arches built of well-coursed but undressed stone span the pendentives. Traces of older plaster suggest that the interior was once plastered and painted but both the dome and faces of the pendentives appear to have been recently rendered with cement. Above the north, west and east openings there is a single relieving arch built into the surrounding wall. The inside faces of the windows in the drum of the dome are covered by small pointed arches.

The cenotaph (*tabut*), the *raison d’être* of the space, is located on the ground in the centre (pl. cat. 15.18). Today the tomb measures 1.05m by 1.62m by 0.65m. It has, however, recently been encased in a thick layer of concrete which makes an assessment of its original size difficult. The rectangular structure has four small marble posts at each corner which rise approximately 25cm above the surface of the concrete. Carved into the two outward facing sides of each post are small, well-preserved inscriptions. Unfortunately the bottom of each inscription is embedded in the concrete and as a result they remain indecipherable. A close inspection suggests that there is no date. This may indicate that the inscription is taken from the Qur’an and it is possible that the four separate inscriptions were designed to be read as one continuous text.

Interpretation

In the absence of a legible inscription or any document giving details as to the identity of Shaikh Sa’d al-Din al-Rusafi and when he lived, it is difficult to be certain whether the building was extant when the Khassaki Sultan foundation was built, or whether it was a later addition. Despite the report by Nabulsi, a judgment has to be made on the architectural evidence alone—and this in itself is contradictory. There does however seem to be a compelling, if speculative, argument to suggest that it was built after 959/1552 but before the end of the 10th/16th century.

The argument for the building having been built after the rest of the complex rests primarily on the design of the east wall of the refectory. It seems highly improbable that the builders of this structure would have incorporated

four large openings to look out into a passage that is less than one metre wide and the blank wall of the west side of the elevation. The number of openings and their position strongly suggest that the area to the east had been more open than the present arrangement. This might explain the high-level opening at the north end of the same wall, which could then be seen as a later addition built into the wall to allow light and air to enter from the larger space to the north of a new mausoleum. The reason that the building has large openings in all four sides can then be explained by the fact that, when it was first built, it was an independent structure within a confined space and open to the sky. This in turn would explain why the southern opening has been designed to be deliberately larger than the east and west openings, for it was the only side from which the faithful could obtain a good view of the chamber. And in turn this would suggest that the 'refectory' and kitchen, at least, were already in place. The third piece of evidence relates to the general mode in which funerary architecture in the region was planned. By building the tomb chamber within the close confines of the neighbouring buildings to the north, east and west, the builders were, it seems, taking the opportunity to create the procession of spaces often associated with other single-phase funerary monuments—that is, an entrance followed by a passage leading to a formal antechamber to the north of the tomb chamber where there would be a grand entrance. An example of this can be found only a short distance to the north in the Mamluk foundation of Turbat al-Sitt Tunshuq (Burgoyne 1987: 505) (fig. 35.1, pl. cat. 15.6).

Other architectural details of the building could be used both to support and contradict the theory that the mausoleum is an early Ottoman foundation. Gadrooned arches are found in some Ottoman monuments in the city until the second half of the 11th/17th century (for example, Qubbat Yusuf, dated 1092/1681—see cat. no. 38). But in Jerusalem they are far more commonly associated with the Mamluk period. The use of gadrooned ('pillow') arches has its origins in the Crusader and Ayyubid architecture of the city and are found, for example, at the Holy Sepulchre (see Burgoyne 1987: 88, 92, 112 and throughout). A number of them can be found around slit openings in the gates and towers of the city wall, for example Bab Nabi Da'ud. Burgoyne states that gadrooned arches were used 'well into the Ottoman period'. While in principle this is true, in fairness it should be pointed out that they were by then extremely rare. The use of alternating courses of different coloured stone occurs throughout the Ottoman period (and later). However the use of black basalt was exceedingly rare. Indeed, to the author's knowledge, the only other monument in which it was used was al-Madrassa al-Mawardiyya (cat. no. 28) which, although undated, is believed to be another Mamluk monument. Black basalt

from the 'Basalt Barrier' in Southern Galilee is a distinctive rough-textured stone and should not to be confused with the black bituminous limestone (*hajar musa*) which is found in the vicinity of Nabi Musa close to the Dead Sea, a type of stone that was also used in limited quantities in Jerusalem (Burgoyne 1987: 41 and n. 24).

To sum up, sparse historical evidence suggests that a person by the name of Shaikh Sa'ad al-Din al-Rusafi is buried in the mausoleum. Until new documentary evidence emerges, any additional speculation would be inappropriate, but the strength of the evidence lies with it being a Mamluk foundation.

Courthouse (al-Da'irat al-'Adliyya) (fig. 35.1)

The 19th-century courthouse is sandwiched between the gatehouse to the west and a house to the east. Although he was restricted in this way, the architect managed to insert into the available space a formally planned, rectangular building measuring 17.5m by 17m. At ground level there are a series of four barrel-vaulted galleries, measuring between 4m and 4.4m wide, ranged around a rectangular central courtyard measuring 6m by 4.8m. The courtyard is today roofed over and a modern mosque, built in the 1950s, occupies the southern half of the roof above.

Exterior (pls. cat. 15.1, 15.8-15.9 and pl. 35.4)

In direct contrast to the surrounding environment, the main elevation of the courthouse displays a regimentation appropriate to the function and planning of the building. A high, round-headed doorway, centrally placed and measuring 1.3m wide, dominates the façade. Above the door there is an undated inscription panel which advertises the function of the building—*al-da'irat al-'adliyya*. Ranged regularly along the elevation on each side of the doorway there are three high, round-headed windows measuring 0.9m wide. The six windows in the façade are surrounded by a flat frame projecting 7cm from the elevation, and a vertical, fluted channel runs up the centre of the frame and around the arch of the window.

The elevation incorporates a type of neo-classical architectural detail that was increasingly the mark of secular Ottoman monuments in Jerusalem from the middle of the 13th/19th century. 'Rusticated' masonry is used in the construction of most of the wall, while decorative details are constructed in smooth ashlar. A plinth, projecting 5cm from the principal face, extends along the base of the elevation. From the top of the plinth, four articulated pilasters, located at the ends of the elevation and on either side of a central door, extend up to first-floor level where they 'support' a simple, flat string course. Incorporated into the south wall of the mosque above the

string course are the remains of higher extensions of the pilasters which seem to have formed part of an upper level to the façade, since destroyed.

Interior

As noted above, the interior consists of four barrel-vaulted galleries ranged around a central courtyard. Today, a number of modern, concrete-block walls divide the spaces into useful compartments for the operation of the printshop.

From the galleries a series of round-headed windows and doors open into the covered courtyard. They are now mostly blocked. Entry into the courtyard is currently through an opening at the west end of the north wall. However, the original doorway, measuring 1.5m wide, is located immediately opposite the entrance door in the south elevation. Two similarly-sized doors are found in the west wall, suggesting that the galleries around the courtyard were originally divided up into separate compartments with their own entrances into the courtyard. In the east wall there are three windows. Above each of the windows and doors in the north and south façades, a small vaulted bay intrudes on the main vault and thus elegantly articulates an otherwise plain interior.

Three large, arched niches in the west wall are the only indicators of the relationship between the gatehouse and the site of the courthouse. All are now heavily plastered and painted, making it difficult to draw conclusions concerning their original function. The survey and the lack of order in their spacing in an otherwise regular building, however, allow for a number of conclusions. The relationship between one of the ground floor rooms of the gatehouse and the niche at the south west corner of the courthouse has already been noted. To judge by the size of this and the middle niche, both were doors—the first leading through to the room currently occupied by the director of the complex. The central one may once have led to a now inaccessible chamber at a lower level, which was adjacent to—and to the north of—the present office. The middle and third niche, located to the north, appear to indicate the position of the north east corner of the gatehouse. The back walls of both correspond exactly to the outside face of the east wall of the *khan*, suggesting that the east face of the *khan* wall continued south to abut the north wall of the gatehouse.

Architecture—North

(figs. 35.3 and 35.8)

Elevation to ‘Aqabat al-Takiyya (pls. 35.15–35.16)

The plainness of this, the most visible elevation of the

complex, is perhaps at first surprising. It should not be forgotten, however, that the richly decorated Mamluk Dar al-Sitt Tunshuq, which adjoins the elevation at its west end, was also incorporated into the foundation of Khassaki Sultan at the time of its construction, and would have provided a fitting façade to the imperial foundation. It is unfortunate that constraints of time prevented a survey of this elevation from being carried out in the summer of 1993.

The elevation measures 33m in length and extends from the western side of Saraya al-‘Iyafi al-Matbuli, up the slope of ‘Aqabat al-Takiyya, to the east end of the principal façade of Dar al-Sitt Tunshuq. Dominating the west end of the elevation—but hardly matching the splendour of the three portals in the earlier building—there is a double height portal gateway. The rest of the elevation is, in essence, a high, plain wall constructed of solid masonry in courses that vary in depth from 0.25m to 0.45m. The elevation rises (or drops) to a maximum of eighteen courses at the east end where the street is at its lowest. The central section of the wall, however, extends higher to first-floor level. Behind this section today there are the classrooms and the house sited above the bakery and stores.

The most attention, predictably, is reserved for the portal arch of the north gatehouse (fig. 35.8 and pl. 35.16). The portal measures 3.35m wide and 0.68m deep, and is dominated by a trefoil arch. The arch and the rest of the gateway are constructed of ashlar masonry of a colour very similar to that of the Mamluk elevation to the east. A vertical joint runs up the elevation to the top of the Ottoman portal between it and the structure next door. The joint is reciprocated on the south side of the gateway. A double quirked ogee moulding extends up the sides of the portal and across the elevation above the arch in a style identical to that found in earlier Mamluk portals (see Burgoyne 1971). The moulding terminates at ground level on the front edge of the stone benches (*maqsala*—literally ‘lazy boys’) to either side of the gate. The moulding splits at the level of the springing of the arch and continues around the line of the trefoil arch to its apex. There it merges with the main frame and forms a circular loop over the keystone.

The gate opening itself is recessed into the portal. It measures 2.15m wide and has a flat-arch lintel constructed of keyed voussoirs measuring 0.58m deep. The lintel is supported at each end on corbels with a double quirked ogee profile. The outside face of the corbels is in each case carved with two small incised medallions and a single *fleur-de-lys* motif. A single stone medallion, measuring 20cm in diameter and carved with radiating petals, is located centrally above the lintel. Above the ends of the lintel, a single boss (measuring 40cm in diameter) projects from the surrounding masonry. Both incorporate

elaborate geometric designs and a central flower with eight petals. Two further medallions, with spiral designs carved into them, are located below.

Above the gate in the tympanum of the portico, there is a large recessed rectangular panel measuring 2m by 1m. It is framed by a woven geometric design. The recess must certainly have contained one of the two 10th/16th-century foundation inscriptions. Located above the panel there is a small window with a grille which opens into a chamber situated above the gateway. Above the portal arch a slit, with an ogee shaped top, provides ventilation to the same room. The façade extends up to a cavetto cornice which continues around to the east elevation of the building. A repeated *muqarnas* motif is carved into the raked surface of the moulding. Carved into some of the *muqarnas* are small circular bosses with floral designs.

The only features in the elevation to the east of the portal are two rectangular windows—which light the stores to the south—and a single ogival arched slit at the west end, which ventilates the latrines on the east side of the gatehouse. Above each of the windows there is a single boss. The left hand (eastern) one incorporates a geometric eight-pointed star and smaller *fleur-de-lys* designs, while the other (western) is a circular design with ten ‘petals’ (pl. 35.17). The lintels of both windows comprise five fanned voussoirs. Those in the right-hand window, that is the one further up the hill, extend through two courses of the surrounding masonry, while those in the left-hand window extend through only one course. This may seem rather curious; however, by standing further down the street to the east, one can clearly see that the architect was attempting to correct the perspective view of the elevation. This apparent concern with the way in which the building relates to the surrounding environment was also noted by Professor Robert Hillenbrand during a discussion in 1993 when it was noticed that the east elevation of the *qantara* of Ribat and Maktab Bairam Jawish further down the slope of ‘Aqabat al-Takiyya is constructed of alternating courses of red and cream-coloured stone, whereas the west elevation is constructed of plain limestone. Professor Hillenbrand suggested that the reason for this apparent curiosity was an attempt by the builders to provide an appropriate frame for the view up the street towards the decorated façades of al-Madrassa al-Mawardiyya and Dar al-Sitt Tunshuq (author’s notes, 1993).

North Gatehouse

The north gatehouse is today a three-storey tower-like structure. The top floor is however a modern addition, and in its original form the building consisted of only two floors. The east end of the south elevation, at first-floor level, is partly ruinous which perhaps suggests that it once

extended further in that direction (pl. 35.18).

The ground level consists simply of a barrel-vaulted space, constructed of rough stonework which leads through to the north courtyard from ‘Aqabat al-Takiyya. At its northern end, the vault drops down to a shallow ashlar arch. Built into it on either side there is a curved stone from which the heavy wooden doors in the gatehouse are hung. In the south elevation, there is a single rectangular window at first-floor level which lights the chamber behind. Two arched ventilation slits are located above and on either side of the opening.

The small rectangular chamber situated over the gateway is reached via a short flight of steps from the roof terrace adjacent to the east. Survey drawings of the building suggest that there may also have been access to the mezzanine level of Dar al-Sitt Tunshuq through a door in the south-west corner of the room, a view shared by Burgoyne in his discussion of the Mamluk palace (1987: 492). Most of the space to the north is roofed over by a folded cross vault with a small domelet at its apex, while a narrower ‘antevault’ covers the south end. Ranged around the walls are a large variety of niches and window openings. There is little further information available about the space, although it has been suggested by Professor Robert Hillenbrand and Dr Beatrice St Laurent that it may have been a small bathhouse. If it is indeed a bathhouse, then it may be the one that Turner mentioned in 1815 (Ben-Arieh 1984: 161).

Soup Kitchen (‘imara) (pl. 35.19 and fig. 35.3)

Of all of the principal buildings in the complex, this is the best preserved. After more than four centuries it remains almost unaltered and, indeed, is probably the only one that performs the same function—if somewhat scaled down—as it did in 959/1552. Other than the *khan*, it is also the largest individual structure, measuring 14.5m by 14.5m. It is a simple box shape in form and is clearly distinguished from the neighbouring buildings by three pyramid-shaped chimneys on the roof.

The exposed north front, facing onto the lower half of the north courtyard, is constructed of well-dressed ashlar masonry in courses that measure up to 0.45m high. The west end of the north elevation is partly covered by the steep flight of steps which leads down from the upper area of the courtyard. It seems reasonable to suggest that the steps were built once the kitchen had been completed.

The kitchen is entered through a shallow arched door measuring 1.55m wide, situated at the centre of the north elevation close to the bottom of the steps in the courtyard. On either side of the door, towards the end of the wall, there is a single rectangular window, measuring 1.1m wide, with ‘eye-brow’ ventilation slits⁶ above its lintel.

There is a single projecting medallion between each of the openings and a further medallion is located centrally on the elevation at a high level. All of the medallions have geometric designs carved in low relief. A deep raked cornice runs along the top of the elevation and returns to the east to abut the façade of an adjoining building where it appears to stop. A slightly curious feature is located at the east end of the wall, approximately 1.7m above ground level. It is a small niche, no more than 0.3m in width, with a trefoil arched top and with a second trefoil arch recessed into the opening below. At the base of the niche, a stone basin—clearly intended to hold water—projects from the elevation.

The precision and solid elegance of this elevation directly contrasts with the comparatively rough construction of the other buildings in the courtyard. The reasons for this apparent curiosity become clear if one stands just outside the north gateway and looks back into the courtyard. The only building visible externally from the unidentified hall to the west of the kitchen is the elevation of the kitchen. It seems probable that the builders of the complex decided there was no reason to build the other structures to the same standard if they were not going to be seen by the general public. Apart from indicating a degree of forward thinking on their part, it also perhaps suggests that the complex was built to a budget.

Located in the centre of the flat roof above the kitchen is a dome supported on an eight-sided drum. In each of its sides there is a small arched window providing light to the interior. Ranged along the south side of the roof, on a high terrace, are three pyramid-shaped chimneys. Both the chimneys and the dome are today rendered in a thick plaster. It is known that during the British Mandate period they were all clad in stone paving (Kendall 1948: figs. 87-8, pl. 35:20).

Interior

The interior of the building is a large square hall divided into nine vaulted bays. The vaults are constructed of rough rubble which is now exposed, and are separated by transverse arches. These spring from simple raked corbels in the walls and piers and are constructed of smooth ashlar in a similar fashion to those found in the ‘refectory’. At the centre of the hall, four solid piers, measuring 1m by 1m, support both the vaulting and the drum and dome noted above. In each side of the cupola there is a single arched window lighting the centre of the hall. Of the remaining eight vaulted bays, the two to the east and west are cross vaults. The ribs of these vaults meet at a

rectangular shaped apex. A brick chimney stack from the ovens below pierces the apex of the west vault, while in the east vault the apex has been opened up to form a small skylight. The three bays to the north are simple cross vaults. Pointed transverse arches separate each of the bays; they spring from slightly projected raked corbel stones which are positioned at the top of the piers or in the walls (pl. 35:21).

The three ceiling bays ranged along the south wall are occupied by the chimneys. In form, the chimneys are elongated pyramids with rectangular openings at their apexes. While the rest of the internal walls of the kitchen are built of well-coursed, but rough, undressed stone, the inside faces of the sloping sides of the chimneys are built of smooth-faced ashlar.

In the central western bay there is a raised platform under which are situated two furnaces. The hatches, through which fuel was once fed, are located on the east side of the platform in a sunken area of the floor. A square brick chimney rises from the top of the platform, through the vault above, to the roof. Embedded in the top surface of the platform are two of the original five large copper cauldrons which Schultz noted at the beginning of the 19th century (Schultz in Ben-Arieh 1984: 161). One of the cauldrons is of a curious inverted-conical shape.

The floor level in the three eastern bays steps up 0.42m to form a platform which is reached by way of three steps located at the north end of the central bay. The bottom step, which is only 25mm high, suggests that the floor level of the rest of the hall—now covered in a concrete screed—would once have been about 0.15m lower. The north-east and east bays are also enclosed by a stone partition, measuring 0.5m thick. The infill stone closely resembles that of the surrounding walls but it would seem likely that the walls were a later alteration to the kitchen. Previous surveys have shown that the south-east bay was also enclosed, but this wall has since been removed (Burgoyne 1987: 486, fig. 48.2). Another change is that the north-east bay recently has been enclosed with a concrete wall to form an office. In the east wall of the kitchen there is a flat slab of stone projecting 0.5m from the surrounding stonework at head height. None of the present kitchen staff could offer an explanation for its purpose. In the same wall, there is an arched opening measuring 2m across which leads through to the adjoining room to the east. Close inspection of the opening reveals that it was broken through the back wall of a wide niche located in the west wall of a chamber immediately to the east of the kitchen. To the south of this opening there is second, smaller, arched opening, recessed 0.3m into the kitchen wall.

Perhaps the most interesting structural feature of the hall is the west wall. Incorporated into it are a number of blocked-up openings. Situated at distances of 1.35m and 2.9m from the north end of the wall there are two high

⁶ The term was first coined by Dr Sylvia Auld in 1993.

(approximately 3m) and narrow (0.7m) openings, positioned 1.5m above floor level. The southern opening is roughly arched, whereas the north one is covered by a single curved span which rises to the north. The function of these niches is unknown, but the similarity between these and similar niches located in the bakery building suggests they were once used to store the long handled 'spades' or spatulas with which the broth was stirred in the cauldrons.

In the same wall, at the same level, 4.2m from the north end, there is a third blocked opening 1.2m wide which resembles an arched doorway. The remains of a second arch can also be seen immediately above the doorway. There are no vertical joints 'supporting' the arch and it seems likely that it is the remaining section of a relieving arch. All three openings are filled with rough, uncoursed stonework. At the south end of the wall there is a deeply recessed niche, raised 0.25m above ground level and measuring 1.45m wide and 1.15m deep with a slightly pointed vault of rubble stones. The back of the niche is filled with a very rough rubble similar to that of the other blocked openings.

The appearance of the niche, and the presence of a high-level blocked-up doorway, suggests that there may once have been access through to the hall to the west of the kitchen which is located at the higher level of the north courtyard. This seems to be confirmed by the fact that the wall is 3.6m thick. Of that perhaps 1m can be attributed directly to the Ottoman kitchen itself, since the other walls are of a similar thickness. Staff in the workshops mention that there were 'two or three' openings in the west face of this wall in the adjoining room, but since its surface is now rendered in plaster it is impossible to know their location, and how—or even if—they relate to those still visible in the kitchen. No identification of the hall has been made. However, given the formal entrance off the upper level of the courtyard, and its proximity to the kitchen it may be that this is the 'refectory' mentioned in the *waqfiyya*.

What can be said for certain is that at this junction there is an artificially sharp rise in the external ground level of about four metres. This leads to one of two possible conclusions: (a) that there was already an existing building to the west of the kitchen against which the builders of the complex positioned the kitchen, or (b) that two buildings were constructed at the same time but that, because of the sharp drop in level, it was decided to build two abutting walls with which to support the roofs.

One additional feature of the kitchen is a small stone lean-to structure located in the south-west corner against the south wall. It comprises a balcony supported on an arch. A blocked-up doorway built into the south wall above the balcony matches a small blocked-up doorway in the north wall of the space to the north of the mausoleum. Its location under one of the chimneys of the kitchen indicates that it was built after the kitchen was founded,

and may confirm accounts by the staff that it was used by the administrators of the foundation to supervise the work of the kitchen.

East Chamber

Adjoining the kitchens, to the east, is a large, roughly rectangular, cross-vaulted chamber. At the southern end of the vault there is a blocked-up opening that once opened to the roof above. In the east wall there is a long alcove with a smaller arch between the corner piers that support the vault. The chamber was originally accessible only from the north courtyard through an arched door situated in its north wall. Today, however, there is direct access to the kitchens through two openings in its west wall. Both openings were clearly later alterations. This can be seen most clearly in the larger of the two, which appears once to have been an arched niche. Evidence for this can be seen in the southern half of the arch, where the original niche is still visible, even through the plaster on the walls of the chamber. In addition, there is a change in stone within the thickness of the opening.

The function of the chamber is unknown. Drainage holes cut through the sill of the main door in the north wall might, however, point to the possibility that it was used for the butchering of animals and the preparation of meat. Curiously enough, no mention of a 'butcher' appears in the *waqfiyya* even though meat is stipulated as a provision within the list of foods to be cooked. However, this apparent omission was rectified in 987/1579 when the *beg* and *qadi* of Damascus were ordered to appoint a special butcher for the complex (Heyd 1960: 144). There had been a shortage of meat during the winter. Unfortunately the butcher had to contend with local quotas of meat which by law had to be supplied to the shops. Whereas other butchers in the market had to supply a nominal one sheep and one goat per week, he had to supply no less than fifteen sheep and fifteen goats (Cohen 1984: 151).

Bakery Building (pl. cat. 15.20 and fig. 35.3)

Although for clarity's sake this is here referred to as the 'bakery building', it both serves and accommodates a number of different functions. At ground level these include the bakery, which still functions as such, as well as ovens and storerooms. The first floor partly serves as a house, while the majority of the rooms today serve as classrooms for the school.

The bakery building is located on the north side of the north courtyard immediately opposite the kitchen, and backs onto 'Aqabat al-Takiyya. The main bulk of this large building is a two-storey box-like structure. Adjoining the

east end of it there is a single storey annexe which, judging by the masonry of the south elevation, appears to have been built at the same time as the rest of the building. Towards the east end of the building, the south elevation returns 0.7m to the north, apparently in an effort to allow freedom of movement around the north side of the *sabil*. This perhaps supports the view that the *sabil*—or at least the site—may have been in existence prior to 959/1552 (Burgoyne 1987: 499). Ranged along the first-floor level of the south elevation there are four rectangular windows, while on the north elevation, fronting onto 'Aqabat al-Takiyya, there are only two, with a single double window in the east front. At ground level in the south elevation, four doors give access into the same number of chambers. A single window lights the interior of the bakery. Excepting the north elevation onto 'Aqabat al-Takiyya, the outer walls are constructed of regularly coursed but undrafted stonework. A careful inspection of the north and south elevations reveals a 'line of construction' at first-floor level, suggesting that there may have been a break between the completion of the ground floor and the construction of the first floor. This is perhaps confirmed by the presence of a large number of re-used stones in the upper level, whereas none are used at the lower level. In fact the *spolia*, mainly found on all sides of the building except the north, are of particular interest. Amongst them are at least five stones with Arabic lettering carved in relief, which have clearly been taken from a large inscription (pl. 35.22). A further seven stones, again carved in relief, have sections of a complex curvilinear design. Careful investigation of these stones reveals that they all probably originated from the Mamluk monument of al-Ashrafiyya (887/1482) in the Haram al-Sharif which was destroyed in the earthquake of 952/1545 (Walls 1980: 199, n. 5; Walls and Abu 'l-Hajj 1980: 29, n. 87-88). The date of this upper level of the bakery, and of the re-use of these stones is probably confirmed by the fact that, according to Cohen, during the 1550s 'explicit orders were issued to clear the entire esplanade (of the Haram) of weeds, building materials and other debris that had accumulated there' (1989: 4). Such building materials would have provided a useful and cheap addition to the new building project.

Ground level

At ground level there are six barrel-vaulted rooms of varying sizes. All of them are entered from the lower level of the north courtyard through arched doors 1.1m wide located in the south elevation of the building. The western chamber, ranging across the full depth of the building, serves today as the bakery. The other four spaces to the east serve as stores for the wood used in the carpentry/joinery workshop now housed in the main hall of Dar al-Sitt

Tunshuq. The two chambers in the eastern annexe are today in a ruinous condition. The southern one has collapsed and is filled with 3m of debris, while the northern chamber is still extant but hardly accessible behind the debris.

The bakery, a long rectangular space, is the largest chamber at ground level and measures 5.2m by 11m. Its vault, which is now plastered, painted and tiled, is higher and more rounded than those of the wood stores to the east, which are pointed. At a distance of 2.3m from the north end of the space, the side walls return approximately 0.8m on each side and the vault drops to a lower level. Located in the resulting alcove is a huge oven. A brick chimney measuring 0.9m by 0.9m extends from the top of the oven through the vault and floor above to roof level. In front of the oven is a sunken area in the floor (approximately 0.6m deep) which allows the baker to slide dough and bread in and out on long-handled 'spades'. Apart from the door, the space is naturally lit from a single window 1.2m to the west, and a narrow slit above the door.

Adjoining the bakery to the east a large chamber, stretching the full depth of the building, today serves as the main wood store. The room is irregularly shaped with a number of changes in direction in the walls. Most of the barrel vault is rendered with modern cement. At a distance of 4.7m from the southern end of the room, the space narrows from 4.5m to 3.7m wide, and the vault drops down to a lower level. This exposes a pointed arch with finely-dressed ashlar voussoirs which would appear to suggest that the space may have formed part of an earlier structure. In plan the thickness of the walls at the north ends of the chambers at ground level is much thicker than to the south. This seems to confirm the suggestion that the remains of earlier structures were perhaps incorporated into the Ottoman complex (see Burgoyne 1987: 499). The space is lit by a single, high level, slit window at each end of the space. At a point 2.2m from the north-eastern corner of the room there is a low door, 0.8m wide and raised 36cm above the ground, which leads through the enormously thick (nearly 2m) side wall to a small chamber to the east. At the west end of the tunnel is a single exposed door jamb with iron door fixings and a deep lintel above. There is no sign of the door jamb on the north side of the opening. The small adjoining space, now completely covered in a cement render, is also lit by a single recessed slit window at a high level. The author has been unable to ascertain the function of this little 'hidden' chamber.

To the south of this room there is a slightly larger chamber entered from the courtyard. It is unremarkable except for the existence of three niches located in the east wall, 0.4m above floor level. While the southern niche is small and rectangular, the two to the north are over 3m high and 0.74m wide and surmounted by a hooded vault. They clearly served as storage alcoves for specific items—

perhaps for the long-handled 'spades' still used today in the baking of bread.

Nothing is known of the south chamber in the eastern annexe which, as noted above, is now ruined. However, the almost inaccessible north chamber is entered through a 2.5m wide archway with a pointed arch made of finely-dressed stones similar to those found in the arch in the main wood store. The space is covered by a cross vault and constructed of a matrix of rubble and plaster. The roof over the vault serves as a balcony for the family who today live in al-Zawiya al-Muhammadiyya (1083/1672?).

First-Floor Level (fig. 35.8)

The first floor of the building is entered from the upper level of the north courtyard via a 2m-wide staircase built against the west end of the building. A door located in the centre of the elevation leads off the landing at the top of the stairs into a cross-vaulted lobby, which in turn leads directly into a long corridor space which is also covered by cross vaults. Doors in the south and east walls of the corridor lead into classrooms which are similarly vaulted. In the west elevation, a second door towards the north end and located in a small roof-top terrace—the courtyard to the east of the bathhouse over the north gateway—opens into a small barrel-vaulted lobby. This leads by way of a low door through into the west end of a large space consisting of two cross-vaulted bays which are today used as the house.

The functional division of the first floor is a later adaptation. The survey shows that the floor is, in point of fact, structurally divided into twelve bays of almost equal size, eleven of which are covered by cross vaults. The twelfth bay in the north-west corner is divided by a small barrel-vaulted space and a staircase, which leads up to the roof of the building. Within this framework it is possible to see that the floor was divided into three principal spaces divided off by two thick (0.65m-0.9m) partition walls.

The largest of the spaces is a great hall, measuring 8m by 12m, located on the north side of the building. The space occupies six of the vaulted bays which are supported in the centre of the space on two square piers. Ranged along the length of the south front of the floor is the second principal space—a long gallery occupying four of the bays arranged end to end. A wide alcove in the north wall of the space accommodates a door which leads through to the central bay of the great hall. The plasterwork covering present on the walls today prevents an investigation to find out whether the opening was contemporary with the foundation of the building, or a later addition. The last space is located in the north-west corner of the floor, adjoining the west end of the great hall. It comprises one cross-vaulted bay which functions today as a lobby space

leading into the classrooms, and the narrow barrel-vaulted space mentioned above. A raised doorway in the north wall opens into the stair. The door is covered by an arch with voussoirs which are, for some reason, massively over-sized for the job that they do. The south-east corner of the lobby conceals, and houses, the chimney rising from the bakery below.

The function of the two main spaces is unknown. However, given their proximity to the chamber over the gatehouse—which, it will be remembered, is thought to be a bathhouse—and their location over the 'working' areas of the complex, it is possible to surmise that they were perhaps used as accommodation (dormitory or otherwise) for the many staff, in particular for the kitchen and the bakery, employed in the complex. Goodwin notes that workers in religious foundations were lodged and fed, and that a hereditary system of apprenticeships developed down through the children of the staff (1971: 456). However, curiously, staff accommodation is not included within the provisions of the (Turkish) draft *waqfiyya*.

Sabil (pls. cat. 15.5 and 15.19)

The *sabil* is a simple rectangular structure projecting from the east wall of the north courtyard and orientated obliquely to its main west-east axis. The structure, which encloses and contains a large water-storage tank, measures 5.3m by 4.4m in plan, and is constructed of well-dressed ashlar masonry of a very similar type and size to that used in the construction of the kitchen. The sides of the *sabil* rise to approximately 2.8m above the level of the lower courtyard. The west front of the *sabil* extends to 1.83m below the level of the courtyard. At the base of the wall there are four slightly recessed arched panels surrounded by a quirked bevelled frame. In the centre of each of the panels a single (modern) tap supplies water from the tank behind. Access to the taps is down a series of eight steps stretching the full width of the *sabil* and terminating close to its west wall.

Access to the water-storage tank is through a small access hatch (0.6m wide) at ground level in the north face of the structure. The stone reveals of the opening are shaped to form the jambs of a small door. A small arched niche, measuring 0.45m wide and 0.45m deep, has been built into the same wall 0.5m to the west of the access hatch. Socket holes in the sides of the opening suggest that the niche was once fitted with a door but its precise function is unknown. The north-west corner of the structure is heavily chamfered and corbels out, in an elegant curve, at a high level. The only possible reason that can be deduced for this arrangement is that it allowed easier movement around the return in the bakery building a couple of metres to the north-west.

The interior of the water storage tank is today disused and filled with a pile of unsavoury debris. It is easy to discern, however, that the space is barrel-vaulted and that both the wall and—after some investigation—the floor, are heavily lined with a layer of plaster 5cm thick up to a level approximately the same as that of the lower courtyard. The corners of the tank are rounded and the walls above are constructed of roughly dressed masonry. A simple calculation reveals that the tank could store in excess of 14.5 cubic metres of water or 14,500 litres. This goes some way to explain why, in 959/1551-2, the complex donated money for the building of a channel that led to the *sabil* from Birkat al-Sultan, which was the principal source of water for the city (al-‘Asali 1989: 24). Although this sounds like a good deal of water, it should not be forgotten that, because of the low levels of rainfall in the region during the summer months, this might have been the only water available to the complex for a significant part of the year.⁷ 13th/19th-century surveys of the city show a channel linking this water storage tank with Sabil Bab al-Nazir (cat. no. 7), located at the junction of al-Wad and ‘Aqabat al-Takiyya less than 50m to the east. Nothing more is known about the channel (Warren 1865: map sheet 1). Immediately to the west of the access hatch to the storage tank there is a settlement tank and a water chute, which suggest that water was also directed to the *sabil* from the roofs of the complex.

Built against the south side of the structure there is a flight of eight steps, measuring 1.1m wide, which leads up to the east to a platform/landing at the level of the roof of the *sabil*. It seems clear that, when it was first built, there was once a small vaulted room on top of the building. Apart from the existence of the steps, two further pieces of evidence point to this conclusion. Firstly, foundations of walls are to be found around the outside of the space, at the corners of which there is the extra thickness of masonry which would indicate support for a cross, or folded cross, vault. Secondly, leading from the landing of the external stairs there are the remains of a sill as well as the bases of the jambs of a door. There is yet a third piece of evidence in the way the chamfer of the north-west corner of the structure arcs out in the top two courses of the existing structure to form a corbel or jetty to receive the corner of the room above.

The overall arrangement strongly suggests that this building functioned as a *sabil-kuttab*, that is, as a public fountain with a small room above used for the tutoring of children in the tenets of Islam. Only one other known example of this type of building has been recorded in Jerusalem to date. This is the *sabil-kuttab* found at the Mamluk foundation al-Tashtamuriyya (784/1382-3), located to the south in Tariq Bab al-Silsila (Burgoyne 1987:

470). Despite the lack of precedents in Jerusalem, *sabil-kuttab*s were firmly founded within the Ottoman tradition, both in Ottoman Turkey and in the provinces of the empire. Qa’itbai had built a number of them in Cairo during the latter half of the 9th/15th century, and the practice continued into the Ottoman period. Indeed, such was their popularity that nearly one hundred were built through the city, perhaps because they were reasonably small and therefore quickly (and cheaply) built (Blair and Bloom 1994: 92; Behrens-Abouseif 1989: 27). Added weight is given to the suggestion that this was a *sabil-kuttab* by its location. Children—orphaned or not—would have been present in this northern half of the complex more than they would have been in the south, as they came to the kitchen. More pertinently, the existing *iwān* to the east of the *sabil*—facing on to the courtyards of what was probably a part of al-Madrasa al-Mawardiyya/Rasasiyya and which probably continued as a religious college under the guise of al-Madrasa al-Khassakiyya (al-‘Asali 1981: 25)—probably did not exist in its present form. A double window is oddly positioned in the east wall of the space once occupied by the *kuttab*, suggesting that it at least, if not the whole *iwān*, was a later addition. As such, the *sabil-kuttab* was also perhaps in an ideal position to overlook the courtyards of the *madrasa* to allow the children on occasion to benefit from the discussions of their elders there.

Summary and Conclusion

It is hoped that the description and analysis of the Khassaki Sultan complex has provided a comprehensive overview of this, the largest imperial foundation in Palestine. It does not pretend to have solved all of the problems that the chapter began by asking. The date and history of the mausoleum and of Shaikh Sa‘d al-Din al-Rusafi remain a mystery. Nor has a satisfactory answer been found to the question of the function of the Dar al-Sitt Tunshuq after that building was incorporated into the complex. Perhaps it was used as accommodation for the principal administrators and their staff? The planning of the south side of the complex suggests that it might have been here that the necessary accommodation for the Sufi community would have been located, perhaps on the site of the 13th/19th-century courthouse. It could be argued that this hypothesis is confirmed by the rather curious layout of the house in the south-east corner of the south courtyard and what appears to be the remains of a connecting doorway between the two. Further confirmation of this would require a detailed analysis of the house, and/or archaeological investigation of the courthouse, a prospect that will have to be ruled out, at least for the foreseeable future.

Leaving aside the ‘fifty-five’ rooms, all of the

⁷ My thanks to Mr Martin Dow for putting this in perspective.

provisions listed in the *waqfiyya* have been identified. The kitchen, the *khan* and the bakery were already known, if not fully documented. The document does not make clear for whose use the refectory was designed. However, the hall in the south side of the complex was almost certainly used by the Sufi community and would undoubtedly have performed the function of refectory. Perhaps too, the rebuilt area adjoining the west wall of the kitchen served a similar function. The 'high praying place' seems to have been located over the south gatehouse. If this is correct then this raises questions concerning the reason for the use of a format of praying place that hitherto, to the author's knowledge, had not been used in an Ottoman foundation. The *sabil* which, judging by its location, would have been primarily for the use of the kitchen, and those who came to eat there, certainly had a chamber over it. That the Ottomans had had a predilection for building *sabil-kuttabs*—particularly in Cairo—both before and after the middle of the 10th/16th century is indisputable. Whether or not this structure has been properly identified here as a *sabil-kuttab* is open to debate.

What has emerged from the survey of the key 10th/16th-century elements in the complex is a clear picture of a socio-religious complex which was carefully organised within the constraints of a dense urban complex to take advantage of existing built resources. The place, however, was almost certainly not designed or planned by Sinan and he certainly played no part in the resulting

architecture. Even if the architecture is not particularly elegant, the planning solution was, and this suggests that it was conceived by a resourceful mind. By clearly dividing the functional requirements of the *waqfiyya* between the north and south sides of the site, that is between the civic requirements of providing for the poor of the city and the pious requirements of pilgrims and the Sufi community, and by linking the two with the joint requirement for the provision of food, the available space was used to its maximum potential. The careful weaving of the new foundation into the already existing Dar al-Sitt Tunshuq, and notably the connection made between the *khan* and the main hall of the Mamluk palace, illustrates that no little thought was given to its planning.

In a sense the architecture did not have to be grand. The borrowed Mamluk palace, Dar al-Sitt Tunshuq, often confused by 19th-century visitors to the city as the Ottoman foundation—which of course by then it effectively was—provided the grandeur that was required. Nevertheless, even though the architecture is solid and workmanlike, there are clear links between this site and the other imperial foundations in the city—the walls and the *sabils*—which suggests that at least the same builders, and perhaps the same architect or supervisor, were responsible. If nothing else, it is hoped that this survey will have provided the foundation, and inspiration, for further work on the site.

Chapter 36

THE ARCHITECTURE OF OTTOMAN JERUSALEM

Yusuf Natsheh

Introduction

Sources

The *sijills* of Jerusalem, standing monuments, descriptions by travellers (Muslim and Western), recent research.

The principal primary sources for this chapter are twofold, as the sub-title—the *sijills* of Jerusalem and the standing buildings—reflects. Other sources too have significantly enriched the research. The intention here is not to present and evaluate all the sources used, but rather to cast some light on the nature and complexity of the most important unpublished material as well as some of the published material regarding the architecture of Jerusalem in the relevant period. All the other secondary references, regardless of the size of their contribution to the study, are listed in full detail either in the Bibliography or in a specific footnote. There follows a list of the central sources used, arranged according to their importance.

*The Sijills of Jerusalem*¹

Sijill (plural *sijillat*), the original Arabic meaning of which was 'to register', is used widely today to refer to the

archives of the Shari'a, or Muslim religious court.² The records of the religious court of Jerusalem provide scholars with an unparalleled fund of information on the history of Jerusalem and Palestine in the Ottoman period—material which is not found in any other available source. The records cover almost all aspects of Palestinian history in general, and Jerusalem life in particular. They contain data on social, legal, and politico-administrative matters relating to both Muslims and non-Muslims, and include a wide range of *firman*s and communications with the capital.³

The official and the legal records, which began⁴ in the year 936/1529 and continue up to the present, are

² For further discussion on the term *sijill* and its development, see Manna' 1986: 351-3.

³ For further details on the importance of the *sijills* of Jerusalem and on the areas of information, see Ma'oz 1970: 10-11, Mandaville 1975: 517-24.

⁴ The first volume of the records of Jerusalem predates the first volumes of the courts of Aleppo (962/1555) and Damascus (991/1583) (Manna' 1986: 354). It is worth mentioning that the earliest volume of the Mühimme Defteri kept in Istanbul is dated 951/1544. The dated documents in Heyd are extracted from a second volume dated 959-60/1552 (Heyd 1960: XVIII 'Addendum', 4.). Tahrir Register no. 522, which includes 72 pages on the *waqfs* of Palestine of which 14-31 relate to al-Quds, is not dated. Tahrir no. 342 has 33 pages exclusively on the *waqfs* of al-Quds and is dated 970/1562-3. Tahrir register no. 602 has no termination date, but Ipsirli (1984: 96) estimates that it may have been compiled a few years after the Ottoman conquest; it includes a list of 243 *waqfs* (pages 463-95), the majority of which belong to the Islamic dynasties before the Ottomans (Ipsirli 1984: 95-96).

¹ Whenever the *sijills* are used as a reference, the number of the volume and the page are given. A colon separates the two numbers. If more than a single *sijill* is quoted, a semicolon appears between the *sijill* volumes.

contained in some 650 bound volumes.⁵ Most of the *sijills* are written in Arabic, but a few are inscribed in Ottoman Turkish. The records are registered haphazardly, with no specific order or classification according to subject or date, but were written as the various matters arose and were recorded.⁶ It is therefore necessary to scan each item in order to determine if it contains information relevant to a specific matter. It is a huge task which will require years of study.

‘Arif al-‘Arif (1961), a Palestinian historian, was the first local scholar in modern times to appreciate the importance of the *sijills* as a source for the history of Jerusalem. He cited many references in his famous book on the history of the city. The value and wide range of the *sijill* records relating to Jerusalem were mainly introduced to Western scholars in two works by Mandaville (1966: 311-19; 1975: 517-24). Tibawi (1978) published the *waqf* foundation of the Moroccan neighbourhood based on two *waqfiyyas* from the *sijills*. Al-Husaini (1982) wrote a book on *waqf* with a transcription of some documents from the *sijills*. Soon after 1967, Cohen (1994: 4, 5) was the first Israeli scholar to use the *sijills*; following this work, the way was paved for a group of Israeli scholars and their students to utilise this primary source for a number of published studies.⁷ Al-‘Asali from 1983 onwards used the *sijills* to a varying degree in his books (see Bibliography); the volume entitled *Watha’iq Maqdisiyya* (vol. 1 1989, vol. 2 1989) contains extensive extracts from the *sijills*, but it mostly pertains to the later Ottoman period.

While some of these publications were in preparation, another group of Palestinian Ottomanists as

well as other Israeli scholars investigated the *sijills*, a process which resulted in a further treatise on the importance of the records. Doumani (1985: 155-72) revealed the value of the records as a source for socio-economic history, and Manna‘ (1986: 351-62) published a valuable article on the Jerusalem *sijills* as a source for the study of Palestine during the Ottoman period. Atallah (1993) published two volumes on the guilds of Jerusalem in the seventeenth century. The *sijills* were also the source of primary information for many MA and PhD dissertations in different institutions.⁸

With the exception of al-‘Asali (1989), who included three short documents concerning building activities, all the studies mentioned above were concerned to seek out and publish various aspects of historical data; they did not deal with buildings or their history. It is indeed noticeable that neither of the works of Atallah include anything on the guilds of the builders. The first—and indeed the only—attempt known to the present writer to investigate the *sijills* for architectural purposes was made by Burgoyne and Richards (1987: 58). As the writers themselves admit, this attempt ‘was largely frustrated’, and after 33 volumes of the *sijills* had been examined, they had not come across a single Mamluk endowment instrument.

Thus, when the present writer began research into the *sijills* in 1995, the situation was neither clear nor promising, although it was hoped that relevant data would be discovered because of the publication of very limited *waqfiyyas*⁹ recorded in the *sijills* regarding certain Mamluk

⁵ Al-‘Asali (1989b: 225 n.3) estimates that these comprise some 100,000 folios; Manna‘ (1986: 356) notes that it is almost impossible to calculate the average number of the documents contained within each volume because of their diversity.

⁶ An attempt was made in the late 1980s by a small team of employees of the Shari‘a court to solve the problem by indexing a number of the *sijills*. The team was headed by the late Shaikh As‘ad al-Imam al-Husaini. Each index entry contains the following: (1) the number of the *sijill*; (2) the number of the page; (3) the number of the document; (4) the subject of the document; (5) the name of the *qadi*; (6) and any notes that were necessary. At the outset, although the size of the index was almost as big as the volume of the *sijill* itself, the attempt was both successful and useful. Unfortunately, the index later became very abridged and therefore less useful. At present there is no further indexing process in hand.

⁷ Cohen’s publications include: *Jewish Life under Islam* (1984); *Economic Life in Ottoman Jerusalem* (1989); ‘Sixteenth Century Egypt and Palestine: The Jewish Connection as Reflected in the *sijill* of Jerusalem’ in *Egypt and Palestine, a Millennium of Association*, eds. Cohen and Baer (1984). Cohen also published several Hebrew articles and books (see Bibliography), the most recent of which was with others in *Jews in the Moslem Religious Court* (1996). Examples of publications by other Israeli scholars are: Baer (1990); Peri (1990); Singer (1994); Ze‘evi (1996).

⁸ For example B Sabri, *Liwa‘ al-Quds fi al-Qarn al-Tasi‘ ‘Ashr, 1840-1873*, MA thesis, ‘Ain Shams University 1981; A Manna‘, *The Sancak of Jerusalem between two Invasions (1798-1831): Administration and Society*, PhD Dissertation., Hebrew University of Jerusalem 1986; D Ze‘evi, *An Ottoman Century—The District of Jerusalem in the 1600s*, PhD Diss., Hebrew University of Jerusalem 1991; M Atallah, *Die Zünfte in Jerusalem im 17. Jahrhundert anhand von Gerichtsurkunden*. PhD Diss., Universität Tübingen 1988.

⁹ Examples of the most important are:

(1) the *waqfiyya* of Khassaki Sultan (al-Husaini 1982: 78-93, al-‘Asali 1983: 127-142) though Stephan noted the difference between the Arabic text in the *sijills* and the published Turkish text (1944: 170-192).

(2) the short *waqfiyya* made by Muhammad Çelebi al-Naqqash for the benefit of the *sabils* of Sultan Sulaiman (al-Husaini 1982: 109-10; 115-16).

(3) the *waqfiyya* of al-Shaikh Muhammad al-Khalili (al-Husaini and Abu Layl 1987).

(4) the *waqfiyya* of al-Madrassa Tankiziyya (al-‘Asali 1983: 108-121). Burgoyne (1987: 224-5) quoted a large part of this *waqfiyya* directly from the *sijill* (92: 426-30).

(5) the *waqfiyya* of al-Khanqah al-Salahiyya by Salah al-Din (al-‘Alami 1981; al-‘Asali 1983: 91-100); see also Frenkel, ‘The Establishment of the Waqf of al-Khanqah al-Salahiyya by Salah al-Din’ in *Cathedra*, vol. 65 (1992: 21-36 in Hebrew).

(6) the *waqfiyyas* of the Maghariba (al-‘Alami *Waqfiyyat al-Maghariba*, Jerusalem: General Auqaf Administration 1981).

and Ottoman buildings. Although the early search proved slow and disappointing, it later changed dramatically, and the results have surpassed any expectations.

With the help of the data found in the *sijills*, the present writer has been able:

(1) to add twelve monuments to the list of the known Ottoman buildings, six of them (cat. nos. 13, 21-25) datable to the 16th century; three others (cat. nos. 34, 41, 48) date to later than the 16th century, and three more are undated (cat. nos. 18, 28, 29).

(2) to find the complete text of 12 unpublished *waqfiyyas*—seven (cat. nos. 11-13, 18-19, 21, 25)¹⁰ of these relate to buildings constructed in the 16th century, and the rest (cat. nos. 33-35, 40-41, 48) relate to buildings constructed after the 16th century.

(3) to find extracts (cat. nos. 1, 3, 20, 22-24, 34) of many other *waqfiyyas*, which for some reason were not recorded in their entirety in the Jerusalem *sijills* and whose original text is most probably now lost.

(4) In addition, the *sijills* provided the data for the second chapter of the study. This deals with building processes, the traditional materials and the activities of the master builders, both local and non-local, Muslim and Christian. The writer was able to follow the fortunes of a local family of master builders for five successive generations. The contents of the study alone demonstrate the importance of the various data. The most important documents are transcribed into Arabic with an English summary in Cat. Appendix 1.

It is certain that future research in the *sijills* will reveal even more information on the architecture of Jerusalem and its history, and will fill in the gaps that remain. The research work that has been done for this study has proved that it is wrong to consider the *sijill* documents of the archives of the Ottoman Court at Istanbul as the main resource, with the Jerusalem *sijills* as merely a supplementary and complementary record. The Jerusalem documents are in fact unmatched as a source for provincial local history, even when they are compared with the archives of Istanbul.

The Standing Monuments

The buildings themselves provide primary evidence, in particular for the architectural fabric of the city. The description of these monument in the accompanying catalogue forms the second part of the study. It was on the basis of the catalogue that the third section was written. It covers various aspects of architecture arranged under three

categories: types of buildings, architectural elements, and decorative elements. These categories have enabled the writer to compare the Ottoman monuments of Jerusalem with those found in the city before the Ottoman period, and those of other areas.

Beside the architectural elements, many buildings contain foundation inscriptions which have been meticulously studied and edited with valuable comments by the famous Swiss epigraphist Max van Berchem in his indispensable *Corpus Inscriptionum Arabicarum* (1922-27). However, a few inscriptions escaped the van Berchem study,¹¹ and in certain cases a different reading to some names and words is offered here (see cat. appendix 2).

Descriptions by Travellers

(a) Muslim Travellers

The status of Jerusalem as a focus for visits and pilgrimage increased in the Ottoman period and many travellers have left descriptions of the city as a whole, and of the Haram area in particular. It is however the case that the majority of these descriptions concentrated on the Dome of the Rock, al-Aqsa Mosque, and on Sufi figures and saints. Most of the travellers were not concerned with architecture or the fabric of the buildings, unless these had some religious significance. Any such reference was included only from a religious or legendary point of view. As a consequence, the reader will be frustrated of any hope of discovering in the writings of the Muslim travellers significant information on the monuments and their architectural features. However, an exception to this general rule must be made for two travellers who left useful descriptions both of the city and of certain of its monuments. The first is the Turkish traveller Evliya Çelebi who visited Jerusalem in 1059/1649. His text was translated into English from the original Turkish by Stephan (see below). Evliya Çelebi left vivid, detailed descriptions of Jerusalem in the *Seyahatname*, his text proving the richest and most extensive of all the descriptions of the travellers who visited the city in the Ottoman period (see al-'Asali 1992). This learned Turk demonstrates an indefatigable interest in the physical appearance of the monuments, to such a degree that he includes the numbers of columns supporting certain of the domes, and he was in addition precise in mentioning the exact location of the buildings. His description of the Citadel is particularly interesting. His remarks cover most aspects of the structure and life of the 11th/17th-century city. But, for all that, it is necessary to sound a word of caution. Care should be taken over some of his opinions

¹⁰ The complete Arabic text with an English summary and a facsimile are to be found in cat. appendix 1, under the number of each catalogue entry.

¹¹ The numbers of these inscriptions as they appear in the catalogue and in cat. appendix 2 are: 13; 14; 15/1; 15/2; 17/2; 19; 33/1; 33/2; 33/3; 35; 40; 42; and 46.

and interpretations, such as, for example, his statement that Qoja Sinan was the architect who was responsible for the projects of Sulaiman Qanuni. No basis for this assertion has yet been discovered. Another problematic area is his belief that the motivation behind Sultan Sulaiman's building activities was a dream that he had about the Prophet Muhammad.

The second traveller whose account is of value is al-Nabulsi, who visited Jerusalem twice, in 1101/1690 and 1105/1693. He left descriptions of the city and its surroundings full of rhetorical expressions in rhymed prose (*saj'*) and much poetry. He was interested in particular in the Sufis, saints, and tombs, rather than in architecture or the individual buildings themselves. Generally his descriptions are concise, apart from that of Sabil Qasim Pasha (cat. no. 2) and al-Khanqah al-Maulawiyya (cat. no. 19). Both of these contain interesting detail, although it is noticeable that al-Nabulsi for some reason ignored the minaret of the *khanqah*.

(b) Western Travellers

The literature of the travellers from the West underpinned the present research with useful but limited information on a few of the monuments under discussion. The limitations of the information are due to many factors. The main interest of the travellers was in biblical and Christian sites rather than the Muslim ones. Even if a visitor was interested in Islamic architecture in the city, that interest would have been confined to the Dome of the Rock and al-Aqsa Mosque or perhaps some other monumental building. The simplicity and unimposing size of the Ottoman monuments meant that they left little impression. It should also be remembered that Western travellers were not allowed easy access to the Haram—the location of the majority of monuments described in this study—until the second half of the 19th century. This meant that any visit by earlier travellers was either conducted under a false name (as was the case of Ali Beg al-Abbassi), or under heavy escort; some visitors even experienced real danger (Burgoyne 1987: 35-6).

Any researcher must use caution when using data included in the reports of some of the Western travellers, for, beside the difficulties they encountered in investigating the sites mentioned above, some early visitors to Muslim sites apparently based their writing on oral information gleaned from the guardians of the Haram rather than from more authentic sources. Van Berchem (1925: 170), for example, commented on Catherwood's use of the name 'Qubbat Fatima' for Qubbat al-Nabi (cat. no. 10) which had no basis in any traditional Arabic reference to the Haram al-Sharif. Schick (1887: 25) gave the name 'Masjid al-Nabi' (Mosque of the Prophet) to the building identified by the restoration inscription as the 'Qubbat al-Hadi al-

Amin' (cat. no. 43). Pirotti (1864: 151-2) considered the 16th-century kitchen of al-'Imara al-'Amira (cat. no. 15) as having been originally a *hammam* (bath-house), and, as Burgoyne (1987: 36) has noted, he ascribed every 'Saracenic' building either to Saladin or to 'Solyman'.

The fact that Qubbat al-Khadr does not appear on any of the three maps drawn before the Ordnance Survey of Palestine dated 1867, although according to Ali Beg al-Abbassi it was extant before then (1816 2: 223, pls. LXXI, LXXII), leads the Spaniard Badia y Leblich to argue against the accuracy of these maps for the small monuments of the Haram. The maps are held in the collection of the Palestine Exploration Fund in London. The first map was drawn by Catherwood in 1833,¹² and the second is a reduced copy of the map with a few corrections and additions. The third is a sketch map of the north-western area of the Haram drawn by Conrad Schick (No. Schick 239/7).

Modern Research¹³

Since 1967, almost every year has seen the publication of numerous articles, books, and theses on Jerusalem past, present, and future. Our knowledge of Jerusalem's history and its development has been impressively enhanced in the last three decades by virtue of archaeological excavations and surveys, and by the discovery of various types of written documentation, such as the Haram records, inscription plaques, and *sijill* documents. Despite this situation, there has been only a mere handful of works devoted to widening knowledge and understanding of the city's development and the nature of its architecture in the Ottoman period, and what has been published is very limited.

Stephan was one scholar of Palestine who showed an early interest in the Ottoman period and its architecture. Although his main contributions were translations from Ottoman Turkish to English, his pioneering work and perceptive remarks command admiration. Stephan (1933: 132-5) began his output by translating from Ottoman Turkish into English and then

¹² The map is published by J Fergusson, *An Essay on the Ancient Topography of Jerusalem*, (1867: pl. IV, London).

¹³ It is worth mentioning here the major recent bibliographical works on the history of Jerusalem. These include J Purvis, *Jerusalem, the Holy City: a bibliography*, vol. 1 1988 and vol. 2 1991; Rasdad al-Imam, *Bibliography of the Holy City of al-Quds Jerusalem*, vol. 1 (1989 in Arabic), vol. 2 part I (1990 in Arabic), vol. 2 part II (Appendices 1991), vol. 3 (1992 in English), Carthage; and K Bieberstein and H Bloedhorn, *Jerusalem. Grundzüge der Baugeschichte vom Chalkolithikum bis zur Frühzeit der osmanischen Herrschaft*, 3 vols. Wiesbaden 1994.

publishing two inscriptions from the Citadel. This was followed by a translation of the text of Evilya Çelebi's travels in Palestine. Stephan published the translation in successive issues of the *Quarterly of the Department of Antiquities in Palestine* (QDAP IV-IX, 1935-42). Schiller reprinted the texts in a single booklet in 1980, and al-'Asali (1992) has recently translated the text into Arabic. Finally Stephan (1944: 170-94) translated the Turkish version of the important *waqfiyya* of Khassaki Sultan with comments regarding the Arabic version recorded in the *sijills*.

Meinecke's article (1988: 257-83) on the restoration of al-Quds/Jerusalem by the Ottoman Sultan Sulaiman is also very important. Though the article is relatively short, the author has surveyed most of the known architectural restoration and construction projects which were carried out in the city during the reign of Sultan Sulaiman. Meinecke based himself primarily on the epigraphic evidence from van Berchem and on some contemporary and recent references. The article includes many photographs and a rich bibliography given the length of the work but it does not include any architectural plan or section. The author was after all based successively in Cairo and Damascus. The value of Meinecke's article lies in his wide knowledge and his ability to draw a comparison between the architectural elements of the Ottoman buildings of Jerusalem and the region under Sulaiman, and other buildings in Cairo, Damascus, and in particular in Aleppo. This cross-referencing allowed him to come to many conclusions, in particular about the origins of the master builders who were employed to work on the imperial projects in Jerusalem, and in general about the sources of the Ottoman architecture of the city. The majority of these hypothetical conclusions have now been proved correct by evidence discovered in the *sijills* by the present writer.

One year after Meinecke's article, two papers appeared in *The Islamic World: from Classical to Modern Times*, edited by Bosworth and others (1989). The first paper was written by Rosen-Ayalon (1989: 589-607), and dealt with the Jerusalem *sabils* built by Sultan Sulaiman. This is the only article known to me which includes a detailed architectural description of Ottoman buildings in Jerusalem. It includes good photographs and plans in addition to a map but has no elevations. Rosen-Ayalon confines her paper to an analysis of the fountains with no concern for the literary sources, which resulted in her missing useful historical material from the *sijills* published by al-Husaini (1982: 113-16). This information was latter quoted and expanded by Cohen (see below). The author traces most of the features of the *sabils* to traditions found in the 'region' prior to the Ottoman period. It follows that most of her analogies are drawn from the buildings of Mamluk Jerusalem, with only two examples taken from outside the city. She concludes that the form of the *sabils* is

not found in other periods or other places, a conclusion with which the present writer does not agree (see section below under *Sabils*).

The second paper by Cohen (1989: 467-77) is devoted to the reconstruction of the walls of Jerusalem under Sultan Sulaiman Qanuni. Cohen investigates the motives which led Sultan Sulaiman to surround the city with a wall, and changes his earlier ideas (Cohen 1982: 407-18) about the administrative and financial role in the project of Castro (a Jewish financial employee from Cairo) in favour of Muhammad Çelebi al-Naqqash, who was the superintendent of the wall project according to his title in the Jerusalem *sijill*. Though the paper concentrates on historical and financial aspects, it contains useful information drawn from the *sijills*.

The following year, Cohen (1990: 31-51), once again basing himself on new material discovered in the *sijills*, published a longer article than his one of 1989 in which he expanded and confirmed his earlier conclusions about the role of Muhammad Çelebi al-Naqqash. In this second article, Cohen provided proof of his supervision of other construction projects in Jerusalem during the reign of Sultan Sulaiman. Among other issues, Cohen also briefly explores the administrative aspects of the city and its Citadel in the early Ottoman period.

Al-'Asali (see Bibliography) has recently published a number of books and articles about the educational institutions and monuments of the city. The works deal with some of the Ottoman monuments under discussion, but very briefly and from a historical rather than an architectural point of view. His contribution is helpful, particularly when it is based on the *sijills* and on new material, for when he depends largely on Mujir al-Din, Max van Berchem, al-'Arif, and the recent publications on the walls and by Burgoyne in *Levant*, his work offers only a limited addition to knowledge of the history or of the development of the Ottoman monuments under discussion. Having said that, his contribution in re-introducing the history of the city and its architecture to the general Arab reader remains unrivalled in recent times.

Many recent Arab authors¹⁴ have collected material on the history and architecture of Jerusalem during the Islamic period. But once again, either they have concentrated on a historical approach or, if they mention the buildings under discussion here, they have repeated the

¹⁴ Shafi'i et al. 1971; Najm et al. 1983; C. Cha'th, *Al-Quds al-Sharif* ('Noble Jerusalem'), Ribat 1988. For a French version of the book printed in Ribat (also published in 1993) *Al-Qods Acharif*, Publications de l'Organisation Islamique pour l'Education, les Sciences et la Culture, ISECO; M Ghosheh, *Bawabat al-Quds* (Jerusalem's Gates) Amman, 1992; I Baydun, *Dalil al-Masjid al-Aqsa al-Mubarak*, Kufr Kanna 1993; Sabri et al. 1981; Taha 1988, 1989 and 1990 (see Bibliography).

known data with little additional material and, frequently, the same errors. It would be a true assessment, however, to say that these works provide the basic tourist information for some of the monuments.

Ben-Dov (1983: 85-120) has devoted a pioneering chapter to the Ottoman walls of the city. This Hebrew version was later translated into English (1990: 12-35). The work includes many photographs and plans not previously published, statistics about the architectural features in the walls, and above all he gives a good indication of recent measurements taken by the Israeli authorities. Unfortunately, neither this chapter nor the books (1983, 1990) as a whole offer anything significant on the buildings under discussion, or their contribution to the study of the Islamic Ottoman architecture of Jerusalem. They include no description of architectural or decorative features nor is there any comparison with other similar features. Bahat (1990), on the occasion of the Ninth International Symposium of CIEPO which was held in Jerusalem at the Hebrew University, concentrated on a selection of the Ottoman buildings of Jerusalem. His article includes a few plans and photographs, but contains only abridged historical data mainly taken from van Berchem on the name and date of the chosen buildings. Its aim was to draw attention to these buildings.

Although *Mamluk Jerusalem*, whose main author was Burgoyne (1987), does not include any direct or indirect study of the buildings under discussion, it does contain useful information about Mamluk foundations which were added to or restored during the Ottoman period. The book is also particularly informative when it traces the difference between the Mamluk elements and the Ottoman additions. The method used by Burgoyne in the descriptions contained in the catalogue entries is the most up-to-date approach, and is therefore followed here with minimal modifications. The book is very rich in plans, sections, and decorative details, and it is without rival or precedent in dealing with the great majority of Jerusalem buildings of the period.

The Development of Ottoman Jerusalem

The development of the architecture of Ottoman Jerusalem can be divided into two phases. The first covers the period extending from the time of Sultan Sulaiman I (926-74/1520-66) until the end of the 16th century, and the second begins in the 17th century and finishes in 1247/1831. During the first phase, Ottoman development was distinguished—almost to the same degree as during the Mamluk period—by substantial architectural

foundations and major restoration projects. The second phase was mainly marked by modest projects, or minor repairs and restoration work, and above all by innumerable domestic Palestinian houses, characterised in particular by the *qantar*as (archway bridges) that span the thoroughfares of the Old City.

The first phase of the Ottoman development was concentrated in three main areas: (1) within the Haram; (2) along Tariq 'Aqabat al-Takiyya (formerly known as 'Aqabat al-Sitt); and (3) more generally within the Old City of Jerusalem. Two new building projects and two repairs were undertaken outside the walls of the city. The second phase focused mainly (1) within the Haram, and (2) within the Old City in areas close to the Haram.

Before attempting to make sense of the development of Ottoman architecture in Jerusalem, it is necessary to make a few preliminary observations about the city, its previous architectural development, and the Ottoman approach to it. In this respect, the development of the walled city of Jerusalem in the Ottoman period, as in any other Islamic period, was deeply influenced by the landscape, by the geographical facts which governed and shaped the later architectural developments, and by its historic and religious character. An additional factor was itself part of the Ottoman development of the city—namely the wall of Jerusalem, which played a major role in confining any expansion within its circumference. The city was freed from that factor only early in the second half of the 19th century.¹⁵ The Ottoman development of the city was also constrained by other factors, particularly by the work done under the Mamluks and by the location of the Haram al-Sharif.

When the Ottomans became masters of Jerusalem, the Haram in particular—but also the city in general—had already attained a high degree of architectural development. This had been particularly marked during the Mamluk period. Both areas had been so enriched with sophisticated buildings and institutions that inevitably they were to leave their influence on some of the future Ottoman projects. Indeed, the excellence of the existing architecture meant that it was only rarely surpassed by Ottoman work. It is however true that the city and its monuments had suffered from years of neglect under the later Mamluks, and it is noticeable that, even under early Ottoman rule, architectural activity in the city was sluggish. The monumental projects of Sultan Sulaiman only began almost two decades after the Ottomans had taken control of the city. It would seem, then, that Jerusalem was equally neglected at the end of their rule by the Mamluks,

¹⁵ For information on the first buildings beyond the walls (1850-80) see Ben-Arieh (1986: 62-81).

and by the Ottomans at the beginning of theirs.¹⁶

The slow start to the Ottoman development of Jerusalem changed rapidly at the beginning of the fifth decade of the 16th century. Sultan Sulaiman I was the man responsible of that dramatic change, for he sponsored three major projects in Jerusalem. In addition his name is associated with many minor and medium-sized projects. His architectural contributions affected the future development of the city for centuries to come, and their impact can still be felt. The way Sulaiman conducted his projects leads to the belief that they were carried out according to a set plan and not in response to sporadic impulse. The fact that no major project—even counting the cells built by Ahmad Pasha—was undertaken during the whole Ottoman period after Sulaiman tends to strengthen this belief. In fact Sulaiman's approach was contrary to that of the Mamluks which was—as shown by Burgoyne (1987: 77-86)—based on individual effort and initiative, rather than on any specific overall plan. In this way, Sulaiman's attitude towards the development of the city can be likened in principle to that of 'Abd al-Malik. It must be admitted, though, that while the motivations of the two men were in some respects similar, the outcome and the impact of their projects differ radically.

There was a specific Ottoman contribution to the city quite apart from the work patronised by Sulaiman. The first element of this was through the setting up of individual pious foundations in various parts of the city, and the second was through the sponsorship of many restoration and repair projects—particularly in and around the Haram, but also within the city as a whole. These restorations were primarily undertaken on the structures of earlier Mamluk pious foundations and institutions. There are many standing monuments which bear witness to the first of these Ottoman contributions, further evidence of which can be found in the foundation inscriptions; proof of the second category is evident in the extensive records of the *sijills* especially in the records of the first half of the 16th century.¹⁷

Although it is true that there was some independent activity by lesser or anonymous patrons, the

major Ottoman architectural projects were on the whole the work of exalted patrons. Seven of the individual foundations were constructed by two patrons—Bairam Jawish and Ahmad Pasha. The biggest and most important foundation in the city, al-'Imara al-'Amira, also known as the Khassaki Sultan, was the work of Roxelana, the beloved wife of the Sultan Sulaiman. The pious foundations, as well as the imperial projects, embellished the city with so many imposing monuments that the 16th century—and particularly the time of Sulaiman—may justly be considered the Golden Age of Ottoman architecture in Jerusalem. Of course, the absence of any Ottoman activity in the city before the time of Sulaiman, and the fact that there were no major construction projects from the first half of the 17th century (with the exception of al-Zawiya al-Qadiriyya of 1043/1633-4) both tend to support that impression.

1. The Haram

From the first days of Islam, the area of al-Haram al-Sharif has always been the principal focus for any architectural activity in Jerusalem. New constructions, as well as the inevitable repairs and maintenance, continued spasmodically from the time of the Umayyads to the end of Mamluk rule, apart from the hiccup of the Crusader period. The Ottomans too contributed to a remarkable degree to the development of the Haram. The first visible sign of their work is the repair and restoration of the Dome of the Rock and al-Aqsa Mosque, and of some of the monuments located on the Haram esplanade and the upper Sakhra terrace. The second sign is the establishment of new, independent buildings.

1.1 Individual Construction in the Haram in the 16th century

Sabil Qasim Pasha (cat. no. 2, 933/1527) was the first new Ottoman pious foundations not only within the Haram but in the city as a whole. It was preceded only by the conversion of the Cenacle (Maqam al-Nabi Da'ud) on Mount Zion into a mosque. The *sabil* is located a few metres from, and opposite to, Bab al-Silsila, one of the main gates of the Haram, where, according to Mujir al-Din (1973: 2: 330), the site of the *sabil* was once occupied by a small *fasqiyya*. It would then have required only minor efforts to prepare the site for the new construction. The *sabil* was constructed in order to provide the faithful with water both for drinking and for ablutions—and still does. The layout is unique among other public fountains either on the Haram or more widely within Jerusalem. It is made up of eight symmetrical walls, surmounted by a small dome. The founder, Qasim Pasha, held many important offices in Egypt and Istanbul in the time of Sultan Sulaiman.

¹⁶ There is no historical information or foundation inscription relating to any significant architectural activity in the city after the works of Sultan Qa'itbai (872-901/1468-96). This period deserves a special study concentrating on the records of the *sijill* as well as a reconsideration of some of the unidentified buildings still extant in Jerusalem. See for example the cat. nos. 28 and 29.

¹⁷ Further support is also found in the architectural description and analysis of the upper parts of the Mamluk foundations by Burgoyne—see Burgoyne 1987: 109, 125, 133, 145, 148, 150, 168, 175, 177, 185, 191, 200-1, 204-5, 207, 211, 214, 217-18, 244-5, 270, 272, 320, 415, 417, 436, 458-9, 515, 568, 570.

Sabil Bab al-‘Atm (cat. no. 8, beginning of Sha‘ban 943/13 January 1537), was the second monument constructed in the Haram. It was ordered by Sultan Sulaiman himself, and was one of the six *sabils* which secured the water supply to the city and, more specifically, to the Haram. It was the fourth in chronological order of the *sabils* project. The *sabil* is located on the northern part of the Haram esplanade, near Bab al-‘Atm and next to Bab Hitta, the two most easily approached gates in the northern section of the Haram. Once again the site was chosen carefully—and with success, for it acts as a counterbalance to Sabil Qasim Pasha for those entering the Haram from the north. And once again, since the site was already occupied by a prayer niche (*mihrab*), the location did not need much preparation or levelling. Sabil Qasim Pasha and Sabil Bab al-‘Atm are the only 16th-century Ottoman structures to be situated within the actual esplanade of the Haram.¹⁸

The next in chronological sequence, the Mihrab Muhammad Beg (cat. no. 10, 945/1538-9), was erected—according to its foundation inscription—by the governor of Jerusalem and Gaza. It is built on a site once occupied by Qubbat al-Nabi, 10m north west of the west gate of the Dome of the Rock. After the *qubba* had been dismantled, a floor *mihrab* known as al-Mihrab al-Ahmar was constructed there. Later, in 945/1538-9, Muhammad Beg surrounded the *mihrab* inlaid into the pavement with his modest walled *mihrab*. At an unknown time, the second Qubbat al-Nabi was built on the same site. Most scholars treat the three standing monuments as a single edifice, and date them all to 945/1528-9. However, in my opinion, the three monuments have nothing in common other than that they share the same location, and a new date is proposed here for the rebuilding of Qubbat al-Nabi. In any case, once again the site did not require initial preparation by the builder of the kind which had been necessary for many of the earlier Mamluk structures.

Hujrat Muhammad (cat. no. 14, 956/1549-50?),¹⁹ Amir Liwa’ (governor) of Jerusalem, was the first Ottoman construction to be built on the north side of the Dome of the Rock at the edge of the terrace which forms the upper

platform of the Sakhra and thus distinct from the esplanade as a whole. The *hujra* was built in the middle of the north side, and consists of two storeys, each with two chambers, which serve to bridge the gap between the two levels of the Haram, as well as forming a buttress to the upper platform. It is in this respect unlike the monuments which are constructed either wholly within the upper terrace or within the esplanade. According to its foundation inscription, the *hujra* was built for the ‘people of knowledge’ (*ulu al-‘ilm*).

The choice of this site by Muhammad Amir al-Liwa’ had a great impact on the future development within the Haram throughout the whole Ottoman period. Its influence can be detected on all 16th-century Ottoman constructions (apart from Qubbat al-Arwah) built after the *hujra*. Not only were these buildings erected on similar sites, they also had a similar design. The motivation for the choice is clear. Building within or around the Haram was always a first option if it was available; the Mamluks (see the map of Burgoyne 1987: 35, fig. 2) had left no spare space around the western and northern sides of the Haram. The two remaining sides to east and south of the Haram terrace were anyway unsuitable for construction. The area to the east is bounded by the cemetery, and the southern border constitutes the wall of the city as well as the wall of the Haram. To build beside either would have demanded a tremendous effort to bridge the levels. Quite apart from these difficulties, the chosen site at the edge of the upper platform, for all its limitations, was eminently appropriate for the nature of the Ottoman buildings. They were in principle small and modest in layout and function, particularly compared to Mamluk foundations. Aesthetically, it seems that the architects who found the solution to the problem of the extremely limited space of the Haram were highly successful: the constructions are pleasing to the eye, they do not block the view, the natural bedrock which was used as a foundation saved both time and money, and—above all—they bridge the relatively short gap between the two parts of the Haram in a practical way.

The direct impact in terms of both location and layout of the Hujrat Muhammad is obvious in the construction of both the Khalwat Parwiz Katkhuda (cat. no. 17), and the Khalwat Qitas Beg (cat. no. 16). The first cell is situated at the north-western end of the north side of the upper terrace and the second is built 3m to the east of that. The façades were originally linked by a stone dais. Both *khalwas* are dated 967/1559-60 according to their foundation plaques. The founder of the former was the deputy of the citadel of Jerusalem, while the patron of the second—son of Parwiz—was the governor of Jerusalem district.

During the thirty years following the construction of Khalwat Qitas, it seems that the development of the

¹⁸ The Sabil Bab al-Maghariba (cat. no. 18) is undated, but an endowment record in the *sijills* implies that it was probably already extant by 987/1579. The *sabil* is situated opposite Bab al-Maghariba on the Haram esplanade. It is strikingly similar to the Well of Ibrahim al-Rumi (839/1435-6) in many of its features, which indicates that the *sabil* was probably built either very early in the Ottoman period, or very late in the Mamluk one.

¹⁹ Although the date of this *hujra* is not yet confirmed, I believe it to be the earliest built in the Haram. This is because I was able to date most of the constructions around the Dome of the Rock terrace. Even if in future the date of the *hujra* turns out to be later, this will not effect the principal development pattern of the Haram.

terrace on the north side of the Dome of the Rock slowed down, for the construction of only one new *khalwa* is recorded—Hujrat Muhammad Agha (cat. no. 20). This cell is located between the *khalwas* of Qitas and of Muhammad. Its specific location opposite the Dome of the Rock is emphasised in the foundation inscription, which also gives the date of construction as 996/1588.

After the building of Hujrat Muhammad Agha, it seems that building activity on the Sakhra terrace became both faster and more localised. However, in contrast to what might have been expected, the next building to be erected under the patronage of the governor of Jerusalem, the Hujrat Islam Beg (cat. no. 21), was on the western side of the terrace, rather than to the north, facing Bab al-Hadid. The *hujra* observes the same principles as the earlier *khalwa*, but is decorated with elaborate *muqarnas* niches above the upper level of the western façade. It was constructed in 1002/1593–4 according to its endowment *waqf*. It is not clear why, when there was still space to the north, Islam Beg decided instead to build on the west side of the terrace.

The years 1009–13/1600–4 apparently saw the first planned project to construct a series of *khalwas* on the north side of the Sakhra terrace. Four buildings formed the basis of the project under the patronage of Ahmad Pasha, the governor of Gaza. On the evidence of the *sijills* as well as that of the standing monuments themselves, it is apparent that in 1009/1600 Ahmad Pasha built two *khalwas*—one called here the ‘North-Western Khalwa of Ahmad Pasha’ (cat. no. 22), and the other the ‘North-Eastern Khalwa of Ahmad Pasha’ (cat. no. 23). The *khalwas* are separated by the North Colonnade and both face Bab Hitta. The first *khalwa* is not only the most elegant of the Ottoman constructions in Jerusalem, it is also the biggest Ottoman building in the Haram. It is lavishly decorated with *ablaq* stone of different colours and there is a clear intention in the design to revive some Mamluk decorative elements such as joggled voussoirs and *muqarnas*. The architecture of the *khalwa* raises immediately the question of the identity of the master builder—not only of this building in particular but also of the other works sponsored by Ahmad Pasha. In the Mamluk and the early Ottoman periods²⁰ some sophisticated buildings similar to the North-Western Khalwa of Ahmad Pasha were built by imported teams of builders. However, to judge by information in the documents of the *sijill* and as a result of architectural

analysis, it would seem that the architect of the *khalwas* for Ahmad Pasha must have been a local master builder and not one brought in from elsewhere (see below, under *khalwas*). The Eastern Khalwa, though smaller, is also elegant and includes decorative and architectural elements which place the buildings of Ahmad Pasha—as well as the Hujrat Islam and Khalwat Bairam Pasha—in a separate category from others on the Haram (details are to be found below under *khalwas*). Both the *khalwas* of Ahmad Pasha span two levels, their main south façade facing the Dome of the Rock.

The third project of Ahmad Pasha was the Junbalatiyya Khalwa (cat. no. 24, 1010/1601–2). It is situated on the north side of the terrace between the Khalwat Qitas Beg and the Odat Arslan (restored 1109/1697). Ahmad Pasha, according to the *sijills*, had contracted ‘Abd al-Muhsin ibn Nammar, the master builder of Jerusalem, to ‘restore’ (*‘imara*) the *khalwa* in 1010/1601–2. This means that the *khalwa* must already have been in existence some time before the contract. The available information does not make clear the exact connection between Ahmad Pasha and the *khalwa*, for it is referred to as ‘al-Junbalatiyya’ and, in a second record in the *sijills*, it is attributed to Ibn Junbalat. Ahmad Pasha’s connection with this *khalwa* is, however, confirmed in another document (Sijill 115: 721). In addition, both the layout and the decorative and architectural elements place it firmly among the projects sponsored by Ahmad Pasha.

The final building attributed to Ahmad Pasha, the Ahmadiyya Madrasa (cat. no. 25, 1013/1604), is as impressive as his previous constructions. However, instead of building it next to his earlier works, he chose a remarkably empty site on the eastern side of the Dome of the Rock between the Eastern Colonnade and the north-eastern corner of the terrace. The reason for such a move from the north side is understandable, for by that time it was fully occupied apart from its eastern corner. But building on the eastern side of the terrace would have necessitated greater efforts in levelling, for the difference in height between the two levels of the Haram esplanade is greater than on the north side. It is worth underlining that al-Madrasa al-Ahmadiyya is the only edifice built on the eastern side of the Sakhra terrace. One reason for this may be the variations in level, for the Haram was—and still on the whole usually is—approached from the west. The Ahmadiyya is also the only Ottoman structure to carry the identification of *madrasa*, and in its *waqfiyya* Ahmad Pasha as donor stipulated that its four students were to gather daily to study, and that the *mudarris* (the lecturer) was to be the best scholar of his age. It has to be said, though, that despite being termed a *madrasa*, neither in its layout nor in its decorative elements does it differ from the Khalwa Junbalatiyya, the Hujrat Islam, the Khalwat Bairam Pasha, or the North-Eastern Khalwa of Ahmad Pasha.

²⁰ For details of some Mamluk constructions which employed imported craftsmen, see Burgoyne 1987: 79–80, 84. A section below deals with craftsmen and builders brought into Jerusalem in the Ottoman period to work on the walls project and al-‘Imara al-‘Amira.

Recent references,²¹ without citing the evidence, have attributed two commemorative domes as being 'Ottoman monuments of the 16th century'. These are Qubbat al-Arwah (cat. no. 30) and Qubbat al-Khadr (cat. no. 31); both are located in the northern part of the Dome of the Rock terrace. Both are undated, and their founders are anonymous. The author has found a record in the *sijills* which proves that Qubbat al-Arwah was in existence some time before 1037/1627-8, but unfortunately whether it is a 16th- or a 17th-century structure is still an open issue. On the other hand, it is hard to believe that Qubbat al-Khadr is a 16th-century structure. The complete argument for this belief is to be found in catalogue entry no. 31 under 'Dating the Building'.

It is clear from the evidence discussed above that the early projects sponsored by Ottoman patrons within the Haram al-Sharif tended to concentrate on the upper area around the Dome of the Rock; it is possible to be more precise, for they tended at first to cluster on the northern side of the terrace, and only later on the west. This practice was continued to a large extent in the period after the 16th century, and was a characteristic of Ottoman structures. It seems safe to suppose, as had been the case with the Mamluks before them, that the Ottoman concentration was inspired by the sanctity of the Haram. Another factor is that the Ottomans were constrained by the earlier Mamluk development on the north and west borders of the Haram. It would almost seem as if the role of developer was divided between the Mamluks and the Ottomans—the former built around the Haram, while the latter concentrated on the upper terrace of the Dome of the Rock, 'the Inner Haram', as vacant sites around the perimeter of the Haram became increasingly scarce.

1.2 The Ottoman Repairs on the Haram in the 16th century

The repairs on the Haram, and in particular to the Dome of the Rock and Jami' al-Aqsa were—and continue to be to this day—a royal responsibility. Knowledge of the Ottoman work has been primarily dependent to date on the epigraphic²² evidence, that is on the inscriptions on the

monuments themselves which document the work undertaken. But it is also necessary to bear in mind that some repairs were not documented in this way at all, or that the relevant inscriptions have since been lost. Those that still existed earlier this century were carefully compiled and edited by van Berchem in his *Corpus Inscriptionum Arabicarum* in the volumes devoted to the Haram and the city, some of which have been recently reviewed, and given a few additions, by Walls and Abu'l-Hajj. Unfortunately, however, many of the inscriptions have disappeared, and the additions to the *magnum opus* of van Berchem have proved limited. The situation improved slightly when scholars such as al-Husaini and al-'Asali (see below) published portions of text from the *sijills* which include information on repairs undertaken during the Ottoman period. It is hoped that the present study will go some way to clarify the situation and to enhance our knowledge, but the picture will not be complete until a systematic and detailed investigation of the *sijills*—a work which will take many years—has been completed. However, in order to put the Ottoman development of the Haram in its historical context, the repairs done by the Ottoman administration will be reviewed here with reference to the research done to date, for they will not be mentioned elsewhere in my chapter, although the public buildings will be studied in detail.

The first major restoration work was undertaken by Sultan Sulaiman I (935/1529) on the Dome of the Rock itself. According to an inscription (van Berchem 1927: 329-32, no. 238; Walls and Abu'l-Hajj 1980: 21, no. 238—the inscription was removed between 1956 and 1964) it was a repair to the glass windows. Meinecke (1988: 259 and note 12) pointed to the account of Evliya Çelebi, and assumed that 'since the act was ordered by Sultan Sulaiman, it can hardly have been restricted to the windows alone, and the date given can be accepted as that for the comprehensive renovation for the monument.'

The next work in chronological order was a monumental project also carried out by Sultan Sulaiman. It included refacing many of the outer parts of the Dome of the Rock and the Dome of the Chain with under-glaze painted tiles.²³ The work was carried out at different dates. It was one of the three major projects ordered by Sulaiman, the others being the *sabils* and the renovation of the city walls. According to the inscriptions, the resurfacing project on the Dome of the Rock included refacing the drum in 952/1545-6 (van Berchem 1927: 333-5, no. 239, Walls and

²¹ Burgoyne (1976: no. 115), with reservation; Najm *et al.* (1983: 320) and Taha (1990: 21) for Qubbat al-Arwah, and for Qubbat al-Khadr, Najm *et al.* (1983: 321), Meinecke (1988: 261-2), Bieberstein and Burgoyne (1990: no. 187), Taha (1990: 21), and Bieberstein and Bloedhorn (1994: 3: 89-90). Buschhausen (1978: 233), unlike these authors, thinks the dome belongs to the late Mamluk period.

²² A detailed study of the Ottoman repairs has to depend on the *sijill* records, the Turkish archives in Istanbul, historical information and on close observation of the structure, in addition to the inscriptions edited by van Berchem and others.

²³ These tiles were replaced during the 1958-64 restoration; a specimen is displayed in the Islamic Museum of the Haram, the majority now being stored there. The Auqaf Administration granted Professor John Carswell and Dr Julian Raby permission to photograph most of these tiles. It is hoped that a study will be published in the near future (see the chapter by Carswell in this volume).

Abu'l-Hajj 1980: 21, no. 239), the octagon in 959/1551-2 (van Berchem 1927: 335-8, no. 240, Walls and Abu'l-Hajj 1980: 21, no. 240), and the restoration of the east and west doors in 972/1564-5 (van Berchem 1927: 339-40 nos. 241-2, Walls and Abu'l-Hajj 1980: 21, nos. 241-2). In addition to the works on the Sakhra, Sulaiman ordered the embellishment of the Dome of the Chain with tiles in 969/1561-2 (van Berchem 1925: 180-3, no. 196; Walls and Abu'l-Hajj 1980: 18, no. 196).

Meinecke (1988: 259-60) in his valuable article *Die Erneuerung von al-Quds/Jerusalem durch den Osmanensultan Sulaiman Qanuni* assumed—quite correctly—that the project was the result of work in several stages,²⁴ and was probably not completed until 972/1564-5. He further concluded that the final decorative stage of the tiles on the Dome of the Rock occurred after the completion of the Süleymaniye Cami which was built between 957-964/1550-7, because under-glaze painted tiles were used for the first time on that building. Meinecke (1988: 260) presumed that the building teams who worked on the task of retiling the Dome of the Rock had also worked on the tiles of the *takiyya* of Sultan Sulaiman in Damascus, which had been completed shortly before, in 967/1560.

Sultan Sulaiman was also responsible for two other minor restorations in the Haram. The first was on the terrace of the Dome of the Rock where a restoration of the North West Colonnade is commemorated by a restoration inscription. It was published by van Berchem (1925: 184-6 no. 198) and is undated, but it contains the name of the sultan, which means it must be dated between 926-74/1519-67. A similar inscription (van Berchem 1925: 168-9, no. 192) is found above the *mihrab* located behind Sabil Bab al-'Atm (see cat. no. 8).

After the reign of Sulaiman, maintenance work continued, for in 1006/1597-8 two windows were opened in the Dome of the Rock (van Berchem 1927: 340-41 no. 243; Walls and Abu'l-Hajj 1980: 21, nos. 243-4; the inscription was removed during the 1958-64 restoration and is now in the Islamic Museum). The present author has located two *sijill* entries (79: 574) dated the middle of Rajab 1006/21 February 1598 which give the reasons for the opening of the two windows. The entries reveal that Shuja' al-Din Efendi, the *qadi* of Jerusalem, had agreed at that

date that the Sakhra required two new windows. One window was to be pierced in the east wall, and the second in the west wall. They were intended to provide enough light to allow the reciters to read the chapters of the Holy Qur'an, for it had proved too dark for them to see. Shuja' al-Din had accordingly despatched a report to Istanbul requesting approval for the opening of the windows, and later an order from the sultan was sent to Jerusalem authorising the work.

While the Dome of the Rock was being renovated by Sulaiman, it is presumed that al-Aqsa Mosque was also being restored, though evidence in the form of an inscription is missing. Van Berchem (1927: 439, no. 294), taking Sauvage as his authority, and followed by Walls and Abu'l-Hajj (1980: 25, no. 294), pointed to an inscription (subsequently lost) which attested to the renovation of a window. It seems that the window in question bore the name of Sultan Sulaiman even though it was dated twenty years after his death. Meinecke (1988: 260-1) accordingly proposed to correct the date ascribed to the window to the year 936/1529, with the argument that the date of the renovation of the glass windows of the Dome of the Rock is given as 935/1528-9.

Cohen (1989: 473), apparently relying on the *sijills* though he cites neither number nor date, recounts that Muhammad Çelebi al-Naqqash—who had responsibility for the collection of the *jizya* (poll-tax)—instead of spending all the money on the walls, directed some of it towards a religious end. Muhammad Çelebi is claimed to have spent, during the period 944-7/1537-41, a total of 300 *qubrusi* (gold coins, equal to 12,000 *para*) 'for the gilding of the banner of the Dome of the Rock', and a further 100 gold coins on al-Aqsa Mosque.

Shortage of time has meant that it has been possible only to scratch the surface of the *sijills* so far, but even that limited research has made it clear that constant restoration work was carried out on al-Aqsa²⁵ Mosque and the Haram area as a whole. As early as 28 Dhu 'l-Qa'da 936/24 July 1530, *Sijill* 1: 20 refers to Hasan Beg as *al-mushid 'ala 'imarat al-masjid al-aqsa al-sharif* ('the person in charge of the restoration of al-Masjid al-Aqsa the Noble'), and in *Sijill* 1: 348 his post is again mentioned as *al-mushid 'ala al-'ama'r al-sharifa bil-quds al-sharif* ('the person in charge of the Noble Buildings in Jerusalem the Noble'). Hasan had received 30,000 *'uthmani* from Yusri Jawish, probably to spend on repairs to al-Aqsa. Muhammad Beg (*Sijill* 2: 6) was *al-mushid* when the citadel was restored in 938/1531-2.

As early as 948/1541-2, the *sijills* (13: 179) seem to

²⁴ In this regard it is possible to see, though with many differences, a recent parallel with the works which have been sponsored by the late King Hussein of Jordan. The first stage of the Hashemite restorations was completed in 1964, and the second as recently as 1993; a third stage is under consideration but recent rapid political changes have delayed the final decision. Between these major phases, minor restorations and maintenance work have continued without interruption, especially following the disastrous fire in Jami' al-Aqsa on 21 August 1969.

²⁵ It should always be borne in mind that the scribes of the *sijills* use 'al-Masjid al-Aqsa' when they refer to the whole Haram, but they use al-Jami' al-Aqsa specifically to refer to the covered building located to the south of the Haram area.

indicate that some repairs had already been carried out at a local level, for it is there reported that the *qadi*, who was accompanied by Husain ibn Nammar, the master builder in Jerusalem, had visited the place of ablutions on the Haram in order to make an investigation and to estimate for any necessary repairs. The cost then amounted to 7,000 *'uthmani*.²⁶

Heyd (1960: 102, n. 2) pointed to an order which reveals that the Dome of the Rock and the Aqsa Mosque were in need of repair in Shawwal 987/December 1579. Da'ud, the *mi'mar bashi* at Damascus, was prepared to undertake work on the lead for 200 gold pieces. The *firman* ordered the *daftardar* of Damascus that he was to pay Da'ud 200 gold pieces as recompense for his work.

According to Sijill 67: 2, new lead sheets were fixed to the roof of al-Aqsa Mosque and the Dome of the Rock in Sha'ban 996/June-July 1588. Muhammad Çelebi, the *qabu aghasi* in the Sublime Porte in Istanbul, was overseer for this task. Sijill 76: 350 records that water had penetrated through the roofing sheets after heavy rain and snow at the beginning of Jumada II 1003/11 February 1595. A group of dignitaries had come to the *qadi* and reported that almost every year water leakage occurred in al-Aqsa Mosque and the Dome of the Rock due to the fact that there was no expert employed to maintain the roofs. They had asked the *qadi* to assign a qualified person to repair the lead. As a result of this deputation, Salih ibn Ibrahim al-Gharabli was appointed to the post of the man responsible for repairing the lead. He was allocated one *misriyya* per day from the income of al-Aqsa *waqf*; the leakage subsequently stopped.

It is clear from Sijill 113: 439 that the lead sheets of al-Aqsa Mosque were restored again by order of Sultan Murad Khan in 999/1590-1. A sheet of lead had been found on 22 Rabi' II 1037/31 December 1627 in storage in al-Aqsa; it had been used in the repairs undertaken at the earlier date.

Burgoyne (1987: 416), in attempting to date the minaret of Bab al-Asbat, suggested that the shaft of the minaret might be an Ottoman reconstruction. He was correct, for a record in Sijill 80: 100 has been discovered in support of his thesis. The record is dated 18 Dhu 'l-Qa'da 1007/12 June 1598 and reveals that Sultan Mahmud Khan had sent 300 *sultani* to the inspector of al-Aqsa Mosque to fund the rebuilding of the Bab al-Asbat minaret. 'Abd al-Muhsin ibn Mahmud ibn Nammar, the chief builder in Jerusalem the Noble, Muhammad known as Khalaf al-Mi'mar, 'the master builder', and 'Ali ibn Khalil al-Hajjar,

'the stonemason', were contracted to undertake the rebuilding work. The architects were to receive 200 *sultani* in return for rebuilding the minaret and providing all the materials needed for the repairs (such as stone, lime, gypsum, water, workers and so on); the exception was the lead, which was to be provided by the inspector. The document specifies in detail the parts of the minaret which were to be rebuilt by the architects. For the complete Arabic text and English summary see Cat. Appendix 1, no. 3/3.

2. Tariq 'Aqabat al-Takiyya

Tariq 'Aqabat al-Takiyya runs 192m between the Bab al-Nazir junction in al-Wad Road and the street named after Khan al-Zait, one of the main markets of the Old City. Khan al-Zait Road lies parallel to al-Wad Road, and they provide the only two routes that cross the Old City from north to south. Both roads appear in the Byzantine Madaba map. Khan al-Zait used to act as the upper *cardo* in the Byzantine city of Jerusalem. Recent excavations in the southern section of the road of Khan al-Zait have uncovered among other things a colonnaded street, and this supports the depiction of the area in the Madaba map.

The east end of Tariq 'Aqabat al-Takiyya lies 100m west of the Haram. Its eastern end is on the same level as al-Wad Road, and it then rises westwards out of the valley (al-Wad) located between the Haram and the road of Khan al-Zait. The road has had various names: Mujir al-Din (1973 2: 54) called it 'Aqabat al-Suq (Market Hill), but he also said that 'now it is known as 'Aqabat al-Sitt (the Lady's Hill), so called after *al-'imara al-'azima* (the imposing edifice) built by the Lady Tunshuq al-Muzaffariyya.' Later, when Roxelana, the much-loved wife of Sultan Sulaiman, constructed al-'Imara al-'Amira (the Khassaki Sultan complex) the road became known as Tariq 'Aqabat al-Takkiya. The name changed because the edifice of Sitt Tunshuq was incorporated into al-'Imara al-'Amira and because *takiyya* in local dialect denotes the place where free food is distributed. The name would indicate the free kitchen—which still functions—although the other three sections of the complex have ceased to operate.

Architectural activity in Tariq 'Aqabat al-Takiyya began under the Mamluks. None of the buildings are earlier than the end of the 8th/14th century. There are now nine monuments in Tariq 'Aqabat al-Takiyya, two of them constructed in the Mamluk period. The first is the imposing palace of Sitt Tunshuq al-Muzaffariyya (790/1388), built on the south side of the Tariq, and the second is Turbat al-Sitt Tunshuq (800/1398), constructed on the north side facing the eastern portal of the palace. Both buildings have been the subject of careful studies by Burgoyne (1987: 485-511).

Judging by both the information in the *sijills* and the architectural features, it seems likely that two other

²⁶ The value of the *'uthmani* (silver coin) does not remain constant but changes from one document to another, but in general forty *'uthmani* were equal to one *sultani* (gold coin), and one *'uthmani* was equal to two *misriyya* coins. For the coins in the Arabic provinces in the Ottoman period, see Sahili (1971: 105-15).

undated monuments were constructed either in the late Mamluk or the early Ottoman period. These are al-Madrassa al-Mawardiyya (cat. no. 28), and al-Zawiya al-Muhammadiyya (cat. no. 29). Both received repair and maintenance attention in the first half of the 16th century. My research has proved that al-Madrassa al-Mawardiyya constitutes a separate monument—evidence that runs contrary to other recent references (al-'Arif 1961: 307; Burgoyne 1971: 23; al-'Asali 1981: 327; Najm 1983: 360; Grabar 1986: 339; Bahat 1990: 26; and Bieberstein and Bloedhorn 1994 2: 359) who have all called it in error by the modern name of 'the Rasasiyya' and who have considered it part of the Ribat Bairam Jawish (cat. no. 11). It is not known when and by whom this monument was constructed, but it is quite clear that it already existed in the first half of the 16th century, and that it includes many Mamluk architectural features. The Mawardiyya is located in the lower part of 'Aqabat al-Takiyya immediately west of the Ribat Bairam Jawish.

Al-Zawiya al-Muhammadiyya is located on the north side of Tariq 'Aqabat al-Takiyya, facing al-Madrassa al-Mawardiyya. A record in the *sijills* (12: 697) as well as physical evidence in the form of a vertical break in the façade in addition to other factors have led the writer to list the *zawiya* too as a separate building, instead of considering it as belonging to Maktab Bairam Jawish (cat. no. 12) which abuts the *zawiya* to the east. The *zawiya* is now in a dilapidated condition and has lost much of its original beauty, but a window constructed with alternating coloured stones recalls its past elegance. The *zawiya* is made up of two floors, only the lower of which is original, the upper storey being a later addition. By whom, when, and for what reason the *zawiya* was constructed are all questions which still remain open.

Sabil Bab al-Nazir (cat. no. 7, 943/1536) was the first Ottoman monument with a precise date to be constructed in 'Aqabat al-Takiyya. It occupies the north-eastern corner of the junction of Tariq 'Aqabat al-Takiyya, and is less than 100m distant from the Haram. It seems certain that the person (probably Muhammad Çelebi al-Naqqash) who was in charge of choosing the site for the *sabil* was aware of the circulation of people in Jerusalem at the time. Sultan Sulaiman, as the foundation inscription asserts, ordered the construction of the public fountain. It is one of the six *sabils* which provided the city with water, part of the well-known project initiated by Sultan Sulaiman. The fountain consists of a recessed and pointed arch, built with a beautiful combination of Islamic and Latin (Crusader) architectural elements. A trough to contain water, which sadly no longer exists, once stood in the lower part the niche. Earlier this century, van Berchem (1922: 417) described the *sabil* as presenting 'un tableau d'un charme exquis'. The fountain has lost much of its architectural decoration, and it is no longer in functional order.

In 947/1540, four years after the construction of Sabil Bab al-Nazir, Bairam Jawish started his individual projects in Tariq 'Aqabat al-Takiyya. He began his work by acquiring a corner site for his first construction. This occupies the south-western corner of the junction of 'Aqabat al-Takiyya and—according to the foundation inscription—the place was described as a *ribat*, so it is known as Ribat Bairam Jawish (cat. no. 11, 947/1540). On evidence of the *waqfiyya*, it seems that the *ribat* in the Ottoman period—or at least this particular *ribat*—used to accommodate Sufis rather than pilgrims, as had been the common practice in the Mamluk period. The *ribat* has three levels and two façades giving onto the street, the north being the principal one. More than four different phases of construction can be distinguished in the northern façade. Inspection and interpretation of these phases, backed by the information provided in the *waqfiyya*, indicate that only the ground and first levels were constructed by Bairam, and that the eastern end of the façade was dismantled when Bairam constructed his own house, which abuts the upper eastern side of the *ribat*.

The second step of Bairam's architectural programme, also in 947/1540, was to work towards the development of Tariq 'Aqabat al-Takiyya. Instead of acquiring a vacant site, he obtained a ruined structure and renovated it to serve as a *maktab*. The Maktab Bairam Jawish (cat. no. 12) is located on the north-western corner of the 'Aqabat al-Takiyya junction, facing the *ribat* to the south and the Sabil Bab al-Nazir to the east—it thus occupies another prominent site close to the Haram. The question arises as to why Bairam chose to acquire a standing structure for renovation rather than constructing a new building in the vicinity of Tariq 'Aqabat al-Takiyya or al-Wad. It seems the answer behind this choice may have been Bairam's explicit desire to use the *maktab* as a burial place as well as a primary school. He apparently wanted a site close to his *ribat*, and near the thoroughfare, where people could recite verses of the Holy Qur'an for his soul. A corner site was thus ideal, but since the four corners of 'Aqabat al-Takiyya junction were already occupied, the only solution for Bairam was to acquire a standing building. Corner sites (as shown by Burgoyne 1987: 84) were also much sought after in the Mamluk period, for they allowed windows be opened in two sides of a tomb chamber, thus allowing Qur'anic recitation to be better heard by passers-by. The *maktab* is made up of two levels, the lower one being the original. It includes one large T-shaped chamber divided into two parts, the eastern of which contains the tomb of Bairam, while the western one was used as a teaching location for the children. Bairam endowed 150,000 *'uthmani* for the upkeep of both *ribat* and *maktab*, which were to be cared for according to certain stipulations specified in the *waqfiyya*. The document has only been recently discovered in the *sijills* by the author. It

is not only one of the biggest but also one of the most important documents of the Ottoman period, second only to the *waqfiyya* of Khassaki Sultan.

The last architectural project undertaken by Bairam at the 'Aqabat al-Takiyya junction was the construction of a private house (cat. no. 13, 959/1551-2). Thanks to the information contained in the *sijill*, it has been possible to add this new monument to the list of Ottoman buildings, instead of considering it as part of the *ribat* or another, unidentified structure. Once again, Bairam was highly successful in picking a key site for his house, close to his earlier constructions. The house is located directly south of the 'Aqabat al-Takiyya junction, above the south side of al-Wad road. It overlooks the north and the south sides of al-Wad road, the street of Bab al-Nazir, the Tariq 'Aqabat al-Takiyya and—above all—not only the Haram al-Sharif area but in particular the Dome of the Rock.

In order to be able to benefit from such a site, Bairam and his master builder came up with a solution to what had become a pressing problem since the Mamluk period—finding desirable sites in the Old City of Jerusalem. Their answer was to build above the thoroughfare by spanning both sides of the road with a series of pointed arches which formed the support for the house in the shape of a *qantara* (archway). Although no documentation or example survives, bridging a road was not unknown in Mamluk Jerusalem for Mujir al-Din (1973 2: 52, 304) mentions a Qantara Khan al-Jubaili. In the Ottoman period this practice became such a dominant feature of domestic Palestinian architecture that now every street in Jerusalem has at least one example of a *qantara*. Bairam's house (*dar*) is the only secular construction with a firm date so far known in the city. It is described with much detail in the *sijill*, and still retains most of its original form, though an upper level was added later. Some of the decorative and architectural elements of the house—for example the roundels and the chevron arch—resemble the elements found in other 16th-century architectural projects, such as the city walls and the Khassaki Sultan complex.

Al-'Imara al-'Amira (cat. no. 15, 959/1552)—as it is called in the *sijill* and the *waqfiyya*—or the Khassaki Sultan as it is called in modern references, is known to the people of Jerusalem as 'al-Takiyya' (the public soup kitchen). It was the most prestigious Ottoman project to be constructed in Tariq 'Aqabat al-Takiyya, to which it has given its name. The complex has no foundation inscription, but its identification and its date are secured by a *waqfiyya* dated 30 Jumada I 959/24 May 1552, as well as by many other records in the *sijills*. It is the largest Ottoman charitable project ever constructed in Jerusalem or elsewhere in Palestine. Its endowment is very large and can be challenged in importance only by the *waqf* of the Haram. Though the majority of the *waqf* properties have

been lost, the soup kitchen still functions today. The project was built under the patronage of Roxelana, the wife of Sultan Sulaiman I, and was supported by further endowments by the sultan himself. It was thus another royal foundation in Jerusalem, to rank beside the projects of the water supply, the walls, and the refacing of the Dome of the Rock with tiles. As stated by Meinecke (1988: 267) the restoration of Jerusalem in the Ottoman period reached its zenith with the founding of Khassaki Sultan.

The complex of al-'Imara al-'Amira ('the Prosperous Edifice') was made up of fifty-five rooms devoted to accommodation for pious Sufis (the *ribat*), a 'noble mosque' connected to these rooms, and a public kitchen, supplemented by a bakery, cellar, woodshed, storeroom, caravanserai and stables. Later, a mill was also constructed inside the complex. The rooms for accommodation, like the mill and the caravanserai, no longer exist. The remaining extant architectural components of the complex, as well as two monumental portals in the north and the south façades respectively, occupy a large area located between 'Aqabat al-Takiyya and 'Aqabat al-Saraya. The complex is now bordered by the Tariq 'Aqabat al-Takiyya to the north, by the remnants of the Palace of Sitt Tunshuq to the west, by Tariq 'Aqabat al-Saraya to the south, and by al-Madrasa al-Mawardiyya and another, unidentified, building to the east.

Architectural interpretation and analysis of the site are not easy because of the intricacy of the development which has taken place in the separate buildings of the Palace of Sitt Tunshuq, al-Madrasa al-Mawardiyya, Ribat Bairam Jawish, and al-'Imara al-'Amira (Khassaki Sultan). Based on the *sijill*, it is however possible to differentiate between the eastern border of the complex of al-Takiyya and the architectural components of the Mawardiyya buildings. Unfortunately it is not as easy to do so on the western border, for the Palace of Sitt Tunshuq was evidently incorporated into the Khassaki Sultan complex. To the north and the south the site is bordered—as noted above—by two main streets. In order to acquire water for the Khassaki Sultan complex and for its *hammam*, two construction operations were needed. The first was to increase the quantity of water which was supplied by the Qanat al-Sabil for it was not adequate. This was done by an order (Heyd 1960: 147, n. 8) dispatched from Istanbul on 2 Rajab 959/24 June 1552, to the Begler Beg and the *qadi* of Damascus ordering them to combine the water from Wadi 'Abyar ('I-Bi'ar) to the water of Qanat al-Sabil. In response to this order, an ancient water-conduit, which had been defunct for a long time, was repaired and the cost—which amounted to 2,000 *floris*—was donated by Hasseki Hürrem (Roxelana), the wife of Sultan Sulaiman.

The second operation carried out in the neighbourhood of Tariq 'Aqabat al-Takiyya was the construction of a water channel to supply the two

bathhouses with water. Sijill 31: 110 (quoted by al-‘Asali 1989a: 98) records that Bairam Jawish had contracted a group of builders to pave the floors of two bathhouses which belonged to the *waqf* of the ‘Imara Khassaki Sultan. Neither bathhouse still exists, but from the architectural description they would appear to have been both impressive and of a high quality. Furthermore, Bairam contracted (al-‘Asali 1989a: 99; Sijill 31: 110) another set of builders (*mi‘mariyya*) in Jerusalem to supply a subsidiary canal to run for 150 *dhira‘* from the water-distribution point (*maqsam*) situated in front of the Sabil Bab al-Nazir to the cistern serving the two bathhouses.

3. Other Buildings and Projects

Outside the two main areas, that is the Haram and Tariq ‘Aqabat al-Takiyya described above, there were several other Ottoman construction sites. These were either individual buildings scattered throughout the city or more specific projects. Of the former it is still possible to identify the conversion of the Cenacle into a mosque, the Zawiya al-Hamra’, the Khanqah Maulawiyya, and the Qaimari Mosque. Of the second type there are the remaining *sabils* of Sulaiman’s original project, the city walls, and the work at the Citadel.

3.1 Individual buildings

The conversion of the Cenacle to a *masjid* named after al-Nabi Da’ud (cat. no. 1, 1 Rabi’ I 930/8 January 1524) was the first major architectural activity in the city undertaken by the Ottoman authorities. The order for the conversion was issued by Sultan Sulaiman and is recorded in the foundation inscription that still exists in its original location. The site lies outside the walls of the Old City some 130m south of David’s Gate (Zion Gate) where it stands high above the Old City in a prominent position. The mosque retains most of the original architectural features of its construction as a church, the conversion works being limited to installing a *mihrab*, the foundation inscription, a small *qubba*, and a relatively short-shafted minaret. Later (see Cat. Appendix 1, no. 1) the site was fully developed to form a great complex, with many estates endowed as *waqf* for the benefit of the *maqam* and the mosque.

Al-Zawiya al-Khalwatiyya (cat. no. 3, 930s/1520s), also widely known by the name al-Zawiya al-Hamra’, was the first Sufi institution constructed in Jerusalem in the Ottoman period. It was built and administered by the prominent Shaikh ‘Ala’ al-Din ‘Ali al-Khalwati, but it had various estates made *waqf* by two governors of Nablus and Safad. The *zawiya* was situated at the Bani Zaid neighbourhood, near the Zawiya Bistamiyya, north of the Haram. Even though its site is comparatively distant (170m) from the Haram, this location had its compensations, for it enjoyed a key position overlooking

the Haram area. No description of the site has been preserved apart from a record in the *sijills* (Atallah 1992: 26-27, Sijill 133: 739) mentioning a mill and a minaret. The minaret is still standing and also dates to the 16th century.

In the same neighbourhood of Bani Zaid, the Khanqah Maulawiyya (cat. no. 19, 995/1579) was founded 150m further north west of the Khalwatiyya Zawiya. It was thus the second famous Sufi institution to be built in Ottoman Jerusalem. The minaret in particular—but also the *khanqah* as a whole—occupies a dominant position overlooking the Old City, once again a compensation for being relatively far from the Haram. Most of the *khanqah* consists of three levels and includes a prayer hall (*masjid*) which was originally a Crusader church dedicated to St Agnes. It still retains its original plan, with many chambers, graves of four Sufis, a minaret, and a *sama‘* chamber. The conversion of the church into a mosque, as well as the construction of many of the chambers on the ground and first floor levels, was completed before the Ottoman conquest. The minaret itself, however, was built in the Ottoman period, some time before 995/1579, and the *sama‘* chamber was constructed in 995/1579, the date of the first *waqf* by the governor of Jerusalem, Khudawirdi Abu Saifain, for the benefit of the Maulawiyya Sufi order in Jerusalem.

One of the most problematic constructions of the Ottoman period is the Masjid al-Qaimari (cat. no. 32) for, although its layout is typically Ottoman, it is undated. No *waqf* document has been found that relates to it, and it is not known either who built it or why it carries the same name as a domed structure, al-Qubba al-Qaimariyya, which dates to the Ayyubid period and is located outside the city wall to the west. The *masjid* is built in a strategic site next to the (modern) New Gate in the north wall of the city, close to where once Tancred’s Tower stood. Perhaps the strangest thing about the site is that it has no minaret, although there is ample space for one. It would have seemed the logical adjunct to a religious building in such a prime position. Modern references (Burgoyne 1976: no. 114; al-Husaini 1977: 20; Najm *et al.* 1983: 51; Bieberstein and Burgoyne 1992: no. 185; Bieberstein and Bloedhorn 1994 2: 62) have dated it with some reservation to the 16th century, but the present writer thinks that it dates to a later period (see cat. no. 32 under ‘Features’).

3.2 Sulaiman’s Projects

The Citadel

The restoration of the Citadel was among the earliest architectural projects ordered by Sultan Sulaiman I. It was only predated by the restoration of the windows of the Dome of the Rock, and by the building of the Sabil Qasim Pasha. The repairs and reconstruction work in the Citadel predate the sultan’s *sabils* project by five years and his project on the city walls by six years. The reason that lay

behind the interest shown in the Citadel by the Ottoman authorities is different from the motivation which resulted in the walls, as Cohen (1990: 36) has noted. The Citadel was the ideal place to house the soldiers required on a permanent basis to preserve the security of Jerusalem; by restoring the Citadel the Ottoman authorities were emphasizing the fact that they were the new masters of the Holy City.

The Citadel (Qal'a) is located in the western area of the walled city, south of Bab al-Khalil (now known as the Jaffa Gate); its west wall is integral with the west flank of the city wall. Though the Citadel is located inside the Old City and is included within its walls, it forms an independent institution. Cohen (1990: 36) explains that it had its own system, special gates and chambers, as well as administrative and military establishment, which amounted to some 104 men.²⁷

As might be expected, the structure incorporates remnants from many periods of the occupation of the city, from the Roman period to modern times.²⁸ It was largely reconstructed by the Crusaders but in 616/1219 al-Mu'azzam 'Isa dismantled parts of it. The Citadel was then re-fortified in the Mamluk period and a new mosque was installed, to act as the only Friday mosque in the city apart from al-Aqsa. This was in order to allow the troops to perform the obligatory Friday prayers without leaving the Citadel unguarded (Burgoyne 1987: 85). According to Mujir al-Din (1973 2: 55, 281) the Citadel had subsequently fallen into neglect and had not been rebuilt. When, therefore, the Ottomans began their reconstruction project in the Citadel, it was being revived after a long period of disuse, and new arrangements were needed.

Van Berchem (see below) published four inscriptions which point to the restorations implemented in the Citadel by order of Sultan Sulaiman I. One fundamental step towards the reconstruction of the defence system was the building in 938/1531 of a new entrance facing east. According to its foundation inscription, it was ordered by the sultan who again is

described as 'Sulaiman al-Thani', as he had been in the inscription on Sabil Qasim Pasha (cat. no. 2). He is further described in it as the 'source of security' (*manba' al-amn*) (van Berchem 1922: 146-9, no. 45; Walls and Abu'l Hajj 1980: 9, no. 45; Meinecke 1988: 263).

Meinecke (1988: 263) concluded that a mosque was also constructed in 939/1532-3 in the south west tower of the Citadel. He cited van Berchem (1922: 164-5 no. 52) among many other secondary sources; but the inscription concerns the erection of a *minbar*, for the mosque had already been constructed during the Mamluk period, as I have described above. It is correct that a new mosque was constructed, but it was located on the east side of the Citadel, immediately between the moat and the main eastern entrance of the Citadel. This mosque, known as 'the Summer Mosque' (cat. no. 27) is undated, although a circular medallion carrying the name of Sultan Sulaiman is located above the *mihrab* (van Berchem 1922: 149, no. 46; Walls and Abu'l-Hajj 1980: 9, no. 46). The Summer Mosque is an open prayer *musalla* and was already by 1151/1643-4 being called *Masjid al-Saif* on an inscription plaque recording restoration work undertaken by the *agha* of the Janissaries, the Khassaki 'Ali Agha.

Another undated medallion, also edited by van Berchem (1922: 149-50, no. 47), carried the name of Sultan Sulaiman as well and indicated the construction of a wall in front of the moat. The inscription was buried in 1898 when the moat was filled in (Walls and Abu'l Hajj 1980: 9, no. 47). The layout and the context of these two medallions are strikingly similar to Mamluk blazons which led Meinecke (1988: 263) to the presumption 'that the medallions suggested that through this restoration the Sultan (Sulaiman) had entered upon the inheritance of his Mamluk predecessors'.

One of the elements of the site that dates to the Ottoman period is the minaret (cat. no. 26) rising close to the Citadel mosque. It is not dated, but has a cylindrical shaft decorated with a billet and roll moulding which, as Meinecke has suggested (1988: 263), would seem to indicate that the minaret was the work of the same building teams who since 930/1524 had worked elsewhere for the sultan in Jerusalem. Meinecke therefore concluded that it was possible to date the minaret too to the period of Sulaiman. But since the minaret was restored by Muhammad Pasha in 1065/1655, it is hard to determine whether the mouldings are a result of these restoration works or whether they belonged to the construction phase. (For a detailed discussion see below, under Minarets, and cat. no. 26.)

Cohen (1990: 36), basing his remarks on Sijill 1: 400 dated 938/1531, has shown that preliminary security precautions had already been taken in the Citadel by the Ottoman authorities during the later phases of the construction of the walls, before the implementation of

²⁷ These consisted of 64 janissaries, 5 gunners, 12 guards on the gates of the city, 2 guards in the Citadel, 10 solders for administrative tasks, 1 prison guard, 1 carpenter, 1 man responsible for the moat and the water channel, and 1 man responsible for the aqueduct. The administrative team was made up of the Commander of the Citadel (*dizdar*), his deputy (*kathuda*), clerk (*katib*), an *imam* and *mu'adhdhin*. It seems that the strength of the fortress declined in the middle of the 17th century for it then numbered only 90 guards, according to an official register summarised by Heyd (1960: 190), which is preserved in the Turkish State Archives (no. 5219). For a comparison with other forces in Palestine and neighbouring districts, see Heyd 1960: 190, Appendix iii.

²⁸ The Citadel has been described and analysed in detail by Johns (1936: 127-31; 1950: 121-90). See also van Berchem (1922: 129-68); Burgoyne (1987: 85); Meinecke (1988: 262-3); Cohen (1990: 35-41) and Chapter 32 by Hawari in this volume.

orders by Sultan Sulaiman. According to the *sijill* record, the buildings inside the Citadel as well as the outer wall had been inspected by the master builders of the city. It had become evident that masonry had fallen from the outer wall in the part facing the street near the moat. The master builders had also noted that the mortar filling the joints in the masonry contained a high portion of *tin* (potter's clay); they recommended, therefore, that in order to strengthen the wall the stones should be dismantled and re-assembled, but using a mortar with a lower proportion of sand and a higher one of lime.

The *sijills* record reveals further interesting information, not quoted by Cohen, on the names and origins of the master builders who investigated the site in the Citadel. They turn out to have been al-Mu'allim al-Hajj Muhammad ibn Mansur al-Halabi (a master builder from Aleppo); al-Mu'allim Muhammad ibn al-Hamawi al-Shami (a master builder from Hama, 'the Syrian'), and al-Mu'allim Husain ibn Nammar al-Muqaddasi (a master builder from Jerusalem). The names confirm the supposition by Meinecke as to the identity of the teams sent to work in Jerusalem, and also shed new light on the local contribution in the construction projects. From another record in *Sijill* 2: 6 dated 12 Rabi' II 938/23 November 1531, one learns that *mafkar al-akabir* Muhammad Beg was *al-mushid*²⁹ (the supervisor) of the construction work undertaken in the Citadel.

Cohen (1990: 36) pointed to another phase of restoration executed in the Citadel immediately prior to the culmination of the walls project. It is recorded in *Sijill* 14: 561 dated 948/1542, and details a total cost of 15,000 *akçe*.

Repairs to the Citadel continued to be one of the priorities of the Ottoman authorities. From time to time maintenance and repair work was undertaken there. The *sijill* (89: 120) dated to the end of Dhu 'l-Hijja 1017/5 April 1609 relates that Salih Agha, the commandant of the Citadel, had come to the Shari'a court and had reported to the *qadi* that the Citadel was in need of restoration. The areas mentioned by Salih included the cresting (*shurafat*), the roofs of the storage rooms, the banner (*'alim*) of the minaret of the *masjid*, the vestibule and the Citadel gate. The *qadi* then commissioned 'Abd al-Muhsin ibn Nammar, the chief architect, and a group of other Muslim nobles to make an estimate of the cost. 'Abd al-Muhsin reported back to the court that the estimate came to a total of 300 *sultani*, equal to 12,500 *qit'a misriyya*. A report was then drawn up, to be submitted to whomsoever it concerned. Later in 1144/1731-2 a restoration to the glacis (*rabad*) was carried out under Sultan Mahmud I. The inscription recording this, edited by van Berchem (1922: 156, no. 49) was buried in 1898 when the moat was filled in.

²⁹ This post is probably similar to the *shad* in the Mamluk period. For his responsibilities, see Behrens-Abouseif (1995a: 293-309).

The Water Supply

Inscriptions on the *sabils* record that the provision of water for the Holy City of Jerusalem was a further important project carried out by order of Sultan Sulaiman. Safeguarding the water supply to the city has been vital throughout the long history of the city, which until recently depended primarily on the collection of rainwater into cisterns. By law, every house had to be provided with at least one if not two of these. Securing the water supply to the Haram in particular, however, as well as to other parts of the city, is not only a secular necessity, but also a religious duty, for water is essential for the ablutions which precede each of the five daily prayers which Muslims have to perform. Sulaiman, in restoring the water supply, would thus appear in the eyes of his subjects as a pious sultan who cared not only for the Holy City but also for its faithful citizens.

The water project comprised the restoration of the Qanat al-Sabil,³⁰ the repair of the reservoir of Birkat al-Sultan, the construction of nine *sabils* (public fountains acting as water outlets), and the extension of the water canal within the Old City. Six of the nine *sabils* attributed to Sultan Sulaiman have been identified and are still standing. Three others, mentioned in the records, remain to be identified, though they were probably located within the Haram area. Qanat al-Sabil ran through pottery pipes (partly covered in earth) from the water reservoirs of al-Maraji' and Aritas (located south of Jerusalem near Bethlehem, and later renamed after Sultan Sulaiman) till it reached the Haram through Bab al-Silsila. A few metres before entering the Haram, at the Daraj al-'Ain junction, it branched north to feed three of the six *sabils* and to provide water for Hammam al-Sultan, *waqf* of Khassaki Sultan.

The first *sabil* to be constructed was Sabil Birkat al-Sultan (cat. no. 4), dated 10 Muharram 943/29 June 1536; it is located outside the city on the road to Hebron, 700m downhill from Bab al-Khalil (Jaffa Gate). It was to be the only *sabil* and only the second Ottoman structure built

³⁰ Qanat al-Sabil was one of the main sources of water for Jerusalem from the time of its construction until the present day. There was a special *waqf* for the *qanat* dedicated to its maintenance and security. The Jerusalem *sijills* (23: 357, 508, 526; 24: 114) record the transactions of the *waqf*. From time to time, the canal was deliberately breached in order to water the land through which it passed, according to *Sijill* 27: 317 and *Sijill* 30: 427. The result was to cut the water supply to Jerusalem. The Ottoman authority acted on occasion to restore the canal. For more details regarding the history of the canal in different periods, see Mujir al-Din (1973 2: 59, 99, 285, 330); van Berchem and his bibliography (1923: 243, 343, 240, 243-4, 338, 341); al-'Arif (1947: 100); Mazar (1976: 79-84); al-Imam (1976: 183-4, and his rich notes); al-Husaini (1982: 115-19); al-'Asali (1982 141-162); Salama and Zilberman (1986: 91-106); al-'Asali (1989: 112 in which he publishes *Sijill* nos. 196, 287); Singer (1994: 102-4). For a map of this canal, see Mazar (1976: 83), and Bahat (1980: 118).

outside the walls. The *sabil* is free-standing and consists for the main part of a recessed niche surmounted by a chevron-pointed arch. The arch is contained within a rectangular wall. A trough to contain water, now hidden because of the raised level of the modern road, previously stood at the foot of the *sabil*. A subsidiary channel from Qanat al-Sabil, the remains of which are still visible a few metres to the west, used to feed the fountain with water.

Sabil Tariq al-Wad (cat. no. 5, dated 1 Rajab 943/14 December 1536) was the second fountain built by order of Sultan Sulaiman. It is located within the city, in the southern section of al-Wad Road near the Suq al-Qattanin, in a crowded trading area close to the principal entrance to the Haram. The *sabil* was built to a design similar to that of Sabil Birkat al-Sultan, the main difference being the inclusion of Crusader architectural features in the fabric. A period of six months separated the construction of these two fountains. This period in all probability represented the time needed to extend the Qanat al-Sabil to reach the Haram area of the city, as Meinecke (1988: 264) has implied, for it took only three weeks to build the next *sabil*.

Sabil Bab al-Silsila (cat. no. 6, dated 22 Rajab 943/4 January 1537), was the third fountain construction, and was located a few metres in front of the eponymous Haram gate opposite the Tankiziyya Madrasa. It comprises a tall recessed niche with a trough to contain the water in the lower part of the recess. It is also similar in design to the other *sabils*.

Sabil Bab al-‘Atm (cat. no. 8), mentioned above under the Haram heading, and Sabil Bab al-Nazir (cat. no. 7), which has also already been discussed as one of the monuments of Tariq ‘Aqabat al-Takiyya, were both built after Sabil Bab al-Silsila. A period of one month elapsed between the building of Sabil Bab al-‘Atm and Sabil Bab al-Nazir.

The last *sabil* built to the order of Sulaiman was that of Bab Sitti Maryam (cat. no. 9), located to the north of Tariq al-Mujahidin, about 10m west of Bab al-Asbat (St Stephen’s Gate). It is situated at a focal point, for it is close to the only open gate in the walls of Jerusalem allowing access from the east, and it is at the start of the road which crosses the Old City from east to west. The fountain is a single-unit structure, consisting of the usual recessed niche surmounted by a pointed arch, which is supported by a stone pillar on either side of the opening. A subsidiary underground channel from Qanat al-Sabil used to provide both it and the Hammam Sitti Maryam with water. The inscription on the Sabil Sitti Maryam is no longer extant, but its identification as belonging to the Ottoman period is secured by a *waqfiyya* in the *sijills* dated 948/1541–2, and the formal comparisons made by van Berchem (1923: 417–18) between it and the other *sabils* indicate that it can be safely ascribed to Sultan Sulaiman.

According to the *sijills* (Husaini 1982: 115) Muhammad Çelebi al-Naqqash was the person in charge (*al-mubashir*) of the water supply project. In a special formal meeting held in the Dome of the Chain on the Sakhra terrace in the presence of Ja‘far Beg, *katib* of the noble provinces in Syria, and Salih Efendi ibn al-Qazwini, the *qadi* of Jerusalem, Muhammad Çelebi al-Naqqash attested that he had repaired the nine *sabils*, and further that he had made them *waqf* in the name of Sultan Sulaiman (see cat. no. 1 under ‘Endowment’ for details and discussion).

In any case, the *sabils* project as a whole was executed in a very short time—10 Muharram 943–2 Ramadan 943/29 June 1536–12 February 1537. Meinecke (1988: 264–5) attributes this remarkably short period to the recycling of old building materials, that is, the use of Crusader debris. However, other contributory factors must also have been the importance of the water supply to the city, and the many master builders available who were in a position to undertake such a complicated project in so short a span of time. To judge by the style of the *sabils*, it seems that at least two teams were involved in the building work, for the fountains can be divided into two stylistic groups. The first group includes Sabil Birkat al-Sultan, Sabil Bab al-‘Atm, and Sabil Bab Sitti Maryam. They are on the whole simple, constructed with original, Islamic architectural materials. The second group, on the other hand, which comprises Sabil al-Wad, Sabil Bab al-Silsila, and Sabil Bab al-Nazir, contains both Islamic and Crusader materials. It would be true to say that in general the examples of this second group are more elegant than the first. That there was an abundance of master builders in Jerusalem in the first half of the 16th century is understandable in view of the extensive architectural activity there, and perhaps particularly because of the walls project. Meinecke (1988: 265), who was basing his analysis on architectural comparisons, presumed correctly that teams of workers had been imported into Jerusalem from Syria (Damascus and Aleppo) to work on the royal commission. An entry in the *sijill* has been discovered which shows that Bairam Jawish, whose biography is detailed under the section on the founder in catalogue no. 11, went especially to Egypt to bring back master builders to work on the walls. Many records in the *sijill* relate to transactions with master builders. Their *nisbas*³¹ betray the

³¹ Even if the *nisba* does not always tell the whole truth—for example, it may relate to a man’s forebears—the fact that most sophisticated crafts were kept within the same family means that it can supply important information. The association of Jerusalem with the Ibn Nammar family, whose building activities continued over a period of almost two centuries through five generations (see below under ‘Ibn Nammar Family’), is based on a single document (*Sijill* 1: 400). Without this entry it would be difficult to confirm their attribution to Jerusalem.

origin of their families if not necessarily of the builders themselves (for details see below).

No comment on Sulaiman's water supply project would be complete without noting the appropriateness of the choice of the location of the *sabils*. There can be no doubt that the person responsible for selecting the sites was fully aware of the movement of human traffic inside the Holy City—and aware too of the streams of visitors. The majority of the sites for the fountains are clustered around the major entrances of the Haram and in this way they served as many people as possible.

The Wall Project

While the water project was still in progress but close to finishing, the Ottoman officials in Jerusalem were busily preparing the infrastructure for another major work of construction. The project was intended to encompass the Old City with a defensive wall. The wall was not, of course, an Ottoman innovation, for the city had had a defensive system of sorts since its foundation and this had continued into the medieval period (see Wightman 1993). The earlier city wall, which had been in part built and in part renewed by Salah al-Din, who worked personally on its construction (Asfahani 1903: 302) after he retook Jerusalem from the Crusaders in 587/1191, was partly dismantled after three decades by al-Mu'azzam 'Isa³² in 616/1219 (Mujir al-Din 1973 2: 402) and for a second time in 624/1227 (Meinecke 1988: 265).

Mujir al-Din (1973 2: 90, 92) reports two attempts to restore the walls of Jerusalem in the Mamluk period. The first was in 695/1295 by Kitbugha (694-96/1294-97) who repaired the east side which abuts the cemetery and constitutes the wall of the Haram, and the second by Muhammad ibn Qala'un, who reigned three times and who repaired the south side near Mihrab Da'ud in 709/1301 during his third period of power (709-41/1309-40). Despite these attempts the city remained without an effective defensive wall for three centuries. Any section of an earlier wall that had survived was in a ruined state, as was noted by some travellers (see al-Imam 1976: 165). The situation continued until Sultan Sulaiman ordered the reconstruction. It is safe to say that the present walls incorporate a good deal of the earlier constructions.

What was the motivation behind Sultan Sulaiman's decision to tackle so many building works in Jerusalem, but in particular the renovation of the walls? Before an answer is attempted, it should be borne in mind that such an immense project was usually motivated not by

one specific reason, but by a group of integrated reasons. It is also important to keep the wall project in perspective. It should not be separated from the rest of the Ottoman work in the city. Seen in this context the work on the walls falls into its historical perspective.

Evliya Çelebi (Stephan 1980: 74), who visited Jerusalem in Ramadan 1082/January 1672, attributed the remarkable commitment to Jerusalem by Sultan Sulaiman to an instruction from the Prophet Muhammad. Evliya Çelebi relates that the Prophet appeared to Sulaiman during one of the 'blessed nights' and asked that he do a number of charitable acts—embellish Mecca and Medina, provide the Sanctuary of Jerusalem with a water-basin, embellish the Rock of Jerusalem, fortify the Citadel of Jerusalem, send money annually to the dervishes and rebuild the Holy City. Evliya Çelebi's interpretation may well reflect the official attitude to, as well the 17th-century public perception of, the reasons for the sultan's good works, and is thus probably not an historically accurate account, as Meinecke (1988: 258) noted. But it clearly implies religious fervour.

Since Jerusalem was located on the edge of the desert, the home of many nomadic tribes, and had been vulnerable for some time to Bedouin³³ attack, it could be argued that Sulaiman's motivation was primarily one of defence (van Berchem 1922: 443-4). However, Meinecke (1988: 265) interpreted the construction in a more long-term historical way, as an attempt to ensure that al-Quds should 'regain its long-lost autonomy as a city.' Cohen's analysis (1989: 468-9) was more elaborate. He touched on the economic impact of the walls, seeing them as a precaution against possible and well-concealed Christian plans to renew their grip on the holy places, and the desire of the Ottomans to demonstrate to their Muslim subjects the difference between themselves and the previous Mamluk rule.

Whatever the motive or—more accurately—the motives behind the wall project, it certainly represented the largest and most imposing project executed in the city during the Ottoman period. Its impact is second only to that of the Dome of the Rock, leaving such important monuments as the Holy Sepulchre and the Wailing Wall in relative obscurity, as Cohen (1989: 467) noted.

The walls of Jerusalem surpass those of other Islamic cities such as Cairo, Damascus, Istanbul, or Aleppo in two respects—first, the walls are still almost intact; and second, they are preserved in their original form, whereas only fragments remain of the other walls, which are earlier

³² It is worth noting that al-Mu'azzam 'Isa contributed to the construction of the walls before he dismantled part of them. Recent excavations have revealed two inscriptions that bear the name of al-Mu'azzam 'Isa. These relate to the foundation of the Ayyubid sector of the walls. For the first of these, see Broshi (1976: 78), and for the second, see Sharon (1977: 179-93).

³³ For the role of the Bedouin in the Ottoman period in Palestine see Heyd (1960: 79-89), Sharon (1975: 11-30). It is, however, worth mentioning that neither Heyd nor Sharon point to any raid of the Bedouin on Jerusalem before the construction of the wall, and so this as a contributory factor should be accepted with some reservation.

in date. While the walls of Acre (Akko) are completely preserved, they are of relatively recent date, being built in the time of Ahmad Pasha al-Jazzar (1148-1219/1735-1804).

Despite the importance of the Jerusalem walls, to date there has been no detailed architectural study of them.³⁴ The recent book written by Wightman (1993) is confined to the periods preceding the Ottomans. It is not within the scope of the present study to present more than these preliminary introductory notes. A brief survey of the historical information contained in recent publications on the wall project follows.

The walls, as Meinecke (1988: 266) notes, were built in the Ayyubid and Mamluk style, and in this way can be compared to the walls of Damascus and Aleppo. The work included the construction of a wall extending about 4km in length, cut by seven gates—of which the Damascus Gate (Bab al-‘Amud) is the most imposing—and two main corner towers with slit openings. The wall incorporates some of the earlier construction—the east and the south east walls of the Haram, and the remnants of the Citadel in the west. It is clear, not just stylistically but also in layout and general lines, that the Ottoman work followed the earlier scheme of the Ayyubid wall. It is explicit from the *sijill* (12: 92) that before constructing parts of the wall, the masons uncovered the ancient foundations of the earlier wall, and the new courses were laid above them.

The scheme was ordered by Sultan Sulaiman, a fact made clear by the foundation inscriptions still extant on gates and the towers of the wall. Van Berchem (1922: 443-4) based his deductions as to the different stages of construction on these inscriptions, including when the project started and when it ended. The first stage was built in 944/1537-8 and included the north and the north west sides, together with Bab al-Zahra (Herod's Gate). Three inscriptions belong to this phase. The first is on the middle tower of the eastern part of the north wall (van Berchem 1922: 437, no. 119); the second (van Berchem 1922: 438, no. 120) is found above Bab al-‘Amud (Damascus Gate); and the third (van Berchem 1922: 438, no. 121) is on Burj al-Laqlaq (Stork Tower) on the north east corner of the wall. In the following year—that is in 945/1538-9—the work of the second stage was continued on the eastern side, from the north east corner up to Bab al-Asbat (St

Stephen's Gate), and, even further to the south, to the north-eastern corner of the Haram (van Berchem 1922: 439, no. 122). At the same time, work continued on the northern part of the west side towards the Citadel. Four inscriptions give the year 945/1538-9 as a preliminary completion date and are preserved on various sites, marking the work on the western section. One (Johns 1950: 172, n. 45, Walls and Abu'l Hajj 1980: 29, no. LIV, see also 31, n. 23) is found on the northernmost extremity of the wall, and one on the southernmost tower (van Berchem 1922: 439, no. 123); and two others (van Berchem 1922: 439-40, nos. 124, 125) are set into the western gate, known as the Bab al-Khalil (Jaffa Gate). The final phase covered the south side of the wall, and four inscriptions edited by van Berchem testify that the work was completed in 947/1540-1. Two inscriptions are located (van Berchem 1922: 441-2, nos. 126, 127) above Bab al-Nabi Da'ud (Zion Gate), one (van Berchem 1922: 442, no. 128) at the south-eastern corner of Burj Kibrit (Sulphur Tower), and the last (van Berchem 1922: 442-3, no. 129) on the southern gate called the Bab al-Maghariba.

As the inscriptions demonstrate, the whole project was completed during the years 944-947/1537-41. It was indeed, as Cohen (1989: 469) notes, a remarkably short period for such an immense undertaking. Cohen goes on to say that 'one may assume that overall construction took substantially longer: preparatory stages were most probably initiated earlier than mid-1538, whereas final touches were very likely applied long after the winter of 1540.' Cohen later (1990: 34) cited *Sijill* 14: 144 as proof of his earlier assumption, and indicates that the work on the wall project continued until the end of Ramadan 948/middle of January 1542.

Even if the final completion of the project took a few more months, it was still a short period for such a complicated task. It must have helped that many places inside Jerusalem—and probably outside the city as well—were in a ruinous condition, for the debris from them was in all probability reused in the construction of the wall. It can be assumed that almost every local master builder, as well as almost every beast of burden, was summoned to contribute their labour to the project, and to bring stones from the surrounding areas. It only needs a preliminary observation of the wall to conclude that different sources of masonry were used in the construction. The masonry is of various sizes, the larger blocks being used in the lower courses, and the stones are of varying tones. They also show different dressing techniques and varied decorative and architectural detailing, which must indicate that several teams of builders contributed to the task of erecting the walls.

Meinecke (1988: 266) compared the vaults in the gates of Bab al-‘Amud, Bab Sitti Maryam and Bab al-Khalil with some late Mamluk gate construction in Aleppo

³⁴ A brief survey of the historical information contained in recent publications on the wall project are found in van Berchem (1922: 443-4); al-‘Arif (1961: 303-4); Najm *et al.* (1983: 342-59); Meinecke (1988: 265-6); *PI* (1984 3: 517-19); Cohen (1989: 467-77; 1990: 32-5), Ghosheh (1992). It is worth noting that there is also a very short note on the walls in *EI* (Grabar 1986: 344). Although Ben-Dov (1983: 85-120), who was writing in Hebrew and was then translated into English (1990: 12-35), devoted to the Ottoman city walls a chapter which includes many photographs and plans not previously published, he does not give descriptions of architectural or decorative features, nor is there any comparison with similar features elsewhere.

and Cairo, deducing that rather than building teams from the central Ottoman region being commissioned to erect this monumental city wall, Syrian or Cairene builders were employed. Meinecke was partly right in his inference for Cohen (1990: 33), basing himself on Sijill 14: 144, has pointed to the inclusion of al-Mu'allim Darwish al-Halabi (the master builder from Aleppo). Al-Mu'allim Darwish played a major role in the wall project, for he was assistant to the person in overall charge of the construction. Relying on the *sijill* evidence (see above), it is possible to conclude that other builders from Syria were employed on the wall project (for a complete list see below under 'Non-Local Builders'). As has already been stated above (and see cat. no. 11 under 'Founder'), another important entry in the *sijills* records that Bairam Jawish went to Egypt to bring back master builders to work on the wall. But one should not underestimate the local contribution in this or any other architectural project. For a fuller discussion on the master builders and their Jerusalem origins in the 16th century, see below under 'Master Builders and Skilled Craftsmen'.

Until fairly recently, nothing was known about the official in charge of the entire project or about the identity of the master builders. Al-'Arif (1961: 307) and al-'Asali (1981: 325), both without citing supporting references, state that Bairam Jawish had been appointed the supervisor of the work on the walls by Sultan Sulaiman. As shown above, Bairam did indeed have some involvement in the project, but he never had overall responsibility. Meinecke (1988: 266) assumed that Muhammad Beg, the governor of Gaza and al-Quds, who constructed a *mihrab* on the Dome of the Rock terrace (cat. no. 10) was the chief overseer builder of the project. But finally Cohen (1989: 470-3), relying on the *sijill* evidence, proved that Muhammad Çelebi al-Naqqash was in charge of providing funds for the whole project. Following this breakthrough, in 1990 Cohen (1990: 34) was able to expand his conclusions, again relying on information in the *sijills*, to show that Muhammad Çelebi al-Naqqash was the official responsible for the whole project, that is, he was in charge of both the financial and administrative aspects.

Muhammad Çelebi al-Naqqash, whose name frequently appears in the *sijills* (10: 16; 12: 922; 12: 905 and see cat. no. 4 under 'Endowment') bore the titles *al-amin 'ala al-amwal al-sultaniyya* (the superintendent of taxes) and *al-amin 'ala sur bait al-maqdis* (the superintendent of the wall of Jerusalem). He was certainly a man of considerable capabilities who, through his supervision of many vital projects,³⁵ contributed a great deal to the development of Jerusalem. The scattered records found in the *sijills* suggest that Muhammad al-Naqqash was assisted by both technical and administrative

experts in the handling of the day-to-day business of the projects. Sijill 12: 905, a record known to Cohen (1989: 476, n. 13), and Sijill 12: 830 relate that detailed books were kept on both the income and expenditure of the project.³⁶ There were many clerks (*yaziji katib 'ala 'imarat al-sur*) responsible for these books. When Khair al-Din Çelebi ibn al-Jamali Yusuf, one of the scribes involved in the wall project in 944/1537-8 (Sijill 7: 151), departed on the *hajj* and sold his right to the post on 18 Jumada II 947/20 October 1540 (Sijill 12: 905), Muhammad al-Naqqash appointed Taj al-Din Khalifa as his replacement and the books were then deposited with the new *yaziji*. Sijill 10: 444, 445, dated 21 Shawwal 945/12 March 1538, mentions Ya'qub ibn Shams al-Din as another *yaziji* working on the project.

In addition to Darwish al-Halabi, the master builder from Aleppo mentioned above, who acted as an assistant to Muhammad Çelebi al-Naqqash, the author has discovered a reference in the *sijills* (12: 922) on 14 Jumada I 947/16 September 1540, to another assistant, again a master builder but this time one who had financial responsibilities. This record mentions that 'it was proven in the council of the religious court that Muhammad Çelebi al-Naqqash, the superintendent of the wall, had authorised *al-mu'allim* (the master builder) Muslih al-Din ibn 'Abdullah al-Rumi *al-qanarwati* (specialist in water channels) to collect the revenue of the villages of Bethlehem and Bait Jala outside Jerusalem in addition to the revenue of Qanat al-Sabil'. The entry is important, for it sheds light on the origins of Muslih al-Din, showing he was a Rumi (Turk), and also gives us his *laqab* (*al-qanarwati*) which identifies his speciality.

A further interesting entry is found in Sijill 12: 92 in a record dated 19 Muharram 946/6 June 1539. It provides us with the name of another master builder working on the walls, as well as data relating to the formation of one of the teams present at the site. The entry states that a ceramic pipe (*qadus*) filled with copper coins dating from the period of previous sultans had been found while the workers were exposing the wall foundations. The location of the site was close to the slaughter-house in the Jewish neighbourhood (the south side), and the discovery had taken place in the presence of the authorised supervisors (*al-mu'tamadin al-waqifin*), Sinan and Paqais the Janissaries in Syria, and other workers, the master builder Husain ibn Nammar, the chief of the builders, and Ya'qub al-Yaziji. This time the master builder was a local

³⁵ For further details on his involvement in architecture and aspects of his personal life, see cat. no. 4 under 'Endowment', and Cohen 1989: 470-3.

³⁶ Unfortunately, so far no information has been discovered in the Jerusalem *sijills* on the financial aspects of building the wall. However, some records were found by me with respect to the master builder. Cohen (1989: 471) has stated that he has not yet come across any relevant data in the central archives of Istanbul, where such books are kept.

person from Jerusalem, for Sijill 1: 400 gives his complete name as Husain ibn Nammar al-Muqaddasi. The money was delivered to the court by Husain ibn Nammar accompanied by Ya'qub al-Yaziji.

Outside the Old City

A few records found in the *sijills* point to Ottoman activity in the suburbs of the Old City. The first, Sijill 23: 168 dated 26 Safar 957/16 March 1550, is an agreement between Hamza Çelebi and Husain ibn Nammar the master builder, to restore the Maqam of 'Azr (Lazarus) in Bethany, which is located to the east of city. The second entry, Sijill 28: 294 dated 4 Jumada I 961/4 April 1554, records permission granted by the *qadi* to the inspector of the *turba* (mausoleum) of al-Shaikh Ahmad al-Thauri. The monument was located to the west of the city and, on the request of the inspector, following a joint visit by both men, he was allowed to restore it. The third record (Sijill 48: 127) reveals that Maqam Rabi'a al-'Adawiyya, on the Mount of Olives to the east of the Old City, was restored in 972/1564-5 by the two master builders, Mahmud ibn Ramadan and Mahmud ibn Nammar. The stones for the restoration were brought by Ibn Sulaiman from an adjacent village, al-Tur. Ibn Sulaiman was contracted by the two master builder to deliver the required masonry. Though the record in Sijill 78: 544 is about a dispute over the quality of lime and no further details are given, it can be determined from it that Maqam Nabi Musa, which is located near Jericho, was restored by the master builder 'Abd al-Muhsin ibn Nammar in the year 1016/1607. The *sijills* also record restorations to Maqam al-Nabi Yunus (at Halhul, north of Hebron—Sijill 79: 383; 84: 548), and Maqam al-Nabi Lot (at Bani Nu'aim, east of Hebron) and Maqam al-Nabi Musa (Sijill 84: 548).

The Development of the Ottoman City, 1010-1247/1600-1831

The second phase of architectural development in Ottoman Jerusalem extends from the beginning of the 17th century until 1831. It is characterised in general by small-scale individual monuments rather than the imposing projects already described. Most of the construction and restoration initiatives, with very few exceptions, were taken by local governors and dignitaries rather than by the sultans or other prominent figures of the Ottoman empire. The general principles of the second phase, however, were those of the earlier, 16th-century work. New building and repair work was concentrated in two main areas—the Haram al-Sharif itself, and a few sites close by within the city walls.

The Haram—individual buildings

The Haram continued to attract the major architectural work of the city but this later period saw the lower esplanade of the Haram share with the upper terrace of the Dome of the Rock the sites for the monuments, in contrast to the earlier phase, which had seen just two *sabils* constructed within the larger esplanade area. The newly-named Khalwa Bairam Pasha, an attribution which has only now been revealed by the *sijill* evidence (cat. no. 34, dated 1038/1628), was the first monument to be constructed after Madrasa al-Ahmadiyya (see cat. no. 25). Almost a quarter of century separated the two buildings. The *khalwa* is located at the western edge of the Sakhra terrace between the Hujrat Islam Beg (cat. no. 21), and the Khalwat Sadanat al-Haram (cat. no. 51). It closely resembles the other *khalwas* found in the Haram in that it consists of two storeys. It is particularly interesting to discover that the Chief Architect of Jerusalem, 'Abd al-Muhsin ibn Nammar, was the builder of the project. In point of fact, Bairam Pasha did not himself construct the *khalwa* but rather bought it from Mustafa Agha. The *khalwa* has no foundation inscription, but it is clear from the *sijill* (115: 721) that it was constructed shortly before 1038/1638-9.

It emerges from the *sijill* records (113: 248) that Bairam Pasha was responsible for other restoration and repair work in the Haram al-Sharif (see below and cat. no. 34 of the catalogue). From the foundation inscription of Sabil Sha'lan (cat. no. 36, restored 1037/1627-8), and the Sijill 113: 248, it is clear that Bairam Pasha can be credited with the sponsorship of the second cycle of restoration on the fountain. It was first constructed by al-Malik al-Mu'azzam 'Isa (613/1216-7), and then restored at the time of Barsbai (832/1429). It is located in the north western section of the Haram esplanade near the north western colonnade which leads to the Dome of the Rock terrace. The *sabil* is known by the name of al-Shaikh Ibrahim ibn Sulaiman ibn Sha'lan, who held the post of *al-siqaya* in 1098/1686-7, rather than being named after either the first patron or one of the later restorers.³⁷

³⁷ It is a common feature in Jerusalem to find monuments given a new name which differs radically from the original. For example, the Ayyubid domed edifice for Qur'anic recitation is now known as the Qubbat Musa (647/1249-50) instead of Qubbat al-Salih Najm al-Din Ayyub after the founder; Sabil Mustafa Agha (cat. no. 48) is more commonly known as Sabil al-Shaikh Budair; Qubbat al-Hadi al-Amin (cat. no. 43) is named after al-Shaikh Muhammad al-Khalili, and the *mastaba* and *mihrab* of Ahmad Qullari (cat. no. 47) is universally known as Mastabat wa Mihrab al-Tin after the fig-tree which used to give it shade, rather than by the name of its founder or restorer. Indeed, when the DIA and the BSAJ began their survey of the Ottoman sites, this was found to be the case for most of the monuments in Jerusalem. Many others were known by the name of the current occupant rather than either by their historical name or by that of their founder.

The next building to be erected in the Haram was the Mihrab of 'Ali Pasha (cat. no. 37, 1047/1637-8). Its construction marked the beginning of the fashion for small, modest monuments which were to become such a feature of the Haram in this period. The *mihrab* is of simple masonry and is at the southern end of a rectangular stone *mastaba* which was constructed at the same time. Located within the Haram esplanade, it lies about 10m north east of Bab al-Qattanin. An inscription plaque gives the date and the name of the founder. Open prayer *mastabas*, with or without a *mihrab*, were a feature of the esplanade long before the era of the Ottomans. There are many references to them in the historical sources, but the Mihrab 'Ali Pasha is the first example to survive from the Ottoman period. It was, however, followed both by a few dated examples of *mastabas* and *mihrabs* and by many undated ones (for details see cat. no. 55).

Yusuf Agha, who according to the *sijill* records (183: 225) seems to have been the governor of Jerusalem in 1092/1681, had previously been *agha* in Istanbul, if the foundation inscription has been properly understood. He was the patron of two small domes which share both a date and name of the master builder. The first, (cat. no. 38, 1092/1681), called al-Qubbat Yusuf, is situated at the south side of the Sakhra terrace, and the second, (cat. no. 39, 1092/1681), called al-Qubbat Yusuf Agha, is located at the south of the Haram esplanade between the Islamic Museum and Jami' al-Aqsa. The reason for the discrepancy in name, despite the fact that they were founded by the same patron, is due to a mistaken attribution of the first dome by certain scholars to Yusuf Salah al-Din al-Ayyubi. The commentators were influenced by a reused inscription plaque which carries the name of Salah al-Din, but they could not have deciphered it fully, for, rather than any reference to the *qubba*, it documents the bridging of a ditch and the rebuilding of a wall. The author has attempted to elucidate the situation and has solved the issue of date, but why Yusuf Agha constructed two domes—in two different styles using different architectural elements—remains an open question, despite suggestions which have been advanced in explanation (see cat. nos. 38-9).

In the late 17th century there was already a building between Hujrat Muhammad Agha to the east (cat. no. 20), and Khalwat Junbalatiyya (cat. no. 24) in the western section of the north side of the Dome of the Rock terrace. Nothing has been published about the earlier development of the site, which is presumably Ottoman. Arslan Pasha, who was governor of Jerusalem, Nablus, and Gaza and *amir al-hajj al-shami* (the Amir of the Syrian pilgrimage caravan), restored this building in 1109/1697, and it has accordingly been designated the 'Odat Arslan' (cat. no. 41) by the present writer, taking the *sijill* reference (198: 109) as authority. Odat Arslan, like most of the other *khalwas* on the Haram, is not described in any published

historical account. But the discovery of the *waqfiyya* in the *sijill* record makes it reasonable to fix the date of its restoration to the last decade of the 17th century. The *oda* has a similar layout to that of most of the *khalwas* on the Haram, but its external appearance is deeply influenced by the Hujrat Muhammad Agha.

Kursi Sulaiman (cat. no. 42, undated, probably after 1017/1608-9) is located at the eastern border of the Haram between Bab al-Asbat and Bab al-Rahma wa'l-Tauba (the Golden Gate). The building is unique in Ottoman Jerusalem for two reasons: (a) it is built in a remote area in the Haram abutting the eastern wall, which also constitutes part of the city wall, and (b) it consists of two parts, one of which—originally an outcrop of bedrock—has been cut and shaped to form a remarkably large cenotaph. Further puzzles arise from the fact that so far it is not known exactly by whom, when, or why it was built. An attempt to answer these question is to be found under catalogue entry no. 42.

Another problematic architectural development was carried out on the Sakhra terrace by Muhammad, governor of Jerusalem, in 1112/1700-1. It is referred to without evidence as 'Masjid al-Nabi' by modern writers; the inscription plaque carries the name 'Qubbat al-Hadi al-Amin' (Prophet Muhammad), and is the name which is suggested here though the *sijills* refer to it as al-Zawiya al-Muhammadiyya after al-Shaikh Muhammad al-Khalili (for more details, see cat. no. 43). The *qubba* is a free-standing monument situated between Qubbat al-Mi'raj and the north-west colonnade. From its inscription panel one can infer that some sort of domed structure was on the site before the present edifice was rebuilt. The architectural coherence of the present building leads to the conclusion that it is the result of a complete reconstruction rather than a minor restoration as the inscription would suggest. The *qubba* is made up of two parts, the lower one being an underground vault with *mihrab* and reused architectural elements, which suggests that it was one of the *ziyara* sites. The upper part is made up of one chamber covered with a shallow dome, and there is a *mihrab* in the south wall.

The next structure, Sabil al-Husaini (cat. no. 45, 1137/1728), built on the south-western corner of the terrace of the Dome of the Rock, abuts the northern façade of al-Qubba al-Nahawiyya. The *sabil* is no longer standing but architectural traces allow a possible reconstruction to be proposed. A foundation inscription attached to the upper section of the south side of the *sabil* gives the date of the construction as 1137/1724-5, and the name of the founder as Hasan the son of al-Dani al-Husaini. According to the relevant *sijill*, the founder was a famous *qadi* in Jerusalem, and his full name appears in the records as al-Sa'id Hasan Efendi Zada al-Husaini. His name denotes that he was from the family of the Prophet Muhammad, and this connection explains the purpose of the building,

which, beside providing water for the Haram visitor, acted as a memorial to al-Husain ibn 'Ali, the son of Fatima and thus the grandson of the Prophet Muhammad. The layout of the *sabil* closely resembles that of the fountain of Mustafa Agha (cat. no. 48).

Sabil al-Husaini concludes the individual Ottoman constructions which have been identified on the Sakhra terrace. There are three other small *khalwas* that defy identification which are located on the west side of the terrace. Here they have been given names that reflect either their current function or position. They are: (1) Khalwat Sadanat (custodian) al-Haram (cat. no. 51), which stands between Khalwat Bairam and the beginning of the steps which lead up to the Western Colonnade; (2) Khalwat al-Mu'adhdhinin (cat. no. 52), which is located between the Western Colonnade and the South-Western Khalwa; and (3) the South-Western Khalwa (cat. no. 53), which abuts the north side of the South-Western Colonnade. It is not known when or by whom these three *khalwas* were built. However, a pilgrim's account would seem to suggest that they were all built around the year 1222/1870. The *khalwas* are very simple, being almost featureless.

With respect to the other constructions on the Haram esplanade, there are five further monuments that deserve a mention, in addition to a group of undated *mihirabs* and *mastabas* (cat. no. 55). The first in chronological order is a cell known as 'Khalwat al-Dajani' (cat. no. 46, 1138/1728). The identification of this *khalwa* relies solely on a foundation inscription, but unfortunately it is not fully secure because there is some justification for believing that the inscription was attached to the monument only some time earlier this century. However, the authenticity of the inscription itself, as well as the identity of the founder whose name appears in it, are beyond doubt. For this reason the *khalwa* is included as one of the monuments relevant to this study. The *khalwa* is located to the west of the Dome of the Rock terrace on the level of the Haram esplanade, between the West Colonnade and the South Western Colonnade. It consists of a single rectangular prayer chamber, with a *mihrab* niche on the *qibla* side. From the *sijill* evidence it is known that the founder was a famous scholar in Jerusalem in the 18th century.

The next work to be undertaken in the Haram was the restoration by Ahmad Qullari of a *mihrab* and *mastaba* opposite Bab al-Silsila, south of Sabil Qasim Pasha, at the site known as the Musallat Ahmad Qullari (cat. no. 46, 1174/1760-1). The identification of this work is assured by the inscription panel which still exists on site above the *mihrab* niche.

Mustafa Agha, a governor of Jerusalem (1144-65/1731-51), contributed to the Haram development by constructing a small, handsome *sabil* (cat. no. 48, 1153/1740-1), better known in recent references as 'Sabil

al-Shaikh Budair'. Because there is no firm reason for doing so, however, it is here named after its founder. It is reason enough, in the view of the writer, that Mustafa should be given due credit for his elegant little building. It is situated within the Haram esplanade, about 20m south east of Bab al-Nazir. A well-designed foundation inscription on site, as well as a short *waqfiyya* in the relevant *sijill*, gives the date and the identity of the founder and provides other essential information. The fountain consists of a square base, four façades, and a small dome supported on three arches and a wall. The arches spring from four small columns decorated with geometrical and floral motifs.

The Iwan al-Sultan Mahmud II (cat. no. 50, 1233/1817-18) was the last Ottoman structure built in the Haram, and it is both the first and the last monument to be commissioned by an Ottoman sultan after the imposing projects of Sultan Sulaiman in the 16th century. Although the structure was erected by order of Sultan Mahmud and under the supervision of the vizier al-Hajj Sulaiman, governor of Sidon and Tripoli, the architectural form of the *iwan* is simple and undecorated. In its unadorned modesty it seems to reflect neither the order of the sultan nor the titles of the founder and the supervisor, being, rather, closer to the architectural language of the Palestinian vernacular than the style prevalent in the Ottoman city. This can be taken as a clear reflection of the decline both in quantity and quality of the architectural work in Jerusalem in the second half of the 17th century. It conforms indeed with the prevailing political and administrative conditions in the Ottoman empire as a whole at the time. The *iwan* is located in the northern end of the Haram precinct, about 20m south of Bab al-'Atm. The description of *iwan* is given in the foundation inscription, reflecting its single-unit structure. Four huge piers at the corners support four tall, pointed arches, which in turn support a dome. The original purpose of the *iwan* is not clear.

The Restorations in the Haram

In addition to the individual monuments constructed in the Haram, restoration activities continued, patronised by figures such as local governors, as well as under the orders of some of the sultans. This category of work encompassed the Dome of the Rock, the Jami' al-Aqsa, the Haram area, the Citadel, the water supply, and so on. None of these projects can compare with the earlier works which had been executed by order of Sultan Sulaiman, for they were limited both in scope and in number. Once again, the principal references to this renovatory activity until the present have depended on the foundation inscriptions collected and edited by van Berchem (see above).

Not all the restorations were carried out in the Haram by external initiative; some were implemented locally. It is disclosed by Sijill 100: 436 dated 20 Safar 1029/26 January 1620 that Muhammad Agha, the inspector of the Aqsa Mosque and the Dome of the Rock *waqf*, reported to 'Umar Efendi ibn Ibrahim, the *qadi* of Jerusalem, that the interior of the wooden ceiling of the western side of al-Masjid (al-Jami') al-Aqsa was damaged. He put the deterioration of the wood and medallions down to the lengthy period which had elapsed without proper maintenance, and to serious leaks which had resulted from the heavy rains. An inspection was ordered by the *qadi* who commissioned 'Abd al-Muhsin ibn Nammār the chief architect in Jerusalem, and the carpenter al-Mu'allim Ibrahim ibn Musa. It was decided that the damage should be repaired and the costs covered from income of the *waqf*.

It appears, that in the first half of the 17th century, securing and maintaining the lead sheets of the Dome of the Rock and al-Masjid (al-Jami') al-Aqsa was a constant worry to the extent that a special post was established. Sijill 113: 322 dated 13 Rabi' II 1037/22 December 1627 records that Muhammad ibn Ahmad ibn Abi Shaduf had replaced al-Shaikh Salih al-Kilari in the post of maintenance engineer for the lead sheets of the Dome of the Rock, al-Aqsa Mosque, and Jami' al-Maghariba. The reason for the change is given in the record as due to the fact that al-Shaikh Salih al-Kilari had not been properly qualified and had been unable to undertake the necessary work. Muhammad ibn Ahmad ibn Abi Shaduf was duly allocated 4 'uthmani per day from the *waqf* income of the Haram.

A major repair was undertaken after Bairam Pasha, the vizier of Egypt, donated money for charitable deeds on 1 Rabi' I 1037/10 November 1627 (Sijill 113: 248) or, more specifically, for the Dome of the Rock and Masjid al-Aqsa and for the *maqam* of Hebron (see details in cat. no. 34, and Appendix I, no. 34/2 for the Arabic text and an English summary). The *sijill* in question explains that when Ahmad Efendi, the *qadi* of Jerusalem, received a letter from Bairam Pasha after his donation had already been delivered to Jerusalem, he held a meeting in the religious court to discuss what was needed in the way of repairs to the Aqsa mosque so that the money from Bairam's donation could be spent appropriately. Among those present at the meeting were 'Abd al-Muhsin, the master builder in Jerusalem the Noble, Ahmad Agha, the representative of Bairam Pasha, and Shahin Çelebi, the scribe of the Aqsa Mosque and the Dome of the Rock *waqf*. It was reported at the meeting that water was penetrating the lead sheets covering the three aisles of the door of al-Jami' al-Aqsa. It was decided to maintain the lead sheets but it was impossible to repair them *in situ* as the holes were too large. There was, therefore, no way of restoring these

sheets except by dismantling them completely and casting them again. When the sheets were taken down, each sheet was weighed separately and it was found that the weight of the individual sheets varied between ten, eight and seven Jerusalem *ratls*, whereas the new sheet weighed seventeen and a half *ratls*. The casting was undertaken by the masters Ibrahim and Yusuf, sons of al-Mu'allim Sadaqa al-Ghazzi, both of whom had been given authorisation from the *qadi* to do the work.

A second repair financed by Bairam's donation was the rebuilding of seven bays of the western portico which abutted Bab al-Nazir. The proceedings of the *sijill* (113: 448), dated 9 Jumada al-Thani 1037/15 February 1628, show that al-Hajj Mustafa ibn 'Abdullah had agreed in the religious court to undertake the rebuilding of these bays in return for 600 *ghirsh asadi*. He further undertook to tie the new construction into the already extant building, and to vault the bays in perfect alignment with the adjacent portico provided that he was freed of the responsibility of covering the cost of timber (*akhshab*), firewood (*hatab*), and *qusurmil*.

Qanat al-Sabil was another of the foundations which was in constant need of repair, and therefore records of its restoration appear from time to time. Al-Husaini (1982: 113-5) has published a lengthy *waqfiyya* which deals with work sponsored by Husain Pasha, governor of Gaza, at the beginning of Dhu 'l-Qa'da 1067/11 August 1657. The work was designed to augment the waters of Qanat al-Sabil by guiding the spring from the village of Artas into Qanat al-Sabil. The undertaking cost 2,000 *ghirsh asadi*, apart from the construction materials such as lime and stone, and was done by al-Hajj Muhammad ibn Ibrahim al-Ghazi known as al-Masri. Mahmud, 'Umar, and 'Ali, master builders in Jerusalem, undertook to help the contractor by providing him with master builders and workers. Al-'Arif (1961: 307) states that the Qanat al-Sabil was restored in 1067/1656 and again in 1077/1666.

Another long record concerning the repair of Qanat al-Sabil is published by al-'Asali (1989: 112-13). It is registered in the proceedings of the year 1106/1694-5 in Sijill 196: 287. Mustafa Efendi, then *qadi* of Jerusalem and previously the *qadi* 'askar (army judge), decided to repair the water channel, and to pay for the work from his own money after the *qanat* had fallen into disrepair, with the consequence that the water normally supplied by it had been interrupted for four years. It was reported that the disruption to the supply of water had caused great distress to the worshippers at al-Aqsa Mosque, for there was no water for ablutions.

Al-'Asali (1989a: 116-7) published a document recorded in Sijill 166: 135 dated 1105/1693-4, concerning the rebuilding of the south-eastern corner of al-Masjid al-Aqsa. It informs us that Muhammad Agha, the *dizdar* (commander) of the Citadel in Jerusalem, came to the

religious court with a group of Muslims and reported that part of the wall of al-Masjid al-Aqsa, where the Mahd 'Isa (Jesus' Cradle) is to be found, had fallen down. The *qadi* commissioned a group consisting of 'Ali al-Nammari, the chief architect of al-Aqsa Mosque, Hibat Allah Çelebi, the chief architect of Jerusalem the Noble, and others to make an inspection and to prepare an estimate of the expenditure needed for the rebuilding. The cost of the work reached 1,300 *ghirsh asadi*.

Sultan Mahmud II (1223-55/1808-39) also contributed to the maintenance of the Haram. He ordered a major programme of restoration to the Dome of the Rock. It included the restoration of the marble of the exterior of the outer octagon in 1233/1817-18 and the restoration of the outer octagon's tiles in 1232-34/1817-19. Al-'Asali (1989b: 219-20) states that these restorations continued for twenty-one months at a cost of 4,000 bags (*sic*, of coins). The work was overseen by the governor of Sidon and Tripoli, Sulaiman Pasha, on the orders of Sultan Mahmud II, in 1233-4/1817-18 (van Berchem 1927: 348-52). Mustafa 'Ali Efendi played a major role in the replacement of the ceramic tiles of the Dome of the Rock. Van Berchem (1927: 353-5) has edited no less than nine panels bearing his name.

Other individual buildings within the Old City of Jerusalem

Only five monuments were constructed in the Old City outside the enclosure of Haram al-Sharif in the two hundred and thirty years from 1600-1831, compared with the seventeen monuments constructed in the previous hundred years. This is another indication of the decline in architectural activity compared to the earlier period. Two of the five constructions were Sufi *zawiya*s, two were *sabils*, and one was a large secular house.

Al-Zawiya al-Naqshabandiyya (cat. no. 33, 1025/1630) was the third Sufi *zawiya* to be established in Jerusalem in the Ottoman period, following the establishment of Zawiya al-Khalwatiyya (cat. no. 3), and Zawiya al-Maulawiyya (cat. no. 19). Al-Zawiya al-Naqshabandiyya is situated on a corner site very close to the Haram, a few metres north of one of the gates, Bab al-Ghawanima. Four *waqf* documents in the *sijills* identify the *zawiya* as belonging to the Ottoman period, and various inscription panels support this identification. The full name of the founder appears in the *sijill* as Sufi 'Uthman Agha ibn 'Abd al-Mu'in. He was the chief door-keeper (*ra'is al-bawwabin*) to the grand vizier (*sadr 'azam*) Ibrahim Pasha. The *zawiya* has been subject to more fundamental alterations and additions than any other building considered here, making its architecture very difficult to unravel.

Situated north west of Bab al-Ghawanima, al-Zawiya al-Qadiriyya (cat. no. 35, 1043/1633) is a neighbour of al-Zawiya al-Naqshabandiyya, which borders it to the north. The *zawiya*, which is now universally known as al-Zawiya al-Afghaniyya, in contradiction to its foundation inscription and *waqfiyya*, is one of the largest complexes constructed in Jerusalem in later Ottoman times. It was founded by Muhammad Pasha, the governor of Jerusalem, who was one of the most famous patrons of the city's pious institutions. Unlike the mutilated Zawiya al-Naqshabandiyya, al-Zawiya al-Qadiriyya has been preserved almost intact, for the architectural elements are in complete agreement with the detailed description given in the *waqfiyya* recently discovered by the author. The document is one of the fullest of the Ottoman period, as important in its way as the *waqfiyyas* of the Khassaki Sultan and Bairam Jawish, for it sheds light on many aspects of the *zawiya* not found in other contemporary sources. Both al-Zawiya al-Qadiriyya and al-Zawiya al-Naqshabandiyya are without a minaret, unlike the earlier Zawiya al-Khalwatiyya and Zawiya al-Maulawiyya—probably because they are both situated so close to the Haram that a separate call to prayer was considered unnecessary.

Sabil al-Shurbaji (cat. no. 40, 1097/1685-6), again a small, modest structure, is another prime example of the characteristic development of the period. It is located at the southern end of the inner square of Damascus Gate, at the point where the two main streets of the city running north-south (al-Wad and Khan al-Zait) converge. As a public fountain, it can thus be seen to fill the gap left by the 16th-century *sabils* of Sultan Sulaiman. According to the foundation inscription panel, the evidence of which is supported by a *waqfiyya*, the *sabil* was founded in 1097/1685-6 by 'Abd al-Karim al-Shurbaji. The fountain consists of a single square room covered by a shallow dome. A recessed niche with a double window opens in the north façade to allow water to be distributed to thirsty passers-by.

Almost three decades separated the construction of Sabil al-Shurbaji and Sabil al-Khalidi (cat. no. 44, 1125/1713), the next dated monument to be built in the Old City. The layout of Sabil al-Khalidi is identical to Sabil al-Shurbaji. There is, however, no foundation inscription, although a space has been left either for a dedicatory or an ornamental plaque. The *sabil* is firmly dated and identified by a *waqf* document recorded in the *sijills*, which gives the name of the founder as San'allah ibn Khalil Efendi al-Khalidi. The fountain is located on the north side of Tariq Bab al-Silsila immediately east to Daraj al-'Ain street. The structure is very simple, for it was converted from a shop.

Dar al-'Izz (cat. no. 49, 1205/1790-91) was the last major construction in the Old City in the Ottoman period. It is located to the east of Tariq al-Wad between Maktab Bairam Jawish to the south and the junction of the Via

Dolorosa to the north. The site has difficulties similar to those of Khalwat al-Dajani. However, here the inscription itself seems to be in its original location, but there are problems relating to both the façade and the interior. The façade has suffered many changes and additions, the various phases of construction being indicated by long, multiple break-lines in the masonry. The interior too has been dramatically changed for it has long been used as a residential house. As a result, it is now lacking either architectural or decorative features. The monument is included here, however, because of the interesting context of the inscription which, sadly, does not include the name of the founder.

Architecture and Architects in Ottoman Jerusalem 922-1009/1516-1600

Introduction

After the decline in building work in Jerusalem at the end of the Mamluk period, and a slow start in the early years of Ottoman rule, new projects began to proliferate from the second decade of the 16th century. In addition to the major restoration projects and new buildings described in the previous section, there was a sustained momentum to maintain and to repair the Mamluk buildings. The records of this activity are scattered at random throughout the proceedings—the *sijills*—of the Shari'a court in Jerusalem.

The construction work, whether on a new building or on the restoration of an older one, demanded the concerted efforts of a variety of local (and sometimes Ottoman imperial) institutions. Funds had to be raised to cover the cost of building materials; the organisation of both skilled and unskilled workers had to be arranged, and a number of regulations were required to systematise the whole process. In other words, three conditions had to be met before building work could proceed—finance, an organised workforce, and official permission.

The aim of this section is to shed light on the role played by the different individuals and institutions involved in this process. The court authority and its role in various aspects of the work will be examined, as well as the activities of the master builders and the craftsmen. The section will investigate the building materials used, where they were acquired and at what price, the administrative aspects of the operation, and so on. The study relies entirely on unpublished material in the Jerusalem *sijills*. These records provide a wealth of primary evidence that was generally unavailable for earlier periods in the history of the city, and was but rarely mentioned in contemporary historical sources. Among other material, the *sijill* records

include inspection documents (*kashf*) for the buildings. These were reports on the condition of a building made by an expert (a master builder) which were presented to the Shari'a court to enable the *qadi* to make an informed decision on the necessity for work to be undertaken. The *sijills* also contain detailed financial accounts (*bayan sarf*) of the expenditure on certain repairs. These include the overall cost of the work and the individual prices for building materials such as lime, stone, *qusurmil*, nails, and timber; the wages of workers and master builders are also recorded, and sometimes information like the daily expenditure or the number of workers on site on a specific day. Also found in the *sijills* are documents granting permission to carry out certain restorations (*idhunat*), various transactions over building materials, and valuable information on the master builders themselves—their duties, titles, positions, and whether they were local residents or brought in to do the work from elsewhere.

Sources of Finance

Ottoman Jerusalem did not have a specific state institution with a special budget allocated for construction and repair projects. But because of the religious significance of the city, there was a substantial income from *waqfs*, some of which had been set up in the Mamluk period. The income from the *waqfs* provided the main source of finance for the maintenance and repair of those Ottoman or pre-Ottoman buildings which were endowed. The *waqf* of the Dome of the Rock and the Aqsa Mosque, for example, was for a long period the best known and the largest in Palestine.³⁸

Research undertaken for this study has revealed that, for almost every institution constructed in Jerusalem in the 16th century, a *waqf* was set up by the founder. In particular, a *waqf* was endowed for monuments whose function required a certain level of expenditure.³⁹ The various *waqfs* and the income dedicated to each monument are given in detail in the relevant catalogue entries under 'endowment'; this information will not, therefore, be repeated here.

In addition to the *waqf* income, sums of money

³⁸ For general information on the Palestinian *waqfs* of Gaza, al-Quds al-Sharif (Jerusalem), Safad, and Nablus according to the 16th-century Ottoman Tahrir Register, see Ispirli and Tamimi (1982).

³⁹ There were some exceptions to this general rule, for example the three monumental domes (cat. nos. 10, 30, and 31), three small *khalwas* (cat. nos. 14, 16, and 17), one *sabil* (cat. no. 2), and an undated mosque (cat. no. 32). However, neither the domes nor that particular *sabil* had a function which required specific expenditure, and any repairs to them were covered by the Haram *waqf*. It is possible that a *waqf* for the three *khalwas* may yet emerge from the *sijills*. The mosque is unlikely to date from the 16th century. For further details, see the catalogue entry for each monument.

were dispatched to Jerusalem from time to time for specific projects. The money was sent either from the imperial treasury in Istanbul or, in response to orders from the sultan, from the province of Damascus. One order (Heyd 1960: 147) records that in 976/1568 2,000 *floris* were donated by Roxelana, the wife of Sultan Sulaiman, to repair a ruined water-conduit. Another 200 gold pieces were paid in 987/1579 by the *daftardar* of Damascus to Da'ud, the master builder of Damascus, who had repaired the lead of the Dome of the Rock and the Aqsa Mosque (Heyd 1960: 157). Sijill 80: 100 contains the information that Sultan Muhammad Khan sent 300 *sultani* in 1007/1598 to cover the cost of rebuilding the Bab al-Asbat Minaret.

Not all revenues for construction were received from the capital or from the province of Damascus. Part of the city wall project, for example, was also funded from local revenue. Cohen (1989: 472) found a document in Sijill 6 which includes information on aspects of the system used to finance this particular project. It reveals that 791,435 *para*, collected in taxes from various parts of Palestine and Syria in 1536-38, were diverted to meet the expenses of rebuilding the walls. Gaza's share was about 70,000 *para*, that of Nablus just over 122,000 *para*, while Jerusalem and Ramla between them contributed some 10 per cent of the total. Sijills 10: 16, 17, 18, 444 and 12: 830 contain the records of a discrepancy in the monies received by Muhammad Çelebi al-Naqqash, the superintendent of the wall project, from Hasan ibn 'Ali, *al-amin 'ala al-amwal al-sultaniyya bidawahi al-Ramla* (the superintendent of the imperial revenues in the suburbs of Ramla). The poll tax⁴⁰ (*jizya*), another source of finance for construction and repairs of *waqf* properties, was under the control and disposal of Muhammad Çelebi al-Naqqash (Cohen 1989: 473).

The role of the Court in the construction process

The records of the *sijills* show that the Jerusalem Shari'a court played a vital role in controlling many issues related to buildings and their maintenance. It was the authority to which complaints were submitted, by which permission for repairs was granted and accounts of expenditures ratified. The authority also received requests for an official inspection of buildings, and settled disputes. The *qadi* of the court handled personally almost every aspect of the construction procedure, even down to the appointment of the master builders and other positions related to the work in hand.

Anyone who had a case concerning construction work, whether or not he held an official position, and

irrespective of whether he was a Muslim or a non-Muslim citizen, could address the court. The *qadi* then usually ordered an investigation, which normally relied on a site inspection (*kashf*) by a nominated group of people. After the team had reported back with their findings, the *qadi* pronounced his decision, which usually concurred with the findings of the experts.

Inspections

The inspection (*kashf*) was an essential part of the procedure, whatever the matter in hand being presented to the court, whether it was in the form of a complaint, or a request for permission to undertake work, or some other business. The inspection team was made up of a variety of people, whose number and specialisation varied according to who had asked for the inspection, and on the importance of the site under discussion.

Inspection of buildings in Ottoman Jerusalem were often carried out by a master builder (*mi'marbashi*), occasionally in the presence of the *qadi* himself, but more often in that of his clerk; if the property to be inspected was endowed, then the supervisor of the relevant *waqf* was also present. A group of the interested faithful frequently attended the inspection; for example Zawiyat al-Maghariba and the Madrasa al-'Afdaliyya (Sijill 25: 152) were inspected solely by *ahl al-khair* (people of charity), and it was on the basis of their report that the *qadi* permitted Shaikh Ahmad al-Masmudi to restore the two sites. These Muslims are described in the *sijill* as '*udul* (people with an honourable record), *tuqa* (pious), or *ahl al-khair* (people of charity) as mentioned above; sometimes, if they were professionals, they are described as *ahl al-khibra* (the experts) (Sijill 21: 264).

When a sultanic order (Sijill 39: 30-1) was received in Jerusalem in 967/1559-60 to expand the kitchen of Khassaki Sultan, Qitas Beg (then governor of Jerusalem), the *qadi*, Sinan Khalifa, the *shaikh* of al-'Imara al-'Amira (Khassaki Sultan), Husain ibn Nammar, chief master builder in Jerusalem, and the representative of Turghud Agha, the caretaker of al-'Imara al-'Amira, as well as many other Muslim dignitaries, made an investigation. On one rare occasion, the governor of Jerusalem, Ja'far Beg, went to the court and asked the *qadi* to inspect the east side of the city wall, south of al-Sirat (Sijill 73: 472). The governor was among those on the inspection team, and permission was granted in 1005/1596-7 to replace displaced stones.

Another case, Sijill 79: 475, dated 1007/1098-9, concerned the *qadi* of Jerusalem being ordered to instruct the caretaker of al-'Imara al-'Amira to build a mill in the complex. The *qadi* himself, Wali Beg, the caretaker, 'Abd al-Muhsin ibn Mahmud ibn Nammar, the chief architect, and many other Muslims inspected the site before deciding on

⁴⁰ For details of this tax, its expenditures, and the involvement of *waqf* institutions in the Ottoman system of collecting the poll tax in late 18th-century Jerusalem, see Peri (1990: 287-97).

a proper location.

Sometimes more than one master builder was involved in the inspection. The Ashrafiyya Madrasa (Sijill 30: 384) was investigated in 962/1554-5 by Husain ibn Nammar and his brother 'Ubaid (see below under 'Local master builders'). It was agreed in 973/1565-6 (Sijill 48: 165) between the two master builders, Muhammad ibn Ramadan and Mahmud ibn Husain ibn Nammar, that they would inspect the buildings together, for they shared the post of master builder of Jerusalem between them. When the wall of the citadel was inspected in 938/1531-2, the team was made up of three famous master builders. Two identical cases are found in the *sijills*. The first, Sijill 12: 910 dated 947/1540, shows that the Madrasa Hanafiyya (which is no longer extant) was inspected by three master builders; the second record concerns the inspection of al-Khanqah al-Maulawiyya (for details, see cat. no. 19).

Complaints

There can be no doubt that one of the main tasks of the Shari'a court was to settle disputes, and to hear complaints and cases brought before it by the inhabitants of the city. Although the records of these cases in the *sijills* are comparatively rare, particularly in relation to inspection or ratification documents, those that have been found give an idea of the type of business brought before the court by people seeking a ruling. The records show that claims were presented to the court either by the *subashi* (representing the state) against certain citizens, or by citizens themselves against their fellows. This second type of case was motivated by a wish to maintain the rights of the claimant against some violation by the defendant, or to preserve the public interest. The complaints cover many different aspects—a water leakage, an unsafe wall or house, new fenestration, and so on.

A record in Sijill 5: 1, dated 26 Shawwal 941/30 April 1535, shows that Shaikh Abu 'l-Ful, the chief of the Khawalida neighbourhood, had come to the court and complained that the wall of Dair (Convent) Fara'un, a residence belonging to the Ethiopian denomination, was unsafe, and if no measures were taken to repair it, damage would be done to the convent itself as well as to its neighbours, and this would lead to looting. The inspection team reported to the *qadi* that they had found many of the stones displaced. They said that if the wall were to be rebuilt, the safety of the neighbours and the passers-by would be ensured. The *qadi* in consequence ordered two Ethiopian monks to rebuild the wall.

On 22 Ramadan 952/27 November 1545 (Sijill 17: 349), the residents of Ribat Mansuri lodged a complaint against the owner of the upper floor (*tabaqa*) above the *ribat* that their property had been penetrated by water. Sijill

17: 354 shows that the inspector of the *ribat* had concurred in the complaint, which had been extended to include the fact that the whole upper floor was in such a dilapidated condition that it might collapse on the passers-by and residents. Following the inspection, the *qadi* ordered the owners of the upper level, Amina and her brother Yusuf, to dismantle it completely, and to pay for any costs.

Fenestration was another cause of conflict between neighbours, as becomes apparent from scattered records in the *sijills*. According to Sijill 45: 55, Fatima al-Rauda came to the court in the middle of Jumada I 971/31 December 1563 protesting against the opening of new windows by Ahmad al-Rumi. She claimed that she was being abused by these windows, presumably meaning that her property was overlooked by them and her privacy invaded. A similar case is documented in Sijill 69: 79, when Khalil ibn Ahmad al-Masri, on 13 Safar 977/28 July 1569, demanded that the window overlooking his house in al-Qattanin quarter should be blocked up. He claimed that the window had been opened up by his neighbour, Yusuf ibn 'Abd Allah. Some cases were rejected by the *qadi*, as appears from the petition of Hanna and Jirjis ibn Fadila against Binan al-Nasraniyya (the Christian). Hanna and Jirjis alleged that Binan's windows were causing them harm, and demanded that they should be blocked up. The *qadi*, basing his decision on the findings of the inspection team, turned down the request of the brothers because the windows in question were not part of a renovation, but had been there for a long time previously.

People appeared before the Shari'a court in Jerusalem in order to obtain a document proving that they had been damaged by some incident. It is likely that they wanted the court to pronounce their rivals responsible for any damage caused to them. On 13 Rabi' I 993/15 March 1585, 'Abd al-Karim al-Jaludi went to the court (Sijill 64: 246) reporting that water was leaking from the house above into a lower floor. He asked that the court be notified of the incident. In another interesting record (Sijill 69: 79), 'Abd al-Wahid ibn Shihab informed the court on 26 Rajab 977/4 January 1570, that the motion of the neighbouring mill had caused part of the wall of his house to fall down. A somewhat similar claim is found in Sijill 46: 97 dated 16 Jumada I 972/20 December 1564; in this case, it is the mill that was damaged by a wall falling on it.

A complaint on behalf of the general public is noted in Sijill 30: 302 dated 24 Ramadan 962/12 August 1555. It records that Najm al-Din, a merchant of Jerusalem, declared that injury had been caused to the walls and to the Muslim citizens of Jerusalem. The damage was the result of the behaviour of a group of traders who employed people to remove earth from soap factories (*turab al-masabin*) and to dump it both inside and outside the walls of the city. The *qadi* himself visited the site with a group of Muslims and noted the quantity of earth. After

being questioned by the *qadi*, Musa al-Tarrab (who had transferred the earth) and his son Sharaf al-Din acknowledged that they were responsible for the accumulation of earth.

In one unusual case, dated the beginning of Dhu 'l-Hijja 1007/25 June 1599 (Sijill 80: 106), the petitioner, Darwish Biyallah, preferred to address the governor of Jerusalem rather than the *qadi*, apparently thereby hoping to receive a more favourable verdict. The governor, Farrukh Katkhuda, forwarded the petition to the council of the *qadi*, 'Abd al-Rahman Efendi, but sent his representative, Yunus al-Tarjuman, to attend the hearing. The case was against two brothers, Ibrahim and Ilyas (sons of Jirjis the Coptic Christian), who were builders in Jerusalem. Yunus informed the court that Darwish Biyallah had already reported to the *subashi* of Jerusalem, Jamshid Agha, on the collapse of part of the kitchen in the brothers' house on his *hakura* (vegetable garden), and that he had drawn their attention to the necessity of rebuilding the damaged section. The house was a *waqf* endowed for the benefit of the Coptic Christians in Jerusalem. Since the two brothers had ignored the request by Darwish and the house had still not been repaired, Yunus asked that an inspection be arranged. The *qadi* sent his clerk, the writer of the *sijill* document, Ghashm ibn Makiyya, together with 'Abd al-Muhsin ibn Nammar, the master builder, and a group of other Muslims, as well as Yunus al-Tarjuman, to undertake the inspection. While they were reporting their findings to the court, Sulaiman ibn Ishaq al-Hadad arrived and informed the court that there was a large crack in the wall of his house, which was constructed above the vestibule overlooking the house in question. The inspection team returned and again inspected the site; their recommendation was that two *dhira'* should be removed from the wall of Sulaiman's house, and that the wall should be supported by two corbel stones to prevent any further collapse. The *qadi* approved the rebuilding of the wall of the kitchen, as well as the reduction in height and the reinforcement of Sulaiman's house. For the complete Arabic text and an English summary see Appendix I, no. 44.

The *subashi* played the role of formal intermediary between disputing parties. He was kept fully informed about the complaint brought by Yunus al-Tarjuman described above. Another *subashi*, named Sinan, attended the hearings of the case of Ribat al-Mansuri in the court, also already described. It is obvious that the role of the *subashi* was to inspect any violation of the law and to report to the *qadi*. He tended to be on the side of public interest. Bali, the *subashi* of the city of Jerusalem, in 977/1569-70 (according to Sijill 52: 43) arrested Khalil ibn 'Abd al-Qadir and Riham ibn Ibrahim al-Ba'labakki, accusing them of tampering with the city walls.

Jamshid Agha again appears as the champion of

public interest in Sijill 80: 106 dated 4 Dhu 'l-Hijja 1007/28 June 1599. This record reveals that Jamshid Agha, who was responsible for *al-khass al-sharif* (the imperial domain revenue), had come to the court with Ibrahim ibn Jirjis al-Nasrani, bringing four beasts laden with stones. Jamshid accused Ibrahim of stealing the stones from the lands of *al-khass al-sharif*, and from the summer houses belonging to a Muslim which were outside the walls of Jerusalem the Noble. Ibrahim rejected the accusation, saying that the source of his stone was the Wadi al-Qatamun, which is located to the west of Jerusalem. Jamshid asked the *qadi* to order an inspection to investigate the source of the stone, and the *qadi* commissioned Lutf Allah ibn Ahmad ibn Muhammad, the court usher (*muhdir*), to undertake an inspection of the site. Lutf Allah reported back to the court that the stones were indeed brought from an ancient Roman wall located near Wadi al-Qatamun. The complete Arabic text with English summary is to found in Appendix I, no. 45.

The same *subashi* Jamshid (Sijill 80: 72) reported on 14 Shawwal 1007/10 May 1599 to the *qadi* of Jerusalem, 'Abd al-Rahman Efendi, that water from the channel which fed Hammam al-Sultan (*waqf* of al-'Imara al-'Amira) was contaminated by sewage from the Madrasa al-Qastumriyya (which is no longer extant). He requested that the *qadi* investigate the matter, for Muslims were being harmed. The *qadi* commissioned Mahmud Agha, the court usher (*muhdir*), Muhammad al-Ghazzi, the clerk of the court and the scribe of the record, together with 'Abd al-Muhsin ibn Nammar, the chief architect of Jerusalem the Noble, and a group of other Muslims, to undertake the inspection. They reported their findings back to the court, saying that some of the *qawadis* (pottery pipes) of the latrines were broken. 'Abd al-Muhsin recommended rebuilding the channel above the latrine pipes. The full Arabic text is provided in Appendix I, no. 46 with an English summary.

Permission to Undertake Restoration and Ratification of Expenditure

In addition to the inspection of sites and estimates of cost, the Shari'a court in Ottoman Jerusalem was authorised to issue permits for restoration to *waqf* properties, and for non-Muslim premises. To conform with the conditions of the legal deeds (*waqfiyyas*), all financial transactions of the *waqf* properties had to be ratified and confirmed by the *qadi*. It was thus inevitable that any *waqf* inspector had to co-operate closely with the court before taking any action which involved expenditure. The *sijills* of Jerusalem contain many financial documents with reference to *waqf* properties. These bear various names and have different wordings, but all were intended to serve a single purpose,

namely to legalise and confirm the transactions.

Many of these documents begin with the words *bayan ma sarafahu* . . . ('statement of expenditure paid by ...'), followed by the name of the inspector of the *waqf*. *Thubt* (proof), *ta'rif shar'i* (legal notification), and *idhn* (permit) are other terms used to denote financial payment for *waqf* repairs. In some cases the master builder undertaking the repairs came to the court and attested that the inspector of the *waqf* had spent a certain sum of money, and that he had either been notified of the expenditure or had spent the money in person (Sijill 13: 51; 13: 352). In certain cases, another master builder confirmed the testimony of the master builder who had been contracted to carry out the restoration (Sijill 5: 810).

The information contained in the documents also varies. Some are so detailed that they include the daily payments, the quantity of materials used, and the source from which the building materials had been either transported or purchased. Other documents are much shorter and give only the total cost of a repair. Sijills 17: 551 and 19: 263 specify the reason for certain restoration work as being an earthquake; another *sijill* (10: 206) gives the reason as heavy rainfall, and yet another (Sijill 7: 346) as water leakage. A further reason which led to permission for repairs being granted was an extended period of neglect and the ruined state of a *waqf* property, so that it was in danger of collapse (Sijills 5: 326; 13: 482). Sometimes inspectors and persons in charge of a *waqf* came to the court when there was not enough cash in hand to cover the cost of repairs. They then sought the court's authority to spend money from their private income, and to consider the sum as a debt against any future income of the *waqf*. One example of this practice (Sijills 7: 435; 14: 151) was by Bairam Jawish when he undertook repairs to the Madrasa Mawardiyya (cat. no. 28) on 16 Shawwal 944/18 March 1538. Ibrahim ibn 'Abd Allah al-Malitani, *shaikh* of the Maltaniyya group, restored a *haush* (Sijill 27: 407) on similar terms, as did 'Abd al-Baqi, the inspector of the *waqf* of al-Aqsa mosque, when he borrowed oil from the representative of Ahmad Pasha to illuminate the Mosque of al-Aqsa and the Dome of the Rock (Sijill 80: 28). The Arabic wording and English summary for the first and the last documents are found in Appendix I, nos. 22/2 and 28/1.

In other cases, the court allowed the inspector to sell specified *waqf* property to cover certain expenses incurred in the repairs, or because a particular part of the property was no longer of use (*yas'ub al-intifa' mihu*). Five hundred stones from the Dar Ibn al-Sa'r (Sijill 1: 57) were sold for 500 *halabiyya* (silver coins) in 937/1530-1 because the property was considered beyond repair. 'Abd Allah Çelebi ibn 'Ali al-Khalwati was permitted (Sijill 22: 235) on 4 Rajab 956/29 July 1549 to sell stones belonging to al-Bimaristan al-Salahi' to cover the expenditure needed for repair work. The inspector of Dar al-Hadith, Darwish 'Ali,

on 959/1551-2 asked the *qadi*'s permission to auction the debris (*anqad*) from the site, for there was no revenue and the site needed to be repaired (Sijill 25: 385). In Sijill 30: 170 dated 10 Rajab 962/31 May 1555, the *qadi* is reported as allowing the sale of the ruins of al-Bimaristan al-Salahiyya to go ahead, after he had personally inspected the site with a group of *ahl al-khibra* (experts), and had been convinced that the dome, the *mihrab*, and the vault were in a ruined state. He was clearly anxious that the debris might be stolen. Sijill 30: 204 records that it had been agreed between the inspector of *waqf* al-Dirkah, situated in the Nasara neighbourhood, and the caretaker of al-'Imara al-'Amira, Farhad Çelebi, that the debris and foundations of the upper part of the site were to be purchased at a specified price. Further cases are recorded in Sijills 59: 182; 69: 367; 76: 49; and 88: 346.

Other methods of financing restoration to, and maintenance of, property under certain circumstances were *istibdal* (the exchange of *waqf* property for another property), *ijara tauila* (a long-term lease), and *khulu* (key-money, or advance money paid by the tenant of a dilapidated *waqf* to be used for repairs). Of these, I have encountered only a single case of *ijara tauila* in the records of monuments dating to the 16th century. It is the *ijara* of Ahmad Pasha leasing a plot of land belonging to the Aqsa Mosque, located in the Haram al-Sharif, for a period of sixty years to enable him to build two cells on it (cat. nos. 22 and 23). These various methods were, however, used frequently in the periods following the 16th century, and in the long run had a negative affect on the efficacy of the *waqf* system.⁴¹

Non-Muslim Subjects

The non-Muslim residents of Ottoman Jerusalem, that is the Christians and Jews (*ahl al-dhimma*), came to the Shar'ia court for varying reasons. They were considered 'protected subjects' and their rights and relations within the Muslim community, and with the authorities, were decided according to Muslim Shari'a law. According to the regulations controlling construction, non-Muslims were not allowed to construct, rebuild, or repair any of their premises without a prior permit from the *qadi*. This means that Christians and Jews⁴² frequented the court to obtain the proper approval.

⁴¹ For details on these and the role they played in the dismemberment of the *waqfs* of Jerusalem, see Baer 1990: 299-332.

⁴² Cohen has published a number of books and articles, mainly on Jewish life in Jerusalem in the 16th century, based on these records. For a short bibliography, see his recent book (Cohen 1994: 10). I do not know of any published study on the Christian communities of Jerusalem based on the records in the *sijills*.

Throughout my research into the *sijills*, I came across many records that concerned construction work by non-Muslim subjects. These constitute a small part of the numerous records pertaining to these communities which cover not only construction but also other day-to-day matters. The few listed below cast some light on the construction business, but further study would without doubt widen our knowledge of these issues and would enable a list of religious properties and Holy Places of the non-Muslim communities in Ottoman Jerusalem to be compiled.

One of the many Christians who came to the Shari'a court to request permission to restore their houses was Yusuf ibn Manuli al-Rahib (the monk), according to Sijill 3: 207 dated 20 Muharram 940/11 August 1533. After the site had been inspected, Yusuf ibn Manuli was granted permission to renovate his house but was allowed neither to enlarge it nor to make it smaller. Permits for restoration work were also issued to a number of others: Ya'qub ibn Yuhana for a house and a stable (Sijill 46: 46), Ghabrian the Copt (Sijill 31: 52), Mikha'il ibn Buni for a *waqf* house (Sijill 46: 252), 'Isa al-Nasrani (Sijill 45: 86), Khalil Qandalaft (Sijill 62: 2), Mikha'il al-Sabbani (the soap-maker) (Sijill 62: 4), 'Isa and Khalil (Sijill 62: 204), 'Abd al-Masih al-Nasrani al-Habashi (the Ethiopian, Sijill 69: 51), who was spokesman of the Christian *waqf*—apparently the Ethiopian *waqf* (*al-mutakallim 'ala waqf al-Nasara*)—and Shalih ibn Jirjis al-Nasrani (Sijill 69: 220).

As well as the dwelling houses, the monasteries and the churches of various Christian communities in Ottoman Jerusalem were restored, and some were permitted to build extensions. The same process was followed for these works—request, inspection and authorisation. The applications to the Shari'a court were presented by the monks or the heads of the community instead of by individuals, as was the case with the Muslim community. Jirmanus ibn Qustantin, the *batrak* (patriarch) of the Greek Orthodox church (*al-Rum*) was allowed to execute restorations in two monasteries. The first (Sijill 22: 187) was the reconstruction of a wall for a convent inside the Old City of Jerusalem. The wall was rebuilt by the master builder, Husain ibn Nammar, on 12 Jumada I 956/8 June 1549. The second restoration was the repair of the gate of Mar Ilyas (Elijah) Monastery, which is located to the east of the road running between Jerusalem and Bethlehem. The repairs were carried out on 11 Dhu 'l-Qa'da 969/13 July 1562. It is also interesting to note that in Sijill 20: 57, dated 13 Jumada I 962/5 April 1555, the same Jirmanus had endowed as *waqf* a house and an oil-press located in al-Nasara neighbourhood for the benefit of the Church of the Holy Sepulchre, and, according to a particular stipulation, after the Holy Sepulchre for the benefit of the Dome of the Rock.

Fragun Biltsata al-Ifranji (the European) was granted permission (Sijill 96: 303) to build an oven inside

the *iwan* in al-'Amud Convent in 997/1588-9. The Coptic Church was inspected on 29 Sha'ban 992/5 September 1584, according to Sijill 14: 107, in response to an application presented by Ibrahim al-Nasrani, the spokesman for the Copts in Jerusalem.

Not all the requests were presented by men, for Sijill 30: 55 shows that a Georgian nun, Sait bint 'Abd Allah al-Nasraniyya al-Karjiyya, together with the monks of Dair al-Musallaba (the Monastery of the Cross), asked for permission to construct an oil-press to produce oil (*sir*), an oven to bake sesame seed, and basins for the *tahina* (sesame paste). She was permitted to do so, following an inspection of the site by a group of Muslims headed by Muhammad al-Nasiri, the *muhdirbashi*. She appealed for permission to undertake two further repairs to the walls of two monasteries, which was also duly awarded her. The first of these is named as Dair al-Tufaha (the Apple Monastery), located in the neighbourhood of al-Nasara (Sijill 30: 56), facing the Khanqah al-Salahiyya al-Sughra (the small), and the restoration is specified as being to its eastern wall. The second monastery was in the Risha district (Sijill 30: 57).

Sometimes the Christian monasteries were inspected on the initiative of the local authorities in response to an order from Istanbul. The Monastery of Zion (Dair Sahyun) was inspected in 958/1551 by the *qadi*, Ahmad Nassuh, to ascertain that there had been no innovation inside the monastery and that it contained no weapons (Sijill 24: 491).⁴³ The order to do so came from Istanbul to Biri Pasha, governor of al-Sham (Syria), and to Shams al-Din Khalifa, the *qadi* of al-Sham, who passed it on to Jerusalem. The inspection uncovered no new buildings, and the monastery was found to accord with its original plan.

Other Responsibilities of the Court

The court was held responsible for another aspect of maintenance. It had to control and to register the progress of work, as well as the use of construction materials and the number of workers on site at different times. Sijill 39: 62, dated 5 Rabi' I 967/5 December 1559, shows that Muhyi al-Din Khalifa ibn al-Hajj Husain, the legal representative of Bairam Jawish, who was in charge of Auqaf al-Misriyyin in Jerusalem, had come to the court and asked 'Abd al-Rahman Efendi, the *qadi* of Jerusalem, to inspect the workers and the materials used in the *khan* of Bab

⁴³ For further information on and interpretation of the various inspections and steps taken against the Franciscans on Mount Zion by the Ottomans, see Darraj (1968: 9-31). An analysis counter to that of Darraj is to be found in Cohen (1986: 147-57), although both studies are based on the documents. See also cat. no. 1.

al-Qattanin. The *qadi* commissioned his clerk, Isma‘il al-Shafi‘i, to go to the site, and, after he had completed his inspection, reported that ‘on Tuesday there had been seven workers (*fu‘ul*), one master builder, one *mujarifi* (a man who used a shovel); and on Wednesday it was as on Tuesday.’ The materials used in these two days were:

Item	Cost in paras
50 <i>qufaf</i> (leather baskets) of lime	35
50 <i>qufaf</i> of <i>qusurmil</i>	10
Ropes and sweepers (<i>makanis</i>)	14
Six donkeys to transfer the lime and the <i>qusurmil</i>	12
Four <i>qufaf</i>	4
Food for the workers	10
Total	paras 85

For the Arabic text and English summary see Cat. Appendix 1, no. 11/10.

The Construction Process

Collection, Sources, and Prices of Building Materials

Some of the principal materials that were used in the construction process, such as lime, were produced locally, while others, like iron and lead, were imported or sent from other parts of the Ottoman provinces. A good deal of material, such as marble and masonry, was collected from ruined buildings. Ottoman Jerusalem architecture in the 16th century, as will be apparent from the descriptions of its public monuments (for details see cat. nos. 4, 5, 6, 7, 12, 15, 19, 21, 22, 27, 30, 31), made use of re-cycled material as part of the fabric embedded into the structure of the buildings. This implies an active circulation of used materials throughout the century.⁴⁴ The Shari‘a court participated indirectly in making some of the construction materials available for re-use in the local market through its approval of the sale of some of the fabric of certain *waqf* properties. The *sijills* include many records of the sale of such recycled building materials. A few cases have already been cited above with reference to stone and debris, and below, under the section dealing with stone, further cases will be discussed.

Lime

According to the *sijills*, lime was produced in kilns in

villages scattered around Jerusalem. It was bought either directly from people at the site of the kilns or from retail middlemen in the city. In some cases it was bought from the villages with the proviso that the vendors would be responsible for its transfer to the construction site. The abundance of the transaction documents registered in the *sijills* that concern lime suggest that it was an important source of income for certain people and places, especially when great projects like the restoration of the walls were in progress. The villages producing the lime were al-Ram (north of Jerusalem), al-Jib or Jib al-Fukhkhar (north west of Jerusalem), Lifta (west of Jerusalem), Dair Ya-Sin (west of Jerusalem), Bait Lahm (Bethlehem), Bait Jala (west of Bethlehem), Bait Mazmil, Bait Hanina (north of Jerusalem), Umm Tuba (south of Jerusalem), ‘Ain Karim (west of Jerusalem), and Burqa. Most of the transactions recorded in the *sijills* are to do with finance—the suppliers requesting the cost of lime from the purchasers, or the purchasers demanding that the suppliers provide them with the stipulated quantity of the lime on time, in the event of a serious delay.

The information contained in these records makes it possible to find out the price of lime, its quality, the master builders who were involved in ordering the required amount, and the names of the carriers. Lime was sold in Jerusalem by the *qintar* (*Sijills* 10: 65; 13: 58; 30: 16, 45, 358; 66: 312), and the price of its carriage was also according to the *qintar* or camel-load (*himl*). The price of lime varies from *sijill* to *sijill*,⁴⁵ according to both quality and date. It was 25 *halabiyya* (silver coins) if purchased at the village (*Sijill* 13: 58) and 55 *halabiyya* if it had to be transferred to the construction site, that is to Jerusalem. Relying on this particular record, which is dated 10 Dhu ‘l-Qa‘da 947/8 March 1541, it thus appears that the cost of transfer added thirty *halabiyya* to the basic price of lime.

Al-Hajj ‘Ala’ (*Sijill* 12: 400), representative of Muhammad Çelebi al-Naqqash, the superintendent of the construction work on the walls, contracted a company of lime-carriers from Bait Hanina and al-Jib village to convey lime from their villages to Jerusalem for 20 *halabiyya* per camel-load. The carriers attested in the Shari‘a court, on 2 Rabi‘ II 947/6 August 1540, that they were satisfied with the price for the five coming months, and they held themselves jointly responsible for the contract. Forty camels were hired to undertake the task of transferring the lime to Jerusalem.

There is a discrepancy of 10 *halabiyya* between these prices for transfer of the lime, though there was only seven months between the two agreements. The reason for

⁴⁴ This practice is also noted in other projects undertaken in the 16th century, (though this chapter does not deal with them in detail), such as the wall project and the citadel restoration. It continued after the 16th century as shown by Qubbat Yusuf (cat. no. 38), Qubbat al-Hadi al-Amin (cat. no. 43), and Iwan al-Sultan Mahmud (cat. no. 50).

⁴⁵ It is difficult to determine the average price of lime, for there are conflicting prices in the documents. In one document (*Sijill* 8: 144) the price for a *qintar* of lime is given variously as 12, 28, 30, and 60 *‘uhmani* respectively.

this difference is probably due to the fact that while the first transaction was private, the second related to a state project. Normally, the wages paid to workers on a state project were lower than those paid privately.

The price of low-quality lime was almost half that for a good grade. Ibrahim al-Yaziji (Sijill 1: 399), the clerk of al-‘Imara al-Sharifa (the Noble Building), came to the court on 27 Muharram 937/20 September 1530, bringing two baskets (*zanbil*) of lime with him. The first basket contained *jir mutaghayyir* (literally ‘changeable’, ‘volatile’, but here meaning ‘low quality-lime’), and, in the second basket, *jir muhkam tayyib* (the best-quality lime). Ibrahim al-Yaziji pointed out that the price of the former was less than that of the latter, and if his supplier brought lime of the lower quality he would pay him only at the rate of 8 ‘*uthmani* per *qintar*.

It seems that one of the reasons for the low quality of lime was faulty production on site. ‘Abd al-Muhsin ibn Nammar, the master builder of Jerusalem, came to the council of the court on 13 Dhu ‘l-Hijja 1016/30 March 1608 (Sijill 87: 544) and reported that he had contracted Mansur ibn Makhluf, Khalil ibn Hannun, and Khusrau ibn Salama, all of whom were Christians from Bethlehem, to build a kiln (*lattan*) near the Maqam Nabi Musa at a cost of 22 *ghirsh*. ‘Abd al-Muhsin claimed that the limemakers heated the material in the kiln for only a few days (which was inadequate) and that they then covered it before it was completely ready. When water was poured on ill-prepared lime, only part of the material was amalgamated while the rest remained as sediment. After a long, complicated and argumentative hearing, Muslims acting as intermediaries between the two parties reached a compromise, and it was agreed that the defendants would build ‘Abd al-Muhsin a new kiln, provided that he would compensate them with a further 10 *ghirsh*.

Stone

Although Palestine throughout its history has been famous for the quality of its masonry, and the traditions of stone-cutting and dressing still continue up to the present day, to date no record in the *sijills*—or indeed in any other source—has been found that gives information on the location of the stone-quarry used for the Ottoman buildings in Jerusalem. The lack of concrete evidence, however, neither proves nor disproves the existence of active local quarries in the vicinity of the city at this period. It is best in the meantime to leave the issue open in the hope that further evidence will emerge, and to concentrate here on the employment of re-used stones.

As already explained above, the circulation of re-used stone and debris was common practice in Ottoman Jerusalem, to judge by the proceedings recorded in the *sijills*. The stones were sold either by a private owner (Sijill

69: 367; 76: 49), or by inspectors of a *waqf* property, provided that prior approval had been obtained from the Shari‘a court. The purchasers whose names appear in the records were either master builders, like Ahmad ibn Khalil al-Shumais and Ahmad ibn Salim al-Kharshi (Sijill 1: 57), Husain ibn Nammar (Sijill 1: 143), Mahmud ibn Husain ibn Nammar (Sijill 69: 367) and his brother Khalil (Sijill 66: 629), or governors, like Sinan Beg Amir Liwa’ al-Quds (Sijill 17: 158), or governors’ representatives, like Yahya ibn Hasan al-Sufi on behalf of Governor Farrukh Beg (Sijill 84: 18). There are also incidents where they were also caretakers of *waqfs* as, for example, Farhad Çelebi, the caretaker of al-‘Imara al-‘Amira or the Khassaki Sultan (Sijill 30: 204; 30: 170). The inspectors of the *waqf* were permitted to sell the stone because the *waqf* property was considered to be in a ruinous state, and there was a fear that the stone might be stolen. In some cases, the money from the sale was used to restore other parts of the *waqf*, as was the case when the *qadi* in 1007/1598-9 allowed the purchase of the stones of a mosque located in al-Nasara quarter (Sijill 79: 444), and *qusurmil* was bought with the money paid for the stones. The governors and their agents bought the stones to use them in new construction work. The master builders were representatives for their clients, or else they purchased the stones for the purpose of trade or as an investment. In some cases they were required to be present at the site for the purpose of valuation and pricing (Sijill 1: 53).

It is possible by eye alone to identify stones from a particular building constructed before the Ottoman period which were re-used within an Ottoman structure. One example can be seen in the building of the bakery of the Khassaki Sultan (cat. no. 15), which contains a number of stones from the Ashrafiyya Madrasa.⁴⁶ Sijill 30: 204 gives more definite evidence with reference to this for it shows that on 19 Rajab 962/9 February 1555 the stones and debris, which had been purchased by Farhad Çelebi, the caretaker of al-‘Imara al-‘Amira (Khassaki Sultan) from the inspector of *waqf* al-Dirkah in al-Nasara neighbourhood, were to be used for the construction of the two bathhouses in Wadi al-Tawahin (al-Wad road). These bathhouses no longer exist but they were endowed as *waqf* for the Khassaki Sultan complex. A similar case, recorded in Sijill 30: 170 dated 10 Rajab 962/31 May 1555, shows that when the same Farhad Çelebi bought through his representative the old stone from the Bimaristan al-Salahiyya, he paid for it from the revenue of Khassaki Sultan. This would suggest that the stone was purchased for re-use in certain sections of the complex which were then under construction. A

⁴⁶ This observation is based on the calligraphic style of the inscriptions still visible on the individual stones, and on their size, colour, and decoration. It seems that the stones were collected from the Ashrafiyya after it had been damaged in a disaster, probably an earthquake.

further clue is to be found in Sijill 84: 18 dated 13 Dhu 'l-Hijja 1011/24 May 1603. The record is a legal declaration to the council of the *qadi* Mahmud Efendi, by Ibrahim ibn Muhammad al-Fakhuri, who attested that while he was sound in body and mind he had sold to Farrukh Beg, governor of Jerusalem, one thousand stones from Zawiyat al-Dirkah, located in Jerusalem, for the price of six 'large' *ghirsh*. The reason stated for the purchase was that they were to build the *khalwa* (chamber) situated on the east side of the Sakhra terrace. Since there is only one structure on the eastern side of the terrace—the Madrasa Ahmadiyya (cat. no. 25)—and since the cell was built within two years of the purchase of the stone, it seems likely that the stone bought by Farrukh Beg was intended for use by Ahmad Pasha, and that the Ahmadiyya was constructed of re-used stones. For the Arabic text and English summary see Cat. Appendix 1, no. 25/2.

The stones were sold individually. In Sijill 1: 57 each of the stones from Dar Ibn al-Sa'r was sold for one *halabiyya dirham*. One-third of the stones of a summer residence (Sijill 10: 46) were sold for 667 *halabiyya* on 17 Jumada I 945/11 October 1538. In some records, the variety of stone was specified, as in Sijill 1: 53, which mentions three types of stone: dressed (*al-ahjar al-manhuta*), hard, undressed (*al-ahjar al-silab al-ghashim*), and heat-resistant flagstones (*al-balat al-'aqad al-nari*).

Some of the recycled stone was brought from outside the Old City, which was ringed by summer residences (*qusur*) (Sijills 1: 53; 10: 46). The debris from some of these palatial houses could reach as many as 2,500–3,000 stones. The trade in re-cycled stone was not confined to material from Islamic sites; it is to be expected that those of other periods—Roman or Crusader—were also robbed. In Sijill 80: 106 one case, mentioned above, records antique Roman masonry collected for trading purposes from the Wadi al-Qatamun by Ibrahim ibn Jirjis al-Nasrani. The detailing of some monuments makes use of Crusader architectural elements as, for example, in the structure of some of the *sabils* of Sultan Sulaiman (see above).

The scarcity of building material meant that a patron was forced to arrange its transportation from an existing building to the new construction site. 'Ali Agha (Sijill 113: 74), the caretaker of the *waqf* of al-Masjid al-Aqsa, acknowledged on 15 Ramadan 1037/19 May 1628, that he had stripped (*qala'*) 56 *balata* (flagstones) off the roof of the eastern portico of the mosque. Ahmad Efendi, the *qadi* of Jerusalem, gave his approval, and the flagstones were used to pave the Mastabat al-Jauza, which so far remains unidentified but is described as being located 'within the Masjid al-Aqsa' (the Haram al-Sharif). It is known from Sijill 83: 51, dated at the end of Jumada I 1010/26 November 1601, that Ahmad Pasha had contracted 'Abd al-Muhsin ibn Nammar, the master

builder of the Aqsa Mosque, either to build or rebuild (*'imarat*) this *mastaba* for ten gold *sultani*. The *mastaba* had to wait almost twenty-five years before it was paved, and this raises the question of whether this delay was due to the scarcity of paving stones. It seems that this must have been the case, if in the end it was worth stripping the stones from the roof of the Aqsa Mosque in order to provide paving for the *mastaba*.

Another extraordinary case that demonstrates the scarcity of building materials occurred in respect to the wall project. Cohen (1986: 151, based on the record in Sijill 14: 196) shows that under pressure from Istanbul, Muhammad Çelebi al-Naqqash, the superintendent of the project, who was attempting to accelerate the progress of construction near Mount Zion, dismantled a number of rooms belonging to the Franciscan Convent while they were still in use. Later, the Franciscans were allowed to rebuild these rooms after they had complained about it to the *qadi*. This demonstrates once again the lack of building stone in the city at the time.

Marble

Wilkinson (1987: 4) states: 'Thus about seventy years before the Hijra (i.e. AD 550), the Roman quarries, which had exported marble, among other places, to Palestine, were all closed. If marble were needed for the magnificent sanctuaries to be built by Caliph 'Abd al-Malik it had to be taken from existing ruins or buildings'. Long before the Ottoman period then, marble was in secondary use, and it was common to move it from one site to another.

The use of marble in the monuments of Ottoman Jerusalem was necessarily limited, for the fact that it was no longer imported into the area and had not been for some time made it expensive. Evidence of the scarcity of marble can be noted in: (1) only three of the twenty-five *mihirabs* described here use marble columns to support and decorate their niches; (2) one column of the four which support the domed portico of the North-Western Khalwa of Ahmad Pasha (cat. no. 22) is of stone, though Ahmad Pasha was very rich (for his biography see cat. no. 22); and (3) the builders of Hujrat Islam Beg (cat. no. 21), and Odat Arslan (cat. no. 41) both used stone instead of marble for the columns. Moreover, some of the shafts of marble columns were reduced in size to conform to their bases, which shows that they are in secondary use (cat. no. 10). Occasionally the columns were damaged, and instead of replacing the flawed areas with new sections, the columns were encircled with metal rings, once again proving the limits to the availability of marble within the city (cat. nos. 10, 30, and 31).

However, despite this situation—or perhaps even because of it—marble was used for the lintels, sills,

columns, capitals and some floors of the Ottoman buildings, although it is true that some of these features were constructed of fragments. Much of the marble used in the fabric of the buildings comprises small pieces used in limited quantities. It is found, for example, used for the small recessed panel niche for the water outlet in the *sabils* (cat. nos. 2, and 5), for the cylindrical shafts of columns (cat. nos. 10, 22, 30, 31, 37, and 48), for decorative and inscription panels set into elevations (cat. nos. 11 and 30), for lintels (cat. nos. 11, 13, 22, and 24), for sills (cat. nos. 22 and 25), and in floor pavements (cat. nos. 10, 12, 31, and 37). Red, black or grey marble was used for these features.

One *sijill* specifies two colours of marble—black and white—when Bairam Jawish contracted with his builders to pave the floors of the bathhouses for Khassaki Sultan (Sijill 31: 110, al-‘Asali 1989: 98-9). Two types of paving stones (*balat*) are also mentioned: the first is black and white marble (*balat rukham aswad wa abyad*), and the second is polished or unpolished *mizi* flagstones (*balat mizi majli* or *min ghair jali*).

Only a few records in the *sijills* have been found that deal with transactions over marble. The first (Sijill 17: 195) is a record of the granting of permission to Khair al-Din al-Aikuri, the inspector of al-Madrasa al-Karimiyya, to sell fifty-six pieces of marble which were then in the *madrasa*. The sale was authorised following an inspection by two master builders, who drew a distinction between the broken and the intact marble slabs. The second (Sijill 27: 269, 270) apparently also concerns a sale, although it had not been approved by the *qadi*, and the marble was therefore delivered back to the store in the presence of a master builder. The very fact that such care was taken over the handling of marble at the time demonstrates its extreme scarcity.

Qusurmil

Qusurmil, which is a mix of ash (*ramad*) and hydrated lime (*mutfa*), was one of the key substances used in the construction process. It is mentioned repeatedly in the *sijills* with reference to repairs to roofs, which would suggest that its main function was to prevent water leaks. *Qusurmil* was purchased by the load, and was often tinted red (*humra*) (Sijill 2: 41, 238).

Other materials

The *sijills* list other raw materials, some of which were used in the construction of specialised buildings, such as mills, soap-factories, oil-presses and bakeries. These materials included gypsum (*jibs*), soil (*turab*, pl. *atriba*), red soil (*turab ahmar*)—all used in the construction of bakeries and a soap-factory; sand (*raml*, pl. *rimal*)—used for a pottery

workshop; bricks (*tub*) for a soap-factory; fired bricks (*tub mashwi*) for bathhouses; *jabbsh*, which were undressed irregular blocks of stone of medium size, used to face walls, foundations, and floors to add strength to the structure; and blocks of baked *jabbsh* (*nari*) which, being heat-resistant, were used in bakeries, bathhouses and soap-factories (Sijills 4: 19; 6: 49). Other secondary materials are often mentioned in the construction process. These are *huwar* (highly refined red soil), salt (*milh*, pl. *amlah*) which was used to roast (*tahmir*) the lime and also used in the furnace (*bait al-nar*) of a bakery to insulate it and keep the paving from overheating; *salab* (according to al-‘Asali 1989: 131 these were ropes made from the bark of trees); *kittan* (linen fibre, see Sijill 6: 157), and cotton (Sijill 8: 155).

Metals and wood

Metal was widely used in a variety of ways. It all had to be imported into Jerusalem from other provinces of the Ottoman empire, in the same way as other materials that were unavailable in Palestine. These were sent in direct response to orders from the sultan, either following his initiation of some particular cycle of restoration or in response to a request from the governor of a fortress.¹⁰ Iron, steel, lead, copper, wood, and marble were all dispatched to Jerusalem for continuing repairs to the Aqsa Mosque and the Dome of the Rock during the reign of Sultan Sulaiman (Heyd 1960: 156). An order sent from Istanbul to the *daftardar* of Damascus and the *beglerbeg* of Tripoli in Syria, dated Shawwal 987/November-December 1579, asked them to forward the lead, which had been sent from Istanbul to Tripoli for the repairs to the Dome of the Rock, the Aqsa Mosque, and the Umayyad Mosque in Damascus. The metal was to be transported to Jerusalem and delivered to Da’ud the master builder, who had been entrusted with the repair work (Heyd 1960: 157).

Lead provided vital protection against penetration by water or rain, and was therefore used to clad the Dome of the Rock, Jami’ al-Aqsa, and the summit of minarets. Most of the other roofs of the Ottoman buildings in the city and around the Haram area were covered with stone slabs. Lead as well as copper was also used in the repair and restoration of soap-factories and oil-presses. Lead was sold by the *qintar*, and the lead sheets were carefully weighed after recasting to ensure against fraud. In Ottoman Jerusalem local experts, Ibrahim and Yusuf, two masters

⁴⁷ Lead was dispatched to other parts of Palestine as well as to Jerusalem. The fortress of Bait Jibrin received two *qintars* on 20 Rajab 959/12 July 1552, and five *qintars* were sent in 976/1568 to the fortress of Gaza (see Heyd 1960: 115-6, and 116, n. 5).

from Gaza, who were the sons of the master Sadaqa al-Gazzi, melted down and recast lead, as recorded in Sijill 113: 439. On another occasion (Heyd 1960: 157), an expert was brought in from elsewhere to do the necessary work, probably because he could be hired for a lower wage.

It is most likely that lead was not easily to be had in the local market, and if available at all it would have been expensive. This explains why lead was the only building material excluded from the contract which was agreed between a consortium of three master builders and the inspector of the Masjid al-Aqsa for the rebuilding of Bab al-Asbat Minaret (Sijill 80: 100). The inspector, 'Abd al-Baqi, agreed to provide the lead (one *qintar*) from the *waqf* for the restoration of the minaret. This, taken alongside the other reports, would suggest that either that amount of metal was purchased especially for the purpose, or that a certain quantity of lead was kept in the stores of the Haram for repair work.

On the binding of Sijill 48, dated 973/1565-6, there is inscribed a note which reports that the lead sheets and the store of al-Aqsa had been checked by the *daftardar* of Aleppo, who had requested the inspection. Heyd (1960: 156), summarising an order dated 984/1576 sent to the *qadi* of Jerusalem from Istanbul, shows that different materials, to be used for repairs on the Aqsa Mosque, had been stored in Jerusalem, most probably in the Haram stores. Sijill 78: 51 records that gypsum, steel, and copper were taken from the store of al-Aqsa in 1005/1596-7. A sheet of lead had also been found in the store of al-Aqsa (Sijill 113: 439) from the repairs executed by order of Sultan Murad Khan.

Previously we included information on the restoration of lead at the Aqsa Mosque and the Dome of the Rock. At one time two named individuals were appointed to the position of 'lead restorer', and were to be paid from the revenue of the *waqf* of al-Aqsa. The fact that it was necessary to employ two men to do the work would indicate that the lead cladding was in constant need of maintenance.

Various items made of iron were used in the construction process—nails (*mismar*, pl. *masamir*), wedges (*dusra*, pl. *dusar*), latches (*dabba*, pl. *dibab*), hinges (*mufassala*, pl. *mufassalat*), and locks (*sukkara*, pl. *sakakir*). Nails were sold by the *ratl*, *uqiyya*, and even individually. On occasion, they were heated before use until the heads became red-hot to ensure easy penetration into the wood or iron (Sijill 8: 130).

Wood was needed on every construction site, whether to be used for a new edifice or for restoration. It was used both for carpentry and for firewood. In particular, wood was used for window frames, doors, and balconies. The circular coffers, beams, and ribs of the Dome of the Rock and the Aqsa Mosque were made from wood. Minarets also used wood for the canopy of the

mu'adhdhin's gallery. Scaffolding too was built of wood. Wood as a raw material appears frequently in the *sijills* with other materials needed in restoration work. It was purchased by the plank (*alwah*, pl. *lauh*) and in pieces. Sijill 100: 436 records that the *rawabit* (tie-beams) and the *jamat* (openings for lighting in the roofs) of the Aqsa Mosque ceiling, which had been damaged by heavy rainfall and the penetration of water, were repaired by the master carpenter, Musa ibn Ibrahim, and that the cost was covered from the revenue of the Aqsa *waqf*. The *sijills* also contain the names of a substantial number of carpenters, who will be listed in the following section. Wood was imported from abroad, as already mentioned, but firewood for heating purposes was probably collected locally.

Master Builders and Skilled Craftsmen

The information contained in the documents of the Jerusalem *sijills* concerning master builders is multi-layered. Much of the material is not found in any other source. The records show the nature of the relationship between Istanbul, the Ottoman capital, and Jerusalem, a small provincial city, whose religious importance was a key factor in the architectural projects sponsored there by the Ottoman authorities. The documents help to clarify the role played by local master builders in the development of the city. It has even been possible to work out the genealogy of a particular local family which contributed to the architecture of the city for more than two centuries. The documents also contain information on master builders brought into the city to work on specific projects, which both confirms the visual impression of the architecture itself and explains the similarities between certain architectural elements seen in Jerusalem and those to be found elsewhere.

Many Arabic as well as a few Turkish terms were used by the scribes of the *sijills* to describe the function of the men who undertook the building work. *Al-mu'allim* ('the master') is the most common term to appear in the *sijills*, and is used to indicate a practical involvement in the construction of a building. It appears before the name of the person in the form of an epithet, while after the name, the description *al-mi'mar* ('the builder') in Jerusalem the Noble—or in one case (Sijill 20: 256) *al-banna'* ('the builder')—is added to denote a master builder. If the *mu'allim* was a stone-cutter, his name would be followed by the term *al-hajjar* (Sijills 12: 124; 18: 448; 21: 235; 21: 148; 24: 264; 59: 387; 66: 178; 80: 178). There is one record (Sijill 12: 922) which names a *qanawati* (one who sets up water installations). *Mu'allim al-mi'mariyya* ('the master of the builders') or *mi'marbashi* ('the chief builder') was added to the name if that man was the chief builder or architect, or was in the designated post of *mi'marbashi*. The

master builders who worked on the Jerusalem wall project were called *mu'allimin maulana al-sultan* ('the master builders of our master the sultan'), or *mu'allim al-sultan bi'l-sur* ('the sultan's master builder on the wall') if given a separate reference. In one case (Sijill 43: 164), the term *ustadh* ('master') was given to the builder, and *usta* is also noted in one other citation (Sijill 31: 86).

The duties of the master builder in particular (and builders in general), according to the information contained in the *sijills*, included the inspection of buildings in order to be able to report back on their condition (for example as to whether they needed restoration or not), estimating the cost of repairs, and determining any weakness in the building that might point to the possibility of danger. The master builders undertook various jobs in the building process, such as paving floors (Sijills 17: 220; 31: 110), demolishing a dilapidated structure (Sijills 17: 440; 20: 98), and removing rubbish from the site (Sijill 16: 214). Other functions relating to construction work included the sale and purchase of building materials (Sijill 2: 47), and the evaluation of an estate (Sijill 12: 910) and of building materials. Another function was to adjudicate on the boundaries of a construction, as was the case (Sijill 24: 353) when the court heard a complaint brought against 'Abd al-Qadir, the son of the citadel deputy, who was ordered to build according to the instructions of Husain ibn Nammar to prevent damage to the property of Khalil al-Bitar. In another case (Sijill 16: 204), the court warned a group of farmers not to plant within the boundaries delineated by Muslih al-Din al-Mi'mar, and if they did not obey, they would be forced to pay a certain sum of money as a fine to the Maqam al-Nabi Musa (near Jericho). The farmers were also ordered to clear an area which they had already planted, otherwise they would be punished. In the last two cases, the master builder was undertaking a task similar to that performed by the modern-day surveyor.

The *sijills* refer to designated posts attached to the construction and maintenance of specific complexes. Some of these were involved in the maintenance of the Dome of the Rock and Aqsa Mosque, like 'the post to restore the roof of the Dome of the Rock' (*wazifat tarmim sath al-sakhra al-musharafa*). This position was occupied (Sijill 76: 350) at one time in 1003/1594-5 by a man called Salih ibn Ibrahim. Another post was to sweep the grass, dust, and gravel from the platform of the Noble Rock (*wazifat kans al-hashish*). The post (Sijill 80: 59) was given to al-Mu'allim Husni al-Samanudi al-Najjar (the carpenter), following the death of his father, on 11 Shawwal 1007/7 May 1599 at a wage of one *qit'a* per day. A similar post to pull out grass (*wazifat qal' al-hashish*) is noted in Sijill 151: 362, but this time the grass to be removed grew between the tiles which covered the Dome of the Rock. The position was filled by al-Mu'allim 'Ali ibn Karim al-Din, known as Ibn Nammar. He was allocated two *'uthmani* per day from the *waqf* of the

Masjid al-Aqsa, and the authorities in Istanbul (*al-sadaqat al-sultaniyya*) granted him another two *'uthmani*. Members of the same Ibn Nammar family shared another post, according to Sijill 151: 452. This was to restore the tiles of the Dome of the Rock (*wazifat marmajiyat qashani al-sakhra*). Previously the post had been occupied by al-Mu'allim Fakhr al-Din ibn Khalil ibn Nammar, who had sold (*tafarraḡh*) three parts of the five of his right to the position to two of his relatives, 'Umar ibn Hasan ibn Nammar and 'Ali ibn Karim al-Din ibn Nammar.

According to Sijill 24: 523 dated 17 Rajab 958/21 July 1551, Muhammad ibn Qasim was *mi'marbashi* for the Khashi building, which so far has not been identified (*'ala 'amal al-khashi*). Another designated post was held by Murad ibn Ibrahim al-Nasrani who occupied the position⁴⁸ of 'the builder (*al-mi'mar 'ala*) of Qanat al-Sabil' (Sijill 43: 501). He was allocated one *'uthmani* daily and a sack of wheat annually from the *waqf* of the *qanat*. The Nabi Da'ud complex also used to have its own designated builder (Sijill 43: 164). A man called Muhammad ibn Ghanim ibn Nammar al-Mi'mar was one of the builders appointed to the position in Jumada I 969/January-February 1562, when he was assigned two *'uthmani* daily from the *waqf* income of the complex. Sijill 121: 231 includes the information that Shaikh Abu Bakr ibn Da'ud was appointed to that particular position for one *'uthmani* daily to be paid from the *waqf* of Khassaki Sultan.

The most important post listed in the *sijills* for a master builder was the *mi'marbashi* (the chief builder) of Jerusalem the Noble, or *mu'allim al-mi'mariyya* (the master of the builders). This position was occupied over the years by a group of prominent men. The earliest reference to the post occurs in Sijill 2: 85 dated 3 Ramadan 938/10 April 1532, when it was occupied by al-Mu'allim Khair ibn Nammar, *mu'allim al-mi'mariyya*. Husain ibn Nammar, his brother, also held the post in 3 Safar 952/16 April 1545 according to Sijill 16: 426. When Rajab ibn Bali, *mu'allim al-mi'mariyya*, asked for leave to go to Mecca to perform the *hajj* on 18 Ramadan 959/7 September 1552, the *qadi* granted him the necessary permit and appointed Husain ibn Nammar and Murad al-Nasrani, the builders, as his deputies (Sijill 25: 628). On 10 Muharram 973/7 August 1565 (Sijill 48: 165), the position of *mu'allim al-mi'mariyya* was shared equally between Muhammad ibn Ramadan and Mahmud ibn Husain ibn Nammar. According to Sijill 79: 280, it seems that some time before Muharram 1007/August-September 1598, Mahmud held the position on his own, because when he asked the *qadi* for permission to perform the *hajj* and was granted leave, Mahmud

⁴⁸ It emerges from an order summarised by Heyd 1960: 146 that Qanat al-Sabil had its own inspector, clerk, rent-collector, watchman, and supervisor (*mushidd*), but no *mi'mari* was mentioned in the order dated 959/1552.

deputised his son, 'Abd al-Muhsin the master builder, to replace him in the post of *mi'marbashi* of Jerusalem the Noble. 'Abd al-Muhsin also held 'the post of the restorer of al-Masjid al-Aqsa' (*wazifat al-ta'mir wa al-tarmim bi'l-Masjid al-Aqsa*; Sijill 77: 453). This last post seems previously to have been one of the responsibilities of the *mi'marbashi* of Jerusalem, for it does not appear in any earlier record. But both the posts held by 'Abd al-Muhsin were occupied in 1105/1693-4 by two builders of the Ibn Nammar family (Sijill 166: 135; al-'Asali 1989: 116).

From the information discussed above relating to the terms on which the builders were employed and the sort of activities undertaken by them, it would seem that none of the terms or activities correspond to the role of the architect as it is understood today. Although there is no suggestion that the master builders in Ottoman Jerusalem designed a structure, the ample information about their contribution implies that their knowledge was greater than that of an ordinary builder, though their expertise was less than that of a *muhandis* (engineer or architect).

With reference to the administrative level, from the notes gathered from the *sijills* it is clear that state projects involved some sort of financial and administrative supervision. Through the control of the court, as already mentioned, there was usually someone who made sure that the workers on site were doing their job, and that the materials used were duly registered and documented. In some cases the absence of the supervisory clerk caused the work to be halted, and a new clerk had to be appointed to replace him (Sijill 24: 523). One of the most famous supervisors was Muhammad Çelebi al-Naqqash, who was the superintendent of the Jerusalem wall project, as well as in charge of the work on the water supply and the six *sabils*. The information given in the previous section as well as that contained here clarifies his role; he was assisted by clerks, tax collectors, and representatives entrusted with various tasks.

In the private or *waqf* sector, the owner or the *nazir* controlled the progress of work, and checked that the job was being done according to the stipulations agreed between the two parties. In one contract recorded in the *sijills* (5: 28) which concerned the repair of Madrasa Manjakiyya, the master builder Ahmad al-Kharshi guaranteed his work for a period of twenty years from the time of the repair. On another occasion, a number of builders who had constructed a water canal guaranteed to undertake any necessary repairs at no additional charge up to a period of three years (Sijill 31: 110; al-'Asali 1989, 99). 'Ubaid ibn Nammar on one occasion (Sijill 39: 50) undertook to repair any faulty *qusurmil* without further charge. In more than one case, it is stipulated that the master builder contracted to undertake the work should do so himself, which might suggest that some master builders were in the habit of subcontracting the work to other teams who would do the job at a lower price, allowing the first

man to pocket the difference. It is, however, odd to see that Husain ibn Nammar, the famous master builder, agreed to a provision which specified that he personally had to remove rubbish, dung, and earth from a site (Sijill 16: 214). Provision of food for the workers on site seems always to have been the responsibility of the patron, for the cost was normally included among the expenditures listed in the documents.

The *sijills* include a large number of names of master builders and builders, together with the details of their contracts. This adds considerably to the limited data available on the subject, in particular by providing more solid ground for research than the speculation and theorising which has characterised discussions in the past. The information gives firm support to the previous suggestions of the transfer of architectural influences, and the movement of craftsmen, between Jerusalem and other Islamic cities in Syria, Egypt, and the Ottoman empire, in particular the capital, Istanbul. It is particularly fortunate that the majority of the master builders described as coming from outside Jerusalem appear in the *sijills* with the names of their cities of origin. This fact has made it possible to differentiate between two main groups of master builders—incomers and locals.

Incoming (non-local) Master Builders

The idea of inviting skilled builders from elsewhere to construct sophisticated buildings in Jerusalem is a well-established fact for a number of buildings constructed in the Mamluk period (see Burgoyne 1987: 97). For the Ottoman period, too, it is well known that work on the Khassaki Sultan complex and the repair of the lead of the Aqsa Mosque, for example, were both undertaken by expert builders dispatched from Damascus; the building materials necessary for the contract were also sent from Damascus (see Heyd 1960: 143 n. 1, 157). The significance of the material in the *sijills* relating to master builders from outside the city lies in part in the information given on the wealth, number, and diversity of their cities of origin.

Table 36.1 shows that seventeen builders from outside Jerusalem were active in the city in the 16th century. Twelve of them came from Syria, seven of whom were from Aleppo, three from Antioch, one from Hama, and one from Damascus. Five of them were Turks, although only one of these has his city of origin identified—Istanbul. With reference to the titles held by the builders, Table 36.1 shows that three (nos. 4, 14, 15) were called 'builders on the wall' (*al-mi'mar bi'l-sur*), six others (nos. 3, 5, 6, 7, 8, 17) are merely identified by the *laqab al-mi'mar* (builder), four (nos. 1, 9, 10, 11) were called *mu'allim* (master), one (no. 12) was named *mi'marbashi* (chief builder), one (no. 13) was called *ustadh* (master), one (no. 2) bears the title the 'sultan's master on the wall' (*mu'allim*

Table 36.1 List of Non-Local Builders in Jerusalem

Name	Province/City	Title	Work
1 Husain ibn Naf'	Syria/Aleppo	<i>mu'allim</i> (master)	trading in stones, and estates (Sijill 2: 40, 47)
2 Darwish al-Halabi	Syria/Aleppo	<i>mu'allim al-sultan bi'l-sur</i>	the Jerusalem wall (Sijill 13: 212), inspection of al-Taziyya (Sijill 14: 144)
3 Muhammad ibn Mansur	Syria/Aleppo	<i>mi'mar</i> (builder)	inspecting the citadel (Sijill 1: 400), repair to al-Tailuniyya (Sijill 13: 352).
4 'Umar ibn Muhammad al-Jammal	Syria/Aleppo	<i>al-mi'mar bi'l-sur</i>	on the wall (Sijill 12: 16), removal of the Bimaristan rubbish (Sijill 20: 98)
5 Yusuf ibn 'Abd al-Qadir	Syria/Aleppo	<i>mi'mar</i> (builder)	purchase of a house (Sijill 28: 24)
6 Mahmud ibn 'Abd Allah	Syria/Aleppo	<i>mi'mar</i> (builder)	various activities (Sijills 16: 163; 17: 24; 28: 140; 31: 52)
7 'Abd al-Qadir ibn 'Abd Allah	Syria/Aleppo	<i>mi'mar</i> (builder)	purchase of a house in Aleppo from his brother (Sijill 28: 380)
8 Muhammad al-Hamawi	Syria/Hama	<i>mi'mar</i> (builder)	inspecting the citadel (Sijill 1: 400)
9 Muhammad ibn Ibrahim	Syria/Antioch	<i>mu'allim</i> (master)	restoration to Khan al-Qattanin (Sijill 6: 354)
10 Rajab ibn Yahya	Syria/Antioch	<i>mu'allim</i> (master)	witness to a financial transaction (Sijill 5: 81)
11 Ghars al-Din	Syria/Antioch	<i>mu'allim</i> (master)	restoration to Khan al-Ghadiriyya (Sijill 5: 81)
12 Da'ud ³⁵	Syria/Damascus	<i>mi'marbashi</i> of Damascus	restoration of the lead of the Dome of the Rock
13 Muhammad ibn Mustafa	Turkey/Istanbul	<i>ustadh</i> (master)	construction of a water canal (Sijill 31: 110)
14 Muslih al-Din al-Rumi	Turkey/?	<i>al-mi'mar bi'l-sur, qanawati</i>	assistant to Muhammad al-Naqqash (see below)
15 Husain ibn Muhammad al-Rumi	Turkey/?	<i>al-mi'mar bi'l-sur, mu'allim al-sultan</i>	stone-cutter on the Jerusalem wall (Sijill 12: 891)
16 Fadl al-Sharaf al-Rumi	Turkey/?	<i>mu'allim al-sultan</i>	inspection and pricing (Sijill 12: 910)
17 'Ali ibn Sayyidi al-Rumi	Turkey/?	<i>mi'mar</i> (builder), <i>usta</i> (expert)	construction for Bairam Jawish (Sijill 31: 86)

al-sultan bi'l-sur), and the last (no. 16) is called the 'sultan's master' (*mu'allim maulana al-sultan*).

Darwish al-Halabi was the best known of the builders from outside the city and the one most often employed. He acquired three different titles: 'the sultan's master builder on the wall of Jerusalem' (*mu'allim al-sultan bi sur al-Quds*), 'the master of the builders of the city of Aleppo the protected' (*mu'allim al-mi'mariyya bi Halab al-mahmiyya*) and 'master of the builders of the city Jerusalem the Noble' (*mu'allim al-mi'mariyya bi'l-Quds al-sharif*). He was one of three masters named as being in the employ of Sultan Sulaiman (*mu'allimin maulana al-sultan*), and in all made a considerable contribution to the architectural development of Jerusalem. With two other master builders, he inspected Madrasa Hanafiyya (no longer extant), assessed the value of the house of Ibn Tawusa (Sijill 12: 910), and above all acted as the assistant of Muhammad Çelebi al-Naqqash, who was superintendent of the wall and water supply projects for many years (Sijill 14: 144; Cohen 1990: 33).

Another master builder who was deeply involved in Jerusalem's development was Muslih al-Din ibn 'Abd Allah al-Rumi al-Qanawati. He was also one of the assistants of Muhammad Çelebi al-Naqqash, for he was authorised to collect the Bethlehem revenues (Sijill 12: 922). A financial transaction is to be found in Sijill 16: 535

showing that Muslih al-Din had received the revenue of the 'ushr of Mar Ilyas (between Jerusalem and Bethlehem). Muslih's contributions were not only financial, however, but also on a technical level. On 16 Shawwal 944/18 March 1538, at the request of Bairam Jawish, he inspected Madrasa Mawardiyya (cat. no. 28) and estimated the cost of its repairs (Sijill 7: 435). As mentioned above, he also surveyed a plot of land near Maqam Nabi Musa. From his final *laqab*, *al-qanawati* ('he who sets up a water installation') and his close association with Muhammad al-Naqqash, seems likely that he was involved in the water supply project. Sijill 16: 296, dated 26 Dhu'l-Hijja 951/10 March 1545, includes a financial account, presented by Muslih al-Din, with reference to the expenses incurred in the repair of a pool connected with the water channel serving Jerusalem.

Al-Hajj Mahmud ibn 'Abd Allah al-Halabi al-Mi'mar appears in *sijill* records (16: 351; 28: 116; 31: 52) as a working builder, but mainly in the private sector. Sijill 28: 380 reports that he had sold a house in Aleppo to his brother on his mother's side, 'Abd al-Qadir ibn Ramadan the builder.

The other builders listed in Table 36.1 above had different levels of involvement, some with lower profiles than others. The builders who carried the title 'the sultan's master' or 'the sultan's master on the wall' were apparently sent to Jerusalem in response to direct orders from Sultan Sulaiman, while others, with no honorific title, may have come to Jerusalem on their own initiative to look for work. It is worth noting that certain Syrian master builders, such as Muhammad al-Hamawi and Muhammad ibn Mansur

³⁵ According to Heyd (1960: 157), who based his view on an order dating to Shawwal 987/December 1579, which was dispatched to the *defterdar* of Damascus and the *beglerbeg* of Tripoli in Syria.

al-Halabi (Sijill 1: 400), are recorded as being in Jerusalem almost ten years before the wall project began, when the first steps were being taken in the restoration of the Citadel. Certainly the wall project must have been a great draw, to judge by the number of builders in Jerusalem. It should be remembered too that the majority of these craftsmen stayed on in Jerusalem after the completion of the walls. Some of them seem to have contributed to the construction of the Khassaki Sultan complex, although no specific record has yet emerged to give concrete confirmation to this assumption. There are records which prove that two of the non-local master builders were involved in the construction of the two bathhouses and the water canal belonging to the *waqf* of Khassaki Sultan. Sijill 31: 110 dated 28 Shawwal 961/26 September 1554, which was published by al-‘Asali (1989: 99), mentioned that Yusuf ibn ‘Abd al-Qadir al-Halabi was one of the three craftsmen who were contracted by Bairam Jawish to pave the floor of the bathhouses. This *sijill* also refers to a Muhammad ibn Mustafa al-Istanbuli, who took part in on the installation of a water canal which extended from Sabil Bab al-Nazir to the cistern of the two bathhouses of Khassaki Sultan.

Although there is an entry in Sijill 12: 360, dated 18 Rabi‘ I 947/23 July 1540, that states clearly that Bairam Jawish went to Egypt to arrange for master builders (*mi‘mariyya*) for the wall project, no record in the *sijills* has been found which gives the name of an Egyptian master builder. There are, however, two records (Sijill 12: 122, 245) which concern two Egyptian porters (*‘attal*) who worked on the wall project. As the records in the *sijill* registers are random and primarily either document a dispute or a particular court matter to be used for future reference, the non-appearance of Egyptian names is not necessarily a proof that no Egyptian master builders worked in Jerusalem.

Sinan,⁵⁰ the Grand Architect

It is not possible to leave the subject of non-local builders working in 16th-century Jerusalem without a passing reference to two pieces of information concerning the master architect Sinan and his association with the Jerusalem projects. In *Tuhfetü ‘l-Mi‘marin* (dated to the 1590s, after the death of Sinan which was probably in 1587 or 1588), the latest of three manuscripts dealing with Sinan’s work, three buildings in Jerusalem are listed as his. These are the restoration of the Dome (of the Rock), the Madrasa of the Dome of the Rock, and the ‘Imara of the Dome of the Rock (Kuran 1987: 283, nos. 402-4). These

are not, however, mentioned in the two earlier manuscripts (*Tezkiretü ‘l-Bünyan*, dated 992/1584, and *Tezkiretü ‘l-Ebniye*, dated 994/1586) as Meinecke has already noted (1988: 281, n. 101). The other reference is by Evliya Çelebi (Stephan 1980: 75) who maintained that Sultan Sulaiman dispatched Qoja Sinan to Jerusalem with building materials and instructions to carry out restorations in the Holy City.

Despite these two accounts, both of which are later than the life of the great Ottoman architect, it is very unlikely that Sinan contributed to the architectural development of Jerusalem, and several reasons may be adduced for this.

(1) The odd names of the structures mentioned above—the *madrasa* and *imara* attributed to the Dome of the Rock—have no parallels in the sources, nor do they exist today.

(2) If these structures really were the work of Sinan in Jerusalem, why were they not mentioned in the earlier two manuscripts? Kuran (1987: 27) notes that the last manuscript was probably compiled in the 1590s after Sinan’s death, for in it there are a number of buildings which were too late for Sinan to have designed or supervised. Kuran gives as examples the Melek Ahmad Pasha Mosque in Diyarbakir (dated 1590) and the Mosque and Türbe of Nişancı Mehmet Pasha among other buildings.

(3) The construction of al-‘Imara al-‘Amira in Jerusalem started soon after 30 Jumada I 959/24 May 1552, and the work continued for two to three years. In the 1550s Sinan was kept fully occupied in building the Süleymaniyye complex in Istanbul, which was finally completed on 21 Dhu ‘l-Hijja 964/15 October 1557, and the comparable complex in Damascus, which was completed in 962/1554-5. It therefore seems likely that someone else was given the commission to build in Jerusalem for Khassaki Hürrem. A *firman* survives to support this hypothesis. It was despatched from Istanbul to the governor of Damascus, ordering him to send a master builder and materials for the building of al-‘Imara al-‘Amira (see cat. no. 15 under ‘Date’).

(4) The name of Sinan has so far not emerged in the *sijills* of Jerusalem. This is particularly striking when more than sixty master builders, both local and imported, are listed there.

(5) None of the Ottoman monuments of the city reflect the classic Ottoman architectural tradition or the style of Sinan (for details, see the concluding remarks).

With regard to the comments of Evliya Çelebi, the prime problem is that he was writing too late. Kuran (1987: 27) has noted that Evliya Çelebi has not been the only commentator to attribute to Sinan buildings and structures which are not mentioned in 16th-century manuscripts, for many other later scholars have continued to do so.

⁵⁰ On Sinan, see Stratton (1972), Kuran (1987), and Goodwin (1993).

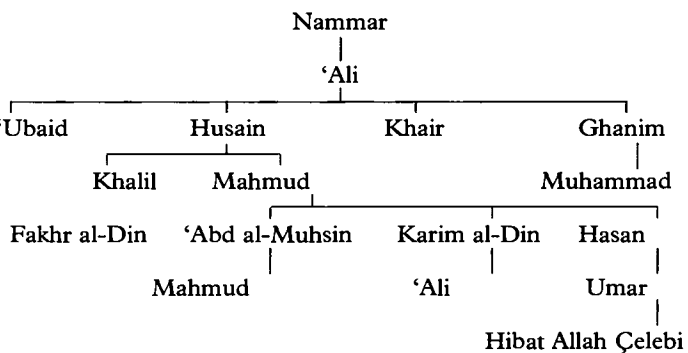

Local Master Builders

Nothing has been published so far on the local builders of Ottoman Jerusalem. Little is known about earlier periods, in particular the Mamluk period, and what has been written depends mainly on speculation, suggestion, and on circumstantial evidence (see Burgoyne 1987: 98). The information preserved in the *sijills* on the local master builders in the Ottoman period is, therefore, of great significance. It is noticeable that, apart from a few master builders, the high-level posts and architectural projects in Ottoman Jerusalem were both controlled and monopolised by a single family—namely that of Ibn Nammar.

The Ibn Nammar Family*

Table 36.2 shows the genealogy of the Ibn Nammar family. Husain ibn ‘Ali was the first master builder who began the tradition of the family involvement in architecture. The family is represented by five

Table 36.2 The Family Tree of ‘Ali ibn Nammar

generations who, without interruption for almost two centuries, lived and worked in the city. There follows a detailed study of the members of the family as they feature in the Jerusalem *sijills*.

The First Generation of the Ibn Nammar Family

Husain ibn ‘Ali ibn Nammar

Husain ibn ‘Ali ibn Nammar, as his full name appears in

* The name of the family is here given as ‘Nammar’, although there are no diacritical points in the *sijills* to aid vocalisation, particularly in the early documents. The reason for this decision rests on one document (Sijill 187:169) dating to the year 1096/1685, regarding Hibat Allah Çelebi, son of al-Hajj ‘Umar al-Nammari. Here the *nisba* ‘Nammari’ is written with clear vocalisation. The form has therefore been back-dated on the assumption that all the *n-m-r* are from one family. [Editorial note: This form of the name has been applied universally throughout the volume; see in particular the chapters by Atallah and ‘al-Alami.]

Sijill 12: 704; 17: 115 (although he is described as ‘al-Muqaddasi’ [from Jerusalem] in Sijill 1: 400), was the head of the Ibn Nammar family, and the greatest local master builder in Ottoman Jerusalem in the 16th century. His many titles reflect his rank. As early as 938/1531-2, he was considered one of the experts (*min ahl al-khibra*) in architectural matters (Sijill 1: 400). He was indeed called *al-mu‘allim al-ajal* (‘the greatest master’) in many of the records (Sijills 12: 92; 12: 759; 13: 178), and sometime his name is preceded by the adjectival phrase *badr al-din*, meaning literary the ‘full-moon of the faith’. Among his epithets are to be found *mu‘allim al-mi‘mariyya bi’l-Quds* (‘the master of the builders in Jerusalem’), *al-mu‘allim al-sultan bi’l-Quds* (‘the sultan’s master in Jerusalem’), and *mi‘marbashi* (‘master builder’).

Husain’s architectural activities spanned some three decades, starting at the beginning of 938/1531-2 and ending in 967/1559-60, to judge by the proceedings of the *sijill*. In the course of his career, he contributed to many construction projects. The wall project was one of them. It is even possible to pinpoint the section of wall he built (Sijill 12: 92). It was in the south, near the abattoir in the Jewish quarter, between the Dung and Zion Gates. Husain was the contractor who extended the soup-kitchen of Khassaki Sultan, and solved the problem of smoke emissions by constructing the three tall chimneys still standing today. Husain, with other builders from outside Jerusalem—Mansur al-Halabi and Muhammad al-Hamawi al-Shami—was one of the team which jointly inspected the wall of Jerusalem’s Citadel (Sijill 1: 400). He was also part of the inspection team for the Madrasa Hanafiyya, in the company of Darwish al-Halabi and Fadl al-Sharaf al-Rumi (Sijill 12: 910). He headed a company formed by Muhammad ibn Mustafa al-Istanbuli and Murad al-Nasrani to construct a canal to provide water for the bathhouses of the Khassaki Sultan *waqf*. In addition, Husain carried out various other inspections and estimates as well as undertaking many restoration contracts. His activities were not confined to architecture alone. He traded in soap (Sijill 16: 368, 369; 25: 6), property (Sijill 16: 520; 16: 330; 17: 115; 27: 487), and lime (Sijill 10:120). Other financial transactions of his are recorded (Sijills 20: 3; 20: 352; 30: 394). Once Husain acted as witness on a contract to pave the two new bathhouses of the *waqf* of Khassaki Sultan (Sijill 31:110, al-‘Asali 1989: 98), which was agreed between a group of builders who included his sons, Khalil and Mahmud, as well as Yusuf al-Halabi, Diyab ibn Ramadan, Hanna ibn Da’ud al-Nasrani, ‘Aun ibn Musa al-Nasrani and Bairam Jawish. Apparently Husain’s sons received their training from their father. Table 37.3 below shows Husain’s major architectural activities as recorded in the *sijills*.

‘Ubaid ibn ‘Ali ibn Nammar

‘Ubaid was another of the sons of ‘Ali ibn Nammar who

Table 36.3 Husain ibn Nammar—Architectural Activity

No.	Site	Sijill, Page	Year	Notes
1	Citadel walls	1: 400	938/1531-2	inspection (with others)
2	Zawiya Wafa'iyya	5:84	942/1535-6	restoration. 1,800 'uthmani
3	City wall	12: 92	946/1539-40	construction work
4	Madrassa Hanafiyya	12: 759	947/1540-1	estimate: 8,000 'uthmani
5	House of ibn Tawusa	12: 910	947/1540-1	house evaluation
6	Khan al-Fahm	13: 178	948/1541-2	estimate: 3,750 'uthmani
7	Aqsa ablution facilities	13: 179	948/1541-2	estimate: 7,000 'uthmani
8	Soap factory	16: 214	951/1544-5	removal of rubbish
9	Iwan pavement	17: 220	952/1545-6	purchase of pavement
10	Madrassa Taziyya	18: 628	954/1547-8	restoration
11	Ethiopian Convent	19: 225	954/1547-8	restoration of a wall
12	Madrassa Jauhariyya	19: 111	954/1547-8	restoration after earthquake
13	Inspection of a tannery	20: 329	955/1548	no damage found
14	Dar al-Hadith	22: 135	956/1549	inspection and estimate
15	Maqam 'Azar, Bethany	23: 168	957/1550	outside Jerusalem
16	Anonymous house	23: 619	957/1550	inspection
17	Madrassa Jauhariyya	24: 307	958/1551	contract with inspection
18	Investigation of a complaint	24: 353	958/1551	
19	Group of houses	25: 405; 521	959/1551-2	contract with Bairam Jawish and the <i>qadi</i>
20	Madrassa Ashrafiyya	30: 384	962/1554-5	estimate and restoration
21	Construction of canal	31: 384	963/1555-6	with two builders

was active in the building trade. His name appears in Sijill 19: 405 as 'Ubaid ibn 'Ali al-shahir bi ibn Nammar al-mi'mar bi'l-Quds al-sharif ('Ubaid ibn 'Ali known as Ibn Nammar the builder in Jerusalem the Noble). His works included the repair of Khan al-Ghadiriyya (Sijill 39: 50), Madrasa Hanafiyya (Sijill 19: 405), and a canal that had become filled with earth (Sijill 27: 55), and he also demolished a sleeping chamber (Sijill 17: 440). He co-operated with his brother Husain on contracts for the repair of the Ashrafiyya (Sijill 30: 384), and worked closely with Ahmad al-Kharshi, a local builder, in restoring a number of houses (Sijill 16: 411; 16: 426). Like Husain, his name appears in the *sijills* (17: 19; 28: 384) in connection with transactions other than building work.

Khair ibn Nammar and Ghanim ibn Nammar

Sijill 2: 85 dated 3 Ramadan 938/9 April 1532 includes an entry under the name of Khair ibn Nammar *mu'allim al-mi'mariyya* (master of the builders). The record shows that Khair had contracted with a group of people from Bait Jala and Bethlehem for the removal of earth and debris from a site near Bab al-Maghariba within the Masjid al-Aqsa (Haram al-Sharif) for a period of three months at a fee of 2,750 'uthmani.

Ghanim is recorded once as restoring a house (Sijill 10:120), and another time (Sijill 15: 552) he is described as 'a builder' when he inspected a wall. His son, Muhammad ibn Ghanim ibn Nammar, was on 9 Jumada I 969/15 January 1562 appointed a builder in Maqam al-Nabi Da'ud (Sijill 43: 164) at a wage of two 'uthmani per day. It is not clear from the *sijills* discovered so far if Khair and Ghanim were the direct sons of Nammar, or whether their father was the 'Ali ibn Nammar who was the father of Husain and 'Ubaid. Most probably the father of Khair and Ghanim was 'Ali, and they were thus the brothers, and not

the uncles, of Husain and 'Ubaid, for this would correspond with their probable lifespan.

The Second Generation of Ibn Nammar Family

Khalil ibn Husain and Muhammad ibn Ghanim

The second generation of the builders of the Ibn Nammar family is represented by the sons of Husain ibn Nammar, Khalil and Mahmud, and by Ghanim ibn Nammar's son, Muhammad. A single record has been found naming Muhammad ibn Ghanim. It concerns his appointment to the post of the *mi'mari* of Maqam Nabi Da'ud. Two documents were found with a reference to Khalil ibn Husain ibn Nammar, both relating to his architectural work. One concerns his contribution to paving the floor of the bathhouses of the *waqf* of Khassaki Sultan in 963/1555-6 (Sijill 31: 110, al-'Asali 1989: 98), and the other records a purchase of stones by him in 993/1585-6 (Sijill 66: 629). The length of time between the two references implies that Khalil must have been an active builder, despite the absence of records in the *sijills*. It is of course possible that not all records have yet come to light.

Mahmud ibn Husain ibn 'Ali ibn Nammar

Most of the construction work of Mahmud ibn Husain ibn Nammar was carried out in the last quarter of the 16th century, a period when most of the large-scale projects of Ottoman Jerusalem had either been completed or were in their final phase. By this time, therefore, construction work in the city had largely been reduced to fulfilling local needs. It was only in the late 16th and early 17th century that major building work began again with the construction of the cells around the upper terrace of the Dome of the Rock

(see the list of these dated *khalwas* in the catalogue).

From the documents found in the *sijills*, it seems that Mahmud began his activities in 963/1555-6 by working with a number of other builders in paving the bathhouses of Khassaki Sultan (Sijill 31: 110; al-'Asali 1989: 98). His brother Khalil was another member of the consortium. His epithet, the builder (*al-mi'mari*), was repeated in Sijill 48: 165 dated 973/1565-6, when he and a man called Muhammad ibn Ramadan shared equally in the post of the master builder of Jerusalem. During the time they held the position jointly, they restored in 972/1564-5 the Maqam Rabi'a al-'Adawiyya on the Mount of Olives (Sijill 48: 127). When Mahmud inspected Madrasa Salahiyya on 977/1569-70, his title in the *sijill* had been changed to the *mi'marbashi* (the master builder) of Jerusalem. The inspection is described as being detailed (*wa kashafuha kashfan shafiya* (Sijill 53: 270). Mahmud was also responsible for the inspection of Madrasa Mawardiyya in 1005/1596-7 (Sijill 77: 537; for details of his report see cat. no. 28, and for the Arabic text and English summary see Appendix I, no. 28/2).

At the approach of the 17th century, 'Abd al-Muhsin, the son of Mahmud, was already trained and prepared gradually to take over his father's position. On 28 Muharram 1007/31 August 1598, while Mahmud was away on the *hajj*, the *qadi* gave permission for 'Abd al-Muhsin ibn Mahmud to fill the post during his father's absence.

Sijill 84: 111 contains a *waqfiyya* registered under the name of *usta* (expert) Mahmud ibn Husain ibn Nammar, the *mi'marbashi* of Jerusalem. It is for the benefit of his family, described as three master builders, *usta* 'Abd al-Muhsin, *usta* Karim al-Din, and *usta* Hasan, as well as two daughters, Ruqayya and Fatima. From the list⁵¹ of properties mentioned in the *waqfiyya*, it would appear at the time that the financial situation of Mahmud was strong.

The Third Generation of the Ibn Nammar Family

'Abd al-Muhsin ibn Mahmud ibn Husain ibn 'Ali ibn Nammar

'Abd al-Muhsin ibn Mahmud represents the third generation of the Ibn Nammar family. In his way, he was as great a builder as his grandfather, Husain ibn Nammar, had been before him. In the various records of the *sijills*, he

appears with many different titles and epithets, all of which indicate his rank and standing in Jerusalem's architectural sphere. 'Abd al-Muhsin is called master (*ustadh*, *mu'allim*), expert (*usta*), the chief builder of Jerusalem the Noble (*mi'marbashi al-Quds al-sharif*), and the chief of the builders in Jerusalem the Noble (*ra'is al-mi'mariyya bi'l-Quds al-sharif*). His main work was carried out at the end of the 16th and the first half of the 17th century, at a time when the patronage of Ahmad Pasha resulted in many important architectural projects in the Haram, and other restoration work was being sponsored by Bairam Pasha. The period and the work of 'Abd al-Muhsin constitute a time of transition between the zenith of Ottoman architecture in Jerusalem—the restoration of the Citadel, the water supply project, Jerusalem's walls, the work of Bairam Jawish and the Khassaki Sultan complex—and the decline in the second half of the 17th century.

'Abd al-Muhsin, in his capacity as *mi'marbashi* of Jerusalem, attended many court hearings and public inspections with reference to construction projects in the city. He appeared in 1007/1598-9 as a witness when the complex of Khassaki Sultan (cat. no. 15) was inspected with the purpose of locating a suitable site for the construction of a mill (Sijill 79: 475). He was among those who were present in the Shari'a court (Sijill 113: 436) when Bairam's donation was discussed in 1037/1627-8. He came to the court once again when he asked the *qadi* to allow him to construct a special *khalwa* on the south side of the Dome of the Rock terrace in which he could keep his tools and equipment (Sijill 77: 453). On that occasion, he was allowed to do so by the *qadi* at a cost of 30 *sultani* which was paid out of the funds of the *waqf* of al-Masjid al-Aqsa.

Table 36.4 below shows most of 'Abd al-Muhsin's works as revealed in the *sijill* of Jerusalem.

Table 36.4 shows that 'Abd al-Muhsin inspected many sites, estimated the cost of certain repairs, restored significant monuments such as the minaret of Bab al-Asbat and the Maqam Nabi Musa, and above all was responsible for the construction of a cell for Bairam, his own cell (which can no longer be identified), the Mastabat al-Jauza, and the reconstruction of Khalwa Junbalatiyya.

The information contained in the *sijills* makes it possible to identify the work of 'Abd al-Muhsin ibn Nammar, for the buildings are still extant today. The *sijills* are entirely clear in attributing three constructions in particular to 'Abd al-Muhsin. These are: Khalwat Bairam, dated some time before 21 Rabi' II 1038/19 November 1628 (Sijill 115: 721; for the complete Arabic text and English summary see Cat. Appendix 1, no. 34/1, and see also cat. no. 22); Khalwa Junbalatiyya (cat. no. 24; Sijill 83: 51), and the Minaret of Bab al-Asbat (Sijill 80: 106, see also Appendix I, no. 3/3 and cat. no. 3). In addition to these works, which can be directly attributed from the

⁵¹ The list of the estates mentioned in the *waqfiyya* includes a two-floored house in al-Sharf neighbourhood, 17 *qirat* out of 24 of the house which was adjacent to this house, 18 *qirat* out of 24 of the orchard located in Bait Jammal village (west of Jerusalem), the whole orchard known as Karim al-Shaikh located in the same village, the whole orchard in al-Baq'a outside Jerusalem, the whole orchard on the land belonging to al-Salahiyya, and another orchard on the same land.

Table 36.4 The work of ‘Abd al-Muhsin in Jerusalem as revealed by the *sijills*

No.	Name of Site	Sijill/Page	Date	Work
1	Anonymous cell, south of the Haram platform	77: 243 & 77: 453	1005/1596-7	cell construction in the Haram to keep tools and equipment
2	Water canal in al-Wad road	80: 72	1007/1598-9	inspection and restoration of contaminated water canal
3	Bab al-Asbat Minaret	80: 100	1007/1598-9	rebuilding the shaft and the pinnacle with other builders
4	House of Jirjis	80: 106	1007/1598-9	inspection of the house and recommendations
5	Junbalatiyya Cell	83: 51	1010/1601-2	reconstruction of the cell
6	Mastabat al-Jauza	83: 51	1010/1601-2	construction for ten <i>sultani</i>
7	Maqam Nabi Musa (Jericho)	87: 544	1016/ 1607-8	restoration of the <i>maqam</i>
8	Citadel, Jerusalem	89: 120	1017/1608-9	inspection and estimate cost of 300 <i>sultani</i>
9	Aqsa Mosque	100: 436	1029/1619-20	inspection of the timber of the ceiling with Ibrahim ibn Musa
10	Bairam’s <i>khalwa</i>	115: 721	before 1038/1638-9	construction of the whole cell

documents, information in the *sijills* and visual comparisons suggest that three other *khalwas*, which were sponsored by Ahmad Pasha (cat. nos. 22, 23, and 25), as well as the Hujra of Islam Beg (cat. no. 21)—all of which are located on the Dome of the Rock esplanade—should in all probability be assigned to the workshop of ‘Abd al-Muhsin. This question will be discussed further below under ‘*Khalwas*’.

The Fourth Generation of the Ibn Nammar Family

‘Umar and ‘Ali ibn Nammar

Although Karim al-Din and Hasan, brothers of ‘Abd al-Muhsin and sons of Mahmud ibn Husain ibn Nammar, were both builders according to Sijill 84: 111, no record has been found which would enable any of their work to be identified. The information skips a generation, however, for a few entries have been discovered relating to their sons, ‘Umar ibn Hasan ibn Mahmud and ‘Ali ibn Karim al-Din ibn Mahmud (see the family tree above).

‘Ali ibn ‘Abd Karim was better known as al-Hajj ‘Ali, and, according to Sijill 183: 226, he had the title of ‘the Builder of the Noble Mosque’ (*mi’mar al-masjid al-sharif*). Sijill 183: 225 reveals that he was the caretaker of the *waqf* of the Dome of the Rock and the Aqsa Mosque, as well as the *waqf* of the Great Mosque at Hebron. In addition he acted as a legal agent for Yusuf Agha when two plots of land outside (*bi zahir*) Jerusalem were endowed by Yusuf Agha as *waqf*. The construction work of Hajj ‘Ali is represented by two small monumental domes in the Haram al-Sharif, both built on the instructions of Yusuf Agha in 1092/1681 (van Berchem 1925: 31, 32, 192). Hajj ‘Ali also inspected the south wall of al-Aqsa with his nephew, Hibbat Allah ibn ‘Umar ibn Hasan (see below).

Sijill 151: 452 dated 1066/1655-56 records the appointment of ‘Umar and ‘Ali to the post of ‘restorer of tiles of the Dome of the Rock’ (*wazifat marmajiyat qashani al-sakhra*). The two men replaced Fakhr al-Din, their father’s uncle, as already explained above. Al-Husaini (1982: 115) published a citation without giving the *sijill*

number. It reveals that when Muhammad ibn Ibrahim al-Ghazzi undertook to repair the Qanat al-Sabil in 1067/1656-7, three other master builders in Jerusalem, al-Mu‘allim Mahmud, al-Mu‘allim ‘Ali and al-Mu‘allim ‘Umar, promised to help Muhammad by providing him with builders and workers who were free to work on the project. The builder named as al-Mu‘allim Mahmud was probably the son of ‘Abd al-Muhsin and called after his grandfather, and was thus also a member of the Ibn Nammar family who, traditionally occupied the post of builder.

The Fifth (and last) Generation of the Ibn Nammar Family

Hibat Allah Çelebi ibn ‘Umar ibn Hasan ibn Nammar

Al-‘Asali (1989: 116) published a document from Sijill 166: 135 dated 1105/1693-4 which deals with a repair to the wall of Jerusalem near the Mahd ‘Isa at the south-eastern corner of al-Masjid al-Aqsa. The site was inspected by a team of Muslim notables in the company of two master builders. The names of these builders are given as al-Hajj ‘Ali al-Nammari, the master builder of al-Masjid al-Aqsa, and Hibat Allah Çelebi, the master builder of Jerusalem the Noble. No further details are given in the document as to their identity. In our researches into the *sijills*, further evidence has been unearthed in the form of a *waqfiyya* dated 1109/1697-8 (Sijill 198: 85) under the name of Hibat Allah Çelebi. Here the full name is given as Hibat Allah Çelebi, the son of al-Hajj ‘Umar the builder. This evidence shows that Hibat Allah was a representative of the fifth generation of the Ibn Nammar family.

Other Local Builders from outside Jerusalem

In addition to the master builders of the Ibn Nammar family, there are a few other local builders whose names appear in the proceedings of the *sijills*. They are divided

into two groups—builders from cities other than Jerusalem, and Christian builders from Jerusalem itself. Of the first group, three names are noted—al-Mu'allim Abu 'l-Jud Da'na al-Khalili (from Hebron), who, according to Sijill 3: 323, repaired a house in the Sharaf neighbourhood; al-Mu'allim Yahya ibn Salim al-Mi'mar al-Ramli (from Ramla), who repaired an oil press (Sijill 13: 36), witnessed the financial report of a restoration (Sijill 8: 133), and worked on the repair of Madrasa al-Sharkasiyya (Sijill 13: 552); and finally, Yusuf and his brother Ibrahim, the sons of Sadaqa al-Ghazzi (from Gaza). These last two men were lead specialists (Sijill 113: 439). They stripped the lead from the roof of the Aqsa Mosque in 1037/1627-8 and, after it had been recast, replaced it back in position.

The proceedings of Jerusalem's *sijills* include a few names of Christian builders,⁵² described there by the *laqab* al-Nasrani ('the Christian'). Frequently the name of the religious community is also given. Information on their building activities is, however, sparse, for most names were registered in connection with financial matters. The most famous and skilled Christian builder recorded in the *sijill* was a man called al-Ustadh Murad al-Nasrani al-Armani al-Mi'mari (master Murad the Christian, the Armenian builder). When Rajab ibn Bali, the master builder of Jerusalem, left Jerusalem to perform the *hajj* on 18 Ramadan 959/7 September 1552, Murad and Husain ibn Nammar together replaced him in the post of master builder of Jerusalem. Murad appears again for he also held an important position at the beginning of 970/30 August 1562 (Sijill 43: 501) when he was *al-mi'mar 'ala* (the builder of) Qanat al-Sabil, the canal which provided water to the fountains and city of Jerusalem. He was one member of a company of builders who were contracted by Bairam Jawish (Sijill 31: 110) to install a water system for the bathhouses of Khassaki Sultan *waqf*. The work carried out by Murad indicates that he had a good knowledge of hydraulics.

'Aun ibn Musa and Hanna ibn Da'ud were both Christian builders who contributed to the paving of the bathhouses of Khassaki Sultan (Sijill 31: 110; al-'Asali 1989: 98). Other Christian builders whose names are recorded were Jirjis ibn Hasan the builder (Sijill 16, 404), Ibrahim ibn Yusuf the mason (*al-banna'*) whose name frequently appears in the *sijills* (20: 248; 20: 256; 20: 398; 20: 535), Tadrus ibn Musa the stone-cutter (Sijill 24: 464), and Ibrahim ibn Jirjis the Copt, who traded in antique stone, as mentioned above under the section dealing with building materials (Sijill 80: 106). Ilyas, the son of Jirjis and

the brother of Ibrahim, was another Christian builder in Jerusalem at the time (Sijill 80: 106). Other craftsmen specified as Christian were a *najjar* (carpenter) named Sulaiman ibn Khalil (Sijill 13: 89), and a *nahhat* (stone dresser; Sijill 6: 157).

Unidentified Builders

The *sijill* records contain a number of names of builders who cannot be further identified as to belonging to a specific region or city, or even race. The majority were probably local builders and, to judge by the entries, their work seems to have been of a fairly mundane nature and generally for a private contractor.

A number of builders in this category were involved more than the others in the construction business; they include individuals such as Rajab ibn Bali and Mahmud ibn 'Abd Allah. The former occupied the post of *mi'mar bashi* of Jerusalem in the sixth decade of the 16th century (Sijill 25: 628), when he was the testator (*wasy*) of the orphan children of Muslih al-Din (Sijill 20: 54), the renowned Turkish master builder in the city who has already been discussed. This fact might imply that Rajab ibn Bali too came from outside Jerusalem. The name of Rajab appears again in the *sijills* associated with a financial transaction (Sijills 18: 466; 25: 183; 24: 360). Muhammad ibn Ramadan shared the post of the chief of builders (*ra'is al-mi'mariyya*) in 973/1565-6 with Mahmud ibn Husain (Sijill 22: 340) when he inspected a house in the Christian quarter, and he collaborated with 'Ubaid ibn Nammar in inspecting a canal that had become filled with earth. Table 36.5 below gives the basic information available on the rest of these builders.

Other Crafts and Workers

Various categories of workers and craftsmen were involved in the construction process, not all of them recorded in the *sijills*, but this cannot be taken to mean that they played no part in the contracted work. In addition to the *mi'mar* or *mi'mari* (builder), the *banna'* (mason) the *hajjar* (stone cutter), and the *qanawati* (who set up water installations)—all of whom have already been mentioned above—the *sijills* contain references to other crafts as well—the *nahhat* (stone dresser; Sijill 6: 157; 13: 268), the *muballat* (floor-paver; Sijill 31: 111), the *saqqal* (scaffolder; Sijill 4: 35), the *naqqash* (painter/decorator; Sijill 8: 155), and the *haddad* (blacksmith; Sijill 12: 490).

The carpenter (*najjar*) is also mentioned in restoration projects in connection with work on doors, and window-locks and latches. A selection of the many names appearing in the *sijill* as carpenters includes Muhammad al-Halhuli (from a town near Hebron, Sijill 12: 306), al-Rumi

⁵² In my research into the *sijills*, I did not encounter in the period under discussion evidence of any Jewish master builder, although recently Cohen *et al.* (1996: 346) have pointed out that the court at a later date permitted Shu'a ibn Yahuda, a Jewish master builder, to repair a house belonging to a Muslim *waqf* in 1200/1786 (Sijill 122: 266).

al-Najjar (Sijill 5: 95), al-Hajj 'Ali al-Najjar (Sijill 6: 279), Salim ibn Khalil (Sijill 16: 275), Shihab al-Din ibn Nasir al-Din, the *shaikh* of the carpenters (Sijill 27: 64), and the master Ibrahim ibn Musa (Sijill 100: 436), who inspected the woodwork of the Aqsa Mosque and replaced damaged sections of it in 1029/1619-20.

Many unskilled workers (*fu'ul*) too were used in the construction process. They are defined according to their job, such as *al-karabili* (or *gharabili*), the man who sieved the soil (*turab*), Sijill 1: 337; 2: 238; 4: 422; 10: 81); *al-jabbal*, the man who mixed the mortar (Sijill 10: 81); *al-jabbash*, the man who plugged the joints of walls and foundations with medium-sized, undressed stones (Sijill 7: 177; 10: 81); *al-tayyan*, the mortar-carrier (Sijill 8: 144), and *al-mujarifi*, the man who cleared earth with a hoe (Sijill 13: 352).

Besides the craftsmen and the unskilled workers, others were employed in auxiliary work within the building

trade. These included the *saqqa*' (water-carrier, Sijill 6: 354), and the *tarrab* (Sijill 30: 302), or *atal* (Sijill 12: 122; 12: 245), the porters who moved materials such as lime and stones, and who disposed of earth and dung.

The Guilds

'Atallah (1991 1; 1992 2) does not include information on construction guilds either in his two-volume publication devoted to the guilds in Jerusalem in the Ottoman period or in his doctoral thesis, nor has any relevant material been found by me. Although two disputes are recorded in the *sijills* about matters related to the building trade, both were solved in the Shari'a court without reference to the guild or to the *shaikh* of the *mi'mariyin*, if the post ever existed. The first dispute on record was between 'Abd al-Muhsin ibn Nammār and a group of Christian craftsmen over a lime-

Table 36.5 Unidentified Master Builders in Ottoman Jerusalem

No.	Name	Sijill/Page	Date	Site and act
1	Ahmad al-Kharshi	2: 40	938/1531-2	purchase of stones
	Ahmad al-Kharshi	5: 28	941/1534-5	restoration of Madrasa Manjakiyya

	Mahmud ibn 'Abd Allah	18: 620	954/1547-8	restoration of shops
12	Musa ibn Abi 'l-Khair	13: 51	947/1540-1	restoration of Ribat Mansuri
13	Khatab ibn Musa	17: 303	952/1545-6	financial transaction
14	Khalifa ibn 'Uthman	18: 445	953/1546-7	stone-cutter; financial record
15	Hamza al-Mi'mar	18: 513	953/1546-7	testator for the orphans of Muslih al-Din
16	Ibrahim ibn al-'Arab	21: 338	955/1548-9	repairs to house, <i>waqf</i> of Turba Kilaniyya
17	Da'ud al-Mi'mar	21: 630	956/1549	—
18	'Ali ibn al-Mi'mar	21: 148	955/1548-9	purchasing a house at Bab Hitta
19	Hasan ibn Ahmad al-Hajjar (stone-cutter)	21: 1481	955/1548-9	selling a house at Bab Hitta
20	Qasim ibn 'Abd Allah	22: 526	956/1549	warranty
21	Muhammad ibn Qasim	24: 523	958/1551	<i>mi'marbashi</i> of al-Kashi building
22	Diyab ibn Ramadan	30: 110	963/1555-6	with others, paving bathhouses
23	'Ali al-Hajjar	59: 320	988/1580-1	inspection of a house
	'Ali al-Hajjar (stone-cutter and builder)	66: 178	994/1585-6	contract to build dais in front of Qubbat Sulaiman
	'Ali al-Hajjar	80: 100	1007/1598-9	rebuilding the Bab al-Asbat Minaret with 'Abd al-Muhsin
24	Muhammad known as Khalaf al-Mi'mar	80: 100	1007/1598-9	rebuilding the Bab al-Asbat Minaret with 'Abd al-Muhsin

kiln and the quality of lime produced there (Sijill 87: 544). The case came to the court, and was later solved through the mediation of an ordinary Muslim citizen. The second case was brought by Murad al-Nasrani al-Armani, the master builder of Qanat al-Sabil, who appealed to the court when the inspector of the *waqf*, ‘Abd al-Qadir Çelebi, refused to pay Murad his daily wage and his share of the annual wheat allocation. The *qadi* ordered the inspector to pay Murad according to the diploma in his possession (Sijill 43: 501). Apart from these two cases, the *sijill* records covered by this chapter would seem to indicate that on the whole master builders and craftsmen co-operated. In many construction projects, the builders worked as a team; they also used to ratify agreements and act as witnesses for each other as to the level of expenses incurred on certain restoration and repair contracts, and they jointly inspected sites.

Tools

There is little evidence in the *sijills* relating to the tools used in the construction process. This is understandable, for the purpose of the *sijill* was not solely to be concerned with construction work, as was the case in the work of the architect Da’ud in his *risala mi‘mariyya* (see Crane 1987). It will be remembered that ‘Abd al-Muhsin ibn Nammar requested the *qadi*’s permission to erect a special cell in the Haram al-Sharif in which to keep his tools. In Sijill 78: 532, there is an undated note inscribed on the binding of the proceedings for the year 1005/1596-7. It states that ‘Abd al-Muhsin ibn Nammar ‘the master builder of Jerusalem’ had returned to al-Aqsa store four *ikraikat* (shovels), ropes, and three *shawraqif* (axes). The implication of this note is that the Haram had its own tools, for these were registered officially as being in the custody of ‘Abd al-Muhsin until their safe return by him. The *sijills* also include mention of other simple tools, such as *quffa* (basket) and *majbad*

(clamp), *mizan* (scale), and *bakara* (pulley block; Sijill 8: 155).

Building-Types: Architectural and Decorative Features

Types of Buildings

Introduction

During both the first (922-1010/1517-1600) and the second periods (1010-1247/1600-1831) of Ottoman rule in Jerusalem, buildings were erected with a variety of different functions and styles. The catalogue of buildings includes detailed descriptions of all the standing buildings which belong to the Ottoman period up to the year 1836, except for the city walls and the citadel. Each building is numbered and listed according to its chronological order. The aim of this section is to give an outline of the types of these building, including their main features. This overview was not included in the catalogue where there was rather a wish to keep the individuality and coherence of each separate entry.

More than one type of structure can exist within a single building, a practice which had already been known in the period predating the Ottoman conquest. Each type will be studied under its own category, although, for the purpose of statistics, only the dominant and the most significant types will be included here. The following table divides these buildings according to their category and number during both periods of Ottoman rule in the city.

Khalwas

Unattached *khalwas* were a new building type introduced into Jerusalem in the Ottoman period. The name, type of plan and the specific location were all unknown in the city in the earlier periods. Although these buildings form about 27 per cent of the Ottoman monuments in Jerusalem (15

Table 36.6 Types and numbers of Ottoman buildings

Category	First period ¹	Second period	Total
<i>Khalwas</i> ²	9	6	15
<i>Sabils</i>	8	5	13
Commemorative buildings	3	5	8
Religious ³ buildings	3	4	7
Sufi <i>zawiyas</i>	3	2	5
Others ⁴	6	1	7
Subtotal	32	23	55

¹ Although the date of three buildings (Qubbat al-Arwah cat. no. 30), Qubbat al-Khadir (cat. no. 31), and Masjid al-Qaimari (cat. no. 32) is not yet confirmed as being of the 16th century, these monuments are considered here as belonging to the first phase.
² This category includes al-Madrasa al-Ahmadiyya (cat. no. 25), for, despite its name, it bears a striking resemblance to the other *khalwas* on the Haram.
³ These are mosques, *mihhrabs*, and *mastabas* which have *mihrrabs*.
⁴ This category is represented by individual monuments: Ribat Bairam Jawish (cat. no. 11); Maktab Bairam Jawish (cat. no. 12); Dar Bairam Jawish (cat. no. 13); al-‘Imara al-‘Amira (cat. no. 15), the minaret of the Qal’a (cat. no. 27), and al-Madrasa al-Mawardiyya (cat. no. 28). From the second period, Dar al-‘Izz (cat. no. 49) belongs to this category.

monuments out of 55) according to the most up-to-date inventory,⁵³ almost nothing has been published on them. It is almost as if hitherto they have not been considered to be typical Ottoman structures. It is only the recent discovery of references to them in the Jerusalem *sijills*, published here for the first time, which has provided information on the authenticity of the names of the founders and thus an accurate dating.

The location of these *khalwas* is always within the Haram area, at the point where the upper and lower platforms meet, particularly on the western and the northern edges of the upper esplanade of the Dome of the Rock. The plan of the cells was also influenced by the sloping topography of the site, for all are built of two storeys and thus bridge the two levels. The upper storey always contains the principal chamber of the building, which in some *khalwas* is preceded either by a small antechamber and ancillary room, or by an antechamber alone.

Some of the structures are referred to in the *waqfiyyas* and the foundation inscriptions as a *hujra* (cat. nos. 14, 20, and 21), an *oda* (cat. no. 41) (chamber) or a *khalwa* (cat. nos. 22, 23, and 24). The travellers who visited the Haram during the Ottoman period have assigned a variety of purposes to these structures. Al-'Ayyashi (al-'Asali 1992: 210) called them 'houses' (*buyut*) for worshippers. Al-Madani (al-'Asali 1992: 320) called them 'chambers' (*odat*) for students who sought knowledge (*talabat al-'ilm*). It is al-Nabulsi (al-'Asali 1992: 259) who uses the term *khalwa* for the structures. He wrote 'We have found there various *khalwas* with domes on the edges of the platform of the Mosque of al-Sakhra (the Rock); these are built with columns and coloured stones . . . some of the *khalwas* are inhabited, some are not and some are blocked.' Al-Saddiqi (al-'Asali 1992: 299-300) and al-Luqaini (al-'Asali 1992: 304) followed al-Nabulsi in the use of the term *khalwa* to refer to the buildings, and according to the accounts, they both stayed in one of the *khalwa* when they visited Jerusalem. Al-Qayati (al-'Asali 1992: 325-26) described them as 'chambers' (*odat*) and 'cells' (*khalwas*); he reported that they were used as dwelling-houses for those who resided inside the Aqsa Mosque (the Haram) to study, and for foreign visitors. He went on to report that one of the *khalwas* had been offered to him. Al-Qasimi, in the early part of this century, used the name *hujurat* (rooms) for them (al-'Asali 1992: 338), and he also recorded that most of the occupiers of the rooms offered him the possibility of sharing their *hujra*. It is unfortunate that none of these accounts give enough information to allow a certain identification of the fifteen listed *khalwa*. Almost nothing more than the information given here has

been recorded apart from the names of some of the cells, which reflect the family name of the patron or user—such as Khalwat Jaralla, Khalwat al-Dajani, Khalwat al-Bairamiyya, and the Summer (al-Saif) Khalwat al-Saddiqi (al-'Asali 1992: 299-300).

The reason behind the construction of almost half of the *khalwas* and *hujras* erected on the upper terrace of the Dome of the Rock (cat. nos. 16, 17, 25, 46, 51, 52 and 53) is not recorded. However, such information is provided for the other Jerusalem *khalwas*, such as cat. nos. 14, 20, 21, 22, 23, 34 and 41, either by the foundation inscription panel or by the *waqfiyyas*. As a general rule, these *khalwas* were established either to serve (1) as a place for teaching, such as Hujrat Muhammad (cat. no. 14), the North-Western Khalwa of Ahmad Pasha (cat. no. 22), the North-Eastern Khalwa of Ahmad Pasha (cat. no. 23), and al-Madrasa al-Ahmadiyya (cat. no. 24); or (2) for reading the Holy Qur'an, such as the Hujrat Islam Beg (cat. no. 21), Khalwa Bairam Pasha (cat. no. 34), Hujrat Muhammad Agha (cat. no. 20); or (3) as a dwelling place, like the Junbalatiyya (cat. no. 24). Additional information can be found in the *sijills*, which furnish further clues as to the original function of the *khalwa*. Sijill 51: 157 reports that one of the *khalwas*, which is no longer either still standing or identifiable, was used to store the shoes (*wazifat hifz al-an'al*) of visitors to the Haram, whereas Sijill 77: 453 shows that the chief builder of Jerusalem and the Haram, 'Abd al-Muhsin ibn Nammar, used to keep his equipment in another *khalwa*, and Sijill 72: 375 indicates that some of them were used as offices for the Haram employees, as is still the situation today. Doubtless the unrecorded *khalwas* were originally intended for some such similar purpose.

It worth noting that one of the *khalwas* (cat. no. 25), which is called a *madrasa*, was used by four regular students and a lecturer (*mudarris*). This is the only Ottoman building which is recorded as having a similar (although not identical) function to the Mamluk *madrasas* in the city. The Ottoman educational process in Jerusalem seems to have been centred on the Aqsa Mosque, the Dome of the Rock, and the old Mamluk *madrasas*, as well as the preaching and lecturing that took place in some of these *khalwas*, as mentioned above. In time, however, some of them came to be used as hostels for pilgrims who were lent a *khalwa* in which to stay for the duration of their visit (*ziyara*), and later again they were used as offices for the employees of the Haram, which is still the situation today.

There are fifteen *khalwas*, nine of which can be dated to the 16th century (cat. nos. 14, 16, 17, 20, 21, 22, 23, 24 and 25). The remaining six are datable to the second phase of the Ottoman period (1010-1247/1600-1831); these are cat. nos. 34, 41, 46, 51, 52 and 53. Although these fifteen *khalwas* have many features in common, it is possible to classify them into four categories

⁵³ See the list of Ottoman monuments at the beginning of the catalogue descriptions.

by an analysis of their architectural style and from information in the *sijill* entries.

(1) The first category consists of four *khalwas* (cat. nos. 46, 51, 52 and 53). They are all located in a line on the western extremity of the upper platform of the Sakhra; from north to south the arrangement is nos. 51, 52, 46, and 53. None of the constructions is dated and almost nothing has so far emerged on their history, the only clue being a re-used and uncertain foundation inscription (cat. no. 46) and the remarks of 'Ali Beg al-'Abbassi (Baida y Lebich Domingo 1816 ii: 233). These give a *terminus post quem* for dating *khalwas* nos. 51, 52 and 53. Their architectural style is simple in the extreme, and they have little decorative or architectural significance, belonging more to the local Palestinian vernacular than to monumental public architecture. The situation is not helped by the fact that they appear to have been restored recently. Category (1) graphically illustrates the decline of architectural activity in the late Ottoman period.

(2) The second group comprises *khalwas* 14, 16 and 17. They are all dated by foundation inscriptions, although these are not always straightforward with regard to context, and the dates are sometimes dependent on a chronogram. These are the earliest *khalwas* on the Haram, and they include some characteristically Ottoman decorative architectural elements such as ornate stone roundels, decorative panels, 'eye-brow' arches, and shallow domes. The plan of this group does not include an antechamber or ancillary chamber, but the upper level of two of them (cat. nos. 14, and 16) has two rooms, and the trace of a domed portico porch is still visible in *khalwa* 14. This category might be considered to be the earliest example of the *khalwas*, which reach their zenith in those of the fourth category.

(3) *Khalwas* 20 and 41 form the third category and they are strikingly similar, although the first is dated by foundation inscription and *waqf* document to 996/1588, whereas for the second only a restoration date of 1109/1697 is recorded. Whether what is now visible in the later *khalwa* is the original design, or whether it is the result of a cycle of restoration, it is certain that both *khalwas* belong to a single style, and that the plan of the earlier, which is properly documented, has influenced the later example. This category has a number of decorative and architectural elements common to the Ottoman period, such as a billet moulding, an 'eye-brow' arch, a domed portico porch, projecting brackets, and an antechamber preceding the main room. An element of local initiative is to be found in the way the two piers and the central column which supports the two arches of the portico have been cut and dressed. Although the group is small, it is possible to see it as an interim phase between the simple second category and the fourth one, which is the most sophisticated.

(4) The fourth group includes Hujrat Islam Beg (cat. no.

21, 1002/1593-4), the North-Western Khalwa of Ahmad Pasha (cat. no. 22, 1009/1600), the North-Eastern Khalwa of Ahmad Pasha (cat. no. 23, 1009/1600), Khalwat al-Junbalatiyya (cat. no. 24, 1010/1601-2), Madrasat Ahmad Pasha (cat. no. 25, 1013/1604), and Khalwat Bairam Pasha (cat. no. 34, before 1038/1628).

These *khalwas* have many historical aspects in common. None has a foundation inscription, but either a *waqfiyya* or an extract from the original *waqf* document is recorded in the *sijills*. Furthermore, these buildings are alike architecturally—they are all constructed of white, dressed stone and most of them use coloured stone accents. They also have a similar plan, which is slightly modified in some cases. The upper section consists of a main chamber which is preceded by a domed portico and an antechamber, and three have an ancillary room. The Khalwat Bairam Pasha has an almost identical arrangement to the Khalwat Junbalatiyya. They are distinguished by a heavy use of *ablaq* and string courses, although they differ as to where the decorative elements are located and how densely they are used. In addition they feature different types of moulding as well as elaborate *muqarnas* niches and tiers. In particular, special care has been taken with the windows and the covering of the chambers. These are features not found in the other *khalwas*, which, as already stated, are remarkable only for their simplicity.

One *khalwa* of this fourth category (cat. no. 22) must be seen as a masterpiece. It can be considered the jewel of Ottoman architecture in Jerusalem, or—to follow the analogy of Mujir al-Din (1973 2: 329), who considered the Ashrafiyya Madrasa the 'third jewel' after the Dome of the Rock and al-Aqsa Mosque—the fourth jewel of the Haram. Although the *khalwa* in question—the North-Western Khalwa of Ahmad Pasha—has a number of decorative architectural elements which are not found in the other *khalwas* of this category, the fact that there are so many common features makes it possible to classify them as a single group. There follows a table which lists the *khalwas* as they appear in the catalogue, and the features they have in common.

From this information, it would seem that this group of *khalwas* must have been built under the influence of a single school of architecture or, more specifically, under a local house style. It is quite possible that the man responsible for this was 'Abd al-Muhsin ibn Mahmud ibn Nammar, the master builder of Jerusalem, and a member of a family which contributed to the buildings of Ottoman Jerusalem over a period of five centuries.

Sijill 115: 721 states that 'Abd al-Muhsin was contracted by Ahmad Pasha to build al-Khalwa al-Junbalatiyya (cat. no. 24). The *sijill* contains an important piece of information about the Khalwat Bairam Pasha. It states that the building was erected by 'Abd al-Muhsin ibn Mahmud, the chief of the master builders (*ra'is al-*

Table 36.7 The decorative and architectural elements of Group 4 of the Haram *khalwa*

Element/ <i>Khalwa</i> no.	21	22	23	24	25	34

Joggled voussoirs	—	✓	—	✓	✓	—

mi'mariyya). Moreover, it includes the statement that the *khalwa* for Bairam Pasha was built according to the layout and the measurements of Khalwat Ahmad Pasha (here called the Khalwat Junbalatiyya).

It is also noticeable that four of the buildings in the group were constructed under the patronage of a single governor—Ahmad Pasha—and that they were built in a relatively short period of time, probably a single decade. This would support the suggestion that there was a single designer for them all. It is thus probably correct to infer that all the *khalwas* in this group, as well as the elegant *khalwa* for Ahmad Pasha (cat. no. 22), were designed and constructed by the same local master mason/architect.⁵⁴

Sabils

Thirteen *sabils* (public water fountains) of the Ottoman period are still standing in Jerusalem. These are divided into two categories on the basis of dates. The first group dates to the 16th century⁵⁵ and contains eight *sabils* (cat. nos. 2, 4, 5, 6, 7, 8, 9 and 18), whereas the second category comprises five *sabils* (cat. nos. 36, 40, 44, 45, and 47) which date to the second Ottoman period (1010–1247/1600–1831).

The style and layout of the *sabils* can also be divided into two categories. The first is confined to a single type, whereas the second category is more diverse. The first group is restricted to the six *sabils* constructed by Sultan Sulaiman Qanuni (cat. nos. 4, 5, 6, 7, 8 and 9). They are in the form of a recessed niche surmounted by a pointed arch enclosed within a rectangular stone panel. The panel is usually attached to a wall, and therefore this type of *sabil* is given the name of 'walled niche *sabil*' (*çesme*) by Aslanapa

(1971: 257–9 and Arabic translation 1987: 235) and Behrens-Abouseif (1995: 679–83). Aslanapa maintains that this type began in Anatolia at the beginning of the Saljuq period. He reports that three *sabils* of this type from the period can still be seen—the first in Sivas in the Gök Medrese (671/1272), and two in Konya on either side of the Sahip Ata Kulliesi entrance porch (657/1258). He reports further that very little is known about the construction history of this type of *çesme*, and points out that there were once 800 *sabils* of this type in Istanbul alone, but that unfortunately most of them have either been demolished or removed from their original site. Behrens-Abouseif (1995: 682) says that this type of *çesme* is a kind of self-service water fountain, and the *çesme* in Istanbul are similar to the fountains of Fas. It is worth drawing attention to the strikingly similarity of the Sabil al-Khazna in Aleppo (renovated 807/1404) to these *sabils*. For more details, see Rihawi (1979: 171, pl. 62). Qal'a-Jiy (1989: 270) published an unclear photograph of the Qastal Sabil al-Harami in Aleppo which was renovated in 897/1490 by Bard Beg ibn 'Abd Allah. This *sabil* consists of a recessed niche surmounted by a huge pointed arch. Though the proportions here are much bigger, in principle it resembles the walled niche *çesme* type of *sabil* under discussion.

Rosen-Ayalon (1989: 605, 607 n. 37), although she refers to Aslanapa's book mentioned above, says that 'they [the six imperial *sabils*] seem to belong to a distinct type of *sabil* apparently not found in other periods or at other places.' In fact, the *sabils* have a distinct decorative scheme, but not a distinct layout design, which has to be seen in relation to the walled niche *çesme* mentioned by Aslanapa. They can be considered one of the many instances of Saljuq-Ottoman influence on the city.

Three of the six 16th-century *sabils* (cat. nos. 5, 6, and 7) incorporate non-Islamic decorative and architectural elements. These are:

- (1) Sabil al-Wad (cat. no. 5): the inner arch and inner voussoirs of the outer arch, the columns and their capitals.

⁵⁴ For more details on 'Abd al-Muhsin and his family business, see above under 'The Family of Ibn Nammar'.

⁵⁵ There was another fountain constructed in the same period in al-'Imara al-'Amira (see cat. no. 15 under the 'Water Fountain').

Table 36.8 The decorative and architectural elements of the *sabils* of Sultan Sulaiman

Element	Sabil Bab al-Khalil	Sabil al-Wad	Sabil Bab al-Silsila	Sabil Bab al-Nazir	Sabil Bab al-'Atm	Sabil Bab Sitti Maryam
Pointed-arch recess	✓	✓	✓	✓	✓	✓
Marble panel for water outlet	✓	✓	✓	✓	✓	✓
Trough to collect water	✓	✓	✓	✓	✓	✓
Foundation inscription	✓	✓	✓	✓	✓	✓
White dressed masonry	✓	✓	✓	✓	✓	✓
Inverted volute (<i>mim</i>)	✓	✓	✓	✓	✓	✓
<i>Muqarnas</i> impost with or without lancet niches	✓	—	✓	✓	✓	✓
Triangles in relief	—	✓	✓	✓	✓	✓
Ogee and ogival mouldings	✓	✓	✓	—	✓	✓
Circular roundel (medallion)	✓	✓	✓	✓	—	—
Flanking colonnettes	—	✓	✓	✓	✓	—
Capitals (Corinthian or <i>muqarnas</i>)	—	✓	✓	✓	✓	—
Re-used material (Crusader)	—	✓	✓	✓	—	—
Plaited columns	—	—	✓	✓	✓	—
Tiers of elaborate <i>muqarnas</i> with scallops	✓	✓	—	—	✓	—

(2) Sabil Bab al-Silsila (cat. no. 6): the elaborately carved rosette from a rose window, and the two carved triangles in the spandrels which form of a single scroll of foliage with a central bunch of grapes.

(3) Sabil Bab al-Nazir (cat. no. 7): the arches and their decoration, and the plaited columns and capitals.

Van Berchem (1927: 422-6) has analysed these elements, plus the three water-troughs which he believed were originally sarcophagi, and identified them as belonging to the period of the Latin Kingdom. Al-'Asali (1982: 280) and Rosen-Ayalon (1989: 600) both followed van Berchem and also drew attention to these elements. Buschhausen (1978: 236) went further and identified them as Crusader from the south of Italy. Jacoby (1982: 325-94; 1984: 400-3) argued against Buschhausen's view and considered their provenance to be from a local workshop operating in the Haram area of Jerusalem.

These Crusader and Latin elements are well integrated into the fabric of the *sabils*, and in fact have little effect on the general layout or on the decorative and architectural features which allow these fountains to be grouped into a single characteristic type. Rosen-Ayalon (1989: 600-1) classified six of these features and traced them back to the tradition which flourished in the region prior to the Ottoman period. A more detailed list is given in Table 36.8, which incorporates the six features identified by Rosen-Ayalon. Their origins and earlier appearances, whether in the region under discussion or somewhere else, will be discussed later in this chapter along with other Ottoman decorative and architectural elements.

It is worth underlining that the *sabils* were ordered by a single patron (Sultan Sulaiman Qanuni), and that the supervision of their construction and the arrangement of their *waqf* were also due to a single person, namely

Muhammad Çelebi al-Naqqash. They were built in a relatively short period (10 Muharram 943-2 Ramadan 943/29 June 1536-12 February 1537). For further details see above, under Water Supply.

The second category is represented by the *sabils* which were built in the second Ottoman period, as well as the earlier Sabil of Qasim Pasha (cat. no. 2) and Sabil Bab al-Maghariba (cat. no. 18). With the exception of Sabil Qasim Pasha, which is an eight-sided elevation without windows but with a marble panel niche in each of the faces, all the *sabils* of this group have four elevations surmounted by a small, shallow dome. This style might be called 'the four-sided *sabil*' following Aslanapa (1987: 235), but it is more practical to classify these *sabils* by their function—that is, a point at which water was distributed to passers-by.

Three types of windows are found in the six *sabils* under discussion. These are:

(1) The single-window *sabil*. This type is represented by Sabil al-Shurbaji and Sabil al-Khalidi. If the small chamber attached to a recessed niche where the window and the trough are located is excluded from the plan, this type of *sabil* would fit neatly into the category of *sabils* constructed by Sultan Sulaiman and already discussed. This is particularly the case when one bears in mind that the two small chambers were originally shops which were, according to the relevant *waqfiyyas*, later converted to chambers to serve the *sabil*. The impact of the *sabils* of Sultan Sulaiman on the later fountains in the city is particularly clear in this case.

(2) The two-window *sabil*. This type is found in the proposed reconstruction of Sabil al-Husaini. Although it is possible that it had two openings, there was only one basin for water (see Sabil Mustafa Agha below).

(3) The three-window *sabil*. There are three examples of

this type: Sabil Bab al-Maghariba, Sabil Sha'lan, and Sabil Mustafa Agha.⁵⁶ The first two examples have a water-basin in each window, but the later *sabil* has a single basin only.

The number of *sabils*, whether they date to the first or the second category (or period) is a clear indication of the importance of water to Jerusalem in the Ottoman period, and also reflects the role of the fountain as a recognised act of charity as mentioned in the Qur'an. Whatever the type of *sabil*, their operation was simple, according to the information contained in a number of the relevant *wagfiyyas*. A caretaker and a water-carrier were employed to make the *sabil* function. The role of the caretaker was to supervise the endowment, to collect its revenue, and to restore the *sabil* whenever the need arose. The water-carrier's role was to supply the trough with water, to clean it daily, and to light its oil lamp. He was to open the *sabil* daily between the hours of dawn and dusk, apart from the month of Ramadan when the *sabil* was to be kept open from the evening prayer until the morning prayer. Any neglect of these duties or illegal absences would mean the loss of the water-carrier's job.

The water was procured either from a canal-branch from the Qanat al-Sabil, or from rainwater collected in the Haram cistern. A number of the *sabils* were built over one of these cisterns, such as Sabil Bab al-Maghariba and Sabil Sha'lan. In other cases, the donor assigned a certain sum of money to buy water for his *sabil*, especially in summertime.

Commemorative Buildings

The sanctity of Jerusalem, its religious importance, and the fact that it was a place of Muslim pilgrimage, did not merely continue to play a major role in the history of Jerusalem and its architectural development. If anything, the impact of these factors was heightened during the Ottoman period. The construction of many commemorative and religious buildings, and the accounts of many travellers to the holy places in the city and the Haram, are a true reflection of the sanctity of the site.⁵⁷ In addition to the religious significance which lies behind the construction of each commemorative building, it is necessary to take into consideration other motives, such as

the desire to maintain and promote Jerusalem as a centre for pilgrims and a place to be visited. In some ways, this state is reminiscent of that which pertained to the Umayyad period. However, no matter what were the motives behind these monumental buildings, their simple structure and design add a touch of beauty to the Haram area.

Eight commemorative buildings are still standing from the Ottoman period. Three of them—Qubbat al-Nabi (cat. no. 10), Qubbat al-Arwah (cat. no. 30) and Qubbat al-Khadr (cat. no. 31)—are attributed by many references (see each catalogue entry) to the 16th century, and they appear thus in the relevant catalogue entry despite the fact that I have shown that none of them has so far been found to date to that century. The other five buildings, which were constructed in the second Ottoman period, are: Qubbat Yusuf (cat. no. 38), Qubbat Yusuf Agha (cat. no. 39), Kursi Sulaiman (cat. no. 42), Qubbat al-Hadi al-Amin (cat. no. 43), and Iwan al-Sultan Mahmud II (cat. no. 50). As will be clear from the names of these structures, the majority consist of a small, domed structure, with the exception of Kursi Sulaiman which has its own peculiar layout.

Iwan Sultan Mahmud (cat. no. 50) was the last commemorative building to be constructed in the Haram in the Ottoman period. The odd shape of its dome, which resembles the one over the second level of Dar Bairam Jawish (cat. no. 13), as well as its *mihrab*, which could equally be original or added later, draw the eye of the visitor. Its original purpose is not revealed in the foundation inscription. In this way it differs from an earlier *iwan* built by the vizier Mustafa, which no longer exists. According to a previously unpublished⁵⁸ rectangular marble plaque in the Aqsa Islamic Museum on the Haram, this earlier *iwan* was constructed to provide a place for the recitation of the Holy Qur'an, and was probably in the Haram area. The plaque contains seven verses of Arabic poetry, each enclosed in a rectangular cartouche. The script is in clear *naskhi* calligraphy with diacritical and auxiliary points. The date is given in the form of a chronogram and also in numerical form in the middle of the last verse. The whole Arabic text is transcribed in Cat. Appendix 2, no. 50/2. The translation is as follows:

(He) has constructed the *iwan*—the distinguished noble Mustafa, the vizier, the descendant of Muhammad.

It is set up proudly neighbouring the saints,

For the purpose of praying, Qur'an

⁵⁶ Al-Husaini (n. d.) describes many *sabils* in Cairo which conform to the three-window types mentioned here. He does not include an example of a *sabil* belonging to the first category of 'walled niche *çesme*'.

⁵⁷ For travellers' accounts see al-'Asali (1992), and for the guide book for Muslim holy places to be visited by pilgrims see Elad (1995: Appendix 164-73). The guide was written by Nasir al-Din Muhammad ibn Khidr al-Rumi, and is included in his unpublished *al-Mustaqsa fi Fada'il al-Masjid al-Aqsa*.

⁵⁸ I would like to record my gratitude to my colleague, Mr Khadr Salameh, the curator of the Islamic Museum, for allowing me to publish this panel.

recitation, and pleasing all visitors,
(He constructed it) seeking great,
everlasting reward, and the blessing of
Muhammad, the *imam* of Messengers.
May Allah be pleased with him, grant
him eternal welfare, safeguard him
from evil, forgive him, and protect him
against the evil eye.
He constructed it in eleven hundred
and forty five (1732).

The common features binding these buildings into a single category are the following:

- (1) All of the monuments are constructed in the Haram area.
- (2) They commemorate either some religious event related to the Haram, or are associated with a prophet or some other individual.
- (3) They all include a *mihrab* in their structure, either on the south wall or in the floor itself, outlined in coloured marble.

Religious Buildings

A long list of buildings could be included under this category, but according to the classification of the types of Ottoman buildings under discussion here, only four mosques and a collection of *mihrahs* will be listed. The first mosque attributed to the Ottoman period in Jerusalem was not a new construction but was rather a conversion of the Coenaculum on Mount Zion into the mosque of al-Nabi Da'ud. It was, therefore, symbolic Islamic features that were inserted into the site. These included a *mihrab*, an inscription plaque, glazed tiles, stucco windows, and a modest minaret. The original Crusader layout was retained.

The mosque of al-'Imara al-'Amira which has been tentatively identified here for the first time (see cat. no. 15 under 'Hall N') displays a distinctive design, being formed from four bays, each of which is covered by a folded cross-vault with a small saucer dome at the centre. This is a type of roofing similar to that used in the Bab al-'Amud (Damascus Gate), and is a typical Mamluk feature that continued to be employed in early Ottoman architecture.

Masjid al-Saif (cat. no. 27) is unique amongst the mosques of Jerusalem, for it is really an open *musalla* rather than a mosque, and is therefore named 'the Summer Mosque' in its restoration inscription. It is undated, but a roundel bearing the name of Sultan Sulaiman implies that it may have been one of the works in the citadel ordered by the sultan.

The last relevant mosque (Masjid al-Qaimari, cat. no. 32) is more problematic. It is undated, but since its plan

comprises a dome over a central chamber—a form which did not exist before the Ottoman period in Jerusalem—a few commentators (albeit with some reservations; see cat. no. 32 under 'Date') have assigned it to the 16th century. So far no information on the mosque has been found in the *sijills*, and the issue of dating has to await future information. Without certain proof, the mosque could be as well be dated to the 16th century as to any other time thereafter. It is worth noting that although the mosque occupies a prominent site in the Old City and there is ample space within its plan for one, surprisingly it has no minaret.

Two categories of *mihrab* were constructed in the period under discussion. The first is a type of isolated *mihrab* which is an independent structure; and the second acts as an architectural component, for it forms part of another building. Both categories were known in the architecture of the Mamluk period (see cat. no. 55 under pre-Ottoman *mastabas*). At this point, only the first type will be mentioned briefly, for a detailed study will examine both categories later in this chapter, under 'Architectural Elements'. Examples of the first type of *mihrab* are either dated by an inscription panel, like the Mihrab 'Ali Pasha (cat. no. 37) and the Mihrab Ahmad Qullari (cat. no. 47), or are undated, like the Mihrab al-Sanaubar (cat. no. 54), the Mihrab wa Mastabat al-Zuhur ('the prayer niche and place of the flowers', cat. no. 55/7), the Mihrab wa Mastabat Bab al-Maghariba (cat. no. 55/8), the Mihrab wa Mastabat al-Dajani (cat. no. 55/9), the Mihrab wa Mastabat Bab al-Ghawanima al-Gharbiyya (cat. no. 55/10), the Mihrab wa Mastabat Bab al-Ghawanima al-Sharqiyya (cat. no. 55/11) and the Mihrab wa Mastabat Sabil Mustafa Agha (al-Shaikh Budair, cat. no. 55/13).

Sufi Zawiyas⁵⁹

Sufi orders and their buildings (*zawiya*, Persian *khanqah*) were well established in Jerusalem long before the beginning of Ottoman rule.⁶⁰ The threefold rise in the population of the city in the 16th century (Goitein 1986: 334; Meinecke 1988: 268), which was a result in part of the new construction projects and the systematic restoration of many earlier institutions, allied to the increasing perception of the sanctity of the city, had an impact on re-activating the already existing Sufi communities as well as founding new orders.

Evliya Çelebi (al-'Asali 1992: 250),⁶¹ who visited

⁵⁹ For the role and activities of some of the *zawiyas* in Palestine in the late Ottoman period, see de Jong (1984: 31-60).

⁶⁰ For details see al-Muqaddasi (1877: 179) who as early as the tenth century makes mention of the Karramiyya; Mujir al-Din (1973 throughout); al-'Asali (1981: 342-368), de Jong (1984); Burgoyne (1987: 63).

⁶¹ This part is not translated by Stephan.

Jerusalem in 1082/1672, describes the city as he saw it.

Although the city appears to be small it has 240 *mihrrabs*, 7 schools for the teaching of Hadith, 10 for teaching the Qur'an, 40 *madrasas*, and *zawiyas* for 70 Sufi orders, the largest of which is that of 'Abd al-Qadir al-Jilani, Ahmad al-Badawi, Rifa'i, and Mevlevi. There are 6 *khans*, 6 baths, and 61 *sabils*.

The number of the buildings erected for the orders is indeed high, and it is right to suppose that Mamluk *zawiyas* were included in Evliya Çelebi's account, for the *sijill* records also point to Mamluk foundations, including—to name but a few—Zawiyat Ya'qub al-'Ajami (*Sijill* 5: 35), al-Zawiya al-Wafa'iyya (*Sijill* 5: 840), Zawiyat al-Maghariba (*Sijill* 25: 152), and al-Zawiya al-Yunusiyya (*Sijill* 12: 264). During the Ottoman period five new *zawiyas* associated with five different Sufi orders were established in the city. In chronological order these are: al-Zawiya al-Hamra' (cat. no. 3), al-Zawiya (Khanqah) Maulawiyya (cat. no. 19), al-Zawiya al-Naqshabandiyya (cat. no. 33), al-Zawiya al-Qadiriyya (cat. no. 35), and al-Zawiya al-As'adiyya on the Mount of Olives (*waqf* dated 1033/1623). The first *zawiya* was associated with the Khalwatiyya order of Sufis, from which it took its name, whereas the later *zawiya* was dedicated to Shaikh Muhammad al-'Alami. All these convents were sponsored by governors who showed favour to their pious *shaikhs* by making over certain estates as *waqf* for the benefit of the foundations and their adherents.

The first two convents—Zawiyas al-Hamra' and Maulawiyya (cat. nos. 3 and 19)—can be dated to the first phase of Ottoman rule, and were built close to each other at a relatively remote distance from the Haram area. They are both distinguished by an elaborate Ottoman cylindrical minaret. The next—Zawiyas Naqshbandiyya and Qadiriyya (cat. nos. 33 and 35)—abut on each other and are close to the Haram, a few metres west of Bab al-Ghawanim, one of the gates to the precinct. They are both without a minaret, and date to the second phase of Ottoman rule (1010-1241/1600-1831).

Al-Zawiya al-Qadiriyya (cat. no. 35) is the best preserved of the Ottoman examples in the city. It retains its original plan, and it is seen now more or less as it was constructed with very little change. Al-Zawiya al-Naqshbandiyya (cat. no. 33), on the other hand, is almost totally non-original. Apart from the minaret of al-Zawiya al-Hamra', and the minaret and the second floor (*sama' khana*) of al-Zawiya al-Maulawiyya, all that now remains of the convents are later additions. To judge from the remaining architectural evidence and according to their descriptions in the *waqfiyyas*, it seems that they incorporated several architectural elements such as a

minaret and a mosque. The general plan of the Ottoman *zawiyas* includes: an open courtyard with cisterns, small *khalkwas* constructed around the courtyard for the Sufi brothers, a suitable place with a *mihrab* to serve as a private *masjid*, a big chamber or hall for religious ceremonies, and a small kitchen.

Other Buildings

This category includes individual monuments—Ribat Bairam Jawish (cat. no. 11), Maktab Bairam Jawish (cat. no. 12), Dar Bairam Jawish (cat. no. 13), 'Imara Khassaki Hurrem (Sultan) (cat. no. 15), Minaret al-Qal'a (cat. no. 27), and al-Madrasa al-Mawardiyya (cat. no. 28). From the second period, one building belongs to this category, Dar al-'Izz (cat. no. 49). The category includes the largest and most important Ottoman buildings of the city. Most of the 16th-century buildings are constructed in a small area close to the 'Aqabat al-Takiyya. As is apparent from the names of three of these building, they were built by one patron—Bairam Jawish (for his biography, see cat. no. 11, under 'Founder'). Unfortunately, there is only one example of each type of building, which makes it difficult to comment on the features they have in common.

Burgoyne (1987: 37, n. 2) noted that the Mamluk *ribats* of Jerusalem were intended as hospices for pilgrims, and were therefore unlike the early *ribats* in North Africa and elsewhere which were fortified outposts garrisoned by religiously-inspired soldiers. The evidence of the *waqfiyya* and the foundation inscription of Ribat Bairam Jawish (see cat. no. 11) suggests the *ribat* in the Ottoman period functioned as a residential house for the pious poor (*al-fuqara' al-sulaha*). In this way, therefore, the *ribat* was similar in principle to the *zawiya*, with one exception. This is that in the *zawiya* the proviso was made that the poor were to belong to the same Sufi order as that of *zawiya* itself. The Ribat of al-'Imara al-'Amira (Khassaki Sultan)—which now no longer exists—had fifty-five rooms, and was also a hospice for the poor rather than for pilgrims to the city.

Maktabas, where poor children and in particular orphans were educated, seem to have been a type of building which flourished in Ottoman Jerusalem, though only the Maktab of Bairam Jawish (cat. no. 12) has survived from the period. It is an unattached structure, unlike most *maktabas* (*kuttab*) of similar date in Cairo, which were attached to *sabils*.⁶² Al-'Asali (1989: 83, 170), working from the *sijills*, has found evidence for two other *maktabas*, but neither still exists. The first dated to the

⁶² Al-Husaini (n.d: 34) wrote that fifty of the sixty-three Ottoman *sabils* in Cairo had a *kuttab* (*maktab*) in the upper floor. He also pointed out (p. 87) that the layout of the *kuttabas* was of the utmost architectural simplicity, being usually a square or rectangular chamber.

Mamluk period and was located close to the Jerusalem Citadel. The second was Ottoman, and was built by Turghad, the caretaker of Khassaki Sultan (cat. no. 15). Some older Mamluk structures, like al-Madrassa al-Taziyya (Sijill 64: 73) and al-Madrassa al-Jauhariyya (Burgoyne 1987: 70), were used as places in which to educate children. The Qadi Ahmad ibn Nassuh established a *maktab* named after himself in Jerusalem in the middle of the 16th century (Sijill 67: 65) but unfortunately no further details are available. There are other references to the appointment of teachers in *maktabs* in Jerusalem (Sijills 22: 182; 80: 149; 83: 253; 145: 292); but again, no further information is available.

Although it would be right to suppose that hundreds of residential houses were built in the Ottoman city and that some still exist awaiting identification, Dar Bairam Jawish (cat. no. 13) is the first house to be securely identified as a 16th-century structure. It was only possible to do so after extensive comparative study and after consulting the *sijill*. There is one other dated house, namely Dar al-'Izz (cat. no. 49), but it is too late in date (1205/1790-91) and too little remains of the original structure to be able to make any meaningful comparison between the two.

Two buildings which are called *madrasas* were found in the course of research on the Ottoman buildings. The first is al-Madrassa al-Ahmadiyya (cat. no. 25). Its date, function and identification were all established by *sijill* evidence, but since it has a similar layout to the other *khalwas* in the Haram, it is here classified as one of them (see above). Al-Madrassa al-Mawardiyya, which has been hitherto mistakenly known as the 'Rasasiyya' (see cat. no. 28), is the second *madrasa* I have found, but its identification and secure dating to the Ottoman period have not yet been finally established. Indeed, I believe that the building may belong to the late Mamluk period. It can be stated with some authority, therefore, that the *madrasa* as a type of architecture is rare in Ottoman Jerusalem, particularly in comparison with the Mamluk period (see Burgoyne 1987).

It is interesting to end the study of the types of Ottoman buildings in Jerusalem with al-'Imara al-'Amira, the biggest and the most richly endowed foundation ever built in the Ottoman period, not just in Jerusalem but in Palestine as a whole. It comprised many structures: a *ribat* made up of fifty-five rooms (now lost), a caravanserai, a 'lofty' mosque, and a free soup-kitchen with many ancillary structures. A great part of the research for this study was dedicated to this important site, and in the catalogue entry no. 15 the complex is studied at length.

Since this is the only complex of this type in Palestine, it is instructive to compare it with similar complexes in other Ottoman territories. There are two examples—among many others of this type—which are particularly relevant as analogies. The first is the Süleymaniyye in Damascus and the second is the complex of Hasseki Hürrem (Khurrem), the founder of the Jerusalem complex, in the Aksari district of Istanbul.

The former was completed in 962/1554-5, almost exactly the same completion date as that of the Jerusalem complex, and while its design is confidently attributed to Sinan, its execution according to Kuran (1987: 75) was obviously the work of one of Sinan's gifted assistants. Apart from sharing a few features in common, like their completion date, the fact that both are widely known as *tekiyyas*, that both are royal foundations, and that the two complexes are made up of nearly the same architectural components (a mosque, 'imara, and caravanserai), they actually present more differences than similarities. The table below which is based on the description of cat. no. 15 on one hand and the analysis by Kuran (1987: 75-8) on the other, lists the major differences between the two complexes.

The comparison between the two complexes of Hasseki Hürrem in Jerusalem and Istanbul fares scarcely better than the comparison between the Süleymaniyye complex in the capital and al-'Imara al-'Amira. The Istanbul complex was built in phases. The first was the construction of a single-domed mosque in 945/1538-9 by Sinan; then, a year later, Khasseki Hürrem ordered a

Table 36.9 Differences between al-'Imarat al-'Amira and the Süleymaniyye

Al-'Imara al-'Amira in Jerusalem

No walls surround the complex.
Executed on a multi-levelled plot of land.
Has buildings of more than one storey.
Two irregular courtyards.
Integrates older buildings and reused material.
An example of provincial architecture.
Built and designed by local and Syrian builders.
No porticoes precede any building.
No trace of any minaret in the complex.
The mosque has four shallow domes with a cross-folded vault.
Intricate and much-altered plan.
Built for the local needs of the poor and the Sufis.

The Süleymaniyye in Damascus

The complex is enclosed within a wall.
Executed on a flat-plot of land.
Exclusively single-storeyed buildings.
One main rectangular plaza.
A coherent complex.
Excellent example of classical Ottoman architecture.
Designed by Sinan, the grand master builder, and executed by one of his assistants.
The mosque entrance is preceded by double-porticoes.
Elegant twin 'pencil' minarets.
The mosque has a single typical Ottoman dome.
The plan is based on a symmetrical composition organised around an axial system.
Built for pilgrims on their way to or from Mecca during the Hajj.

Table 36.10 The location of Ottoman monuments¹ in Jerusalem

Location/period	First phase	Second phase	Total
Dome of the Rock upper esplanade	14	8	22
Haram platform	1	10	11
Inside the Old City outside the Haram	8	5	13
Tariq 'Aqabat al-Takiyya	7	-	7
Outside the walls of the Old City	2	-	2
Sub-total	32	23	55

¹ This table does not include the majority of the buildings in the Old City which are basically 'Ottoman', especially the domestic housing and the shops lining the main streets.

madrassa and a *maktab* to be constructed near the mosque, and some years after that an *'imara* (1550/957) and hospital were added (Kuran 1987: 46-47). Though the *'imara* is widely known as Sinan's work, Kuran (1987: 27, 46-7) has shown that it was probably not designed by Sinan, for there is no evidence to that effect and Sinan was busy with other important projects at that time. Despite the fact that the Istanbul *'imara* was not constructed in the style of Sinan, it displays a completely different design from that of the Jerusalem complex, and apart from the shared function of a free soup kitchen, and the presence of two stone bosses with a small rosette roundel on the south entrance which leads to the courtyard of the *'imara*, it is very hard to see a further similarity. The *'imara* in Istanbul is constructed with alternating courses of stone and brick, and it has an arcaded square open courtyard with domed units on three sides. The kitchen itself is made up of two units and four chimneys; all are roofed with domes with circular drums, unlike the only dome of the Jerusalem kitchen. This has an octagonal drum, and is closer to Mamluk domes rather than the classical Ottoman variety.

It is clear from this discussion that the Jerusalem complex belongs in the category of provincial architecture; it signally lacks the features of classical Ottoman architecture (see my concluding remarks).

Locations

The Haram area attracted most of the Ottoman building activity, for over half of the monuments (33 out of 55, which is equal to 60 per cent) were built either on the upper esplanade of the Dome of the Rock or on the greater Haram platform. This is a different situation from that of the Mamluk buildings, which were very rarely built within the Haram itself but were rather constructed around its perimeter (see Burgoyne 1987: 35, fig. 2). There are many reasons for the concentration of the Ottoman buildings in this particular area, but the primary one was the sanctity of the Haram and the availability of space remaining to the Ottomans. Table 36.10 shows the locations of the Ottoman monuments and their numbers.

Founders⁶³

The majority of the thirty-two standing monuments of the 16th century were founded either by Sultan Sulaiman or by high officials of the Ottoman empire. Although abstract numbers can sometimes mislead as they hide the size of individual monuments (for example, in crude numerical terms a small dome such Qubbat al-Khadr is treated as equal to the complex of al-'Imara al-'Amira Khassaki Khurrem Sultan), it is undeniably true that Sultan Sulaiman Qanuni and his wife, Hasseki Hürrem Sultan, were the patrons of nine of these thirty-two structures, and this moreover takes no account of the sultan's contribution to the restoration of the walls, the Dome of the Rock, the Aqsa Mosque, and the Citadel (see above for details). The monuments of the 16th century in the city thus include many royal foundations, which contrasts not only with the succeeding Ottoman phase (1010-1247/1600-1831)—which has only a single royal structure, itself of the utmost simplicity (see below)—but also with the preceding Mamluk period, which saw only three royal foundations (Burgoyne 1987: 68). There is no getting away from this major change of emphasis.

Ottoman officials were responsible for a further twelve of the thirty-two buildings erected in the 16th century, but if both phases of Ottoman construction are calculated together, it is they who make up the largest category of patrons (19 out of 55). Most of them were governors of cities in Palestine, in particular of Jerusalem and Gaza. They held various titles such as *mir liwa'* (governor), *pasha*, *beg*, and *agha*, and two of them were *amirs* of the Syrian Meccan pilgrimage caravan. Among their number there are also minor officials such as the *kathkuda* (deputy commander of the Citadel), and one was a mere soldier. Most of these officials were in post when they constructed their monuments and established their endowments, in contrast to the majority of the Mamluk *amirs* who were not in service (*battals*) at the time

⁶³ The historical background to the monuments and the biographical details of the founders are given in the relevant catalogue entries.

(Burgoyne 1987: 68). The majority of the officials were extremely rich, not because they had their own *khass*-fiefs, but because they undertook a variety of financial transactions. This information is revealed by the *sijill* records and is discussed below in the context of the biography of some of the founders. It is interesting to discover that Bairam Jawish, who began his career in Jerusalem as a high Ottoman official, finishes by being one of the great—if not the greatest—merchants in Jerusalem and Palestine, so much so that he has been listed under the category of merchant rather than official in Table 36.11. Ahmad Beg was able to lend oil to the *waqf* of al-Masjid al-Aqsa (the Haram) in times of difficulty, and frequent financial records mention the names of Muhammad Pasha and Qitas Beg.

In order to have an overview of the patrons and the type of monuments they founded, and in order to compare the two phases of Ottoman architecture in Jerusalem, there are tables 38.11 and 26.12. The first lists the monuments of the 16th century and the second those of the second phase.

Motivation

The motives of the founders are unequivocally expressed in a great many cases, either briefly in the foundation inscription or at length in the relevant *waqfiyya*. The wording differs from one case to another, but it is true to say that in each case the motivation stems from religious teaching and general piety, which encouraged good deeds and charitable acts in return for a reward in the life to come.

Sabil Qasim Pasha (cat. no. 2) was constructed 'for the benefit and countenance of Allah', and Muhammad

Shakir restored Qubbat al-Nabi (cat. no. 10) hoping that his restoration and the Messenger of Allah (Muhammad) would mediate on his behalf on the Day of Judgment. Qitas Beg constructed his *khakwa* (cat. no. 16) in order to bring himself closer to Allah, and Yusuf Agha reiterated three times the wish that the reward for the construction of his two domes (1092/1681) would all fall to himself.

Other phrases are more detailed, and express other expectations and motivations. Al-Shurbaji, for example, who constructed his *sabil* in 1097/1685, hoped to have as a reward blessing and charity from Allah, whereas Mustafa Agha and 'Uthman opted for their *sabil* to be considered among those who are blessed, and that they would drink from the basin of Taha or, in other words, that they would be in Paradise. In an unpublished foundation inscription from the construction of his *iwan* (not extant today) now in the Aqsa Islamic Museum on the Haram (see above under Commemorative Buildings), Mustafa the Vizier sought the blessing of Muhammad, and that Allah might grant him eternal welfare, safeguard him from evil, forgive him, and protect him against the evil eye.

Most of the *waqfiyyas* express similar sentiments. They contain almost identical quotations from the Qur'an, such as 'On the Day whereon neither wealth nor sons will avail, but only he (will prosper) that brings to Allah a sound heart' (Qur'an XXVI: 88, 89) (see Cat. Appendix 1, no. 11/4 line 12) or from the sayings (Hadith) of the Prophet Muhammad, such as 'When a man dies, all his works cease, except for three things, an ongoing act of charity, some learning which gives benefit, and a pious son who will pray for him' (Cat. Appendix 1, no. 11/4 line 7; 21 line 5). A second famous tradition of the Prophet says 'Fear hell fire at least [by donating] half dates' (Cat. Appendix 1, no. 19/1 line 11; 21 line 5).

Architectural Features

Domes

Domes are a prominent element⁶⁴ in the Ottoman architecture of Jerusalem and form an integral part of the majority of the structures. They cover the apex of minarets, *sabils*, halls of mosques, the main chambers of *khalwas*, and above all they in themselves constitute a separate⁶⁵ monumental structure. These domes usually have a pointed or hemispherical exterior profile, but two⁶⁶ have a curious unfinished shape with a truncated pyramidal profile, and one is an umbrella dome.⁶⁷ They are usually covered on the exterior with stone slabs to protect them from the elements, but a few are sheathed in lead. The majority of the domes culminate in a stone crescent finial, and a few have a more recent finial in bronze.

The interior of all the domes is plastered, and here the dome is expressed either as a single shallow concavity or as a smaller, shallow, ribbed saucer. Most of the interiors of the domes are plain, although some are decorated. The decorative scheme of one dome consists of a central radiating 'pleated' fan, surrounded by nine unequal concave divisions (cat. no. 12). The main dome in the North-Western Khalwa of Ahmad Pasha is expressed from inside as a shallow saucer of thirty-two whorled ribs. The centre contains a roundel with incised relief lines which appear to radiate from a central inner point (cat. no. 22). Another small dome, this time in the Khalwat Junbalatiyya (cat. no. 24), is decorated with a double interlacing incised curved band which forms seven units. The interior of the dome of Yusuf (cat. no. 38), is decorated with a series of thirty-eight radiating ribs which curve away from the central depression in a whorl pattern. Round this central device runs a concentric, incised band of thirteen zig-zags which is surrounded in turn by intersecting concave-sided stars of irregular form, with thirteen points in all reaching to the edges of the dome.

Most of the domes constructed in the period under discussion are either supported by arches, or carried directly on the walls of the square chambers beneath, or set

on the octagonal elevations of the structures without an intervening drum. The transitional zone is mostly made up of four undecorated pendentives in the corners of the room, but in four cases squinches are found instead of pendentives.⁶⁸ This type of dome, which is shallow and without an intervening drum, may be considered as a direct descendant of the traditional Ottoman dome.

There are among the domes which are attributed to the Ottoman period six⁶⁹ which have octagonal or dodecagonal drums pierced with pointed or semicircular arched windows. In these, the transition zone from the square to the circle of the drum is managed by undecorated pendentive triangles at the four corners. Only the drum of the dome of the mosque of al-Madrassa al-Mawardiyya has four *muqarnas* pendentives (cat. no. 28) made up of four rows of small lancet niches. The *muqarnas* is constructed of red and black masonry, some of which is decorated with small ribbed shells.

Minarets

The minaret, used by the *mu'adhdhin* to call the five daily prayers, and the place from which the observation of the beginning of the Arabic months, especially the month of Ramadan, takes place, is the most distinctive feature of any Islamic town or city. Although the function of the *mu'adhdhin* has recently been replaced by electric speakers and by tape recorders, the minaret remains a dominant feature in almost every newly constructed mosque throughout the world of Islam.

In all there are twelve historic minarets in the Old City of Jerusalem. Eight of these have been studied and published by Burgoyne (1987: 127; 178; 244; 270, 415; 513; 517; 568). These were either constructed or reconstructed in the Mamluk period, and all—apart from the Bab al-Asbat minaret, which has a cylindrical shaft—follow the type of square Syrian tower. Burgoyne (1987: 89) wrote '... but the cylindrical stone shafts could be the result of a later Ottoman reconstruction, for all the

⁶⁴ Twenty-three of the thirty-two monuments attributed to the 16th century have a dome; the catalogue numbers are 2-3, 10-32. Fifteen of the twenty-three monuments of the second phase also have a dome; the catalogue numbers are 33-43, 48, 50-53.

⁶⁵ Examples of these are cat. nos. 10, 30 and 31.

⁶⁶ The first is over Dar Bairam Jawish (cat. no. 13), and the second—which is clumsily finished—is over the Iwan of Sultan Mahmud II (1233/1817-18).

⁶⁷ This is constructed over Sabil Sha'lan which was built in the Ayyubid period, but was restored twice in the Ottoman period; the dome dates to the later restoration.

⁶⁸ Examples of squinches are in to be found in cat. nos. 14, 20, 23 and 32.

⁶⁹ These are: the dome of the kitchen of al-'Imara al-'Amira (cat. no. 15), the dome of the tomb chamber which was built close to al-'Imara al-'Amira, the dome of the mosque of al-Madrassa al-Mawardiyya (cat. no. 28), the two domes of the upper level of al-Zawiya al-Muhammadiyya (cat. no. 29), and the dome of Masjid al-Qaimari (cat. no. 32). It should be recalled that only the date of the dome of the kitchen of al-'Imara al-'Amira is confirmed as being of the 16th century, for the other domes are undated. The two domes of al-Zawiya al-Muhammadiyya and the dome of Masjid al-Qaimari should probably be dated later than the 16th century, and the dome of the tomb chamber and that of al-Madrassa al-Mawardiyya are probably late Mamluk. For further details see the catalogue entry for each monument.

Ottoman minarets in Jerusalem have cylindrical shafts.' In another place (1987: 417) he comments that 'there is some justification, therefore, to suppose that the shaft of Bab al-Asbat Minaret may be an Ottoman reconstruction.' In this he was correct, for I have discovered a document in *Sijill* 80: 100 which proves his hypothesis.⁷⁰ The document, which is dated 18 Dhu 'l-Qa'da 1007/12 June 1599, will help in dating the Ottoman minarets in Jerusalem, especially Minaret al-Hamra', for it bears a striking resemblance to the one at Bab al-Asbat. The *sijill* record informs us that Sultan Muhammad Khan (1003-12/1595-1603) had sent 300 *sultani* to the inspector of al-Aqsa mosque to fund the rebuilding of the Bab al-Asbat minaret. 'Abd al-Baqi Beg had accordingly entered into a contract with three master builders, in the presence of Ahmad Pasha, the governor of Gaza, for the rebuilding. The builders—'Abd al-Muhsin ibn Nammar, a master-builder in Jerusalem the Noble, Muhammad known as Khalaf al-Mi'mar, and 'Ali ibn Khalil al-Hajjar (the stone cutter)—were to receive 200 *sultani* in return for a well-executed reconstruction of the minaret from the octagonal base (*min hadd al-muthamman*) to the *sham'a* (pinnacle), and from the *sham'a* to its apex (*al-ra's al-fuqani*), all without reducing the extent of its staircase which then amounted to sixty-eight steps. They were to provide all the materials and the tools needed for the repairs, such as stones, lime, gypsum, water, workers, *qufaf* (leather baskets), shovels and so on; the exception was the provision of lead which was to be the responsibility of the inspector. The complete Arabic text is transcribed with an English summary in Cat. Appendix 1, no. 3/3.

Four other minarets can be assigned to the Ottoman period. These are the minaret of al-Nabi Da'ud (cat. no. 1), the minaret of al-Hamra' (cat. no. 3), the minaret of al-Maulawiyya (cat. no. 19), and the minaret of al-Qal'a (cat. no. 26). Two of these minarets are associated with Sufi foundations (cat. nos. 3 and 19), and two with mosques (cat. nos. 1 and 26). None of them is built in the

vicinity of a Mamluk minaret, and they all occupy a dominant site in the city. One (cat. no. 1) is built in the south-west section of city where the complex of al-Nabi Da'ud is located. Another (cat. no. 26) stands in the west within the Citadel, and the remaining two (cat. nos. 3 and 19) are in the north of the city and relatively close to each other. Without exception, all are located in a topographically dominant site. This was undoubtedly a deliberate choice designed to show the Islamic face of the city, particularly in a case such as the minaret of al-Nabi Da'ud (cat. no. 1), which was constructed on one of the holiest sites of the Christian Holy Land.

Each of these minarets consists of four basic parts, conforming to the usual design of the developed minaret in Islam: the base (*al-qa'da*), the shaft (*al-badan*), the gallery (*al-shurfa*), and the pinnacle (*al-sham'a*). In each case, the base is square in plan and either converts directly into a cylindrical shaft, as in the minaret of al-Nabi Da'ud and the minaret of al-Qal'a, or does so by means of an octagon, as in the minaret of al-Hamra' and the minaret of al-Maulawiyya. The transition from the square base to the circular shaft is achieved by chamfering the apex of the four corners of the base to form either a convex curve, or convex pendentive triangles or Turkish triangles.

Without exception, the four minarets have a cylindrical shaft terminating in a circular gallery. The shaft is usually divided into two or three storeys by a variety of mouldings, which serve the double purpose of adding a decorative element. The gallery is carried either on tiers of *muqarnas* (as on the minarets of al-Nabi Da'ud and al-Hamra') or simply on a single moulding (as on the minaret of al-Qal'a) or on multiple mouldings (as on the minaret of al-Maulawiyya) in order to create the necessary projection. The gallery is crowned by the *sham'a* which is made up of two parts, the upper of which has a small dome with a pointed profile.

There is no universal rule with regard to the position of these minarets in relation to the neighbouring building. The minaret of al-Nabi Da'ud stands near the south-west corner of the hall of the mosque, while the minaret of al-Qal'a stands in the south-east corner of the mosque, and the minaret of al-Maulawiyya and al-Hamra' are both located to the south east of the *zawiya*.

Although foundation inscriptions provide the date for the Mosque of al-Nabi Da'ud and al-Khanqah al-Maulawiyya, the inscriptions do not include any indication of the presence of a minaret. However, Burgoyne (1987: 416-17), in trying to date the reconstruction of the Bab al-Asbat minaret, based his suggestion on the inscription of al-Khanqah al-Maulawiyya. In addition to the confirmation in the *sijill* for Burgoyne's tentative date, I have come to the conclusion that the minaret of al-Maulawiyya is most likely to have been constructed in the 16th century, probably some time before the year 995/1586-7. This is based on observation of the technique

⁷⁰ Burgoyne has suggested that another Mamluk minaret was reconstructed in the Ottoman period. He states of the Fakhriyya minaret that 'The square shaft of the south-western minaret of the Haram (Fakhriyya), considering the weakness of its decoration, may also be an Ottoman reconstruction' (1987: 89). Burgoyne (1987: 272) gives additional support to his thesis by adding that 'the feeble profile of the moulding around the entrance door, the *paterae* above the door, and the finicky daintiness of the *muqarnas* head of the window is characteristic of Ottoman architecture in Jerusalem.' We would also point out that the two carved stone bosses on either side of the door of the minaret, which I call roundels, are also a common feature of Ottoman architecture in the city (see below under the discussion of the characteristic features of the Ottoman buildings of Jerusalem). It worth noting also that the *muqarnas* of the windows in the minaret is similar to the *muqarnas* of the windows of the North-Western Khalwa of Ahmad Pasha (cat. no. 22).

employed in the building of the minaret in relation to the dated level of the *sama'* chamber, and on the unpublished *waqfiyya* which has been discovered in Sijill 66: 551. For more details, see Catalogue entry no. 19 under 'The Minaret', and Cat. Appendix 1, no. 19/1 for the whole Arabic text of the *waqfiyya* with an English summary. If I am correct, this would mean that two of the five minarets attributed to the Ottoman period are dateable to the 16th century.

Although the minarets under discussion display variations in the design of their bases, general height and proportions, as well as architectural detailing, zones of transition, and size of masonry used (as shown in Table 36.14 above), they have many features in common and these serve to unite them within a single category or architectural style. These features are:

(1) Without exception, the minarets have the same four elements, and a square base which carries a cylindrical shaft. It is a general rule that no minaret in Jerusalem or in Palestine as a whole from the Mamluk period has a cylindrical shaft—all have a square tower of the Syrian type.

(2) Each of the four minarets is constructed near a 16th-century building, and the general circumstances favour the

supposition that the minaret was built more or less at the same time as the main building. For example, the conversion of the Coenaculum into a mosque (al-Nabi Da'ud) is dated to 930/1524 by foundation inscription. The conversion was carried out after a long dispute and with religious fervour by the local Muslim community on the order of Sultan Sulaiman. Symbols of Islam were added to the site such as a *mihrab* and a small dome, and it is almost certain that a prominent minaret to call the faithful to prayer and to announce Islamic sovereignty was considered essential. It is most likely, then, that the minaret was constructed at the same time as the conversion. For more details see Catalogue entry no. 1 under 'History and The Minaret'. The minaret of al-Qal'a had a similar history, for the Citadel was a main focus for Ottoman repairs and constructions. These repairs started before the reign of Sultan Sulaiman Qanuni; they continued throughout it and intermittently thereafter, but the majority of the work—and certainly the most important part of it—was carried out under the patronage of Sulaiman himself in 938/1531-2. These parts include repair of the wall and a moat, construction of a summer mosque (cat. no. 27), and rebuilding the outer eastern entrance of the Citadel (for further details see above under 'The Citadel'). If one takes into consideration the overall works which have earned

Sulaiman the reputation of a great restorer of the city (Meinecke 1988: 268-9), the prominent location of the Citadel, and the fact that it houses the only Friday mosque in the city other than the Masjid al-Aqsa, the conclusion must be that the minaret of al-Qal'a was constructed in the time of Sultan Sulaiman. Although nothing but the minaret is still standing today, al-Zawiya al-Hamra', otherwise known as al-Zawiya al-Khalwatiyya (cat. no. 3), was probably also built in the 16th century because two relevant *waqfs*, recorded in the *sijill*, were set up by two governors in the first half of that century.

(3) There are many architectural and decorative features that the four minarets share with the Bab al-Asbat minaret. Table 36.13 above lists most of them but the most important feature of all is the shared frieze of the incised counterchange joggling mentioned by Burgoyne (1987: 417) as one of the common elements of Ottoman minarets. The second feature of importance to note is the zone of transition on the minaret of Bab al-Asbat, which resembles closely the transitional zone of the minaret of al-Hamra' and the minaret of al-Maulawiyya. First, it is conceived as a series of Turkish triangles, and second, it is made up of two parts. These triangles are now proven to be Ottoman rather than Mamluk—as Burgoyne himself (1987: 417) surmised—by the *sijill* document mentioned above.

From the information in Table 36.13 and from the points already covered, it seems probable that the three undated minarets assigned to the Ottoman period should be seen as dating to the 16th century and should thus join the minaret of al-Maulawiyya and the reconstruction of the minaret of Bab al-Asbat.

Mihrabs

As early as the second half of the 4th/10th century, al-Muqaddasi (1877: 170) listed a number of *mihrabs* within the sacred precinct of the Haram, and prayer niches continued to be built throughout the Ayyubid, Mamluk and Ottoman periods. In Jerusalem, the *mihrab* can be either integrated into a building or remain as a separate element of architecture, and furthermore, it seems that a special type of *mihrab* (the reserved or floor *mihrab*) was developed within the Haram al-Sharif, where it related to commemorative sites of religious importance (see below).

Some twenty-nine *mihrabs* have survived from the Ottoman period; the great majority of them are in the Haram area with only four (cat. nos. 1, 3, 26 and 32) located outside the sacred enclosure. Most of these *mihrabs*⁷¹ are attached to buildings such as mosques, *khalkwas*, *zawiyas* and *qubbas* but their position within the pious foundation is irregular. Some,⁷² as already stated, are

an isolated element, constructed separately on the south side of a raised stone dais (*mastaba*). The *mihrabs* can be grouped into three types:

(1) The arched-niche *mihrab*. This is the most common type in Islamic architecture, built within a rectangular block in the *qibla* wall, and consisting of either a flat (*musattah*) or concave (*mujawwaf*) niche. There is no extant example of the first kind in Jerusalem from the Ottoman period,⁷³ but there are many examples still standing of the second type. The majority of the concave *mihrabs* of Ottoman Jerusalem are built of dressed masonry⁷⁴ of white stone now weathered to grey, although a few (cat. nos. 28, 36, 42, 47 and 50) are built with *ablaq* masonry of red, black and grey. These *mihrabs* are surmounted either by a pointed or a semicircular arch, which in general springs from the sides of the niche with no supporting column. Only three *mihrabs* have columns (cat. nos. 28, 50 and 55/12)—however, the attribution of two of these to the period under discussion is not conclusive.

Contrary to the general rule for *mihrabs*, whether Ottoman or from other periods, the majority of the niches under discussion are undecorated.⁷⁵ The exceptions are the Mihrab al-Sanaubar (cat. no. 54) and Mihrab al-Nabi Da'ud (cat. no. 1), although the latter in my opinion is very recent, while the former is undated and has its own problems. Mihrab Kursi Sulaiman (cat. no. 42) is the only Ottoman example which has stucco decoration.⁷⁶ It has a cornice of small, simple, painted *muqarnas* niches in stucco crowning the rectangular block and in the conch, which is decorated with four scalloped ribs of carved stucco. The

⁷³ There are three *mihrabs* in the Haram al-Sharif known to the author that are *not* in the form of a concave niche, but are rather flat (*musattah*) *mihrabs*. The first is located in the cave of the Dome of the Rock, and the other two flank the main *mihrab* of al-Aqsa Mosque. Creswell (1932 1: 70) considered that the first of these is the earliest extant *mihrab* in Islam, and ascribed it to the time of 'Abd al-Malik. Féhervari (1993: 8) added several other points in support of Creswell's dating. For a different view that sees the *mihrab* as dating to the Ikshidid dynasty, see Baer (1985: 17).

⁷⁴ All the extant *mihrabs* in Jerusalem are built of stone. I know of none made of stucco, brick, or wood. It is worth mentioning that there are four plain wooden panels with shallow concave niches in the Islamic Museum at the Haram (not yet published). They were used in the past in the Dome of the Rock to indicate the direction of Mecca, for it was difficult for all the worshippers to stand in the correct position towards the south owing to the octagonal plan of the building. These were not mobile *mihrabs* in any sense for they had fixed locations and therefore cannot be likened to the mobile wooden *mihrabs* of Cairo of the Fatimid period.

⁷⁵ For the decorative scheme of four Ayyubid and Mamluk *mihrabs* see Rosen-Ayalon (1986: 553-63).

⁷⁶ Carved stucco decoration on Mamluk *mihrabs* in Jerusalem is also very rare. The only example recorded is in the Turba of Sitt Tunshuq (before 800/1398). Burgoyne (1987: 508-9) regarded this decoration as being under the influence of Iran.

⁷¹ Their cat. nos. are: 1, 3, 8, 10, 21-22, 27-28, 30, 32, 34-37, 39, 41-43, 44-47 and 50.

⁷² Their cat. nos. are 37, 47, 55/7-55/11 and 55-13.

design of these *mihhrabs* does not follow the traditional royal Ottoman pattern. The exception is Mihrab al-Nabi Da'ud which in my opinion is a modern copy. The other *mihhrabs* are closer to the traditional niches of Mamluk Jerusalem.

(2) The floor or 'reserved' *mihhrab*. Three examples of this type survive in the Haram—the floor *mihhrab* of Qubbat al-Nabi (cat. no. 10), Mihrab Qubbat al-Khadr (cat. no. 31), and Mihrab Mastabat al-Zuhur. None of them is dated and very little is known about them, probably because they are located within Ottoman monuments, and therefore considered as dating to the same period. It is suggested here that on the contrary the *mihhrabs* predate the domed buildings, and apart from sharing the same site, there is no relationship between the *mihhrabs* and the domes. According to al-Suyuti and Mujir al-Din, the *mihhrabs* were constructed in the Mamluk period (cat. nos. 10, and 31). Because of its simplicity, it is probably right to see the third *mihhrab* (Mihrab Mastabat al-Zuhur) as Ottoman. This type of *mihhrab* is called in Arabic *mihhrab makhtut fi'l-ard*. Here it has been described as a 'floor *mihhrab*' or, more commonly, as 'reserved within the floor'. It is a type of *musattah mihhrab* but instead of being attached to a wall it is laid flat at floor level. It is simple in design and is made up either of coloured marble slabs (as in Mihrab Qubbat al-Nabi and Mihrab Qubbat al-Khadr), or of monochrome flagstones (as Mihrab Mastabat al-Zuhur). The slab facing south (*qibla*) is cut in the form of a pointed arch. The only parallel in principle to the layout of this *mihhrab* can be seen at the Maqam Ibrahim in Mecca in the circular courtyard of the Ka'ba. But this apart, it seems that this type of *mihhrab* is not found in other periods or anywhere outside the Haram of Jerusalem. So far they have been ignored by scholars.⁷⁷

(3) The free-standing walled *mihhrab*. There are three examples of these also still extant in the Haram area of Jerusalem; all appear to be datable to the Ottoman period. These are: the Mihrab of Muhammad Beg within Qubbat al-Nabi (cat. no. 10), Mihrab Qubbat al-Arwah (cat. no. 30), and Mihrab Mastabat al-Zuhur (cat. no. 55/7). The simplicity of this type is reflected in its name, for it is in fact a low wall enclosing either a floor *mihhrab*—as in the Mihrab Qubbat al-Nabi and Mihrab Mastabat al-Zuhur—or it is a low wall with a semicircular curve, as in Qubbat al-Arwah.

Arches

The Ottoman buildings in Jerusalem rejoice in many and various arches, some of which are part of the construction, and some of which are purely decorative. The pointed arch is the most predominant type, and is used for spanning niches—such as those of the *sabils* sponsored by Sultan Sulaiman Qanuni—doors and entrances, domes, porticoes, *qantar*as and *mihhrabs*. In most cases the pointed arch is

large in relation to the monument it adorns; sometimes it is huge, as in the monuments described in catalogue entries nos. 9, 11, 13, 15, 22 and 28. In many examples (cat. nos. 4, 6, 8 and 38) the voussoirs of the arch are cut in a chevron ('zig-zag') shape. This decorative element is reflected in the name given to type which is called here 'the pointed chevron arch'. On occasion, the voussoirs are constructed in a double tier (cat. nos. 11, 13 and 25). The double-tiered voussoir is probably a domestic innovation introduced into Ottoman buildings in Jerusalem to give more load-bearing strength to the arch. The double tier is not found in Mamluk architecture and there are no examples of it in the walls. From the construction technique, it seems that the voussoirs of the upper tier of certain arches were added later when a new structure was built over the original building.

The relieving arch, which is known also as the flat arch, is common in Jerusalem in the period. Its use was confined to the construction of the lintels of windows and doors, although it is found most commonly over windows. Its main purpose is to lessen the load on the lintels, but as many of this type of arch are not load-bearing, it must also have been used as decoration. The arch was constructed with three (cat. nos. 11 and 16), five (cat. no. 11), seven (cat. nos. 11, 13, and 28), or nine (cat. no. 13) voussoirs. The voussoirs are either joggled—in which case they are coloured—or plain and of monochrome masonry. There is one notable feature associated with the relieving arch in many of the Ottoman buildings of Jerusalem when it is constructed with three voussoirs—the side voussoirs and half of the central one forms a shallow curve over the lintel of the arch, reminiscent of the curve of an eye-brow over the human eye. The resemblance has suggested the name coined here for the feature—an 'eye-brow' relieving arch. It is probable that this type is the result of local initiative, for no parallel has yet emerged from the neighbouring towns within Palestine in the surviving buildings. The 'eye-brow' arch was apparently used for the first time in the Khalwa Qitas (cat. no. 16). From then on it was seen in other 16th-century buildings (cat. nos. 17, 21 and 24). Later it became a common feature, and it appears in many important monuments (cat. 34, 35, 41, 42 and 46), and was also widely adopted in local domestic buildings in the late Ottoman period.

The horse-shoe arch, which according to Goodwin (1971: 458) is almost unknown in Ottoman Turkey (although he cites one fine example at Arap Cami in Istanbul), is also rare in the Ottoman buildings of Jerusalem. Apart from al-Madrasa al-Mawardiyya (cat. no. 28) which has them, there are only three examples of horse-shoe arch (cat. nos. 17, 22 and 25) in 16th-century buildings. Two further arches of this type are found in the buildings described in catalogue entry nos. 48 and 54. Some even terminate in a slight point (cat. nos. 22 and 54).

The trefoil arch, though rarer than the pointed

⁷⁷ See for example the article 'Mihrab' in *EIF* by Féhervari (1993: 7-15) which includes no reference to the floor *mihhrab*.

arch, is also found in 16th-century buildings, for example over the north entrance porch of Khassaki Sultan (cat. no. 15). Another surmounts the rectangular recessed panel in the north façade of Dar Bairam Jawish (cat. no. 13), and there are further examples in the tall recessed panel of the west elevation of the North-Western Khalwa of Ahmad Pasha (cat. no. 22), and on al-Madrassa al-Mawardiyya (cat. no. 28). Yet another example surmounts the doorway of Qantarat Bairam Jawish which is undated but was apparently built after the 16th century.

The segmented arch appears with less frequency in the architecture of the period under discussion, but it is found in buildings described in catalogue entry nos. 11, 14, 15, 16, 22 and 24. It usually surmounts door lintels and is made up of three, five, or seven voussoirs.

The semicircular arch, on the other hand, is a type used frequently in Ottoman buildings in Jerusalem. It is either to be found over doors, or it surmounts the interior openings of windows. In the latter case it is often plastered but over doorways it is either blocked up (cat. nos. 14 and 23) or left uncovered. It is sometimes made up of counterchange joggled voussoirs (cat. no. 11) or a double tier of voussoirs (cat. no. 11). In two cases it has chevron voussoirs (cat. nos. 28 and 33), but the first instance of this variant is probably late Mamluk and the second is datable to after 1880.

Though the gadrooned arch is used in the restoration of the walls,⁷⁸ it appears only twice in the buildings under discussion. The first is in the al-Madrassa al-Mawardiyya (cat. no. 28), and the second is in Qubbat Yusuf (cat. no. 37).

Other types of Islamic arches—such as keel, ogee, and cinquefoil—do not feature in the Ottoman buildings of Jerusalem.

Portals and Porticoes

In general, the Ottoman buildings in Jerusalem lack the tall impressive entrance portals which are such a dominant feature of the Mamluk period. Apart from al-Madrassa al-Mawardiyya—which whenever it is mentioned carries the caveat of its unconfirmed date—there are only three buildings (cat. nos 11, 15 and 35) which have monumental portals. But even so, the architectural design is very simple and modest in comparison to the Mamluk doorways or some of the Ottoman portals in Istanbul, or even the Mawardiyya entrance (for details, see its description under the north façade in cat. no. 28). Two of the entrance portals—Ribat Bairam Jawish (cat. no. 11) and Zawiya Qadiriyya (cat. no. 35)—are almost identical even though a century separates their construction. Both are set into a recessed porch with a pointed arch. The door is flanked on

both sides by a stone bench and is surmounted by a lintel; above the lintel there are stone panels containing a foundation inscription. The third portal is a little different, for it was a royal foundation (cat. no. 15). It is both taller and wider than the two just mentioned. It is set within a trefoil arch of monochrome masonry, the arch is framed by ogee moulding, and it is flanked by two stone benches placed on either side of the recessed porch.

The entrances of one group of Ottoman buildings were preceded by a domed portico of two or three bays supported by arches and columns. This type is found only in the buildings (cells, here described as *khawas*) constructed on the upper esplanade of the Dome of the Rock in the Haram al-Sharif. Some of these porches no longer exist but traces of their earlier existence are clearly evident. The *khawas* with the salient porch are: Hujrat Muhammad Amir al-Quds (cat. no. 14), Hujrat Muhammad Agha (cat. no. 20), Hujrat Islam Beg (cat. no. 21), the North-Western Khalwa of Ahmad Pasha (cat. no. 22), the North-Eastern Khalwa of Ahmad Pasha (cat. no. 23), Khalwat Junbalatiyya (cat. no. 24), Madrasat Ahmad Pasha (cat. no. 25), Khalwat Pasha Bairam Pasha (cat. no. 34); and Odat Arslan (cat. no. 41). The feature is new to the Ottoman period; it is not seen in Jerusalem buildings erected prior to the conquest with the single exception of the huge, seven-bayed porch of al-Masjid al-Aqsa built by al-Mu‘azzam ‘Isa. In this instance therefore the practice of Ottoman Turkey was probably influential on the builders of Jerusalem. The first porch was built for the undated Hujrat Muhammad Amir al-Quds (cat. no. 14), but the second is securely dated to 996/1588 (Hujrat Muhammad Agha, cat. no. 20)—a length of time which is ample to allow central Ottoman architectural techniques to reach the small provincial city of Jerusalem.

Vaults

The catalogue of monuments demonstrates the use of the dome or vault as a system of roofing under the Ottomans. Domes were used for square areas, while vaults covered both square and rectangular spaces. Vaults had of course been popular in the architecture of Jerusalem long before the advent of the Ottomans. They had been used widely by the Ayyubids and developed to an even greater degree in the time of the Mamluks. The Ottoman vaults are in general both simpler and smaller than earlier ones. Nine buildings⁷⁹ of the fifty-five listed in the catalogue have a

⁷⁸ There are examples in Bab al-Asbat and Bab al-Nabi Da‘ud (Zion Gate).

⁷⁹ The numbers are a rough estimate to show the predominance of the dome over the vault. The main chamber has been taken as the prime example, although many buildings utilise both the dome and the vault as a means of roofing. This is particularly the case in the cells on the Haram, each of which is covered by a dome in the upper main storey, while the rooms of the lower floor are vaulted.

vaulted roof, and twenty-seven are domed. Although vaults in the period were used less widely than a shallow dome, three types of vault are found. These are the tunnel (or barrel) vault (cat. nos. 3 and 11), the cross vault (cat. nos. 11, 12, 15 and 28), and the folded cross vault (cat. nos. 11, 12, 13, 15 and 19). The cross vault and folded cross vault usually include a small saucer dome in the centre.

Windows

In Ottoman buildings, a number of different types of windows were used to provide the interior with light and ventilation. The most popular one was the rectangular window. As a rule, this has a simple sill and is surmounted by a stone lintel, with a relieving arch or string course above. It is also usual to find the window fitted with an iron grille. A small slit window was frequently opened in the façade at a high level, and this is often surmounted by a trefoil head outlined by a fine carved groove. A few examples of oculus windows are also found; these are very simple, constructed of plain blocks (cat. nos. 12, 13, 19 and 26), but one (cat. no. 13 on the north façade) has sophisticated joggling. A star-shaped window with eight points (cat. nos. 11, 12 and 15) is another type found in a few of the buildings. The final type is the double window (cat. nos. 11, 12, 15, 28 and 29), and here the two sections are separated by a column in the centre.

Decorative Elements

Panels

Three types of decorative panels are used on the façades and elevations of Ottoman buildings. The first type has a foundation or restoration inscription, the second decorative motifs, and the third has nothing in the centre but is surrounded by an elaborate frame. Although Arabic epigraphy is decorative in itself, the inscription panels are listed below under a separate heading.

Inscription⁸⁰ Panels

Ottoman buildings, in common with other Islamic buildings in Jerusalem and elsewhere, frequently include an inscription which gives vital information on the building, the date either of construction or restoration the name of

the founder, his (or her) position, and titles. The majority of these plaques are of marble, but some are limestone. All the inscriptions are carved in relief, but the calligraphy on two (cat. nos. 15 and 40) is incised. The calligraphy is normally Ottoman *naskhi*, but exceptions exist for one panel (cat. no. 14) uses *ta'liq*. The inscriptions are always found at a focal point on the exterior of the monument, and are usually clearly visible, designed to attract the eye of the viewer. They are placed above the entrance and, if the building is made up of two parts (for example, cat. nos. 14 and 16), the inscription plaque is fixed in the centre of the double façade. Some of the buildings have more than one inscription (cat. nos. 8, 10, 15, 27, 33, 36, 38 and 39), but only two of these (cat. nos. 38 and 39) bear the same date. The text can be either in standard or poetic⁸¹ form, and is arranged as a series of lines within a rectangular panel. The lines of text are separated by a variety of cartouches, but if it is poetry, each line is divided into two equal verses, and the date is given in both numerical form and by chronogram. The background of the inscription in most cases is plain, but sometimes it is filled with decorative floral or geometric motifs (cat. nos. 10/1 and 40). All the inscriptions are rectangular, with a single exception (cat. no. 27) which is in the form of a roundel divided into three horizontal sections in a style reminiscent of the typical Mamluk blazon.

Within this group, attention should be drawn to four simple rectangular panels (cat. nos. 28, 30, 42 and 44). These were presumably intended originally to contain an inscription, but are blank. It is impossible to know now whether there was once an inscription which is lost, or whether for some reason they were never completed. A further example of such a panel is in the rear elevation of Herod's Gate. There is only one comparable example in a Mamluk building in Jerusalem. This is a plaque set above the entrance of Ribat Maridini⁸² (before 763/1361-2).

Decorative Panels

This category includes ten panels which are variously square, rectangular, and octagonal, and their decorative schemes are equally varied. One panel (cat. no. 11, in the south façade of the eastern *qantara*) has glazed tiles with arabesque decoration. A second panel is rectangular (cat. no. 13) and its decorative scheme of a vase is carved in relief. A third example is in re-use and is decorated with a geometrical motif (for details see cat. no. 3, under the description of the base of the minaret). A fourth panel is triangular (cat. no. 16), designed like a book-flap, and has a shallow relief arabesque. Panel five (cat. no. 11) is a combination of geometrical and floral motifs which form

⁸⁰ For complete details on the inscription, with location, date, published literature and the Arabic or Turkish text, see the relevant catalogue entry under 'Date'. The Arabic or Turkish text appears in Cat. Appendix 2. It is worth mentioning that twenty of the thirty-two monuments which are attributed to the first Ottoman period have either foundation or restoration inscriptions, and fifteen of the twenty-three of the second Ottoman period have at least one inscription.

⁸¹ Examples are found in cat. nos. 10, 14, 15/1, 26, 27, 33/2, 37, 38/2, 38/3, 40, 43, 45, 46, 47, 48 and 49.

⁸² For this *ribat* see Burgoyne (1987: 412-14).

an octagon. Each octagonal element of the design is filled with small roundels separated by a triple-headed leaf. There is a star pattern at the centre of the panel, and the four corners are filled with a vegetal trefoil. Panel six (cat. no. 50) appears to be similar to panel five at first glance, but its scheme encloses an engraved geometrical ornament in the form of a star pattern, which in turn encloses two- and three-petalled rosettes that radiate from the points of the stars. At the centre there is an octagonal rosette. A further two panels (cat. no. 22) are identical in that they both contain a geometrical pattern. They occur on a single building, and they are positioned one above the other.

The last two panels to be discussed here are octagonal. The first example occurs on Sabil Bab al-Nazir (cat. no. 7). It has a small central rosette from which emerge twelve ribs enclosed in an eight-lobed roundel. The second is found in Dar Bairam Jawish (cat. no. 13), set above the keystone of the northern arch. Here the decorative scheme is composed of a floral motif enclosed within a thin fillet border and there are eight small circles formed out of, and connected to, the frame.

Blank Panels

This type of panel appears to conform to a single tradition, for they have many features in common:

- (1) Most of the panels are large; all the examples are bigger than the first category described here.
- (2) The central area is blank.
- (3) Without exception, all the panels appear on buildings datable to the 16th century.
- (4) The frame surrounding the panel, which is recessed, is either an incised and twisted triple-rope motif or a geometrical interlace of chevrons.
- (5) The original purpose of the panels was in all likelihood to carry a foundation inscription or a decorative plaque. As they are now blank, it is impossible to be certain if they were once filled and were subsequently defaced, or if for some reason they were never completed. Meinecke (1988: 268) points out that these panels adopt a decorative motif which was current in Damascus at the time, as for example in the façade of the Lutfi Pasha Mausoleum dated 940/1534.
- (6) The blank panels, of which there are nine examples in all, are found in three buildings. Four occur in the Khassaki Sultan complex (cat. no. 15), three in the North-Western Khalwa of Ahmad Pasha (cat. no. 22), and two in the Khalwat Junbalatiyya (cat. no. 24).

There are similar panels in the walls of Jerusalem, one of which is to be found on the eastern doorway of Herod's Gate, one in Burj Kibrit (Sulphur Tower), and four in the east façade of the Golden Gate. Since this feature is

not common in Mamluk architecture but appears frequently in Ottoman⁸³ monuments, it could be seen as an Ottoman influence, perhaps introduced by a master builder from Aleppo who was working on the city wall restoration project. Later it was copied by other master builders working on other monuments. Further proof of the Ottoman date of the blank panels is the example found on the North-West Colonnade, where it was inserted when the colonnade was restored by order of Sultan Sulaiman.

Roundels

Different types and sizes of roundels are used as a decorative element in the Ottoman buildings. Their large number and the impact of their ornamentation makes them one of the main decorative features of the 16th-century monuments of Ottoman Jerusalem—if not the predominant one.

In particular, the roundels are placed on the façades and elevations of the buildings, where they can easily be seen and appreciated by the public,⁸⁴ although in some of them—especially on the walls of Jerusalem by the Damascus Gate—the decorative scheme is difficult to read because of the height at which they are placed. It is not easy even to get a good photograph, for in addition to their inaccessible position, some are badly eroded, like some of the roundels in the courtyard of the caravanserai of al-'Imara al-'Amira (cat. no. 15). As a general rule, the roundels are found on the keystones of arches, on the spandrels of arches, and to the side of and above windows and decorative panels, although on occasion they are also located elsewhere.

Although the roundels are not identical in terms of size or shape, they are here treated as a single category. They have been called by various names in the past.

⁸³ See for example the side galleries of the Selimiyye mosque (Kuran 1987: 178, pl. 184), the entrance of the stairs which link the upper and the lower courtyard of the Zal Mahmud Pasha complex in Istanbul—Eyüp (Kuran 1987: 210, pl. 216), entrance of Kiz Türbe which is located near Bayezit Türbe in Istanbul, and above all the Süleymaniyye Türbe. However it should be noted that in these examples the panels project slightly instead of being recessed as in Jerusalem.

⁸⁴ It is worth noting that, with the exception of Bab al-Tauba and Bab al-Rahma (Golden Gate), these roundels disappear from the east wall of Jerusalem from the point where the Haram wall is incorporated within the wall of the city until it reaches Burj Kibrit on the south side. The immediate interpretation of this fact may be the pressures put on Muhammad Çelebi al-Naqqash, the superintendent of the wall project, to finish the work as soon as possible (see above under 'The Wall Project'). But the frequent incidence of these roundels on Bab al-Khalil and Bab al-Nabi Da'ud confirms that the roundels were placed in locations that were frequented by many people. It is noticeable also that there is only a single occasion on which a roundel is placed on the interior of a building (see cat. no. 15).

Aslanapa (1971: 257) refers to them as 'round medallions'; Burgoyne (1987: 271) defines some as 'a raised stone disk' or 'patera', and in another instance (Burgoyne 1987: 568) as a 'dish-shape roundel'. Kuran (1987: 87) called them 'rosettes', whereas Rosen-Ayalon (1989: 602) confines her description to 'medallion', and Auld⁸⁵ (1997/9: 467-79) calls them 'roundels'. Here I will term them 'roundels' and they will be divided into three main categories.

Small Roundels

These measure between 10-25cm in diameter, and all are found on buildings dating to the 16th century. There are twenty-three of them, and they appear on the buildings as follows: fifteen on Sabil Qasim Pasha (933/1527, cat. no. 2), one on Sabil al-Wad (943/1536, cat. no. 5), two on Sabil Bab al-Silsila (943/1536, cat. no. 6), three on the north entrance to al-'Imara al-'Amira (959/1552, cat. no. 15), one on Khalwat Qitas (967/1559-60, cat. no. 16), and one on Khalwat Parwiz (967/1559-60, cat. no. 17). The majority of them have incised decoration, and are inset into the surrounding masonry so as to be at the same level, with neither recession nor projection. Four examples, however (cat. nos. 2, 6 and 15), have a carved decorative surface in low relief and project slightly from the supporting wall.

The decorative scheme of these roundels differs. It largely consists of variations on the theme of a geometric design combined with a small rosette of six petals (cat. no. 2), or of hexagons containing a five- (cat. no. 16) or six-petalled rosette (cat. no. 2). A few roundels have a whirling⁸⁶ rosette (cat. nos. 2 and 15), and eight of them (cat. no. 2) have a decorative motif of an interlaced knot consisting of two irregular intertwined ovals around a small central roundel.⁸⁷ One roundel (cat. no. 6) contains six ribs in the form of projecting triangles, and another has

carved foliage (cat. no. 6). All the roundels of this category are made of stone, with one exception (cat. no. 5), apparently of stucco, which has geometric decoration in the form of a six-pointed star. It is possible that this example has a stone core which has later repair work in stucco.

Medium Roundels

These measure between 32-38cm in diameter, and constitute the majority. Most of them project slightly, but a number are at the level of the surrounding masonry. This category can be divided into two types. The first consists of a flat plain roundel and the second is decorated.

Flat Plain Roundels (the Disc Roundels)

There are six roundels of this type in the buildings under discussion; they are found on Mihrab al-Nabi Da'ud (cat. no. 1), Sabil Birkat al-Sultan (cat. no. 2), and Sabil Bab al-Silsila (cat. no. 6). The first of these is, however, a recent construction, and the latter has also been renovated lately, although apparently on the basis of the original work. There are large numbers of this type within the city walls—Damascus Gate, Herod's Gate, Burj Laqlaq, Bab al-Asbat, the Golden Gate, Burj Kibrit, and Jaffa Gate. According to Ben-Dov (1983: 103) there are one hundred and twenty-four in all.

Rosen-Ayalon (1989: 602) says of these roundels (medallions) that they are traditional in Islamic gates and very common for *mihirabs*. She mentions Bab al-Nasr in Cairo, and the gates of Marrakesh and al-Mansura of North Africa as a few examples where such roundels can be found. Auld (1997/98: 468) thinks that these roundels took their inspiration from different sources, and she mentions the walls of the city of Aleppo as one example.

Although this type of roundel is very rare in the architecture of Jerusalem before the Ottoman period, three examples deserve to be mentioned in this context, for in principle they resemble the roundels under discussion here. The first is to be found in the re-used trough of Sabil al-Wad (cat. no. 5). The trough was originally a sarcophagus. The second occurs in the decorative scheme of the marble of the Dome of the Rock, although here the roundel does not project.⁸⁸ The third example is located above the internal arch of Bab Hitta, one of the northern gates into the Haram, where there are two plain roundels. They are, however, not strictly flat for their faces are slightly concave. It is difficult to be sure whether these

⁸⁵ I am most grateful to Dr Sylvia Auld for allowing me to read her article 'The Jewelled Surface—The architectural decoration of Jerusalem in the age of Suleyman Qanuni', before its publication in the *Real and Ideal Jerusalem in Jewish, Christian and Islamic Art*.

⁸⁶ A whirling roundel also appears on Mihrab al-Sanaubar (cat. no. 54), as well as in the internal decoration of many domes.

⁸⁷ There are three roundels with similar but not identical decoration. The first is found above the keystone of the outer southern arch of Bab al-Silsila. This gate is dated to the Ayyubid period, but the roundel might form part of a restoration. The decoration here has no oval, and the braiding consists of two lines crossing a square. The second example is found above the niche of one of the arrowslits of the wall of Jerusalem located south of the interior of Bab al-Asbat. This roundel is bigger than the ones on Sabil Qasim Pasha, but the decorative scheme is closer. The third roundel is found on first tower located west of Bab al-Nabi Da'ud. Here again the roundel is larger than those on Sabil Qasim Pasha, and is marked by a double border; in other respects, however, the decoration bears a close resemblance.

⁸⁸ Similar roundels are found in Istanbul in the interior and on the exterior of the Süleymaniye, in the courtyard of the Sokollu Mehmed Pasha Mosque-Medrese, in the Mihrimah Mosque at Edirnekapu, Yeni Mosque and the Sultan Ahmet Mosque. The last two examples are 17th-century, whereas the others are all 16th-century structures.

roundels had any impact on the Ottoman examples under discussion.

If the inspiration for the Ottoman roundel came from outside Jerusalem, which is quite possible, the most likely source is Aleppo rather than Cairo. This assumption relies on many factors. If the influence was Cairene, it would seem reasonable to suppose that roundels would have appeared on the Ayyubid architecture of Jerusalem, or even on Mamluk buildings. In fact neither period saw this type of decoration incorporated into the architectural fabric apart from the examples already mentioned above the internal arch of Bab Hitta. The type does not even appear on any of extant Ayyubid or Mamluk *mihhrabs* (see Burgoyne 1987; Rosen-Ayalon 1986). Many features of the Ottoman buildings in Jerusalem follow the Mamluk school of architecture found in Damascus and Aleppo, as Meinecke (1988: 269-70) has pointed out. His hypothesis, made on stylistic grounds, has been proved by my recent discoveries in the Jerusalem *sijills* of the origins of the builders working in the city, who were not local men. It is also the case that builders from Aleppo were close to the architecture of the Saljuqs and of the early Ottomans, which displays many examples of roundels (Aslanapa 1971; Goodwin 1971).

Decorative Roundels

Ben-Dov (1983: 103) counted one hundred and thirty-five decorative roundels used in the restoration of the city walls. The catalogue lists only forty-four of this type in the buildings under discussion, and these appear on only five of the buildings. There are twenty-nine in al-‘Imara al-‘Amira (cat. no. 15), nine in Dar Bairam Jawish (cat. no. 13), one in Khalwat Qitas (cat. no. 16), and five in the North Eastern Khalwa of Ahmad Pasha (cat. no. 23). The decorative scheme of two of them (cat. no. 13) is in the form of an octagon but these are framed by a double-bordered roundel. The roundels in the North-Eastern Khalwa of Ahmad Pasha are flat. I can only cite two roundels of this type datable before the Ottoman period, one above the arch of Bab Hitta, flanked by the two flat, plain roundels mentioned above, and the other above the arch of Bab al-Sakina which is adjacent to Bab al-Silsila. Both, however, are found in undated buildings and they may be in secondary use.

In the main, the roundels are decorated either with purely geometric or with floral motifs, but some have a combination of both. Each roundel features in the catalogue entry as part of the architectural description. There is no point in repeating those descriptions here. But it is worth turning briefly to a matter which has been raised recently about the purpose and the meaning of some of the roundels on the buildings and on the walls.

Auld (1997/98: 470-79), after quoting Grabar’s

conclusion (1992: 154) that geometric pattern ‘is only meant to be beautiful’, agrees that ornamentation must be a major factor in the use of these devices on the Jerusalem city walls and on the monuments. At the same time she raises the possibility that the roundels were intended to convey something more than mere decoration. After surveying most of the roundels and comparing some of their decorative patterns with similar ones in other materials, she raises various possibilities. She suggests first that the ‘floral roundels found on the imperial commissions ... may be markers of some kind.’ She also makes a particular point of the open flower device, which is found on ‘Imaret Khassaki Sultan in Jerusalem, by pointing out that it appears in Istanbul over the entrance portal to the complex of the Hasseki Sultan Hürrem and on her *türbe* in the Süleymaniyye (and in a more complex form on that of the sultan). Next, Auld raises the possibility that roundels with the *khatam Sulaiman* (Seal of Solomon), which appear on the inner walls of Herod’s Gate and elsewhere, could have had several purposes—that the Seal of Solomon may have been used as an identification of the patron—in other words, as propaganda—that use on the Herod’s Gate may have been intended to mark a ceremonial way, or that it may have been used as a talisman to protect the city; it is possible, she thinks, that the use of the device was a combination of all these functions. Nevertheless, she notes the fact that the roundels appear on the inside of the gate and that the motif appears elsewhere, on Burj Laqlaq for example. Finally, she points out that Herod’s Gate was called the Gate of Flowers, perhaps because its roundels bear flower patterns; but here she has some reservations, for she notes that other gates too have floral roundels.

It is difficult to accept the first proposal because many roundels are found in other buildings which did not involve imperial patronage, and furthermore if these roundels were intended to denote imperial patronage they might be expected to be uniform in design, like the Mamluk blazons, whereas in fact they display a remarkable diversity in shape, size, and decoration. One wonders also if the roundel with the *khatam Sulaiman* was really intended to mark the ceremonial entrance of the sultan, placed as it is in the very modest location of Herod’s Gate rather than the Damascus Gate, which is the most impressive entrance to the city. Why too do the tiles of the Dome of the Rock lack this important device, especially as the connection with Solomon would be stronger here than in the case of the wall? It is also known that the construction of Herod’s Gate was finished in 944/1537, while the first indication of a possible visit of the sultan was only in 955/1548-9, and the other two indications are even later, in 961/1553. The question raised here is whether there could have been a plan to display the device on Herod’s Gate, ten or eighteen years in advance of a proposed visit. There is also an identical roundel with the

khatam Sulaiman on the east elevation of Burj Laqlaq. These reservations make me incline towards the view that the devices had no meaning other than ornamentation.

Bosses

Only two bosses are found in the buildings under discussion. The first is in Sabil al-Wad (cat. no. 5), where its decoration consists of a geometrical and foliate arabesque. The other example is placed above the keystone of the arch of the south entrance of al-‘Imara al-‘Amira (cat. no. 15). Here the ornamentation is an eight-fold device with an eight-petalled central rosette surmounted by an interlaced frame. There were two further bosses, now missing, in Sabil al-Wad, which probably resembled the one mentioned above.

Fourteen bosses still exist in the walls of Jerusalem. Some are found in the centre of a large roundel, whereas others are either arranged separately above the keystone of the arches, or project from a stone. They are distributed as follows: six at the Damascus Gate; one at the eastern doorway of Herod’s Gate; one at the northern entrance to Herod’s Gate in the centre of a large roundel; two in the tower which is located between Herod’s gate and Burj Laqlaq; two in Burj Laqlaq itself in the north and east elevations respectively; one in the keystone of the arch of Bab al-Asbat; and one in the centre of the blind circular window of the Golden Gate.

There are no bosses in the pre-Ottoman buildings of Jerusalem, but they are widespread in the Saljuq architecture of Anatolia,⁸⁹ in the Ottoman capital, and in other cities.⁹⁰ It is possible that this element was borrowed from Saljuq buildings and introduced into Ottoman Jerusalem by builders from Aleppo, or others of Rumi origin, who were sent to work on the Jerusalem projects. Auld (1997/98: 472) notes that the bosses of the capital are confined either to imperial foundations or to those patronised by the imperial family. This may explain why bosses in the buildings under discussion are rare, and also why they are confined to the projects patronised by Sultan Sulaiman. But it must be added that some imperial projects are without bosses.

Triangles in Relief

Relief triangles—whether decorated, as in Sabil Bab al-Silsila (cat. no. 6), or plain, as in Sabil Birkat al-Sultan

(cat. no. 4), Sabil Bab al-Nazir (cat. no. 7), Sabil Bab al-‘Atm (cat. no. 8), and Sabil Bab Sitti Maryam (cat. no. 9)—are used as a purely decorative element. No analogue to these triangles has been found in the pre-Ottoman buildings of Jerusalem⁹¹ and only one further example in addition to those already listed occurs, in the eastern doorway of Herod’s Gate.

Ablaq

Ablaq, the use of alternating coloured stone to achieve a decorative effect, was one of the most characteristic features of Mamluk structures in Jerusalem and elsewhere. It is not found in the early Ottoman buildings of Jerusalem such as the Citadel, the *sabils* of Sultan Sulaiman, the city walls, al-‘Imara al-‘Amira, and the Ribat and Maktab of Bairam Jawish. This absence could be explained by saying that the Ottoman buildings in Jerusalem follow the traditional architecture of Istanbul, where *ablaq* is not a principal feature. But it is known that the builders of these early projects were mainly local, and when they were not, they came from Syria, so that all of them must have been fully cognisant with the use of *ablaq* and its beauties. Most probably the disappearance of *ablaq* from these early projects can be put down to technical difficulties in obtaining the necessary materials. Coloured stone does appear in a few buildings, but in a very simple and restricted way. The modest doorway of the minaret of al-Hamra’ (cat. no. 3) and the entrance to the Dar of Bairam Jawish (cat. no. 13) both have a few red and yellow stones, but true *ablaq* re-appears for the first⁹² time in the North-Western Khalwa of Ahmad Pasha (cat. no. 22). The use of the technique in this *khalwa* indicates a deliberate move towards a revival of certain Mamluk features. It must be admitted that the impression is not entirely successful, despite the effort invested in the attempt. *Ablaq* continued to be employed in a few Ottoman buildings constructed after the 16th century (cat. nos. 37, 40, 44 and 48), and in particular in the jambs of windows and arches. But here again, it was used only on a limited scale.

Mouldings

A variety of mouldings are used in the Ottoman buildings

⁸⁹ Examples of Saljuq bosses can be found in the Ince Minareli Medrese (663/1264-5), the Karatai Medrese (649/1251-2), and the Sahip Ata Cami (656/1258)—all of them in Konya.

⁹⁰ Examples of Ottoman bosses can be found in Istanbul in the Bayezid Mosque on the *mihrab* and in the courtyard, Rustam Pasha mosque, the Zal Muhammad mosque (1551), and the Süleymaniyye, in the Yeşil Türbe (1421) at Bursa, and in the Selimiyye at Konya (1567).

⁹¹ Some Ottoman monuments have such triangles; they include the Üç Şerefeli Mosque, and the Selimiyye Cami (1567), both in Edirne, and in Istanbul in the Şehzade Mehmed Complex, and the Süleymaniyye Türbe.

⁹² It is worth mentioning that *ablaq* is employed in the architecture of Qubbat al-Nabi (cat. no. 10), Maktab Bairam Jawish (cat. no. 12), al-Madrassa al-Mawardiyya (cat. no. 28), and Zawiyat Muhammadiyya (cat. no. 29), although in Qubbat al-Nabi it is the result of a later restoration. On the other hand, the Maktab Bairam Jawish had been already constructed before Bairam acquired it, and the latter two buildings are probably late Mamluk structures.

of Jerusalem. They act as markers for architectural conjunctions or for decorative purposes to delineate elevations, arches, panels, and to serve as cornices for a building. Mouldings were known in Jerusalem before the Ottoman period, for Mamluk architecture continued the Crusader-Ayyubid practice, as Burgoyne (1987: 95-6) points out.

Cornices

In addition to the billet-moulding cornices mentioned below, friezes adorned with repeated small, lancet *muqarnas* niches are also used as cornices in many buildings. Their decorative scheme is close to the impostes with lancet niches. Examples of the cornices are found at the north entrance of al-‘Imara al-‘Amira (cat. no. 15), the top of the west elevation of Hujrat Islam Beg (cat. no. 21), at the top of the north elevation of the North Western Khalwa of Ahmad Pasha (cat. no. 22), and in Qubbat al-Khadr (cat. no. 31). But on occasion, the cornices do not encircle the whole elevation of a building for they are interrupted at the sides of the portico. Similar, but not identical, decorative cornices were known in Jerusalem from the end of the 7th/13th century (Burgoyne 1987: 95, 366 fig. 32.11), but the *muqarnas* niches in the Ottoman buildings are smaller and their decorative scheme differs from the Mamluk type. Some buildings (cat. nos. 1, 2, 16, 17, 23 and 19) terminate without a cornice at all, and some end with their ultimate masonry course projecting slightly forward (cat. nos. 9, 11, 14, 20, 21 and 24).

Decorative bands which use a similar motif are found in different locations. A single re-used band of ten and a half triangular, lancet *muqarnas* panels occurs in the middle of the eastern elevation of the hall ‘C’ in the first floor of Maktab Bairam Jawish. Each lancet is different in design (see cat. no. 12 for a complete description). Another frieze is found above the *mihrab* of the caravanserai of al-‘Imara al-‘Amira (cat. no. 15); here it projects slightly and contains fifteen small *muqarnas* niches.

The Billet Moulding

The billet, which consists of small square blocks placed at regular intervals, is a well-known feature of Ottoman architecture in Jerusalem. This type of moulding became popular in the second quarter of the 9th/15th century, for it appears in many Mamluk buildings,⁹³ and it was apparently adopted for Ottoman monuments. According to

Meinecke (1988: 262), once again the origins go back to the Aleppo school of architecture.

In the buildings under discussion, the billet moulding acts primarily as a cornice. In this form it appears in Sabil Birkat al-Sultan (cat. no. 4), Sabil Bab al-Silsila (cat. no. 6), and above the portico of Hujrat Muhammad Agha (cat. no. 20) and of the North-Western Khalwa of Ahmad Pasha (cat. no. 22). It is also employed as a frame for the inscription panel of Dar Bairam Jawish (cat. no. 13), and the panel of al-Madrassa al-Mawardiyya (cat. no. 28); and it frames the arches of Qubbat al-Khadr (cat. no. 31). Finally it is used as a marker or separator in minarets, such as the minaret of al-Hamra’ (cat. no. 3), and the minaret of al-Qal’a (cat. no. 26). This type of moulding is not found in the city walls or in the Citadel, apart from the minaret there, but it is found in the Fakhriyya minaret and in the North Qantara (colonnade), both of which were restored in the Ottoman period. It is also found in many buildings, both dated examples (such as Sabil al-Shurbaji 1097/1685) and undated ones (see cat. no. 31 under ‘Dating the Dome’), which were constructed after the 16th century.

The Ogee ‘Cyma Recta’ Moulding

Ogee mouldings are used in the early Ottoman buildings of the city. This type of moulding encircles most of the *sabils* constructed by order of Sultan Sulaiman (cat. nos. 4, 5, 6, 8 and 9) and frames the street window of al-Zawiya al-Muhammadiyya (cat. no. 29). The same moulding is used as a marker to articulate the component parts of the shafts of minarets (cat. nos. 3, 19 and 26), and is employed twice as a cornice (cat. nos. 18 and 22). It also frames the extrados of many arches (cat. nos. 7, 8, 9 and 28). Burgoyne (1987: 96) reports that the ogee moulding first appeared in Jerusalem as a frame around the entrance portal of al-Madrassa al-Sallamiyya (738/1388).

When the ogee moulding is used as a frame, it terminates at both sides of the façade in a large volute which resembles the letter *mim* in Arabic; this gives it the name of *mims* or *jeft* decoration according to Mamluk documents.⁹⁴ Rosen-Ayalon (1989: 602) considers correctly that this element was adopted from Mamluk architecture in Jerusalem, citing the inverted volute of the Madrasa Tashtamuriyya as an example. However, Burgoyne (1987: 96) states that the feature was originally found in the sixth-century churches of the mountains of North Syria and that it continued in use throughout Umayyad, Crusader, Ayyubid, Mamluk, and Ottoman periods. He mentions examples found in the Mamluk edifices of the Khatuniyya, Tashtamuriyya, Ashrafiyya, and Basitiyya.

⁹³ Al-Zawiya al-Basitiyya (*waqf* 834/1431), Well of Ibrahim al-Rumi (839/1435), al-Madrassa al-‘Uthmaniyya (840/1437), al-Madrassa al-Jauhariyya (844/1440), minaret of Jami‘ ‘Umar (before 870/1465), and Salahdiyya minaret (before 820/1417-18).

⁹⁴ Amin and Ibrahim (1990:29).

The Roll or Ring Moulding

Another type is the roll or ring moulding which has either a semicircular or a more complete circular section. This type is used to separate the component parts of the shafts of minarets (cat. nos. 1, 3, 19 and 26) and to articulate their lanterns. It also frames the windows in the North-Western Khalwa of Ahmad Pasha (cat. no. 22) and his Madrasa (cat. no. 15). This moulding is also found in miniature in the columns to mark the three different sections (cat. nos. 5, 8, 10, 20 and 30). It was used only rarely in Mamluk buildings in Jerusalem, but it is well-known for its appearance in Ottoman minarets.

Muqarnas

The *muqarnas* (pl. *muqarnasat*), is one of the principal elements of Islamic architecture. Its use persisted throughout the Ottoman period in Jerusalem in various ways. The use of *muqarnas* in Ottoman architecture as a general rule is both less frequent and more simple than the sophisticated employment of the device in Mamluk Jerusalem. All the examples are executed in stone, and are adorned either with a simple floral device or left plain.

Corbel Muqarnas

In the minaret of al-Nabi Da'ud (cat. no. 1) and the minaret of al-Hamra' (cat. no. 3), *muqarnasat* were used to form the projection needed to support the gallery. In the former there are two plain corbelled levels, and in the latter there are three levels of alternating niches and corbels, with the niches decorated by a trilobate head.

Stalactite Muqarnas

Another use of *muqarnasat* was to mark the apex of niches and doorways. The niches of three of the imperial *sabils* (cat. nos. 4, 5 and 8) have an elaborate stalactite *muqarnas*. The niche of Sabil Birkat al-Sultan is filled with three tiers of *muqarnas* crowned by a ribbed scalloped niche. But the most impressive is that found in Sabil Bab al-'Atm. Here it is made up of four tiers surmounted by a half-dome decorated with five scalloped ribs. A similar half-dome crowns the three tiers of *muqarnas* in Sabil al-Wad (cat. no. 5), where the half-dome is surmounted by a shell hood with three scallops. Another niche with three scallops on a smaller scale is found in the imposts of the doorway of al-Madrasa al-Mawardiyya (cat. no. 28 2, 3). An even smaller version of this decorative feature is found in the many lancet niches which decorate the bands and the impost on many of the buildings under discussion. Rosen-Ayalon (1989: 602), while offering a comparison of these stalactites with details from Mamluk examples, called the scallop of Sabil al-Wad a 'half-rossette', and mistakenly

drew attention to the doorway of Turbat Sitt Tunshuq, instead of the east portal of Dar al-Sitt Tunshuq, as well as the second *mihrab* of al-Madrasa al-Muzhiriyya. Burgoyne (1987: 588 n. 30) also cited the two examples above, and adds 'whether or not this type of decoration is meant to represent the word "Allah" remains a matter for conjecture.' A panel in the west elevation of Hujrat Islam (cat. no. 21) is crowned by two elegant tiers of stalactite *muqarnas*, the lower tier of which contains a series of twenty pendant stalactites. Finally, this type of *muqarnas*, which was well known in many Mamluk buildings in Jerusalem⁹⁵ as well as in Egypt and Syria, crowns the doorway of the North-Western Khalwa of Ahmad Pasha (cat. no. 22).

Muqarnas Imposts

Decorative *muqarnas* is also used in the imposts of arches, two types of which are found in the buildings under discussion. The first is made up of two sections, each with a different number of small concave *muqarnas* niches—there are examples of five, six, and seven niches, with an occasional semi-niche at one end. In one case (cat. no. 15), the impost is made up of a single section, but here the niche is a little taller than the impost and thus forms a second part. The niches are either plain with a slanting chamfer or decorated with one of the following motifs: three small scallops, a five-headed leaf (cat. no. 7), ten petals (cat. no. 8), a cinquefoil (cat. no. 4), or four vertical grooves. The niches are separated by a grooved line, and the top edges are chamfered. This type of impost is to be found mainly in the four imperial *sabils* (cat. nos. 4, 6, 7 and 8) and on the doorway of the east *qantara* of Ribat Bairam Jawish (cat. no. 11).

The second type of impost consists of three vertical *muqarnas* niches, each with three tiers of small lancet panels. The uppermost central niche has a half-dome. The niches are either undecorated (cat. no. 28) or they have a sloping chamfer, or they are decorated with floral motifs consisting of a small palmette (cat. no. 15). A bracket with a similar design is found in the portico of the North-Western Khalwa of Ahmad Pasha (cat. no. 22). It is noteworthy that these niches include lancets of the curvilinear 'Syrian' type, although another bracket, which is also found in the portico of the North-Western Khalwa of Ahmad Pasha, includes the angular 'Egyptian' type (see Burgoyne 1987: 98, fig. 13).

⁹⁵ Examples are found in al-Madrasa al-Tashtamuriyya, al-Turba al-Kilaniyya, al-Turba al-Sa'diyya, and al-Madrasa al-Manjakiyya.

Conclusion

As the reader made his way through this chapter, it will have become apparent that the Ottoman authorities exerted considerable efforts both to control and to maintain the architectural fabric of Jerusalem, despite the fact that it was only a small, provincial town. Donations and allocations of money, as well as a variety of building materials, were expressly sent to Jerusalem when there was need for them. The authorities in Damascus and Istanbul closely supervised the administration of the city in general, and of the Haram al-Sharif area in particular. Two additional windows opened in the Dome of the Rock, or an expansion of the kitchens of al-‘Imara al-‘Amira, for example, required direct authorisation from the capital.

It is clear that the city was not isolated from neighbouring cities and regions when it came to stylistic trends in architecture. This is particularly true of the architecture of cities in Syria, for example Aleppo and Damascus. But the *sijills* contain far more interesting information on the role of local master builders. Evidence of their number and the extent of their contribution surpassed all expectations, especially when compared to information on earlier periods or on other cities that had been known previously.

It is worth emphasising that there is no indication of an abrupt break with local building traditions in the decorative and architectural features of the monuments discussed in this chapter and in the following catalogue. On the contrary, local traditions with or without Mamluk elements continued to be popular side by side with new features that can properly be termed ‘Ottoman’.⁹⁶ The use of *ablaq* masonry, joggled voussoirs, various types of moulding (cornices, billet, ogee, *cyma recta* and roll), and the different types of *muqarnas* (corbel, stalactite and

imposts) are all good examples of the interrelationship between the two styles.

The employment of large numbers of local builders and the impact of the Ibn Nammār family leave no room to doubt the significance of the local contribution to architectural activity and development of the city. It is possible that this ‘school’ of local builders was responsible for the innovation of the relieving arch described here as the ‘eye-brow’ arch, and the double-tiered voussoir arch.

It is these two types of arch, as well as the double window, the eight-pointed star window and the shallow ribbed dome, which constitute the main features of a Jerusalem grammar of Ottoman architecture, details of which have been drawn by David Myres and appear here after the catalogue of buildings. These features continued to flourish in the city in the later Ottoman period until the advent of modern western architecture imposed its own style on the traditional local forms.

Another characteristic feature of these buildings is the prevalence of recycled building materials of both Muslim and non-Muslim origin. The catalogue contains details of these, in particular *spolia* from the Crusader and classical Roman periods. References in the *sijills* make it clear that such materials were routinely collected from old sites and ruined buildings.

To sum up, it is clear that Ottoman architecture did have a certain impact on 16th-century buildings in Jerusalem. The influence was, however, remarkably small. The main features of monuments built in Jerusalem at this time show an eclecticism which combines an inspiration from many divergent sources—classical Ottoman, the ‘school’ of Aleppo, extant Mamluk buildings in the city, local traditions, and re-used elements from Roman and Crusader sites.

⁹⁶ A good example is the use of roundels, which were apparently not in widespread use as a decorative element in Jerusalem before the classical Ottoman period, but are to be found. For example, they appear above the internal arch of Bab Hitta and on Bab al-Silsila. They were popular in buildings constructed under Sultan Sulaiman in Istanbul—on the side galleries of the Selimiyye Mosque (Kuran 1987: 178 pl. 184), the entrance to the stairs which link the upper and lower courtyards of the Zāl Mahmūd Pasha complex, Istanbul-Eyüp (Kuran 1987: 210 pl. 216), at the entrance of Kız Türbe, located near the Bayazid Türbe, and above all in the Süleymaniyye Türbe. In all these examples, the panels project slightly instead of being recessed. However, rather than from Istanbul, the inspiration for the Jerusalem roundels appears to come from Aleppo, perhaps through the master builders who came to work on the wall and water

projects. In Aleppo, roundels are found among other places at the Minaret al-Jami‘ al-Rumi (768/1366), Jami‘ al-Utras (801/1398), and on the façade of the main hall (Qa‘at al-‘Arsh) in the Citadel (restored 880/1475). These are all Mamluk buildings (Rihawi 1979: 180–1, pls. 57, 58 and 65). Examples of Ottoman roundels are found in Khan al-Wazīr (1093/1683; Tals 1956: pl. 134–5; Rihawi 1979: 232, pl. 87) and on the city wall at Bab al-Faraj and Bab al-Jinan (Tals 1956: 32, 34). Roundels were rare in Mamluk Egypt, but a few examples are to be found in the Mausoleum of al-Salih Najm al-Din (647–8/1249–50), the Mausoleum of al-Imam al-Shafi‘i (608.1211), Mosque of al-Salih Tala‘i‘ ibn Ruzāik (555/1160), Mosque of al-Zahir Baibars, Madrasa of al-Nassar Hasan, and Wakalt al-Ghuri (Meineke 1992 1: pls. 1c and d; 6b; 8a; 10a; 75b; 76a; 77a; and 136c).

Acknowledgement

My contribution is based on research undertaken over many years towards a doctoral thesis. During this period I have benefited greatly from the help and many individual acts of kindness extended by institutions, colleagues, and friends. Most of all, I am grateful to my wife, Huda, whose endless patience, understanding and support made it possible to spend long periods away from the family in London and in Jerusalem. My thanks to her can never be enough.

Of the others, first and foremost, I wish to express my gratitude to the Director of the World of Islam Festival Trust, and the Trustees for their constant financial support while I was writing this study. That support covered both my own and my family's upkeep, and my fieldwork. Without that generous and prolonged support, neither my thesis nor my contribution to this book would have been possible. I am also much indebted to the staff of the British Council for granting me a doctoral scholarship to study at the School of Oriental and African Studies, the University of London. In particular, I would like to record my thanks to Mr Christopher McConville, the previous Director of the British Council in East Jerusalem, and to Ms Muna Khelif, Director of the Department of Fellows and Scholars.

On the academic side, the editors, Professor Robert Hillenbrand and Dr Sylvia Auld, have played an invaluable role in the completion and shape of this study. The beauty and clarity of photographs taken by Dr Joe Rock of Edinburgh University, supported by The World of Islam Festival Trust, have also helped me considerably. If faults remain, they are my sole responsibility. As already explained, the work published here grew from my doctoral dissertation, written for the University of London between 1993 and 1996. This was supervised by Dr Geoffrey R D King, whose help, encouragement, guidance and kindness during its writing have left their impact on the results.

The Ottoman Jerusalem Project has benefited from the support of many people. It would have been impossible without the many efforts expended in earlier years by the Department of Islamic Archaeology of the Administration of Waqfs in Jerusalem. I am extremely grateful to Ahmad Taha, Husain Katiba, Kamal al-Munayyir, 'Umar Hijazi, and Taufiq al-Sharif, all from the Department of Islamic Archaeology, for helping in the preparation of the drawings and photographs used in the thesis, which have formed the basis for the figures in this section of the book. My thanks are also extended to the Ministry of Waqfs and Islamic Affairs at Amman, to Shaikh

'Abd al-'Azim Salhab, head of the Supreme Muslim Council at Jerusalem, and to 'Adnan al-Husaini, Director of Administration of Waqfs in Jerusalem, for their support and for granting me unpaid study leave to accomplish my research.

I would also like to extend my thanks to Professor Graeme Auld, Mr Richard Harper and Mr PG de Courcy-Ireland from the British School of Archaeology in Jerusalem for their help and enthusiasm in setting up the Ottoman Jerusalem Project.

Constant help and benefit have been derived from discussions with friends and colleagues. I should mention here my warm thanks to my friend Khadr Salameh, Curator of the Museum and the Aqsa Library, for his endless help in deciphering the secrets of the *siyills*, to Dr Michael Burgoyne for his invaluable comments and the time he gave in visiting some of the buildings, and to the architect David Myres, from the British School of Archaeology in Jerusalem, for his work on the drawings. Grants for part of the fieldwork of my research were made available by the Barakat Foundation, and I would like to thank their Trustees and Administrator, Dr Julian Raby. It is sad that three of the people who gave their support to the Project have died before they saw the results —Mr Anwar al-Khatib (Governor of Jerusalem), Mr Hasan Tahbub (Palestinian Minister of Waqfs and Holy Places), and Dr Kamal al-'Asali.

I owe a debt of gratitude to the many institutions who granted me access to archival material. I am grateful to 'Abd al-Qadir 'Abdin (Chief Judge), to Ibrahim Sabri (Deputy), to 'Umar Tahbub (Chief Clerk), all of the Shari'a Court of Jerusalem; to Dr Hamad 'Abd Allah Yusuf, Mr Ghassan Muhaibish, and Mr Muhammad al-Safadi from the Department of the Revival of Islamic Heritage in Jerusalem, Abu Dis, and to Drs Rupert Chapman and Shimon Gibson from the Palestine Exploration Fund in London.

Finally my sincere thanks go to several academic colleagues and friends—Dr Nazmi al-Ju'beh for many discussions and for translating any German text; Khalid 'Abd al-Salih al-Razihi of Yemen and Sa'ib Quwwas, for helping in Arabic-English translations; Dr Hasan al-Silwadi (Dean of the Faculty of Arts, al-Quds University) for help with poetry in the foundation inscriptions; Dr Kamil 'Abd al-Fattah (Birzeit University); Dr Su'ad al-Amiri (Riwaq); 'Isam 'Awad (Aqsa Restoration Committee); 'Abd al-Rahim al-Khayyata (Auqaf Administration); Dr Mahmud Hawari; Dr Shadya Tuqan (Welfare Association); and Mrs Haifa al-Khalidi.

CATALOGUE OF BUILDINGS

Yusuf Natsheh*

Introduction

The catalogue is a description of fifty-five standing Ottoman monuments. Each building in the catalogue is given a number and is listed in chronological order. As a first choice, the name of each building is taken from either foundation or restoration inscription. If no inscription exists, the name of the building has been adopted from the relevant *waqfiyya* or *sijill* record. In a few instances, the name reflects the function or location of the monument. The dates are also taken from the inscriptions and *sijill* records, and appear first in the *hijri* form, followed by the equivalent in the calendar of the Christian Era.

Following a brief description of the location and comments on the site of each building, a short description is supplemented by a more detailed treatment which is divided into two main sections. The first concerns the

history of the monument. It focuses on the literary evidence—inscriptions, *waqfiyyas* and other texts, where there is such material—to provide details as to the date, identity of the founder, endowment and any attendant stipulations, the purpose of construction, and the original use. If there is information on subsequent usage, this is also included.

The second section covers the physical appearance of the building, and consists of a more detailed description of the architectural and decorative features. Wherever possible, an attempt has been made to differentiate between the original structure and later additions or changes, based on documentary evidence. This information is contained either within the text of the catalogue entry, or in a footnote. This section is illustrated with drawings—plans, sections, and elevations—and with photographs.

* *Acknowledgements and thanks: plans and photographs*

The majority of the drawings for the catalogue of buildings were prepared for publication by David Myres from originals by draughtsmen from the Department of Islamic Archaeology, Jerusalem. These were:

Husain M Katiba	‘Umar S Hijazi
Taufik al-Sharif	Hatim S al-Ja‘bari.

The original surveys were by architects from the Department of Islamic Archaeology:

Bassam K al-Hallaq
Khalil I Abu ‘Arafa.

Most of the photographs were taken by Joe Rock from the University of Edinburgh. Others are by:

Kamal al-Munayir	Ahmad Y Taha (DIA)
David Myres	Sylvia Auld

The plans and photographs for al-‘Imara al-‘Amira (cat. no. 15) are by:

David Myres	Hamish Auld
Elizabeth Jackson	Euan Miller
Sofie Skoug	Joe Rock.

Plans for al-Khanqah al-Maulawiyya (cat. no. 19) were prepared for Dr Shadia Tuqan, Director of the Technical Office of the Welfare Association, Jerusalem.

1 MASJID AND MINARET AL-NABI DA'UD

Name: Masjid al-Nabi Da'ud (Mosque of the Prophet David)

Date: The lower level of the Cenacle was converted into a mosque in 856/1452, the upper level in 930/1524

Endowment: At various dates:

- (1) 10 Dhu 'l-Qa'da 963/15 September 1556
- (2) Beginning of Jumada II 964/April 1557
- (3) End of Shawwal 973/19 May 1566

Variant of name: Mujir al-Din (1973 2: 98, 349, 351) gives two names—the first being Qabr (Tomb)¹ al-Nabi Da'ud; and the second is Qabu (vault) al-Nabi Da'ud. In the Auqaf Administration File² 3/17/124 the site is called either Maqam al-Nabi Da'ud (Place of the Prophet David) or Masjid al-Nabi Da'ud. The names of the site in Christian tradition are 'Alliyat Sahyun (The Upper Room of Zion) and the Place of the Last Supper (Coenaculum) or Cenacle.

Modern name: Masjid al-Nabi Da'ud

Location

The site is located outside the walls of the Old City some 130m south of David's Gate (Zion Gate).

Site and brief description (figs. 1.1-1.2, pls. 1.1-1.7)

The complex is extensive. It has not been surveyed for the purposes of this book because access is restricted; it is now in part a *yeshiva* which occupies the ground floor. The description which follows is therefore largely based on earlier work, notably that of Vincent and Abel. The layout comprises a sequence of halls, courtyards, three mosques, a minaret, *zawiya*, cemetery, and a hall built in Crusader style, which houses the Coenaculum itself, as well as rooms, vaults and attics. These structures date to different periods—some are doubtless Crusader and some are Mamluk. The majority, however, date to the Ottoman period. The present study is restricted to the architectural elements dating to the 16th century—a period which covers the conversion of the site to a mosque, the installation of the *mihrab* and the small domed structure at the south-west corner of the mosque adjacent to the minaret.

The complex, which has been of varying importance at various times to Jews, Christians and Muslims, has undergone several changes of ownership, with extensive alterations over the years. From 1368/1948 it has been under the control of the Israeli Ministry for Religious Affairs, acting as a representative of the Israel Lands Authority for the Custodian of Absentee Properties. Part of the complex now houses a *yeshiva*, and the lower mosque

has been converted into a synagogue. The Coenaculum was opened to the public in the mid-1980s.

History

Identification

Mujir al-Din (1973 2: 98, 351) gives a brief, concentrated account of the site, from which it can be understood that it was then in the possession of the Christians,³ and that it was the source of innumerable disputes. Although the issue was laid before more than one sultan, the site continued to change hands frequently between Muslims and Christians. Mujir al-Din reports that this volatile situation remained unchanged until 856/1452 when, during the reign of Jaqmaq (842-57/1438-53), it was decided to expropriate it from the Christians. On the other hand, Darrag (1968: 9), relying on Franciscan documents of the Mamluk period, has shown that the dispute was rather between the Christians and the Jews. According to this study (Darrag 1968: 27), the Jews took advantage of the deterioration in relationships between the Mamluks and the Franks and took control of the site in 823/1420 and again in 833/1429, during the reigns of Sultan Shaikh al-Mu'ayyad Saif al-Din and Barsbai (al-Ashraf Saif al-Din) respectively. It was only later, in the time of Jaqmaq, that the Mamluk authorities decided to convert the lower vault into a mosque. The Ottomans followed their example and converted the upper hall too into a mosque, taking the view that the conversion would finally provide a solution to the problem. The work was done in stages, the major phase being under Sulaiman in 930/1524.⁴ This phase is documented by an

³ The site has a long history and is highly venerated by Christians. Almost every prominent visitor or scholar has written about it, and it is considered one of the essential sites to be visited by every pilgrim to the Holy Land. It is sufficient here to indicate the recent bibliography for the site compiled by Bieberstein and Bloedhorn (1994 2: 118-27).

⁴ Following the conversion to a mosque, in 960/1552 the Franciscans were expelled from the site but continued to live in the area of Mount Zion. From that time up to the present day, the Franciscans have continued to stress their rights to the site, but their efforts have so far proved unsuccessful. According to Fr A Rock, the Franciscans tried in 1230/1814 to reach an agreement with the Auqaf Authority by which the Coenaculum would be separated from the *maqam*, with the friars retaining the former while the latter continued to be administered by the Auqaf. But the negotiations were halted for some unknown reason. In September 1971 the Israeli Ministry of Religious Affairs turned down a request from the representative of the Dajani family, Shaikh Jamal al-Din al-Dajani, to be allowed to regain access to their properties on Mount Zion (File 3/17/124, 43). The Dajanis are prevented from burying their dead in the family cemetery, although they are allowed access for visits. The monumental stucco windows of the mosque were vandalised some time between 1984-6, although the mosque (the hall of the Coenaculum) was closed to the public at that time. The Dormition Abbey, which is close to the Masjid al-Nabi Da'ud is reported to have 'apprehended and turned over to the police a fundamentalist rather than *yeshiva* student who had broken all the windows in the Dormition's new administration wing with stones in a dawn attack' (see *The Jerusalem Post Magazine*, Friday 6 June 1986). A little later, early in 1986, the Israeli Ministry of Religious Affairs decided to open the hall of the Coenaculum to the public. As a result, an architect, Peter Bougat, was entrusted with the necessary repairs to the room. According to *The Jerusalem Post Magazine* (Friday 6 June 1986), he left the windows without attempting a restoration in order not to change the *status quo* of the site, adding new windows for protection on the outside. Dr Hisham Dajani, in a letter (File 3/17/124) sent to the Israel Minister of Religious Affairs expressed his

¹ Mujir al-Din (1973 1: 116; 2: 349), in reference to this definition, modifies it somewhat by adding 'it is said that ...'. His description has already confirmed that the Prophet David is not buried here, but rather to the east of the Jismaniyya (Gethsemane). It is not known where the Prophet David was buried, although some scholars hold that the site was on the ridge to the west of Silwan, if it is right to see this area as 'the City of David'. But all this is contentious. For a recent discussion, see Auld and Steiner 1996: 21-47.

² The file is comparatively new; it contains only sixty-two pages, the first dated 18 December 1978, and the last 13 Shawwal 1407/9 June 1987.

inscription on the eastern wall of the mosque. The minaret, as an important symbol of Muslim presence, is also, in my opinion, by virtue of its design, datable to the Ottoman period.

Date

The minaret is not dated by inscription, but it can safely be assigned to the 16th century because of its architectural features (see below). The conversion of the Upper Room to a mosque, on the other hand, is securely dated 1 Rabi' I 930/8 January 1524, according to an inscription published by van Berchem (1923: 403-4, no. 109). The marble panel, measuring 70cm by 35cm, is fixed to the eastern wall of the mosque. The inscription consists of four lines of Arabic written in early Ottoman *naskhi* script. The lines are set in cartouches, but are difficult to read because of the extremely condensed arrangement of the words, which are interwoven with each other. According to van Berchem (for the Arabic text see Cat. Appendix 2), the translation is as follows:

In the name of Allah, the Compassionate the Merciful, the order to purify and cleanse this place and to make (here) a mosque in order the name of Allah be recited in it, is by the Sultan of Mankind, the Protector of the Islamic Faith, the Servant of the Sacred House (at Mecca), the Establisher of Justice and Security, the Sultan, son of the Sultan, the Sultan Sulaiman son of 'Uthman, may Allah support Islam throughout his life, by the hand of our Master the Leader of the *shaikhs*, al-Shamsi Muhammad al-'Ajami the Preacher, may Allah carry out blessings through his hands and have mercy upon his parents, on the day of Thursday at the beginning of Rabi' I in the year nine hundred and thirty, and praise be to Allah alone.

From the Franciscan documents, Darrag (1968: 30) has shown that al-Shaikh al-Shamsi Muhammad al-'Ajami had previously travelled to Istanbul with a local *fatwa* and a report from the *qadi* of Jerusalem. He had been granted a decree by Sultan Sulaiman at the beginning of Jumada I 929/March 1557 which ordered the *qadi* of Jerusalem to demolish the hall over the vaulted chamber and to convert the site into a mosque.

surprise that he had not been consulted in his role of caretaker of the *waqf*. He added that the actions of the Israeli Minister of Religious Affairs were 'a violation of the law and the circulated regulations'. The Auqaf Administration is not satisfied with the restoration undertaken: this neglected other parts of the site that also needed attention; the standard of the jointing is unsuitable; and the old iron grilles were replaced by a new unsuitable version (file 3/17/124, 9). On the other hand, Fr Claudio Baratto was quoted (*The Jerusalem Post*, 30 May 1986) as praising the ministry for the restoration work. However, the representative of the Custodian of the Holy Places in the Holy Land, Fr A Rock, commented in *The Jerusalem Post Supplement* for 20 June 1986 that Fr Baratto's comments were purely personal. Finally, Fr Maurilio Sacchi, the Custodian of the Holy Land, responded to an account in *The Jerusalem Post* and *The Jerusalem Post Magazine* of Friday 10 February 1987 that properties were to be let in Mount Zion by the Israel Lands Authority who were acting in their capacity as Custodian of Absentee Properties. His letter (File 1/17/124, 54) to the Ministry of Religious Affairs stated that 'we regret to say that we cannot accept this, because neither the Islamic *waqf* nor the Custody (*sic*) of the Holy Places, which have claims on these Holy Places, can be considered absent.'

Endowments

Sijill 53: 54 contains a lengthy report of some five hundred words on the various endowments to the Maqam al-Nabi Da'ud. It is dated 16 Rajab 977/25 December 1569, and was presumably copied into the *sijill* as a precaution, should there be any opposition in the future to the work of the administrator of the *waqf*. The reason for so believing stems first from the context of the report, and secondly because it finishes with a clear message contained in the phrase 'this was recorded to be used (as a proof) whenever the need should arise'. The report contains three parts. The first is an introduction from which it becomes evident that the Maqam al-Nabi Da'ud had no *waqf* or other income, unlike all the other *maqams* of the prophets. The governor and the *qadi* of Jerusalem had reported this fact to the sultan, and he in response had issued an order to the governor of Syria and to the *daftardar* (in charge of the finance) of the district of Syria and Aleppo, specifying certain estates as *waqf* to Maqam al-Nabi Da'ud.

These estates, descriptions of which constitute the second element of the report and which were made *waqf* by means of variously dated orders, were:

1. The village of al-Sawiya in the district of Nabulus, dated 10 Dhu 'l-Qa'da 963/15 September 1556.
2. The village of Bait Sira in Gaza district dated on Jumada I 964/March 1557.
3. The *muzra'a* (cultivated area inhabited seasonally) of Tell al-'Uja near the village of Majdal Yaba.
4. A plot of land near the village of Bidya known by the name al-Dawawiyir.
5. The *muzra'a* of Umm al-Tina close to the village Majdal Yaba. The last three items were dated at the end of Shawwal 973/19 May 1557.

All the above income (not further specified) was to be allocated for the benefit of the *maqam*, to provide food for visitors and the poor, for the maintenance of the *maqam*, and for providing the wherewithal to light the lamps of the *maqam*.

The third and final part of the report is the longest. It is a confirmation of the legal authorization issued by the *qadi* to al-Shaikh Yunus to continue in the position of *al-mashiyakha* (administrator) of the *waqf* as his father and grandfather had been before him. (For the whole Arabic text see Cat. Appendix 1, no. 1/1.) It appears that the Khassaki Sultan, wife of Sultan Sulaiman (see cat. no. 15), had also donated a certain *waqf* to the *maqam*. Sijill 83: 186 dated Shawwal 1010/March-April 1602, includes the record of the appointment of al-Shaikh 'Abd al-Hafiz ibn Mahfuz to the position of Qur'an reader in the *maqam*. He was to read passages from the Qur'an every day after the noon prayer. No details of his salary are given. Sijill 121: 231 dated 1043/1633-4 states that al-Shaikh Abu Bakr had been appointed to the position of restorer (*mi'mariyya*) in the Maqam al-Nabi Da'ud. He was allocated one *'uthmani* per day from the income of the *waqf* of Khassaki Sultan. Bairam Pasha, the governor of Egypt, as reported in Sijill 113: 1, also sent a generous donation to the *maqam* in the year 1038/1628-9. It included different kinds of variously coloured drapes (*sir*), in addition to one thousand *qit'a misriyya* (silver coins). In the 11th/17th century, Nabi Da'ud evolved as a sanctuary for pilgrims (*ziyara*) and was visited by al-'Aishi, al-Nabulsi, al-Bakri and others, who have all left a brief description of the site and are cited by al-'Asali (1992: 212, 266, 273, 281, 287, 292, 300, 306). It appears that the Dajani family

were entrusted with the role of caretakers of the site, and continued in the position, which was inherited, by means of royal *firmans* and decrees (Auqaf file 3/17/124).

Architecture

The Mosque

The mosque is situated on the second level, and approach to it is by way of a staircase leading to a passageway that has been recently roofed. Its main entrance is on the north façade, and there is another small inner staircase in the south-western corner of the mosque that gives onto the first floor; this is now closed. The mosque, which in Christian tradition is the place of the Last Supper, retains most of its earlier architectural features, and employs some Crusader material, for example the arches and the columns which act as window-frames, and the vaulting. The interior consists of a rectangular hall divided into three sections by central piers. The east section is rectangular while the central and western sections are each square bays. The hall is covered by rib vaults, carried on the two central piers. For a full description and detailed plan see Vincent and Abel (1922 2, 3: pl. XLIV, 431-40).

When the site was converted into use as a mosque, certain architectural and decorative elements with a symbolic content were added. The main focus is the *mihrab*. There is also a small cupola whose original function is unclear in the south-western corner of the hall; this includes a medieval capital depicting pelicans plucking their parent's breast; their feet rest on grotesque heads. This image, which connoted self-sacrificing love in medieval Christian iconography, symbolised Christ who gave his blood for the sake of humanity. In addition to the *mihrab* and the cupola there are two monumental windows with stucco supports for coloured glass, tiles with Islamic phrases in Arabic calligraphy, and a minaret.

Mihrab

The stone *mihrab* is unique in Jerusalem for its size, design, high quality and skilled carving. It relates more closely to Ottoman than to Mamluk examples found on the Haram and in the Old City; indeed, it seems to represent the first and last example of this type of Istanbul court sculpture to be found in Jerusalem.

(Editorial note. To find a parallel it is necessary to look at imperial work in Anatolia like the Selimiyye Cami, Edirne (Goodwin 1971: 265, pl. 253) which has several close parallels to the Jerusalem *mihrab* or the Süleymaniyye (Necipoğlu-Kafadar 1985: 103, pl. 14 and 111, pl. 23—*mihrab* and portal respectively) and its successors (like the Sokullu Mehmet Pasha Cami, Istanbul, Goodwin 1971: 234, pl. 224 and 274: 261), although a similarly fine *mihrab* existed in the Süleymaniyye in Damascus (Watzinger and Wulzinger 1924: 104, *Abb.* 25). The finely worked *mihrab* is in the form of a rectangular panel (2.8m x 5.3m) that acts as a frame to the central niche. It is raised above the level of the floor on a stone dais, and is capped by a heavy cornice that carries a triangular pediment headed by a trilobate foliate frieze. The flat surface of the *mihrab* is plain. The main area, that is the area of the niche itself, is marked by a *cavetto* moulding which acts as a frame. The upper part of the niche is accentuated by a stalactite semi-dome and is framed by another *cavetto* moulding which mounts the slope of the triangular form in steps. A single plain roundel decorates the spandrels to either side of the central semi-dome. The lower part of the niche, which is faceted, consists of three stone countersunk panels, each with a trilobate head. These in turn are flanked by a pair of engaged columns,

with identically designed bases and capitals, which stand on faceted plinths. The form of the capitals and bases is that of a ribbed gadroon which is constricted at the centre by a ring moulding with zig-zag decoration. The gadroons are in turn framed by an angular geometric chain-interlace between two plain fillets. The overall effect is elegant but unstable, as if capital and base were too slender to support the weight of the column, let alone the implied weight of the inner frame. SA.]

The *mihrab* is undated but in my opinion, taking the plan from Vincent and Abel (1922 2, vol. 3: 431-40, pl. XLIV) as my authority, it would appear that it was installed some time after the publication of that survey.

The Minaret

The minaret rises from the south-western corner of the roof of the mosque and is constructed of stone. Its form is a somewhat squat cylinder in comparison to other Ottoman minarets in Jerusalem, but the prominence of its location and the site itself, high on Mount Zion, more than compensate for the short shaft. This is borne on a plinth, which acts also as a zone of transition to mark out the minaret as distinct from the roof of the mosque. The plinth has four courses of stone that are different in quality, size and cut from those employed for the shaft. The stone of the plinth would appear to be *malaki*. The upper four corners of the plinth are chamfered in a convex curve to convert the square plinth to a circular base for the cylindrical shaft, the start of which is marked by a ring moulding. A door in the eastern face of the plinth gives onto a spiral staircase with a solid core of steps that lead up to the gallery. A second roll moulding marks the end of the shaft and the start of the *muqarnas* head. The shaft is unadorned apart from two slit windows that provide light and air for the interior. The *muqarnas* zone, which acts as the support for the projecting gallery, consists of two corbelled levels, topped by another roll moulding. Below the corbels there is a narrow band of counterchange joggling in the form of trefoils (compare the decoration of Sabil Qasim Pasha, cat. no. 2).

The gallery for the call to prayer, supported by the *muqarnas* zone, is circular and at present uncovered. It is surrounded by a solid stone barrier whose appearance suggests a recent date; it was erected, perhaps a short time before 1948, by the Supreme Muslim Council. A similar stone barrier is found on the minaret of the Citadel, but that was done in 1956. The lantern (*sham'a*) is also circular and consists of two parts. The lower level is built of stone and rests on the base of the *mu'adhdhin's* gallery. The staircase ends here and opens through a doorway to allow access for the *mu'adhdhin* as well as providing light and ventilation for the stairwell. The transition to the apex of the lantern is marked by another prominent roll moulding, from which rises the ovoid dome. This is undecorated and is constructed from a mortar and stone mix, which is a firm indication of a later restoration.

Dating the Minaret

As already explained, the minaret is undated, although it includes many architectural and decorative features in common with other examples in Jerusalem dating from the Ottoman period. These include a circular shaft, rounded convex triangular corners to the base, friezes of incised counterchange joggling, simple *muqarnas* corbelling, and various types of moulding. Because of this there is some justification in the proposal that the minaret of al-Nabi Da'ud may be a 16th-century construction. This is supported by the importance of the minaret as a symbol of the presence of

Islam as well as the swift conversion of the site into a mosque, as reported by Darrag (1968: 29-30). For a detailed argument on this and a comparison with other Ottoman minarets in Jerusalem (including the minaret of Bab al-Asbat, which was restored in 1007/1598-9), see Ch. 36 under 'Minarets'.

[Editorial note. Evidence for a 19th- or early 20th-century restoration or rebuilding is to be found over the windows of a small building within one of the courtyards. An oculus window is centred above a larger opening with a grille; the oculus is filled by a stone grille of an eight-pointed star polygon. Immediately below it, the upper of two stone lintels is incised with a design of two affronted birds, their beaks joined over a small 'tree'. The design is abstracted, the birds being shown as semicircles from which a tuft (the tail) emerges at the outer end and the head at the inner end. The only other detail is a pair of short curved additions on their 'backs' to represent the wings. The style is reminiscent of embroidery. Compare, for example, the 'branch of pigeons' design for cross-stitch (*irq al-hamam*; Rajab 1989: 143) or, even closer, the couched thread pattern in the centre of a side skirt panel from a dress from Bethlehem of the late 19th century (illustrated in Weir 1989: 132 left). It is interesting, but probably not related unless as an appropriate motif to bring good luck, that birds also feature at the terminals of a decorated panel in the east portal of Dar al-Sitt Tunshuq (Burgoyne 1987: 487, pl. 48.2). The effect of an embroidery pattern on the building at Nabi Da'ud is heightened by the treatment of the central 'tree' on the carved lintel. The tree is probably intended as the tree of life, and its appearance is very close indeed to the almost universal use of the cypress tree (*sarw*) in cross-stitch panels. (For a clear example, see Weir 1989: 222 right). Analysis of these patterns was initiated by Grace M Crowfoot and Phyllis M Sutton (1935: 25-37) who illustrate the cypress in pl. XII 2, a cock (*dik*) and a pigeon (*humama* or *hamam*) in pl. XIII, 3 and 7 and XVI, and ducks or geese (*but*, *wizz*) in pl. XIV 5. A single example of the bird appears over the smaller window to the left at Nabi Da'ud.

On the main lintel above the larger window, there is a curious design of two 'horns' to either side of a central medallion. The roundel has a six-pointed star carved in relief (a seal of Solomon—*khatam Sulaiman*—see Auld, Ch. 25); in the centre of the design there is a hexagon, each corner of which is joined by a bar to the centre. The effect of the paired 'horns' is reminiscent of a severely abstracted image of a quadruped, but is probably derived ultimately from the Mamluk blazon of paired trumpets or powder horns (Leaf 1983: 61-74). Similar abstract motifs are found elsewhere in Jerusalem, for example on the Sabil al-Khalidi, where they flank a central suspended medallion (see cat. no. 44). SA]

2 SABIL QASIM PASHA

Name: Sabil Qasim Pasha (The Fountain of Qasim Pasha)

Date: 933/1527

Endowment: See below

Variants of name: The monument appears as 'Sabil Qasim Pasha' in al-'Arif (1947: 99), al-'Asali (1982: 255), Drory (1980: 66), and Schiller (1989: 126), and as 'Sabil Bab al-Mahkama'¹ and 'Birkat Ghaghanj' in Burgoyne (1976: no.121) and al-Husaini (1977: 20). Some authorities have combined the two names: van Berchem (1925: 167); Walls and Abu'l-Hajj (1980: 18), Najm *et al.* (1983: 332), and Taha (1988: 74). The name of the pool is obscure and appears in different forms in the references cited above, for example *varanj*, *ghanghanj*, *ghaghanj*, *varnj*. Al-'Asali (1982: 257) has reviewed the variations in the title and proposed a correction of the form to *naranj* (bitter orange), taking as his authority the relevant Jerusalem Sijill 205: 24 dated 1119/1707-8 and the *waqfiyya* of the Tankiziyya (729/1328-9). Two earlier records in the *sijills* (76: 227; 85: 8) have been discovered (see below) which tend to add support to the proposal of al-'Asali.

Modern name: Sabil Qasim Pasha and Birkat al-Naranj.

Location

The *sabil* is located to the west of the Haram esplanade, about 30m north-east of the Bab al-Silsila.

Site and brief description (fig. 2.1, pls. 2.1-2.6)

The *sabil* is free-standing, situated opposite al-Ashrafiyya and between Mastabat Sabil Qa'itbai and the Mihrab Mastabat al-Tin (Mihrab Ahmad Qullari cat. no.47). It is octagonal in plan and consists of a closed cistern covered by a shallow dome. The *sabil* itself is constructed over a low base sunk 1.1m below the level of the Haram esplanade. The excavation of the foundation was necessary to secure the flow of water into the *sabil* cistern through the traditional canal (Qanat al-Sabil)² used to irrigate the Haram area from al-'Arub and Birak Sulaiman (King Solomon's Pools). It appears that the source and canal continued to provide the *sabil* with water until the late 1940s, for al-'Arif (1947: 99-100) maintained that the water for the *sabil* was provided by the Qanat al-Sabil, and that the fountain was then still in use.

The pool abuts the *sabil* to the north. It too is below the level of the Haram at a depth of 0.5m. It is square in plan, each side measuring 7m. It is 0.5m deep, that is its sides finish at ground level. It is paved with marble slabs, and in the centre there is a modern fountain. The perimeter is fenced by a modern cast-iron grille. Both the marble paving and the cast-iron fence are the result of a restoration by the Supreme Muslim Council in 1922 (al-'Asali 1982: 257). Although the *sabil* still functions, the pool

and fountain are no longer used. There are, however, recent stone benches which were built in 1998 by the Aqsa Restoration Committee to service the *sabil*. The benches are built around the east, west, and north sides of the pool. Each bench is placed opposite a water tap to allow visitors to the Haram to perform their ablutions.

Function

The word *sabil* literally means 'way' or 'path' and is still commonly used with the word Allah (*fi sabil allah*) to denote a charitable act or a work done for the sake of Allah. From an architectural point of view, the term is used for a building which provides drinking water for humans. The main function of any *sabil* was to deliver free fresh water to the general public whether for drinking or for ablutions. In Jerusalem the earliest *sabils* still standing date to the Ayyubid period. During the Mamluk period many *sabils* were built in Jerusalem, the best preserved example of which is the Sabil of Sultan Qa'itbai (887/1482) (on Sabil Qa'itbai see Kessler and Burgoyne 1978: 250-60. On Mamluk *sabils* in general see Burgoyne 1976. For a general view on the *sabils* which were built in Jerusalem during the Ottoman period, see Ch. 36 under *Sabils*; and for specific information about each Ottoman *sabil*, see cat. nos. 4, 5, 6, 7, 8, 9, 18, 36, 40, 44, 45, and 47).

History

Identification

In the course of his account of the restoration programme on the Haram al-Sharif undertaken by Qa'itbai, Mujir al-Din (1973 2: 330) relates without further detail that Qa'itbai repaired a *fasqiyya*,³ located to the south of the *mastaba* adjoining the sultan's *sabil*. Al-Nabulsi, who visited the Haram in 1101-5/1690-3, gives more detailed information. His description of the pool (cited by al-'Asali 1992: 257) states '... at the boundary of Masjid al-Hanbila (part of al-Ashrafiyya) and facing it, there is a big square pool (*bahra*); its water runs from a fountain at its centre'. The description of the *sabil* is amplified by his statement that 'next to that pool, there is a small dome with water pipes around it to (serve those) who seek ablution. Its taps are turned to allow the water to flow or cease.' Despite the earlier reference to the *fasqiyya* by Mujir al-Din, the current *sabil* is securely attributed to the Ottoman period by its foundation inscription.

Date

The foundation inscription carries the information that the *sabil* was constructed in the year 933/1527. The date is significant because it makes the *sabil* not only first monument built in the Haram al-Sharif during the Ottoman period but also the first in the Old City of Jerusalem as a whole. (See below for a fuller discussion.) The earlier work in the Ottoman period had not been a new building but rather the transformation of the Cenacle into the Masjid al-Nabi Da'ud (David), situated outside the present city walls. The inscription on the *sabil* is published by van Berchem (1925: 167) with a valuable commentary. The panel is of hard limestone and is to be found in the middle of the western

¹ *Mahkama* is the Arabic word for 'court, tribunal'; Bab al-Mahkama is an alternative name for Bab al-Silsila because al-Madrassa al-Tankiziyya used to house the Shari'a Court. An early reference to the name is by Evliya Çelebi (Stephan 1980: 89; see too al-'Asali 1992: 243-4).

² Qanat al-Sabil was one of the main sources of water for Jerusalem from the Roman occupation to the end of the British Mandate (1917-1948) when water was brought to Jerusalem from Ras al-'Ain, west of Jerusalem. There was a special *waqf* for the Qanat dedicated to its maintenance and security. For more details on the Qanat al-Sabil, see Ch. 36 under the title 'The Water Project' and especially note 16.

³ *Fasqiyya* has two different meaning in Arabic. The first, which is the one intended here, is the place where water is gathered. It could therefore refer to a fountain or place of ablution. The second meaning is a burial niche in a collective tomb. For more details about the use of the word in Mamluk documents, see Amin and Ibrahim (1990: 85).

side of the octagon; it is rectangular in shape, measuring 75cm by 38cm. The text, which is here to be found in Cat. Appendix 2, no.2, is composed of three lines of Arabic written in condensed Mamluk *naskhi* script set in a rectangular cartouche. The script is fine with diacritical and auxiliary points. Van Berchem put a question mark after the name Qasim, probably because there is an additional of *alif* between the name 'Qasim' and title 'Pasha'. Its translation reads:

This blessed *sabil* has been constructed for the benefit and countenance of the Extolled Allah, in the days of our master the greatest Sultan, the second Sulaiman to rule the world, the Sultan Sulaiman son of Sultan Selim Khan, the Prince of the Arab and non-Arab princes, by our master Qasim Pasha, may Allah facilitate what he (Qasim) intended, by the hand of the slave who is in need of Allah, 'Abd Rabbihi Mustafa in the last ten days of the extolled Sha'ban, the year 933.

Founder

The founder of the *sabil* who features in the inscription is probably Qasim Pasha Guzelje, which would confirm van Berchem's reading of the name (1925: 168), for Sumer (1987: 722) said of Qasim Pasha that 'he was interested in both building and charitable concerns'. According to this commentator, Qasim Pasha Guzelje held many different positions but was not affiliated to Jerusalem in any of them. Al-'Arif (1947: 99) and other local authorities after him (al-'Asali 1982: 255; Najm *et al.* 1983: 332; Taha 1988: 74) thought Qasim Pasha was governor in Jerusalem when the *sabil* was built. Unfortunately they give no reference to back their belief. It would rather seem that Qasim Pasha ordered the *sabil* to be built in 933/1527 while he was governor of Istanbul, and not governor of Egypt.

Because Sabil Qasim Pasha today serves mainly for ablutions, and because Mujir al-Din (1973 2: 330) reported that a *fasqiyya* on the site had been repaired by Qa'itbai (see above), al-'Asali (1982: 257) believed that Qasim Pasha had not in fact constructed the *sabil* but rather had rebuilt it. The inscription, however, is quite explicit; it refers to the *construction* of the fountain by Qasim Pasha. It is also possible that the site of the old *fasqiyya* referred to is that of the present pool rather than the site of the *sabil* itself.

Endowment

So far no endowment has been found in the *sijills* for the Sabil Qasim Pasha. Perhaps the records begin too late; the first record in the *sijills* is dated 14 Shawwal 936/11 June 1530 and is thus almost three years after the date for the construction of the *sabil* recorded in the foundation inscription. However, two records were located for the 'Pool of the Bitter Orange' and they cast some light on the source and the type of endowments for the pool. The first record is in *Sijill* 76: 227 dated 1 Muharram 1003/16 September 1594. It reports that a group of people went to the *qadi* and informed him that the water in the two pools of the Haram (one of these is the Birkat al-Naranj) had run out. They requested that the two pools be refilled from the cistern situated close to the Birkat al-Naranj, as had been the custom in the past. Shaikh 'Abd al-Qadir, the deputy inspector of al-Aqsa, was summoned and was ordered to refill the pools with water. He was given permission to buy buckets and ropes from the *waqf* budget. The second entry (*Sijill* 85: 8), dated 11 Rajab 1013/3 December

1604, records the appointment of Yahya the son of al-Shaikh Mahmud to the half-post of cleaning the Naranj pool, al-Kas (the water basin) and the *hanafiyya* (tap),⁴ which are located in the precinct of Aqsa mosque. Yahya was to be allocated one '*uthmani*' (silver coin) per day. From the above two entries it is possible to infer that the maintenance for the pool of the Naranj and probably the *sabil* as well was paid out of the endowment of the *waqf* of al-Aqsa mosque.

Architecture

Exterior—elevations

The *sabil*, built entirely of white dressed stone, consists mainly of eight symmetrical elevations surmounted by a dome. Each of the elevations can be divided theoretically into three sections for the sake of architectural description. The lowest level, composed of five courses of stone, appears at first glance to be different from the rest of the fabric of the *sabil*. But closer inspection shows that while the quality of stone is the same, the joints between the stones differ considerably from those of the central and upper sections of the elevation in that they are thicker and darker. It would seem that the change in pointing is due to relatively recent repairs. The first course of the lowest level is set directly above a low projecting base, which is constructed of rubble and is now clad in cement. The centre of the lowest level of each elevation is decorated by a marble panel set in a shallow recess. Each panel has a rounded apex and is three courses deep (35cm by 75cm). Except for the western face, a central roundel (18cm in diameter) is incised into the coping stone above the panels. The roundels contain either (1) a six-petalled rosette, the tips of each petal cutting through a central circular recess; (2) a whirling rosette of thirty spines; or (3) a hexagon subdivided into a six-petalled device.

The middle section of six of the façades contains a blind recessed window, surmounted by a pointed arch. The voussoirs are framed with three engraved interlacing lines. The western and eastern façades differ from the others in that in place of the window the position is used to house the foundation inscription and the doorway respectively. The blind recess of the other faces has at the centre of each a white marble panel measuring 19cm by 53cm and, directly beneath, a decorative motif of an interlaced knot (22cm in diameter) consisting of two irregular intertwined ovals around a small central roundel.

The upper third part of the elevations is undecorated apart from a panel (65cm by 23cm) of engraved trefoil counterchange motifs. Once painted in black—for traces of the colour still can be seen—they may once have been filled with ceramic insets. Although not identical, other examples of this technique are to be found in the entrance porch of the Ashrafiyya and in the North-Western Khalwa of Ahmad Pasha (cat. no. 22). Two courses above the decorated band, a broad canopy shelters the steps and the benches around the *sabil*. The canopy is made of wood; it is covered with lead sheets and supported by eight wooden posts. Each post has a square, stone plinth and a wooden console. There is evidence of the remains of springing in the main fabric in this part of the *sabil*. The canopy is not dated, but it is

⁴ It is unfortunate that the text in the *sijill* does not define the exact location or give a further description of the *hanafiyya* (tap or faucet) in the Haram. But it is presumed that the water tap had an associated basin, to explain the reference to cleaning. It is worth mentioning too that *hanafiyya* is the name of the most famous orthodox school of theology in Islam, founded by Abu Hanifa (d. 150/767)

possible that it is the work of the Supreme Muslim Council in the 1920s. It was renewed in 1998 by the Aqsa Restoration Committee; during the restoration work it became clear that the stone had been cut at the point where the canopy rests on the octagonal body of the *sabil* in order to support it. This means that the canopy is not original. At one time, therefore, the fountain had a form different from its present appearance. Further evidence can be drawn from the shape of the dome of the *sabil*.

Before the Aqsa Restoration Committee initiated the repairs on Sabil Qasim Pasha in early 1998, the dome had been covered with lead sheets. From the exterior, the sheets gave the dome a pointed profile and it appeared to rest immediately on the octagonal elevation of the *sabil* with no zone of transition. It culminated in a typical bronze Ottoman crescent-finial facing east-west. But when the lead sheets were removed, a very beautiful and well-executed stone dome emerged. It has the profile of a horseshoe arch and it is closer to an Indian or onion-shaped dome than the typical shallow saucer of the Mamluk or the Ottoman periods. This discovery provides further proof that the original appearance of the *sabil* was once markedly different.

This raises many questions as to when this dome was built, and by whom, and how this shape of dome was introduced into Jerusalem. There are in the Haram area three domes with a similar profile although of a different size. Two of these domes, which belong to the Is'ardiyya Madrasa (760/1359) located at the north side of the Haram, are larger than the dome of the Sabil Qasim Pasha. The third dome is smaller than the dome under discussion; it crowns the *mu'adhdhin* gallery of Bab al-Ghawanima Minaret (restored c. 697/1298). It is well documented (Burgoyne 1987: 178, 370) that Minaret al-Ghawanima and the Is'ardiyya were restored by the Supreme Muslim Council, the former in 1341/1922-23 and the latter in 1346/1927-8. It would thus seem probable that the stone dome of Sabil Qasim Pasha was constructed at the same time in the 1920s by the Supreme Muslim Council. But this does not clarify why this particular shape, rather than a Mamluk one like most of the domes of Jerusalem, or, indeed, an Ottoman one was chosen. Since the Supreme Muslim Council employed the famous Turkish architect Kamal al-Din to supervise the architectural projects of the Council in the 1920s, it is possible that this innovation in the dome shape is his responsibility, or that of one of his assistants, such as Rashad al-Imam.

Interior—plan

Seven sides of the fountain are provided with four steps; only the northern façade is different in having two. The steps lead to the stone benches provided to accommodate people as they wash. The plan of the *sabil* is simple. It consists of an octagonal cistern, each side measuring 1.4m in length by 55cm thick. The present water level⁵ reaches up to 1.6m. The cistern is roofed by a shallow dome with a rounded profile, and the interior is plastered throughout to render it watertight.

⁵ There is no longer water in the cistern of the *sabil*. After the restoration work of 1998, the taps of the *sabil* were connected to running water through the main tap.

3 MINARET AND ZAWIYA AL-HAMRA' (AL-KHALWATIYYA)

Name: Minaret al-Hamra'

Date: Undated. Probably 16th century (see below).

Endowment: There are two sets of relevant *waqfs* dated c. 939/1532-3. The first was made by Hajji Beg, the previous governor of Safad and Nablus, and the second by Qasim Beg, who was then the governor of Safad and Nablus.

Variants of name: The *sijill* gives two names for what is known today as Masjid al-Zawiya al-Hamra'. The first is 'al-Manara (minaret) al-Hamra' (Sijill 69: 5, 120, 186, 189, 200, 379) and the second is 'Zawiyat al-Shaikh 'Ala' al-Khalwati' (Sijill 121: 337). The second entry in the *sijill* is explicit; it details 'the *zawiya* of al-Shaikh 'Ala' al-Khalwati which is known as 'al-Manara al-Hamra''. It is due to this combination that it is possible to identify the earlier *waqf* relating to the *zawiya*, where the building is registered under the name of 'Ala' al-Khalwati' only. In recent references, too, it appears under several similar names. Burgoyne (1976: no. 117), al-Husaini (1977: 20), and Najm *et al.* (1983: 322) all call it 'Minaret al-Hamra' (The Red Minaret), but in the Auqaf File 3/7/31 it is called both the Jami' al-Manara al-Hamra', and the Masjid al-Mi'dhanat (Minaret) al-Hamra'. The Jami' Harat ('Lane') al-Sa'diyya also occurs early in 1379/1960.

Modern Name: Masjid al-Mi'dhanat al-Hamra'

Location

The minaret is in the northern part of the Old City, to the west of al-Mi'dhanat al-Hamra' road, a few metres south of 'Aqabat al-Bistami.

Site and brief description (figs. 3.1-3.2, pls. 3.1-3.5)

The complex of al-Zawiya al-Hamra' at present consists of a minaret, a mosque and an open courtyard. The minaret is located at the north-eastern corner of the courtyard, and stands unconnected to the mosque itself. This is because the mosque was built later, probably after the total disappearance of the *zawiya* (see below). The present building, which dates to the late Ottoman period, is located in the south-western corner. The courtyard is rectangular in plan and partly planted with trees. A modern latrine is to the east, and the well-head of a cistern is located in the eastern part of the courtyard. To the east, the site is bordered by the main road (Tariq al-Mi'dhanat al-Hamra'), to the north by a passageway leading to a residential complex, and to the west and south by as yet unrecorded buildings.

The minaret and the mosque are still in use and daily prayers are recited; and in addition meetings are held on Monday and Friday nights for the invocation (*dhikr*) of Allah by the local Sufis.

History

Identification

Neither the minaret nor the *zawiya* appears in Mujir al-Din's account of the city, although he does refer to the 'Zawiya al-Bistamiyya' (1973 2: 48), which is a close neighbour, and also to the 'Zawiyat al-Hamra' (1973 2: 47), which he locates among the buildings of the western part of the Old City, close to the Khanqah al-Salahiyya. Presumably, therefore, the complex did not exist in its present state when Mujir al-Din was writing in

900/1494-5. Many records in the *sijills*, however, refer to the *zawiya* and the minaret. As early as 3 Muharram 948/29 April 1541, Sijill 13: 224 reports that 'al-Hajj Muhammad ibn Ahmad al-Amasi (probably from Amasiya, Turkey) al-Khalwati had sold the whole property which is located in Bani Zaid neighbourhood (*hara*). It is located near the *zawiya* of the deceased Shaikh 'Ala' al-Khalwati.' The *zawiya* also appears in Sijill 68: 46 published by al-'Asali (1989: 261). The record is dated between 995-7/1587-9, and is contained in a schedule of the stipends of officials and beneficiaries of the religious institutions in Jerusalem. Al-Zawiya al-Shaikh 'Ala' al-Din Khalwati is mentioned separately, and the name of the inspector of the *zawiya* is given as 'Muhammad' in a document dated 974/1566-7. There is also an important indirect record regarding the Minaret al-Hamra' in Sijill 69: 5. This is dated 28 Muharram 997/17 December 1588. It provides information about the lease of a house located close to the Hamra' minaret. The endowments and subsequent history of both *zawiya* and minaret are discussed more fully below.

Date

The minaret and the current mosque are not dated by inscription, and no mention of them is to be found in contemporary authorities of the Ottoman period or in accounts by early Western visitors. The relevant Auqaf File 3/17/31 also has nothing in it relating to date or patron. Despite this lack of documentation, modern scholarship has suggested a date in the 16th century, albeit without detailed discussion, and there is some justification for this position. Burgoyne (1976: no. 117) was the first to date the minaret to the 16th century, though with reservations. Al-Husaini (1977: 20) and Najm *et al.* (1983: 322) quote Burgoyne and, without further discussion, date it unequivocally to the 16th century. Though Sijill 69: 5, which proves that the minaret was already in existence in the late 16th century has just been mentioned, and this in turn supports the tentative date given by Burgoyne, the dating of the minaret itself needs more serious consideration. A conclusion will be attempted here after the minaret has been described.

Founder

The founder of the *zawiya*—according to Sijill 39: 516-17—was al-Shaikh 'Ala' al-Din Abi 'l-Hasan 'Ali al-Khalwati (see also above). He is described in the *sijills* (39: 516-17; 56: 650) as *qudwat al-rashidin fakh al-sulaha' al-nasikin*. These titles (which are added to his name) indicate that he was one of the prominent mystics in Jerusalem at the time. He apparently succeeded in establishing the Khalwatiyya Sufi order in Jerusalem. This particular order (*ta'ifat al-khalwatiyya*) was one of the many which were prominent in the city during the Mamluk and Ottoman periods. Muhammad ibn 'Abd al-Qadir was appointed as *shaikh* to the order on 13 Rajab 1020/21 September 1611. The descendants of Shaikh 'Ala' al-Din are frequently mentioned in the *sijills*. One reference is to his son 'Abd al-Qadir Çelebi (Sijill 56: 650) who was appointed to the position of clerk for the *waqf* of Bairam Jawish (see also cat. no. 11). Another son was the Muhammad Çelebi who administered the *waqf* of al-Zawiya al-Hamra' after the death of his father, and whose own two sons, Mahmud Çelebi and Ahmad, attested to the benefit of the *waqf* in favour of al-Zawiya al-Hamra' in the presence of the *daftardar* (see below). A third son was Ibrahim al-Khalwati (Sijill 100: 285), whose son Ishaq, and grandson Mahmud ibn Ishaq Çelebi, respectively administered the *waqf* of the *zawiya* in due course. The founder of the minaret is unknown, but it is also possible that

it was built by al-Shaikh 'Ala' al-Din or by one of his sons. The founder of the modern mosque is also unknown, but it is possible that it was built through the initiative of a group of people living in the neighbourhood.¹

Endowments

The *sijills* contain two principal documents which are relevant to the history of the Khalwatiyya (al-Hamra') as well as scattered records concerning certain appointments to the *zawiya*. The first document is registered in the proceedings of Sijill 39: 516, and is dated Dhu 'l-Qa'da 967/July-August 1560. The document states that 'it was proven by means of the law (*bi-'l-tariq al-shar'i*), in the Council of the Religious Court of Jerusalem, in the presence of our lord 'Abd al-Karim, *daftardar* (the high official in charge of finance) of the province of Syria, that the following were among the *waqfs* which belong to al-Zawiya al-Khalwatiyya. It is located in Jerusalem the Noble in the Bani Zaid neighbourhood, and was established by al-Shaikh 'Ala' al-Din al-Khalwati, may God grant him mercy.' The listed properties were:

- (1) The whole share (5 *qirat* out of 24) of the village of Dar Duyuf which is known as Bait Saqaya of the district of Jerusalem.
- (2) The complete (fourth) portion (6 *qirat* out of 24) of the grape and fig orchard (*ghiras*) in the land of al-Baq'a outside Jerusalem the Noble. It is well known by the name of the orchard of Shaikh al-Salahiyya.
- (3) The whole share (6 *qirat* and one fourth *qirat* out of 24 *qirat*) of the *qasr* which is located on the above-mentioned land.
- (4) The whole orchard of olive trees—which amounted to 120 trees—planted on the land of Lifta village (west of Jerusalem).
- (5) The whole weaving (*hiyaka*) shop situated below the *zawiya*.
- (6) The whole vault of the mill which abuts the aforementioned *zawiya*.

All the above-mentioned (estates) were made *waqf* by the late *qudwat al-umara' al-kiram al-fikham Hajji Beg mir liwa'* (governor) of Safad and Nablus.

The document goes on to record that Hajji Beg stipulated that the inspector of the *waqf* should be 'our lord al-Shaikh 'Ala' al-Din al-Khalwati during his lifetime, and after him, his sons and his descendants and heirs'. The document ends by saying that Shaikh 'Ala' administered the *waqf* in his lifetime, and after him it was administered by his son Muhammad Çelebi for more than twenty-eight years up to the date mentioned, that is 967/1559-60. A list of prominent witnesses is given at the end of the document, testifying to its legality.

The second document is close to the first in almost every detail apart from the name of the donor and the list of endowments. It carries the same date and is registered within the same *sijill* but on the following page, number 517. Here the name of the donor is given as Qasim Beg Mir Liwa' Safad wa Nablus. Qasim Beg had made *waqf* for the *zawiya* the whole share (6 *qirat* out of 24) of the orchard which was located in the land of al-Baq'a outside Jerusalem; this was attributed to the *shaikh* of al-Salahiyya. In addition, the 'whole portion (6 *qirat* out of 24) of the

qasr which was located on the above mentioned land' was specified. For the complete Arabic text with an English summary, see Cat. Appendix 1, nos. 3/1, 3/2.

It is unfortunate that the amount of income from these estates is not specified, but it is nevertheless possible to reach a rough estimate. In Sijill 100: 285, which includes the events of the year 1028/1618-1619, Ishaq Çelebi, the son of Ibrahim al-Khalwati and the inspector of the *waqf* of his father's grandfather, attested in the religious court that for the past five years he had faced difficulties in collecting revenues from the people of the *waqf* of the village of Bait Saqaya and of the village of Lifta. He had, therefore, exchanged the *waqf* income for 25 *ghirsh asadi* (gold coins)—twenty for the village of Bait Saqaya and five for the olives of Lifta—with the agent of *amir al-umara'* (the prince of princes) Muhammad Pasha, who had retired in Jerusalem (for his biography, see cat. no. 19).

It seems in 1041/1631-2 that the descendants of al-Shaikh 'Ala' al-Khalwati lost their monopoly of the administration of the *zawiya*, and another prominent family (al-Ghudayya) became their rivals. Sijill 121: 379, dated 8 Safar 1043/14 August 1633, records that the *qadi* had prevented Ishaq Çelebi from opposing al-Shaikh 'Abd al-Rahman ibn Ghudaiya in his office as *imam* in Zawayat al-Mi'dhana al-Hamra'. The *qadi* further ordered Ishaq to register the name of the *imam* in the *sijill* and to pay him his due salary from the date of his appointment at the end of Ramadan 1041. On 5 Rabi' I 1043/9 September 1633, Mahmud Çelebi, the son of Ishaq Çelebi al-Khalwati, was appointed 'inspector and *mutawalli* (administrator) of the Zawayat al-Shaikh 'Ala' al-Khalwati, known also by the name al-Manara al-Hamra', which is situated in Jerusalem the Noble.' He was allocated two *misriyya* pieces (silver coins) per day, and had replaced his father on the latter's death. In 1992 Atallah (1992 2: 27) published a *sijill* document dated 6 Ramadan 1052/17 September 1642 on the names of mills and millers. One of those listed was a mill by the name of 'al-Mi'dhana al-Hamra'.

Later periods

The file (3/17/31) in the archives of the Auqaf Administration includes the name of 'Masjid al-Mi'dhana al-Hamra', as shown above. The earliest entry in the file, which contains some two hundred pages, is dated 9 Muharram 1359/17 February 1940, and the most recent is dated 9 Jumada II 1413/3 December 1992. The file gives the usual information on personnel and maintenance work relating to the building. The data on maintenance can be divided into two periods, with a gap of ten years between them. The recorded work relates exclusively to the mosque, apart from the mention of the erection of two shelters for the *mu'adhdhin* over the gallery of the minaret. It is difficult, therefore, to be sure what repairs (if any) have been undertaken on the minaret in the past few decades.

The minaret and the mosque were provided with electricity in the middle of 1379/1960 (File 3/17/31, 106, 123). In the same year, the Auqaf applied to the Jerusalem Municipality to connect the mosque to the main water supply (File 3/17/31, 113).

Architecture

The minaret

Najm *et al.* (1983: 323) published a plan and an elevation, but apart from these almost nothing has been published about the minaret and its architecture. The base of the minaret is raised above street level by means of ten steps; each step is 1.24m long by 30cm deep. The minaret measures 18m from top to bottom,

¹ Burgoyne (1987: 89) considers that the three minarets added in the 9th/15th century outside the Haram al-Sharif were a symbolic gesture directed towards the non-Muslim population. However, it is also necessary to remember the symbolic importance of the minaret in Islam in general (for a further discussion on the symbolism of the minaret, see Hillenbrand 1994: 129 and especially Bloom 1989).

and it is completely built of stone. Most of the blocks are white although some are red, especially around the door of the minaret; all are carefully cut and dressed. Most are rectangular (the largest measures 60cm by 22cm) but there are some that are square in shape (22cm by 22cm).

The shaft rises above a square plinth, each side of which measures 2.9m by 3.67m high. On the western side of the plinth there is a small doorway (65cm by 1.37m) through which the gallery is reached by means of a spiral staircase, with forty-six steps around a central, cylindrical core. The jambs of the doorway are built of red and white *ablaq*, and it is surmounted by a large, white lintel measuring 1.4m by 45cm.

A *cyma recta* moulding with two engraved lines separates the plinth from the first octagonal zone of transition. At this level there are four prismatic triangles on the non-cardinal sides to allow the transition from the square plinth to the octagon. Similar prismatic triangles, although they are not identical, are found in the minaret of al-Maulawiyya (cat. no. 19) and the minaret of Bab al-Asbat (first built in 769/1367-68), the rebuilding of which is dated 18 Dhu 'l-Qa'da 1007/12 July 1599. Burgoyne (1987: 416) notes that 'similar zones of transition were used in eighth/fourteenth-century minarets in Egypt and Syria.' Prismatic 'Turkish' triangles do not appear in Jerusalem architecture before the Ottoman period, and what in the minaret of Bab al-Asbat was thought by Burgoyne (1987: 417) to be Mamluk is now proven by Sijill 80:100 to be Ottoman. For further details, see Ch. 36 under 'Minarets'.

The side of the octagon that faces west is decorated with a re-used square stone panel, placed directly above the *cyma recta* ring moulding centred above the lintel over the door, and was therefore intended to emphasise it.

[Editor's note: The panel on Minaret al-Hamra' is carved in relief and consists of an equilateral triangle with a circular boss in the centre. This boss is decorated with a central radiating disc that expands into a sixteen-petalled rosette in relief. The ground is cut away at a sharp angle to give a deep recessed area in the points of the triangle around the central boss. The frame is a double fillet, again sharply delineated both by the crisp cutting away of the ground and a deep central groove. To each side of the main triangle, the field in reserve forms two identical smaller triangles. These spandrels are deeply recessed leaving a smaller version of the flat central boss in reserve. These bosses are also engraved with rosettes, this time with ten petals. Three sides of the panel are framed by a zig-zag border of equilateral counterchange triangles in reserve. SA]

The reason behind the location of this panel above the lintel of the door is unclear. Although it could be seen by people approaching the minaret, few in fact would do so apart from the *mu'adhdhin*. A somewhat similar panel is found on Ribat 'Ala' al-Din al-Basir (Burgoyne 1987: 122, pl. 3.4). The similarity between the two panels would imply that they were taken from the same site. It is possible that the panel on Minaret al-Hamra' was initially set in a more prominent position in al-Zawiya al-Khalwatiyya. Then, when that complex was destroyed, the panel was placed in its present site.

A roll moulding in the form of a *cyma recta*, narrower than the one below the panel, marks the end of the first level of the octagonal zone of transition. The second level of the octagon is double the height of the one below. Each face terminates in a half-circle, almost as if they had been conceived as blind arches; in between each 'arch' there is, as it were, a 'pendentive' that acts both as spandrel and as the conversion to the circular plan of the

shaft above. At this point a simple roll moulding marks the start of the cylinder. This particular architectural device of treating the lower shaft as a succession of blind arches is not seen in any other minaret in Jerusalem, whether Mamluk or Ottoman. [Editor's note: However, a similar treatment of the piers of the west gallery in the Rüstem Pasha Cami, Istanbul (Goodwin 1971: 251, pl. 241)—although here disguised to an extent by the addition of ceramic tiles—shows that the concept was current in the later 16th century. It probably represents a logical development of the blind arches that decorate such faceted buildings as the octagonal minarets at the corners of the *tabhanes* adjoining the mosque of the Beyazit Complex, Edirne which was completed in 895/1488 under the direction of the Royal Architect at the time, Mimar Hayrettin (Goodwin 1971: 143-7, pls. 135, 136). SA] Perhaps because it is taller than other Ottoman minarets in Jerusalem, the Minaret al-Hamra' has more graceful proportions than its counterparts. For a comparison between the measurements of this minaret and those of other examples in the city, see Ch. 36, under 'Minarets'.

The cylindrical shaft, which measures 2.62m in circumference, rises above the roll moulding described above. Some of the stones from which it is constructed are lighter in tone than the rest, as are some in the zone of transition, and this may indicate that they are replacements from some period of restoration. Indeed, some damaged stones are still visible in the shaft and in the *muqarnas* cornice. The shaft is pierced by slit windows to give light and ventilation to the interior, and is otherwise plain until one course below the *muqarnas* cornice, which is marked by a narrow frieze of counterchange trefoil joggles.

At the top of the shaft there is a *muqarnas* corbel that projects to carry the gallery from which the call to prayer is made. The gallery is circular in form. The base of the cornice is marked by a narrow roll moulding, above which there are three levels of *muqarnas*. These take the form of alternating niches and corbels, each framed by a stepped detail. Beneath each corbel the divisions between the triangular areas are marked by a rib. The intervening niches have trilobate heads with a deep triangular niche cut out of the central area. It is probable, although it is difficult to be positive because of damage, that the alternating devices were envisaged as mirror images of each other. This is perhaps underlined by the moulding above, which marks the beginning of the gallery, for it is a single billet, and thus is also conceived as a series of alternating or counterchange projections and recessions. The type of *muqarnas* on the Minaret al-Hamra' is both markedly different from, and of a higher quality than, that carried by the Minaret al-Nabi Da'ud. In this respect, it is closer to the Mamluk tradition. The last part of the minaret is circular and is both thinner and shorter than the shaft. It rises directly from the gallery. The gallery is sheltered by a recent corrugated iron canopy which is carried by the central shaft and was installed in 1385/1965. The lantern is capped by a circular drum and a small dome which culminates with a stone crescent-finial. A door gives access from the stairs to the gallery. There are four small openings at the top of the circular drum, each measuring 20cm by 25cm, to light the interior and to provide ventilation.

The mosque

The north façade of the mosque is the main one. A simple door leads into the interior. It is off-centre, and has a dressed stone jamb and lintel which were fitted in 1376/1956. The main fabric of the façade is, in contrast, rusticated with varying sizes and

shapes of stones, and with thick mortar joints. The eastern elevation of the building resembles the north façade, but at the centre, in place of the door, it has two rectangular window openings, each measuring 75cm by 1.78m. The jambs and lintels are dressed in the same way as the entrance, although they were fitted later, in 1406/1985. The shutters and the grilles of the windows are modern.

The basic plan of the room is rectangular. It measures 8m by 2.95m and is covered by a simple cross-vault with, in the centre, a very shallow saucer dome. There is a recess to the west and east with deep barrel vaults, 1.96m in depth. The *mihrab* is placed at the centre of the south wall, and is round-headed. The springing of the vault, which begins at the same height as the springing of the *mihrab* arch, and which creates a semicircular profile to the top of the wall, elegantly echoes this simple design. The niche measures approximately 1.15m in width, 80cm in depth and 1.63m in height. At either side of the niche opening, directly below the springing of the framing arch, there is a space. Presumably these spaces were reserved for columns, but they were never made, were perhaps not used, or have been removed at a later date. Their absence creates an odd sense of unease, as the framing arch appears to be unsupported. The inside of the hood and the niche itself are covered with modern blue tiles, 10cm by 10cm square. In Ramadan 1398/August 1978 the *mihrab* was faced with a stone slabs of the same quality as those that cover the walls of the mosque to a height of approximately 1m in an attempt to control condensation from the adjoining wall of a neighbouring building (Auqaf File 3/17/31, 155). The upper part of the walls and the vaulting are plastered. There are two other wall-openings; one, to the north-east of the north wall measures 65cm by 75cm by 1.25m, and the other at the south-west of the west wall measures 70cm by 32cm by 1.8m; both serve as wall cupboards. Light to the interior is provided by the two window openings described above.

Dating the minaret

Minaret al-Hamra' is itself undated. It should probably, however, be seen as dating from the 16th century, for the following reasons:

1. The minaret shares many features, both architectural and decorative, with the minaret of Bab al-Asbat, which was rebuilt in 1007/1599, and with Minaret al-Maulawiyya (cat. no. 19), which was constructed sometime before 995/1586-7. The full details of these shared features are listed and discussed in Ch. 36 under 'Minarets', where a comparison between the minarets of Ottoman Jerusalem is given.

2. Minaret al-Hamra' is not mentioned by Mujir al-Din (1973). His reliable history was concluded in the closing years of the 15th century. The minaret does, however, feature in Sijill 13: 224, which dates from as early as 3 Muharram 948/29 April 1541.

3. Burgoyne (1987: 416) has noted that 'we know of only two other 8th/14th-century Mamluk minarets with circular shafts, both in Aleppo and both different in style and execution from Bab al-Asbat Minaret. All other minarets with circular shafts in Jerusalem are Ottoman.'

4 SABIL BIRKAT AL-SULTAN

Name: Sabil Birkat al-Sultan¹ ('The public fountain of the pool of the Sultan')

Date: 10 Muharram 943/29 June 1536

Endowment: 948/1541-42

Variant of name: None known

Modern name: Sabil Birkat al-Sultan

Location

The *sabil* is located to the south west outside the city walls, on the road which leads to Bethlehem and Hebron, facing south. It appears as number 43 on the map of Jerusalem (1992) and is to be found on square D8.

Site and brief description (fig. 4.1, pls. 4.1-4.3)

The siting of the Sabil of Birkat al-Sultan on the road to Hebron, 700m downhill from Bab al-Khalil (literally 'the Hebron Gate', known today as the Jaffa Gate) is significant. It greets any traveller who approaches the city from the west or south, standing proud (4m above) of the centre of the retaining southern wall of the Birkat al-Sultan on what must have always been the main route to and from Hebron. The modern road level is higher than when the *sabil* was first constructed so that its base is now 73cm below the surface. The *sabil* still greets anyone arriving from the south to Jerusalem. This *sabil* is the earliest of six *sabils* attributed to Sultan Sulaiman. Although the *sabils* were built by order of Sulaiman within a relatively short timespan, and although they are related in layout and design, they can be divided into two groups. This is discussed in detail in Ch. 36 under *Sabils*. The fountains differ slightly both in measurement and in decorative detailing. One of them (cat. no. 9) stands out as being different because of the paucity of its ornamentation. The function of these water fountains is discussed under the catalogue entry for Qasim Pasha (cat. no. 2) as well as in Ch. 36.

Sabil Birkat al-Sultan is a free-standing structure, consisting in the main of a recessed niche surmounted by a chevron-pointed arch. The arch is contained within a rectangular wall. A trough to contain water, now hidden because of the raised level of the modern road, previously stood at the foot of the *sabil*. The *sabil* itself is no longer in working order. A subsidiary channel from Qanat al-Sabil (al-'Arrub channel), the remains of which are still visible a few metres to the west of the *sabil*, used to feed the fountain with water.

History

Identification

The Sabil Birkat al-Sultan is identified by the foundation text and by a *waqf* document in the *sijills* dated 948/1541-2 (see below).

Date

According to the inscription panel commemorating the construction of the *sabil*, it dates to 10 Muharram 943/29 June 1536. The inscription is to be found on a marble panel at the

centre of the niche. The plaque measures 1m by 55cm, and consists of three lines of Arabic. The script is an elegant, slender, slightly compressed Ottoman *naskh*² with some interlacing. The three lines are contained within rectangular cartouches separated by a plain, narrow fillet. Although there are diacritical and auxiliary points, some diacriticals are lacking. There is a slight degree of extra ornamentation in the form of several small hearts and two 's' shapes. The *alif* of *hadha* ('this') also serves the words *al-sabil* ('the fountain') and *al-mubarak* ('the blessed'), doubtless a deliberate stylistic quirk on the part of the calligrapher. In the third line *al-sultan* is written without the initial *alif*, as van Berchem (1923: 413) noted when he published the inscription. The translation runs as follows:

- (1) (There) has ordered the construction of this blessed *sabil*, our master, the Sultan, the greatest prince and the honourable
- (2) Khaqan, who rules the necks of the nations, the sultan of the (land of) Rum, the Arabs and the non-Arabs ('*ajam*'), the Sultan Sulaiman
- (3) son of Sultan Selim Khan, may God perpetuate his reign and his sultanate. On the date of the tenth of the month of Muharram the sacred, in the year nine hundred and forty-three (29 June 1536).

Founder

The *sabil*, as the inscription states, is a royal foundation, the patron being Sultan Sulaiman I (926-74/1520-66).

Endowment

The *sijills* (al-Husaini 1982: 109-10, 115-16) reveal that in the year 948/1541-2 an official meeting was held in the Dome of the Chain on the Haram al-Sharif, at which Muhammad Çelebi al-Naqqash informed those attending that the repairs to the aqueduct and to nine *sabils* had been completed. The aqueduct to which Muhammad Çelebi referred used to bring water from Sulaiman's pools (The Pools of Solomon), located to the south of Jerusalem near Bethlehem, to nine public fountains in the Holy City, as well as to the Haram precinct and a number of baths within the city. Muhammad Çelebi al-Naqqash further stated that he had endowed all that had been repaired as a pious legal foundation for the benefit of all Muslims, in the name of Sultan Sulaiman. Six of the nine *sabils* are still *in situ*. The first of these is the one now under discussion and the rest are described in the following catalogue entries (cat. nos. 5-9).

The document described above raises serious questions about the actual date of construction of the *sabils* of Sultan Sulaiman. There is a gap of five years between the construction dates of the *sabils* as reported in their foundations inscriptions and the date of their endowment after their restoration. It is possible that the date of completion of the construction of the *sabils* was the date of their endowment, and that the inscriptions were prepared in advance, hoping that the *sabil* project would be finished within the intended time period, but that in fact the project was for some reason delayed. A similar although not identical example occurred during the building of al-Ashrafiyya

¹ The pool is very old and has been frequently repaired, the last documented occasion being by Sultan Sulaiman. It was, however, already known by the name 'The Sultan's Pool' (*birkat al-sultan*) before his reign (see Mujir al-Din 1973 2: 92, 94). For an historical and archaeological account of the pool, see the recent bibliography compiled by Bieberstein and Bloedhorn (1994 2: 65).

² In this study, where the word 'Ottoman' precedes the type of calligraphy, it refers to a period rather than a style. The author knows of no publication which addresses the problem of the stylistic differences between Ottoman and Mamluk calligraphy in Jerusalem.

(van Berchem 1923: 27; Rogers 1976-7: 182, n. 2) for the *madrasa* was completed according to its foundation inscription in 887/1482-3, but Felix Fabri found various craftsmen still at work on the site some months later. Although the construction year of the *sabils* (namely 943/1536) is given as the same on all the fountains, the day and the month is specified differently for each one. The gap between construction and restoration of the water installations was, it seems, long enough to warrant repair work, and this tends to diminish the likelihood of the hypothesis just advanced. It seems therefore most likely that each *sabil* was indeed completed on the date time mentioned in its foundation inscription. To be more specific, it is highly unlikely that the structure of the *sabil* itself would have decayed, but it is quite possible that the supply of water to all of them was impeded and repair work was required for the water channel. Information on the water supply and the recorded attempts to breach the Qanat al-Sabil is included in Ch. 36. At that time Muhammad Çelebi al-Naqqash publicised the *waqf* dedicated to the *sabils* in the name of Sultan Sulaiman.

Muhammad Çelebi al-Naqqash, who announced the endowment of the *sabils*, has been shown by Cohen (1989: 470-73) to have been the person responsible (*al-amin*) for the sultan's project for the walls of Jerusalem. As explained above, he was also responsible for the repairs to the water project, which were vital if the supply of water to the city was to be secured. There are many records in the *sijills* which feature Muhammad Çelebi al-Naqqash. These records can be divided into two categories. The first (*Sijills* 10: 16; 12: 905, 922; 13: 525; 18: 293) refer to his official capacity as the man both in charge of the project and the finances of the walls of the Holy City (*al-amin 'ala al-amwal al-sultaniyya wa'l-amin 'ala 'imarat sur bait al-maqdis al-sharif*). The second category concerns his personal life. In the latter, *Sijill* 17: 168 dated 20 Jumada II 952/29 August 1545 bears witness to expenses incurred on the house owned by him in Jerusalem. A *waqfiyya* in his name is also to be found in *Sijill* 18: 425, dated the middle of Rabi' I 953/16 May 1546, in which a house is endowed for the benefit of his freed slaves. *Sijill* 22: 503 dated 3 Dhu'l-Hijja 956/23 December 1549 contains a list of his effects when he died; it records that he had no heirs to inherit these effects which should therefore be claimed by the state treasury (*bait al-mal*). Finally, it is interesting to note that according to *Sijill* 17: 112, which includes the proceedings for the year 950/ 1543-4, he was the man responsible for the Haram of the Noble Rock (*al-amin 'ala haram al-sakhra al-musharrafa*). From the context of the record it is inferred that this position meant that he was the administrator of the *waqf* of the Noble Rock; the *sijill* reveals that Muhammad Çelebi acknowledged that he had received from Bairam Jawish the revenue and the tithe for the year 950/1543-4. This information makes it possible to state unequivocally that Muhammad Çelebi al-Naqqash was one of the most important

characters in Jerusalem in the early Ottoman period and that he played a major role in the history and development of the Holy City.

Architecture

Sabil Birkat al-Sultan is entirely constructed of a dressed, white stone that has now weathered to grey, in the same way that the other five *sabils* attributed to Sultan Sulaiman have done. Fortunately, the *sabil* seems to have retained most of the elements of its original architecture.³

The *sabil* is designed as a single rectangular panel, measuring 4.1m in height (minus the trough) by 3.69m in width. As stated above, today the *sabil* is 73cm below the level of the modern road. A recessed niche with a pointed chevron⁴ arch dominates the upper part of the construction. The chevron moulding, which was much used in Norman, and thence Crusader architecture in Palestine, was very rare in Mamluk Jerusalem (see Burgoyne 1987: 133). But in Ottoman Jerusalem it is used on four monuments in addition to the *sabil* under discussion. These are Sabil Bab al-Silsila (cat. no. 6), Sabil Bab al-'Atm (cat. no. 8), Dar Bairam Jawish (cat. no. 13); and Qubbat Yusuf (cat. no. 38), all of which date to the 16th century with the exception of cat. no. 38. Yet, as just noted, the chevron arch is not an Ottoman motif. It is noticeable that all these monuments—again with the exception of cat. no. 13—also incorporate Crusader and Latin elements into their architectural fabric (see Ch. 36 under *Sabils* for more detail). The chevron arch should, therefore, probably be considered as a deliberate copy of a non-Muslim motif—unless, indeed, it is re-used Crusader material.

The extrados of the chevron arch is framed by a splay-faced moulding and its spandrels are decorated with a flat, plain slightly projecting medallion. The arch springs from two similar *muqarnas* imposts. Each impost is made up of two sections, and each section has seven small *muqarnas* niches.

[Editorial note: The decoration of the niches of the lower section is repeated at the top and bottom, with the exception of the seventh one which is hidden. The device is quinquafoliate. The second, the third and the fourth niches reading from west to east have a bigger leaf than the others. Each *muqarnas* niche is separated from its neighbour by a groove and has a chamfered frame. The upper sections of the *muqarnas* niches of the impost are variously carved. That of the second, the fifth and the sixth niches, again reading from west to east, is identical to the niches of the lower section. The first and the third niches have four vertical grooves, while the fourth niche is the most elaborately decorated, its foliate motif with ten little leaves filling the whole space of the niche. SA]

The tympanum of the arch is filled by three tiers of elaborated *muqarnas* crowned by a ribbed scalloped niche. The scallop at the level of the third tier is flanked on either side by stalactite *muqarnas* niches. The second row of the *muqarnas* consists of plain panels, the only decoration being chamfered framing at the upper edges. The lowest level of the *muqarnas* is formed by a series of six small lancet elements lightly recessed within an equal number of larger niches. There is no parallel for this differentiation between tiers of *muqarnas* in the other two examples of *sabils* (cat. nos. 5, 8) which have similar decoration. It probably represents an idiosyncratic decision on the part of the craftsman or designer.

³ Rosen-Ayalon (1989: 592), comparing the present state of the *sabil* with a photograph taken in 1273/1856 by Schiller (1978: 197), mentions that the small shallow niche for the water outlet, the trough to catch the water, and the inverted volute on each of the flanking pillars are now hidden. However, the top of the stone panel which replaced the niche of the water outlet is still visible, and the inverted volute is also visible. The divergence would appear to be due to her dependence on an old photograph which she publishes (1989: 591, fig. 37.3) and which had been taken by Garo, presumably before the restoration of 1978. The photograph in pl. 4.1 was taken some time in 1980 and shows the current state of the *sabil* as represented in fig. 4.1.

⁴ On the chevron arch, see van Berchem (1923: 412-17; 425, n. 2) and Burgoyne (1971: 23-6; 1987: 133; 140, ns. 35, 36).

The recessed plaque containing the inscription is set beneath the *muqarnas*; one course below there is a white stone panel which served to house the water outlet. This panel is new, and has replaced the smaller shallow niche which appears in a photograph taken in 1273/1856 (Schiller 1978: 197). The panel is slightly recessed, and has a rounded apex with a rectangular extension. The shape and the design of the panel is identical to those on other *sabils* constructed at this time. The similarity to them suggests that it was a deliberate copy of one of the four panels still existing rather than a restoration of the original one seen in the photograph of 1273/1856. The repairs to the panel were probably undertaken at the time other work was being done on the *sabil* in 1978 by the East Jerusalem Development Company.

The water-trough is no longer visible, for it is now filled with rubble. It is at the level of the top of the trough that the moulding which frames the entire upper level of the *sabil* terminates in an inverted volute. The moulding is a beautifully executed *cyma recta* with a concave section running round its inner face. A similar volute is to be found on the Sabils al-Wad, Bab al-Silsila, Bab al-'Atm and Bab Sitti Maryam (cat. nos 5, 6, 8, and 9).

The *sabil* is rectangular in plan, measuring 3.69m long by 1.5m wide. The niche is 1.9m wide and 71cm deep. The back of the masonry block, and the western and eastern sides, are built of the same quality of stone as the façade but are all plain, simple, solid walls. The roof of the block slopes towards the north to prevent the water from collecting and is covered in stone.

5 SABIL AL-WAD

Name: Sabil al-Wad

Date: 1 Rajab 943/14 December 1536

Endowment: 948/1541-2

Variant of name: Sabil Mahallat Bab al-Qattanin

Modern name: Sabil al-Wad

Location

The *sabil* is located on the east side of Tariq al-Wad, a few metres south of the west entrance of Suq al-Qattanin.

Site and brief description (fig. 5.1, pls 5.1–5.6)

Sabil al-Wad is situated at the south end of one of the two main roads crossing the Old City of Jerusalem from north to south. The site has been as carefully chosen for maximum impact as that of the Sabil Birkat al-Sultan, for it is close to Suq al-Qattanin, a prime centre for local trade, which leads to one of the three main entrances to the Haram al-Sharif from the west. The *sabil* is a single-unit structure in the same style as the others built by Sulaiman I (926-74/1520-66). It consists of a lavishly decorated recessed niche with a pointed arch. The arch springs from a pillar on either side. Behind the *sabil* there is a rectangular cistern which is invisible from the front and which was originally designed to collect the water. The cistern is adjacent to the west wall of the Hammam (public bath) al-'Ain. Both the *hammam* and the *sabil* were probably once supplied with water through a subsidiary canal from Qanat al-Sabil. The *sabil* no longer functions, although it is in good condition.

History

Identification

An elaborate foundation inscription identifies the *sabil* as dating to the Ottoman period; it also features in the *sijills* of the Shari'a records (see above, cat. no. 4) as one of those restored and made a *waqf* by Muhammad Çelebi al-Naqqash (see below).

Date

The date of Sabil al-Wad, according to the inscription panel, is 1 Rajab 943/14 December 1536. The inscription is located in the centre of the niche and has been published by van Berchem (1923: 414). It is a marble plaque measuring 1.2m by 50cm, and consists of three lines of Arabic. The inscription resembles that of Sabil Birkat al-Sultan in its layout, script, context and literary style but it differs in that it has three additional epithets. The translation runs as follows:

- (1) (There) has ordered the construction of this blessed *sabil*, our master the Sultan, the greatest King and the honourable Khaqan, who rules the necks of the nations, the
- (2) Sultan of the (land of) Rum, the Arabs and the non-Arabs, the glory of Islam and the Muslims, the shadow of God on earth, the protector of the two sacred sanctuaries, the Sultan
- (3) Sulaiman, son of Sultan Selim Khan, may God perpetuate his reign and his sultanate—on the date of the beginning of the month of Rajab the venerated of the months of the year nine hundred and forty-three (14 December 1536).

The presence of additional epithets here, over and above those included in the inscription on Birkat al-Sultan (cat. no. 4),

is worth underlining. Although no definitive reason can be given for their inclusion, perhaps the reference to Sultan Sulaiman as 'the glory of Islam and the Muslims, the shadow of God on earth, the protector of the two sacred sanctuaries' (*hami al-haramain al-sharifain*) relates to the proximity of the site to the Haram al-Sharif, one of the two sanctuaries under his protection.

Founder

The founder of the *sabil* is Sultan Sulaiman I (926-74/1520-66).

Endowment

The Sabil al-Wad is mentioned in the Shari'a records in the *sijills* (al-Husaini 1982: 109-10, 115), where it is referred to as the 'Sabil Mahallat Bab al-Qattanin'. The *sijill* shows that this is one of the nine *sabils* repaired and made a *waqf* by Muhammad Çelebi al-Naqqash in the year 948/1541-2 (see Sabil Birkat al-Sultan, cat. no. 4 for more details).

Architecture

The Sabil al-Wad is similar in both plan and decoration to Sabil Birkat al-Sultan (cat. no. 4) though it is not identical. This change in style, which is discussed more fully in Ch. 36 under *Sabils*, could be due either to the availability of old material or to the fact that the *sabils* were built and designed by two different master builders. One style concentrates mainly on Islamic elements. This is seen in Sabil Birkat al-Sultan (cat. no. 4); Sabil Bab al-'Atm (cat. no. 8), and Sabil Bab Sitti Maryam (cat. no. 9). The second style incorporates non-Islamic features. This applies to the *sabil* under discussion here, Sabil Bab al-Silsila (cat. no. 6), and Sabil Bab al-Nazir (cat. no. 7).

The recessed niche of Sabil al-Wad has a double pointed arch of Gothic style *voussoirs* and the external arch of the two has a double stone moulding frame which Rosen-Ayalon (1989: 594) considers to be an additional outer arch. The first frame is made up of a bold quirked ogee moulding and the second is a splay-faced moulding. The spandrels of the arch are decorated with triangles in relief which were once adorned with stone bosses in the form of rosettes, as can be seen in an early photograph (van Berchem 1920: pl. XCIV, no. 111); both of these are now missing.

There are short slender colonnettes engaged to either side of the spandrels of the arch, immediately above the upper external corners of each pillar. The shafts of the two columns are made up of four pieces of stone, and they rest on a rough square base with a circular plinth, torus and apophyge. The space where capitals might be expected to occur are now void, but there are two possibilities as to how they were once filled. The first is that there never was a capital, and a piece of stone identical to the stones of the shaft was used to fill the gap. This solution appears on the columns directly below them on the same vertical axis. However, the second possibility is more likely, and this is that the columns were once completed with capitals, for the uppermost stone of the shaft of each colonnette is shorter than the rest of the pieces, probably to allow space for a capital. The same practice is to be found on the columns which support the two double arches of the niche itself. All the six shafts share the same measurements and design (see below).

Each of the two pointed arches of the niche springs from a slender engaged column. These columns are similar to those situated above, though here the capitals are retained and their bases differ in size and decoration. The capitals are ultimately derived from the Corinthian order; they consist of a series of thick leaves arranged in three tiers; they also have a roll-moulded

astragal, and date probably to the Crusader period, being re-used here. The capitals share an abacus in the form of a projecting cornice made up of fragments of stone. This is plain apart from a *cyma recta* ornamentation; the overall effect is that of a frame separating the arches from the pillars. The bases of the columns are square and are integrated into the fabric of the *sabil*. They are decorated with small rectangular recesses. They rest on square plinths, decorated by pairs of blind round-headed recesses, and have a torus moulding and apophyge. Below the colonettes of the upper storey, which are placed so that they mark the return of the façade on each side, there is an engaged colonnette identical to those described above. These two columns are without capitals, and they are taller than those of the upper level by 30cm, although they have identical bases. An ogee moulding is contained between the external engaged column supporting the arch and the colonnette of the main pillar. The moulding ends in an inverted volute or *mim* decoration (a term derived from the Arabic letter 'm').

The crown of the niche is filled by three tiers of elaborate stalactite *muqarnas* surmounted by a half-dome on which part of a shell with three scallops is carved. At one time three hemispherical roundels of stone, probably identical, had been set into the stalactite *muqarnas*, but now only the one in the centre is still in place.

[Editorial note: The roundel is decorated in a four-part design made up of split palmettes arranged to form four dart-shaped divisions which surround four trefoils. Additional split palmettes emerge from the darts, which are arranged as a saltire, to continue the theme to the border. A star polygon is left in reserve at the centre.

The design was popular in the Timurid period. It can, for example, be seen clearly on a jug, perhaps made in Herat, dated 871/1467, where it appears in a quatrelobed cartouche between two areas of inscription on the widest part of the belly.¹ Although the position occupied by the stone roundel on the *sabil* and its worn condition now make it difficult to 'read' the carved design, the deeply recessed areas between the different parts of the motif may indicate that it was at one time coloured in some way. SA]

The inscription panel is set directly below the first row of the *muqarnas* (see above). It is situated at eye level, and two courses below it there is recessed marble niche for the water outlet. A rectangular stone trough measuring 50-60cm wide, 1.90-2m long and 54-56cm high is set at the base of the *sabil* to catch the water. According to Canneau (1899 1: 233) this trough was originally a sarcophagus. The face of the trough is decorated with three unadorned roundels in slight relief, and when Canneau (Rahmani 1988: 42) examined it, he found the same scheme of decoration on the back of the trough, in addition to a single large roundel on each short side. This cannot be checked, for the back of the *sabil* is inaccessible, sunk into a cistern and the trough is cemented into the sides of the fountain, leaving only the front face

visible. Canneau also noticed that the sarcophagus had been set at a slight angle, the front lip being slightly higher than the back one.

A billet stone cornice runs round the three visible sides of the *sabil* and marks the top of the rectangular niche. Above this, and directly over the crown of the arch, there is a roundel set against a series of stones in secondary use decorated with an acanthus motif. This is the only section of the original upper cornice still in place; the central roundel is flat and has a geometrical decoration of a six-pointed star which appears to have been cast in stucco. Despite these differences, Rosen-Ayalon (1989: 594) believed this roundel to be of the same sort as the boss in the centre of the *muqarnas* (see above). A recent course of white stones flanks the carved section.

The street level has recently been raised and this has resulted in the base of the *sabil* being now situated below ground level; it is reached by two steps measuring 28cm in height. The plan of the *sabil* is rectangular; it measures 4.23m long by 1m wide and 5m high. The niche is 2.21m wide and 70cm depth. As with Sabil Birkat al-Sultan, the sides are solid; they are, however, constructed of masonry differently dressed from that of the main façade.

Pl. 5.1 Sabil al-Wad, capitals.

¹ The jug (*mashraba*), which is made of brass inlaid with silver and gold and a black substance, is signed by Husain al-Din Shihab al-Din al-Birjandi and is now in the Türk ve İslam Eserleri Müzesi, no. 2961. It was formerly in the Topkapu Sarai Museum no. 2/2150. The decoration also occurs on contemporary Herati manuscript decoration (Lentz and Lowry 1989: 341, cat. no. 57, illustrated in colour 161). For many other examples of metalwork objects with a similar design, see Komaroff 1992 throughout, and for a discussion on the Husain al-Din Shihab al-Din al-Birjandi jug in particular see her entry cat. no. 5.

6 SABIL BAB AL-SILSILA

Name: Sabil Bab al-Silsila ('The Fountain of the Gate of the Chain')

Date: 22 Rajab 943/4 January 1537

Endowment: First endowment dated 948/1541-2, second dated 1000/1591-2, and third dated 1018/1609-10

Variant of name: Sabil Mahallat Bab al-Silsila

Modern name: Sabil Bab al-Silsila

Location

The *sabil* is situated on the west side of the square of the same name, facing Bab al-Silsila/Bab al-Sakina.

Site and brief description (fig. 6.1, pls. 6.1-6.3, col. pl. LXIV)

The Sabil Bab al-Silsila abuts the east wall of al-Turba al-Sa'diyya to the west; to the south, it is flanked by the street of Bab al-Silsila and the entrance of al-Madrassa al-Tankiziyya, and to the north by the building of Ribat al-Nisa'; it faces east over the square which leads to Bab al-Silsila/Bab al-Sakina from which it is only 7m distant. The site is as significant as those of the two *sabils* already described, for it has been the focus of architectural activity from the early Islamic period.

This *sabil* resembles the others built by Sulaiman I in that it is a single-unit structure and consists of a recessed niche framed by a pointed chevron arch. The niche is flanked to either side by the stone rectangular wall which contained the elements of the *sabil*. A trough to hold water is placed at the foot of the *sabil*, which is no longer in operation. It was provided with water from the Qanat al-Sabil before it entered the Haram precinct.

History

Identification

The Sabil Bab al-Silsila is identified by a foundation inscription in addition to a *waqf* contained in the Shari'a records in a *sijill* dated 948/1541-2.

Date

According to the plaque, which was published by van Berchem (1923: 415), the date of construction of Sabil Bab al-Silsila is 22 Rajab 943/4 January 1537. The inscription is to be found in the centre of the niche. It is of marble and measures 1.72m wide by 60cm high—measurements that do not quite correspond with those cited by van Berchem, who gives 1.5m by 50cm. It consists of three lines of Arabic. This inscription is identical to the one recording the building of Sabil al-Wad (cat. no.5) with the exception of the date and the addition of '(may God) make his justice and beneficence endure!' The complete translation runs as follows:

- (1) (There) has ordered the construction of this blessed *sabil*, our master the Sultan, the greatest King and the honourable Khaqan, who rules the necks of the nations,
- (2) Sultan of the (land of) Rum, the Arabs and the non-Arabs, the glory of Islam and the Muslims, the shadow of God on earth, the protector of the two sacred sanctuaries, Sultan
- (3) Sulaiman, son of Sultan Selim Khan, may God perpetuate his reign and his sultanate, and make his justice and beneficence endure!—on the date of the twenty-second of the month Rajab al-Murajjab (the blessed) of the months of the year nine hundred and forty-three (4 January 1537).

As with the Sabil Tariq al-Wad (cat. no. 5), the fuller epithets may relate to the position of the *sabil* at a gate into the Haram al-Sharif.

Founder

The founder of the *sabil* is Sultan Sulaiman I (926-74/1520-66).

Endowment

The *sabil* is mentioned among those which were repaired and made a *waqf* by Muhammad Çelebi al-Naqqash in the year 948/1541-2 (see cat. no. 4). *Sijill* 75: 2 dated 29 Shawwal 1000/8 August 1592 informs us that "Abdallah Çelebi the son of Hamza, the former Deputy of Ramla, has attested that he has made as *waqf* the entire small copper bowl together with the iron chain and the iron lock for the *sabil* that is located at the Gate of the Chain'. The bowl and its attachments were to be placed on the *sabil* (*al-'ain*) until sunset and were to be retained by the door-keeper of the Gate of the Chain. There is another endowment in the *sijills* (197: 324) dedicated to Sabil Bab al-Silsila. It appears within a long *waqf* document dated the middle of Rabi' II 1018/18 July 1609, which was drafted by Qasim Beg the son of Rajab ibn 'Abdallah, the translator in the Jerusalem religious court. Qasim Beg stipulated that one silver coin (*qit'a misriyya*) should be allocated per day from the income of his *waqf* for the cost of water to be put in the *misqa* (small fountain) facing al-Madrassa al-Tankiziyya.

Architecture

Despite a recent restoration, probably undertaken by the Supreme Muslim Council in the 1940s, and despite many excavations conducted within the last decade in the vicinity of the *sabil*, it is still in surprisingly good condition and retains most of its original architectural and decorative features. These are similar to the other *sabils* of Sultan Sulaiman, though not identical. Sabil Bab al-Silsila is again in the form of an aedicule or entrance porch. It has a recessed niche framed by a pointed chevron arch and measures 2.4m wide by 62cm deep. The arch and the niche as a whole are framed by a crisply carved, boldly quirked ogee moulding which terminates in an inverted volute just above the level of the water-trough. In Arabic this form of volute is known as a *mim* (the letter 'm'). The spandrels contain fragments of Crusader stonework in the form of a single scroll of foliage with a central bunch of grapes. These have been cut into a triangle and are attached as relief decoration.

The pointed chevron arch springs from two identical *muqarnas* imposts set on either side of the wall of the *sabil*. Although the imposts have been renovated recently, they are carved in a similar style to the *muqarnas* panels of Sabil Birkat al-Sultan, and that would suggest that they retain their original design or have been deliberately carved in imitation of it. Each impost is made up of two sections.

[Editorial note: The upper tier has five and a half small concave *muqarnas* elements or concave lancet niches, the half niche appearing at the inner edge. These are alternately decorated with a rayed device in the upper part, and left plain; each is surrounded by a slant-cut groove, with a plain spandrel in relief between. The lower tier has six undecorated lancet panels, again surrounded by a slant-cut groove, but here the spandrels are cut away to form triangular recesses. SA]

On the façade, the two imposts are decorated with a recent stone roundel inscribed in Arabic with the statement that the *sabil* is an Islamic *waqf*. These roundels replace two circular

medallions, one of which can be seen in the photograph taken by van Berchem (1920 2: pl. XCIII, no. 112). Rosen-Ayalon (1989: 597) has suggested that the original roundels may have matched the small carved rosette at the apex of the arch (see below).

An engaged colonette with a plaited central motif is placed at the external corner of each support. In each case, the decoration of the colonette is identical and is made up of three sections. The upper section is the capital, which is made up of two parts each with three small lancet niches. The middle section of the column is ornamented by a plait, as described above, and the lower section shares the same decorative scheme as the upper part, though here it is inverted. Most of the stonework of the supports, including the moulding, is the work of recent restoration.

The tympanum of the arch, which unlike Sabil Birkat al-Sultan and Sabil al-Wad is flat, contains an elaborately carved rosette taken from a rose window. The use of *spolia* in Ottoman Jerusalem is discussed in Ch. 36 under re-used material. The scheme of the ornamentation consists of a large central rosette made up of three levels of relief tracery from which eight complete round-headed arches ray outwards. Four others are cut by the supporting wall beneath. The arches have gadrooned voussoirs and are supported by twelve columns with slender, marble shafts. They have crocket capitals, and their bases are square with a circular torus and apophyge. The whole window is framed by a narrow frieze of acanthus leaves. The reduction of the small arches from twelve to eight, in addition to other features of the window, suggest that it is in secondary use. Its form of course makes it ideal as a filler for a tympanum. It is probably of Crusader origin, and according to Buschhausen (1978: 236) dates to the 12th century.

The inscription panel is set one course below the rose window, and directly below it there is an eroded stone roundel. The recessed niche, which is of marble and houses the water outlet, is set two courses below the roundel. A rectangular stone trough measuring 50-67cm wide, 2.56-2.27m long and 45cm high is set at the bottom of the *sabil* to catch the water. The face of the trough is highly decorated. Its main scheme is made up of two parts; the upper part is a condensed geometrical ornament composed in principle from interlocking circles. The decoration of the lower part is a combination of figurative and foliate motifs. Ganneau (1899: 129-30) says that this trough was a sarcophagus, and that it was originally taken from the Tombs of the Kings (north of the Old City of Jerusalem) just as other sarcophagi were re-used in the *sabils* and the basins constructed by Qa'itbai (Ganneau 1899: 131). There was a similar sarcophagus in the Madrasa Tankiziyya, given by the Turkish governor of Jerusalem in 1866 to the French scholar De Saulcy. It is now in the Musée du Louvre, Paris. Rahmani (1988: 41-2) studied this sarcophagus and publishes three photographs of it. A billet stone cornice runs around the top of the *sabil* and marks the apex of the rectangular niche. A stone roundel of carved foliage is set between the billet cornice and the crown of the chevron arch.

The *sabil* is rectangular in plan and measures 3.96m wide by 1.02m deep. The niche is 2.4m wide and 62cm deep. The west and east sides of the *sabil*, built of the same quality of stone as the main façade, are both simple, solid constructions. The rear of the *sabil*, as already described, is incorporated into the wall of a cistern.

7 SABIL BAB AL-NAZIR

Name: Sabil Bab al-Nazir (Fountain of the Gate of the Inspector)

Date: 2 Ramadan 943/12 February 1537

Endowment: 948/1541-42

Variant of name: None known

Modern name: Sabil Bab al-Nazir

Location

The *sabil* is to be found at the north-eastern corner of the crossing of Tariq al-Wad and Tariq Bab al-Nazir.

Site and brief description (fig. 7.1, pls. 7.1-7.4, col. pl.LXI)

The Sabil Bab al-Nazir is located at the western end of Tariq Bab al-Nazir which leads to the Haram precinct through the gate from which the *sabil* has taken its name. The site was subject to intense architectural activity in the 16th century following the Ottoman conquest. The north side of the fountain lies adjacent to the south wall of an unidentified building (thought to be an example of Ottoman domestic architecture). It lies directly opposite to the Maktab (cat. no. 12) and the Ribat (cat. no. 11) of Bairam Jawish, and the soup kitchen of Khassaki Sultan (cat. no. 15) is located a few metres further to the west on 'Aqabat al-Takiyya. The *sabil*, like the others of the group, is a single-unit structure built of stone and contains a recessed niche surmounted by a double pointed arch. The arch springs from two rectangular pillars integrated into the masonry of the *sabil* to either side. The fountain no longer functions. A reservoir to the rear of the *sabil*, in addition to a cistern and, possibly, a subsidiary channel of the Qanat al-Sabil, once provided it with water.

History

Identification

The Sabil Bab al-Nazir is dated by inscription to 2 Ramadan 943/12 February 1537, and is further identified in a *waqfiyya* in a *sijill* dated 948/1541-2 (see cat. no. 4).

Date

The date of construction is recorded in the inscription panel as 2 Ramadan 943/12 February 1537. The inscription is identical to the one on Sabil Birkat al-Sultan (cat. no. 4) apart from the date. It has been published by van Berchem (1923: 417) and its translation is thus the same as Sabil Birkat al-Sultan (cat. no. 4) with the exception of the date.

Founder

The founder of the Sabil is Sultan Sulaiman I (926-74/1520-66).

Endowment

The *sabil* is one of the nine made a *waqf* in the name of Sultan Sulaiman in 948/1541-2 by Muhammad Çelebi al-Naqqash (see cat. no. 4).

Architecture

The fountain is made up of a single block forming a rectangular edifice measuring 3.91m high by 3.6m wide by 1m deep. A recessed niche with a double pointed arch dominates the upper part of the *sabil*. The arches—and thus their decoration—are in secondary use. They were originally Crusader as stated by Buschhausen (1987: 236); in this way they are similar to the arches of Sabil al-Wad and Sabil Bab al-Silsila. The habit of

recycling Crusader or other *spolia* is well known in the architecture of Islamic Jerusalem. It perhaps reflects an appreciation of the artistic value of the earlier work, but could equally reflect a wish to conserve time and money. The extrados of the external arch is framed by a bold quirked ogival moulding and its voussoirs are also decorated with a double quirked ogee separated by a *cyma recta*. Both strata of the quirked ogival moulding are filled by a band of carved foliage.

[Editorial note: The outer band is decorated by a single motif repeated on each of the nine voussoirs. The motif is made up of a central cusp of foliage supporting a central drilled 'flowerhead'; a stalk issues from this central device to each side, terminating in an acanthus leaf that reverses back towards the centre. The inner band consists of a series of small rosettes, with a variety of foliate motifs. Each voussoir at this level is adorned with two rosettes apart from the keystone, which has only one. The lowest voussoir and thus also the first rosette to each side of the arch is missing. SA]

The internal arch is made up of a roll moulding and its intrados is decorated with a series of small rosettes similar to the rosettes that decorate the inner band of the external arch.

Both of the external and internal arches spring from a *muqarnas* impost similarly carved and arranged on either side. This is original Ottoman work, unlike the arch itself and its decoration. Each impost is made up of five small *muqarnas* niches. The first, the third and the fifth niches from south to north are ornamented by a leaf with five ribs, whereas the second and the fourth are plain chamfered niches. Each *muqarnas* niche is separated from its neighbour by a groove and its upper edge is finished by a sloping chamfer. The spandrels of the arch bear an undecorated flat triangle in slight relief. At the top of the arch a billet stone cornice extends around the top of the *sabil*, and directly above it, there is a slightly projected chamfered frame which marks the apex of the rectangular niche.

The two pillars which support the imposts are themselves rectangular, measuring 87cm in width and 1.83m in height, and each is flanked on the two outer corners by two engaged columns. The two inner columns are shorter than the outer ones, being 1.38m in height; their shafts are made up of three parts, the upper and lower parts being fluted, while the central area has a plaited braid. The origin of the plaited braid is non-Ottoman, but here the plaited motif is imitated and integral to the structure of the *sabil* structure. The motif is also found in Sabil Bab al-Silsila (cat. no. 6) and Sabil Bab al-'Atm (cat. no. 8) (for more details see Ch. 36 under *Sabils*). The capitals are a form of debased Corinthian, the upper volutes being replaced by fleshy acanthus leaves. Buschhausen (1978: 236) believes that the capitals are Crusader for they belong to the South Italian sculptural technique like the arches above. It is however not possible to be sure that both the arches and the capitals came from a single source. The bases are square and undecorated apart from a torus, scotia and apophyge. The two outer columns (measuring 2.32m high) are less ornate; they have cylindrical shafts and a *muqarnas* capital consisting of two tiers of small lancet-shaped niches cut in a sloping chamfer. The base of the eastern column is hidden, while the base of the western one is below the raised street level, although the apophyge is still visible.

The tympanum of the arch is filled by a large octagonal medallion. It has a small central rosette from which emerge twelve ribs enclosed in an eight-lobed circle. The recessed plaque with the foundation inscription is placed beneath the medallion on the exact level of the spring of the arch, and two courses below there

is a white stone panel (now painted black) for the water outlet. The shape and the design of this panel is identical with those of the other *sabils* of Sulaiman. The trough (if indeed it still exists) is now hidden beneath an infill at the level of Tariq al-Wad. A band of moulding adorns the inner level of the niche, which takes the shape of a pointed arch. It is made up of a repeated leaf shape carved in relief on a recessed background.

The *sabil* is rectangular in plan and measures 3.6m wide by 1m to the west and 88cm to the east. The difference in

the depth between the two exterior sides of the *sabil* is due to the alignment of the street. The *sabil*, as already explained, is located at a corner where the street of Bab al-Nazir meets Tariq al-Wad. The difference would indicate a slight change in direction of the thoroughfare, for originally the *sabil* would have been set square to the corner. The niche is 1.82m wide and 54cm deep. The west and east sides of the *sabil*, built of the same quality of stone as the main façade, are both simple, solid constructions.

8 SABIL BAB AL-‘ATM

Name: Sabil Bab al-‘Atm

Date: (A) The *sabil*. Beginning of Sha‘ban 943/mid-January 1537

(B) The *mihrab*. Undated, but renewed during the reign of Sulaiman I (926-74/1520-66), probably in 943/1537

(C) The *mastaba*. Undated, but it appears to have been built at the same time as the *mihrab*

Endowment: 948/1541-2

Variants of name: Sabil al-Sultan Sulaiman I, Sabil Qubbat al-‘Ushshaq (van Berchem 1923: 415), the *sabil* opposite the Gate of al-Dawadariyya (*sijill*, cited by al-Husaini 1982: 109-10, 115).

Modern name: Sabil Bab al-‘Atm

Location

The *sabil* is situated on the Haram esplanade to the north, 15m to the south of Bab al-‘Atm.

Site and brief description (figs. 8.1-8.2, pls. 8.1-8.5, col. pl. XLII)

Sabil Bab al-‘Atm is a single-unit structure built of stone and consists of a recessed niche surmounted by a pointed arch with chevron designs. This arch springs from two slender engaged columns integrated into the masonry of the *sabil*. A *mihrab* is to be found in the rear (north) wall of the fountain. A rectangular *mastaba* adjoins the *sabil* to the north, and gives it its name—‘Mastabat Sabil Bab al-‘Atm’. To the east, west and south the construction is surrounded by open ground. Qubbat al-‘Ushshaq (Iwan al-Sultan Mahmud II, cat. no. 50) is situated 5m to the south, which explains the fact that the *sabil* was once known as Sabil Qubbat al-‘Ushshaq (van Berchem 1923: 415, n. 2). Although there has been recent interest expressed in restoring the fountain, it remains out of use at the time of writing.

History

Identification

The *sabil* is securely placed within the early Ottoman period by virtue of the foundation inscription. It is referred to as the ‘*sabil* opposite the Gate of al-Dawadariyya’ in the relevant *sijill* (cited by al-Husaini 1982: 109-10, 115). The *mihrab* as it now exists is equally identified as belonging to the Ottoman period by inscription.

Date

The inscription dates the *sabil* to the beginning of Sha‘ban 943/mid-January 1537. Van Berchem (1923: 415-6) published the text, which corresponds to that found on Sabil Birkat al-Sultan (cat. no. 4) in layout, style and phraseology; the final line, however, differs in that it includes the words ‘on the date of the Hijra’ (*bi-tarikh hijra al-nabawiyya*) before the date, and ‘blessing be upon Muhammad and upon his followers’ after it (the Arabic text is cited in Cat. Appendix 2, no. 8/1). The plaque, which is attached to the centre of the niche, is of marble and measures 1.2m by 50cm; the text is contained in three lines of Arabic set in rectangular cartouches. The translation is as follows:

- (1) (There) has ordered the construction of this blessed *sabil*, our master the Sultan, the greatest King and the honourable
- (2) Khaqan, who rules the necks of the nations, Sultan of

the (land of) Rum, the Arabs and the non-Arabs, Sultan Sulaiman son of Sultan Selim Khan, may God perpetuate his reign and his sultanate.

- (3) On the date of the Hijra of the Prophet at the beginning of Sha‘ban the venerated in the months of the year nine hundred and forty-three, and blessing be upon Muhammad (the Prophet) and upon his followers.

The *mihrab*, as already mentioned, is not dated. However, the renovation is recorded as being undertaken in the name of Sulaiman I, and was probably therefore executed at the same time as the building of the *sabil*. The arrangement and the general layout of the back face of the edifice supports this theory—that is, the quality of the stone, the lines of the joints, and the size of the stones all point to a single building campaign. The lower courses have been repointed in modern times. The inscription recording the rebuilding of the *mihrab* is contained in a rectangular, slightly recessed slab set within a rectangular chamfered frame. It too was published by van Berchem (1925: 169, no. 192). A deep slant-cut groove separates the frame of the panel from the rest of the masonry. The inscription is composed of three lines of Arabic written in a fine *naskhi* script. The three lines of text are provided with diacriticals and a degree of auxiliary pointing. The translation runs as follows:

- (1) This noble *mihrab* was renewed (*juddida*)
- (2) during the reign of our master the Sultan Sulaiman
- (3) son of Sultan Selim Khan—may God support his rule.

Founder

The *sabil* is yet another of the royal foundations of Sultan Sulaiman I.

Endowment

The *sabil* appears in the Shari‘a court records described as ‘the *sabil* opposite the Gate of al-Dawadariyya’ (cited by al-Husaini 1982: 109-10, 115 without giving the *sijill* number). This document, as already shown (cat. no. 4), records that this *sabil* is one of the nine repaired and made a *waqf* by Muhammad Çelebi al-Naqqash in the year 948/1541-2.

Architecture

Sabil Bab al-‘Atm is constructed of dressed white stone and consists of a single block forming a rectangular wall measuring 6.3m high, 4.74m long and 2.24m wide. The *sabil* is built 1.3m below the ground level of the Haram to allow the water to flow into the trough, probably from a channel located nearby.¹ The lower level of the water-trough is reached by way of five steep steps. The upper part of the recess, which measures 2.8m wide by 1.34m deep, is dominated by a pointed arch with chevron patterning. The extrados of this arch is framed by a concave

¹ There were two possible sources of water to serve the *sabil*—either from one of the cisterns on the Haram, which are located at a relatively short distance from the site, or from a subsidiary canal of Qanat al-Sabil. The text of the *waqfiyya* (see cat. no. 4) and the round hole in the eastern corner of the *sabil* would seem to support the second source as being the more probable. *Sijill* 79: 282 dated Safar 1007/September-October 1598, records a dispute which erupted between two individuals over a share of water taken from the ‘*ain* (water source) near Bab Hitta, one of the Haram gates. No further details are provided to confirm the nature of the ‘*ain* and whether it provided the *sabil* with water or not.

moulding. Each spandrel is adorned with an undecorated flat triangle that stands slightly proud of the surface. The arch springs from two identical imposts placed on either side of the block of the *sabil*.

[Editorial note: Each impost is constructed in two sections, the lower part with six small *muqarnas* niches and the upper with five such niches terminating with a semi-niche at each end. The carved ornament that decorates the upper part of each niche of the lower row—a cinquefoil device—is repeated in the main lower area (see Grammar of Architectural Ornament). Each *muqarnas* element is separated from its neighbour by a groove, and is delineated by a chamfered frame. There are two distinct designs in the upper section of the *muqarnas* niches. That of the first and fifth niche (reading west to east) is identical to the design of the lower section, while the third niche is marked out by four vertical grooves. The second and fourth niches—that is, they are arranged alternately—are the most elaborate, being filled by an organic device with ten subdivisions. The semi-niche to the west has half of this more complicated device, while that to the east has two vertical grooves. SA]

An engaged colonette whose central section is carved as if constructed from plaited strands marks the external corner of either side of the wall (the block). The decoration of the engaged columns is in each case identical and consists of three sections. The upper part appears as a double capital made up of two components of small *muqarnas* niches cut in a sloping chamfer. The central area of the column is an interlace forming a plaited braid, while the lower part is made of a roll moulding in the form of a torus base. The pillars and the arch are enclosed in a frame of concave moulding terminating at the level of the first course of each pillar with an inverted volute, or what is called in Arabic a *mim*. The top of the main niche is embellished by four tiers of elaborate stalactite *muqarnas*, the elements of which vary in size and depth from tier to tier. The *muqarnas* is surmounted by a half-dome decorated with five scalloped ribs.

At the base of the niche there is a plain rectangular basin, which was used to catch the water, and measures 2.8m long, 1.34 m wide, and 56cm high. A hollow aperture is opened

at the eastern inner corner of the *sabil* at the level of the top of the trough, which was possibly once connected to the channel that supplied it with water. Directly above the centre of the basin there is a small shallow niche for the water outlet. This now houses a modern metal pipe that does not work and which was probably installed recently, for in 1980 the Auqaf Administration proposed bringing the *sabil* into use again.² A small iron wedge-shaped nail is fixed in this niche, which presumably was intended to provide an anchor for drinking cups.

Above the plaque with the foundation inscription already described there is another smaller inscribed slab of 70cm by 30cm written in Ottoman Turkish. The script is arranged in two lines, and the panel is undated. Van Berchem (1923: 416) considered it to be a restoration text. The translation is as follows:

Tē[ra]düf-i çestemden Ebi [Şati] Oğusun şāhibü 'l-ḥayr dü'ātī

From the sequence/string of [the words of] my song may Ebi Şati [?] sing the praises of the benefactor.

The sides of the *sabil* to east and west are unbroken and built with undecorated masonry. The construction is all of the same dressed white *malaki* stone; although the courses contain stones of different sizes, they have a standard height of 38cm. In the centre of the north wall, which is also otherwise unbroken, there is an undecorated concave niche measuring 1.08m wide by 53cm deep by 1.59m high. This is the *mihrab*. The apex of the *mihrab* is in the form of a fluted shell and is surmounted by a pointed arch, the two voussoirs flanking the key-stone being unusually formed to accommodate its flat top and inward-sloping sides. The keystone projects well into the next course and indeed the masonry of these two courses is notably uneven.

One course above the arch, and two courses below the top of the façade, there is another plaque (described above) which records the restoration of the *mihrab* by Sultan Sulaiman. The height of this northern face is 40cm lower than the one facing south in order to allow for a sloping roof.

Lying north of the *sabil*, the Mastabat Sabil Bab al-'Atm terminates at the *mihrab* just described. The square *mastaba* measures 10m by 10m and is raised by an average 55cm above the Haram esplanade. Its location is only 4.9m from northern *riwāq* of the Haram. The Mastabat Sabil Bab al-'Atm is both constructed and paved with slabs of the same white stone, though the surface of the pavement is more highly finished. The majority of these slabs are of medium size (33cm by 40cm) though some are much larger at 2.2m by 3.1m. Access to the *mastaba* is possible from all sides, though the most convenient access is from the north, for here there are two steps, each measuring 1.71m long, 30cm wide and 17cm high.

² The Auqaf Administration agreed to provide the *sabil* with water from the pipeline at Bab Hitta in 1400/1980. The purpose was to allow visitors to the Haram to make their ablutions there. Despite the approval of the Auqaf the proposal had not been implemented at the time the catalogue entry was first drafted in 1995 (File MAQ, 333,80). However, two years later in 1997 the area which surrounds the *sabil* on the east, south, and west was adapted into a site for ablutions by building square benches equipped with water taps opposite them. The ground level in front of the *sabil* has been raised both by a layer of unnecessary concrete, and by a new stone pavement.

9 SABIL BAB SITTI MARYAM

Name: Sabil Bab Sitti Maryam (Fountain of the Gate of My Lady Mary)

Date: 943/1536-7

Endowment: 948/1541-2

Variation of name: Sabil Bab al-Asbat (Fountain of the Gate of the Tribes)

Modern name: Sabil Bab al-Asbat.

Location

The *sabil* is located to the north of Tariq al-Mujahidin, about 10m west of Bab al-Asbat. The gate is also known as St Stephen's Gate and the Lions' Gate.

Site and brief description (fig. 9.1, pls. 9.1-9.2)

Here again the *sabil* is situated at a focal point, for on the one hand it is close to the only open gate in the walls of Jerusalem allowing access from the east, and on the other, it is at the start of the road which crosses the Old City from east to west. The recent southern façade of the Greek Convent of the Birth Place of the Virgin Mary forms the back of the *sabil*. Its corner to the east is flanked by the street that leads to the Hammam Sitti Maryam and to Bab Hitta Lane. The fountain is a single-unit structure. Like the other *sabils* built by Sulaiman (cat. nos. 4-8), it consists of a recessed niche surmounted by a pointed arch, which is supported by a stone pillar on either side of the opening. The arch and the pillars are contained within a rectangular wall. A trough to contain the water is at the base of the *sabil*. The *sabil* is in poor condition and is no longer in use. A subsidiary underground channel from Qanat al-Sabil used to provide both it and the Hammam Sitti Maryam with water (al-Husaini 1982: 115).

History

Identification

The Sabil Sitti Maryam is identified as belonging to the Ottoman period by a *waqfiyya* in the *sijills* dated 948/1541-2 (see cat. no. 4). The architectural layout also supports this identification (see below).

Date

A comparison with the other *sabils* and the fact that there is a recessed space of the right size suggest that there was once an inscribed plaque which would have supplied a foundation date. The plaque had doubtless already been removed by 1311/1893 for van Berchem has no record of it, although he recorded another inscription relating to the *sabil* which was still in place (see below). As he argued (1923: 417-8), the layout and design of the *sabil*, though lacking some of the decorative features of the others, closely resembles the five examples built in the name of the Sultan Sulaiman I (926-74/1520-66). All recent references, such as al-'Arif (1961: 306), Burgoyne (1976: no. 128), al-'Asali (1982: 276, 278), Najm *et al.* (1983: 341), Rosen-Ayalon (1989: 600), and Bieberstein and Burgoyne (1990: no. 169), accept van Berchem's argument and concur in dating the *sabil* to 943/1536-7. There is no reason not to agree with them.

There is another inscription still *in situ* located above the frame of the missing plaque. This is undated and is probably a restoration text. It is inscribed on a rectangular plaque measuring 80cm wide by 42cm high; slightly recessed, it consists of two lines of Arabic script written in fine Ottoman *naskhi* calligraphy. The

script has both diacritical and auxiliary points, and it is now painted in black. The inscription was published by van Berchem (1923: 418). The translation runs as follows:

- (1) Peace be upon the soul of the purified Prophet!
- (2) His fingers have made the (pure) waters gush forth like Kauthar.¹

Founder

As already explained above, it is to be supposed that the Sabil Bab Sitti Maryam is another royal foundation of Sultan Sulaiman I.

Endowment

The Sabil Bab Sitti Maryam is one of the nine *sabils* which were made a *waqf* in the name of Sultan Sulaiman in 948/1541-2 by Muhammad Çelebi al-Naqqash (see cat. no. 4).

Architecture

Sabil Bab Sitti Maryam is the simplest of the six founded by Sultan Sulaiman I. The reason for its severe simplicity is not clear—it seems unlikely that there were no *spolia* that could be included or, in view of the expense of the later wall project, that there were no funds. Perhaps there was a pressure on time. Without the discovery of a written comment, no explanation can be given for the apparent break in stylistic continuity with the rest of the *sabils* of Sulaiman. It is made up of a recessed niche with a pointed arch measuring 3.73m long by 4.72m high. The extrados of the arch is framed by a bold double ogival moulding. The spandrels contain undecorated irregular rectangles in stone which project from the façade; each element of the design—one rectangular, one triangular—is cut from a single stone. The pointed arch, as in the other examples, springs from two imposts supported by a stone pillar integrated into the fabric of the *sabil* on each side of the opening. The imposts have a slight salient and a chamfered moulding; sometime after 1967, they were replaced as substitutes for the originals, which were cut away when two modern plaques were attached to the western impost by the Jerusalem Municipality. The modern plaques give directions for visitors to the city.

The tympanum of the arch contains the panel with the restoration text described above. One course beneath an empty stone frame marks the site of the missing inscription. It measures 1.3m by 68cm. In 1982 the Auqaf Administration filled this space with a modern slab containing the same foundation text as that found on Sabil Bab al-Nazir. The lower part of the niche was previously blocked (Rosen-Ayalon 1989: 601), but has more recently been exposed to show a shallow stone niche to contain the water outlet. The water trough at the base of the niche measures 52cm deep and 2m wide. Its south-facing side is now missing, probably damaged when the rubble which once filled the trough was removed. The trough is on the same level as the Tariq al-Mujahidin; it would thus seem that the level of the road has remained unchanged since the *sabil* was first built in 943/1536-7. The façade is framed at its top by a simple stone cornice. Above the cornice runs a modern string course which marks the second storey of the Greek Convent of the Birth Place of the Virgin Mary which was built in 1907. The façade of the *sabil* is framed with the same moulding as the rest of the examples founded by Sulaiman,

¹ Kauthar is the name of a river or fountain in Paradise granted by God to the Prophet (Qur'an CVIII: 1); for its spiritual meaning see 'Ali (1946: 1798).

which duly terminates one course above the level of the water-trough with the same inverted volutes or *mims* found in other *sabils* (cat. nos. 5, 6, 8). The eastern part of the *sabil* is used as the support for a simple segmented arch built over the street leading

to Bab Hitta Lane. The fabric of the arch and the wall built over it are clearly later than the *sabil*. The *sabil* is rectangular in plan, measuring 3.72m long by 1.32m wide. The niche is 2m wide and 50cm deep.

10 QUBBAT WA MIHRAB AL-NABI

Name: Qubbat wa Mihrab al-Nabi (The Dome and Prayer Niche of the Prophet)

Date: (A) *Qubba*

(1) The first undated construction was 'dismantled' but was probably Umayyad

(2) The second construction or first restoration is also undated but is Ottoman and is believed to be before 1030/1620

(3) A further restoration by Muhammad Shakir is dated 1261/1845

(B) *Mihrab*

(1) The first phase, the reserved floor *mihrab*, is undated, but is probably to be placed between 693/1294 and 726/1326

(2) The second phase, the walled niche, is dated 945/1538-9

Endowment: The first endowment for the *mihrab* is dated 1037/1627-8, the second is 1091/1680-1.

Variants of name: Various names have been given to the domed structure known now as al-Qubbat al-Nabi. The only contemporary commentator to retain the name given to it by Mujir al-Din (1973 2: 20) is Yusuf (1982: 109) who referred to it as the 'Maqam al-Nabi', despite Mujir al-Din's indication that the floor *mihrab* for the dome had not yet been constructed (see below). 'Qubbat Jibril' (the Dome of Gabriel) is another name given Qubbat al-Nabi, this time by Schiller (1989: 188) but this was in error. 'Maqam Jibra'il' (The Place of Gabriel) is yet another misnomer, this time used by Drory (1980 10: 58). 'Qubbat Fatima' (The Dome of Fatima, the Prophet's daughter) is yet a further name used, for no apparent reason, by Drory (1980 10: 58) as well as by Schiller (1989: 118-9), despite the fact that van Berchem (1925: 170) had previously commented on Catherwood's use of the name (Bartlett 1850: 152), noting that it had no basis in any traditional Arabic reference to the Haram al-Sharif known to him. The undated foundation inscription (see below) refers to the site simply as 'Qubbat al-Mihrab'.

In addition to the names listed here for the dome, three names were given to the floor *mihrab*: 'Maqam al-Nabi', 'al-Mihrab al-Ahmar', and 'Mihrab al-Rasul'. Van Berchem (1925: 169), followed by Walls and Abu'l-Hajj (1980: 118-9) referred to the walled *mihrab* as 'Mihrab Muhammad Beg'.

Modern name: Most recent writers, such as Burgoyne (1976: no.137), al-Husaini (1977: 21), Najm *et al.* (1983: 351), Sabri *et al.* (1981: 20), Drory (1980 10: 58), and Shafi'i *et al.* (1971: 32) call it 'Qubbat al-Nabi', but some, such as al-'Arif (1947: 77-8) and Bahat (1989: 112), still refer to it as 'Mihrab al-Nabi'.

Location (fig. 10.1, pls. 10.1-10.7)

Both *qubba* and *mihrab* are located between the Dome of the Rock (Qubbat al-Sakhra) and Qubbat al-Mi'raj (The Dome of the Ascension), some 19m northwest of the western gate of the Dome of the Rock.

Function: The *qubb*as (small domed structures) are a prominent feature of the architecture of Ottoman Jerusalem. They are either integrated into a larger building, or in themselves constitute a separate monument. Of the last category, there are five domes belong to the Ottoman period. Three (the dome under discussion, Qubbat al-Arwah, cat. no. 30, and Qubbat al-Khadr, cat. no. 31)

are similar both in principle and in architectural features. These are:

- all of them are located on the upper terrace of the Dome of the Rock
- they are free-standing open-sided structures
- the dome is supported on columns and arches
- they all are undated
- they have a *mihrab* reserved in the floor.

The function of these domes is commemorative, for each is associated either with an important figure or a special event related to al-Haram al-Sharif.

The other two domes (Qubbat Yusuf, cat. no. 38, and Qubbat Yusuf Agha, cat. no. 39), although they were built by a single patron and the same master builder, are remarkably different from each other. For a general discussion on the domes dating to the Ottoman period, see Ch. 36 under Domes.

Site and brief description (fig. 10.1, pls. 10.1-10.8)

The site, presumably the same for both the dismantled and the new domed structure (see below), is in a prominent position, close to the western of the four entrances to the Dome of the Rock. It was associated as early as the mid-9th century with the Night Journey of the Prophet Muhammad by al-Wasiti (1979: 73-74) as the site where the Prophet prayed with messengers and angels before his ascension. (On the importance and the growth of the traditional attribution of the site to the place where the Prophet Muhammad prayed, see the references included below under Identification.)

The *mihrab*, which is located within the domed structure, is unusual¹ *vis-à-vis* the others on the Haram in that it consists of two main and apparently distinct parts, the first of which is a reserved area flush with the floor; this predates the second part. This latter *mihrab* consists of a low wall, which is placed around the reserved area of the floor niche. The building is octagonal in plan and is a free-standing single-unit structure. The columns carry eight pointed arches which remain open, and the dome itself begins a single course of stonework above them. The space under the dome houses the eponymous *mihrab*, Mihrab al-Nabi. The dome should thus be identified as a monument erected to commemorate the Night Journey of the Prophet to the Farthest Mosque (*al-Masjid al-Aqsa*) following his ascension.

History

Identification

The Dome

Confusion surrounds the identification of the minor domes on the Dome of the Rock esplanade which are believed to have been built to commemorate specific incidents or tenets of faith, for there is a good deal of insecure and contradictory evidence. This confusion is found not only in the traditional Arabic sources of most periods, but also in most modern publications where, unhappily, the situation is no clearer, despite the valuable information given by Le Strange (1965: 153-6), van Berchem

¹ There is another similar *mihrab* on the platform of the Dome of the Rock below Qubbat al-Khadr. It is undated, and Mujir al-Din (1973 2: 20-1) is the earliest source that mentions it (see cat. no. 31). Another similar *mihrab* is to be found on the Haram esplanade, also undated. It is now known as Mihrab al-Zuhur (see cat. no. 55).

(1925: 38-49), and the recent publication of Elad (1995: 48-50, 74-6) in an attempt to clarify the issue. For example the building considered by most recent scholars to be the Dome of the Ascension is identified by its foundation inscription as the Dome of the Prophet (*hadhihi Qubbat al-Nabi*—see van Berchem 1925: 37). To add to the confusion, al-Suyuti considers the Dome of the Chain to be Qubbat al-Nabi (Le Strange 1965: 155-65).

The first indispensable step in any attempt to identify the Dome of the Prophet is to differentiate between the existing dome, which is under discussion here, and the earlier building which was subsequently dismantled. Ibn al-Faqih in 291/903 (1885: 101), Ibn 'Abd Rabbihi in c. 301/913 (1983: 292), al-Muqaddasi in c. 375/985 (1877: 170), al-Wasiti in c. 410/1019 (1979: 79) and Ibn al-Murajja at the beginning of the 5th/11th century (1995: 71, 77, 144) all make reference to the earlier 'Dome of the Prophet', but unfortunately none of them give details, and as Elad (1995: 74) has noted 'it is impossible from their description to give the exact location of the Dome'. When Nasir-i Khusrau (1945: 30-1) visited the Haram in 438/1047 he described Qubbat al-Rasul (al-Nabi) as follows: 'It is located to the northwest of the Sakhra about 20 cubits distant from the Dome of Gabriel, and it is set upon four marble columns'. It is presumed that this earlier dome was built in the Umayyad period. As Le Strange (1965: 155) notes, the use to which the dome was put during the Crusader period is not known. If the accounts (see below) of al-Suyuti (1982 1: 173-4) and Mujir al-Din (1973 2: 20) can be accepted as accurate, this first dome remained in place until the end of the 7th/13th century when it was dismantled and replaced by a floor *mihrab* (see below). This is the only clue indicating that the present domed structure was built on the same location as the earlier one.

As to the identification of the domed building now standing, Evliya Çelebi (Stephan 1980: 86), who visited the Haram in 1083/1672, is the first and indeed the only commentator to give any information on the second Qubbat al-Nabi. He states: 'Between the Western and the Northern doors of the Dome, looking to the north, and close to the outer walls of the building, there is a "red prayer-niche", Qubbat al-Naby. A small dome rises over it on four small slender columns. Its prayer niche is low and (built) of natural reddish stones ...'. This description of the dome differs from its present state, for, as described above, the building now consists of a dome resting on *eight* (rather than four) columns. The change seems to be a result of the restoration works which were carried out on the dome in 1261/1845. It is certainly noteworthy that the domed building is not included in the mid-16th century *Guide for the Muslim Pilgrim to Jerusalem* (Elad 1995: Appendix 164-173). The guide was written by Nasir al-Din Muhammad ibn Khidr al-Rumi, and is included in the author's book *al-Mustaqsa fi Fada'il al-Masjid al-Aqsa* (still in manuscript). However, the author of the guide does include a reference to '*al-mihrab al-ahmar*' (Elad 1995: 166—see below). Al-Madani (see below) mentions a dome situated to the north of the Rock, but gives no further details; it is difficult to decide whether he is referring to the Dome of the Prophet or to the Dome of the Ascension, or whether he is confusing the two.

The reserved mihrab within the level of the floor (*al-mihrab al-ahmar*)

The identification of the floor *mihrab* rests on many historical sources. The first is al-Suyuti (1982 1: 173-4, translated by Le Strange 1965: 156) who recorded in 875/1470: 'Now, as to the place where the Prophet prayed in the company of the former

prophets and the angels, it is said that this spot is beside the Dome of the Ascension on the platform of the Sakhra where there used to stand a beautiful dome. When, however, they flagged the Platform of the Sakhra, they did away with this dome, and set in its place a handsome *Mihrab*, the floor of which is laid in a circle with red marble slabs, after the manner of other parts of the Sakhra court'. Mujir al-Din (1973 2: 20) later copied the information given by al-Suyuti and added 'it (the *mihrab*) still exists today' (that is, about 900 /1494-5). He called it 'Maqam al-Nabi'. As already stated above, Nasir al-Din (Elad 1995: 166) in the mid-16th century included in his guide *al-Mihrab al-Ahmar* ('the Red Mihrab') as one of the places in the Haram that warranted a visit. Nasir al-Din lists the *mihrab* immediately after Qubbat al-Mi'raj (The Dome of the Ascension) saying that 'then the Muslim turns to al-Mihrab al-Ahmar, which is located west of the Dome of the Rock'. Sijill 183: 290 confirms the identification of al-Mihrab al-Ahmar for it includes the information that the *mihrab* is situated on the platform of the Noble Rock. Another earlier record in that *sijill* refers to the site as Mihrab al-Rasul (for details see below under Endowment).

A few of the travellers and visitors to the Haram in the 17th century have left short references to the *mihrab*. For instance al-Maqqari (al-'Asali 1992: 208), who was in Jerusalem in the period 1029-37/1620-8, wrote '... after I entered al-Masjid al-Aqsa ..., I saw a place in which (Muhammad) led the prayers of the esteemed guided Messengers'. Al-Madani (al-'Asali 1992: 217), writing some forty years after al-Maqqari, reported '... and within (al-Masjid al-Aqsa) to the north of al-Sakhra (the Rock) there is a dome said to be the place of the Noble Ascension, and the Noble *mihrab* in which the Prophet (Muhammad) led the prayers of the Prophets in that noble *maqam*'. Al-Nabulsi (cited by al-'Asali 1992: 259) who visited the Haram in 1011-1105/1690-3, says '... from there we went to Mihrab al-Nabi next to Qubbat al-Mi'raj (The Dome of the Ascension). It is a flagged *mihrab* in the ground (*fi'l-ard*), which has a marble border extending about 1 *shibr* (span)'. Al-Dimyati (cited by al-'Asali 1992: 309), on the other hand, even though his visit to the Haram took place as late as 1143/1731, refers only to a place (*muda*) '... and what is more, there is in this mosque (al-Aqsa) the place where (the Prophet Muhammad) prayed with the Prophets and the angels in this blessed site'. In addition to the descriptions given by these travellers—which can only refer to the combined floor and walled niches—the latter can be identified by a foundation inscription.

Date

The Dome

Modern authors give two dates for the construction of the present Qubbat al-Nabi, both of which are irrelevant. Shafi'i *et al.* (1971 2: 32), Sabri *et al.* (1981: 20), and Najm *et al.* (1983: 351) all give 1261/1845 as the year in which the dome was constructed. This, however, is the date of the restoration work undertaken by Muhammad Shakir, rather than that of the actual construction. Al-Husaini (1977: 21), Burgoyne (1976: no.137), Drory (1980 10: 58), Bieberstein and Burgoyne (1992: no. 177), and Taha (1990: 20) all consider the date of construction to be 945/1538-9. This date is also irrelevant, for it refers only to the second, walled *mihrab* which was built by Muhammad Beg. So far, there is no archaeological or architectural reason to assume a relationship between the construction dates of the *mihrab* and of the domed building, apart from the fact that they share the same site.

To date the domed building, however, is no easier in view of the lack of reliable documentation, and the fact that the only description we have of it—that by Evliya Çelebi—does not, as we have seen above, correspond to the dome as it now stands. It is just as impracticable to date it to the 16th century, as Taha has done (1990: 20), solely on the basis of the architectural style, with no proof or comparative study in support of the hypothesis. Furthermore, what one sees today is not the dome as it was built for the second time, but rather the result of at least one of two cycles of restoration—the last one of which was carried out by Muhammad Shakir in 1261/1845. If, however, we can accept as correct the description by Evliya Çelebi of the Qubbat al-Nabi at the time of his visit—that is, it then consisted of a dome resting on four columns—this must mean that the dome as described by him was constructed before 1083/1672, and thus by extension that the present dome cannot be a 10th/16th-century structure as most authors state. This hypothesis does not solve the problem of the date of construction of the dome seen by Evliya Çelebi in 1083/1672, but a new approximate date is now proposed based on a new interpretation of the undated inscription, and on information discovered in the *sijills* of Jerusalem.

The interior of the domed building has no decoration other than the two panels that have been already published by van Berchem (1925: 172-3). Both panels are located to the south and are contained within the curve of the dome, immediately above the zone of transition. Their position must be deliberate—for anyone standing within the *mihrab* area, facing the *qibla* in prayer, is also facing them. In this way, the patron's name has a high profile in the consciousness of the faithful and may be said to be included in his prayers. The first panel is undated. It is of marble and measures 40cm by 20cm. It consists of two lines of Arabic poetry, both of which are framed in relief by a plain fillet. The script is a condensed Mamluk *naskh* and is on the whole contained within the frame, although in the upper line the curving tails of *dal*, *mim*, *ra* and *sin* intrude minimally into the fillet separating the two halves of the inscription. The translation runs as follows:

As completed (or perfected), the Dome of the
Mihrab seemed beautiful / and chanted in praise,
saying 'In the reign of Farrukh the city of Jerusalem
witnessed neither oppression nor treachery.

The new interpretation of the date rests on two words—the first is *kamulat* in the first line, and the second is *farrukh* in the last line. Van Berchem (1925: 172-3) reads the latter as *faruh* meaning 'joyous'. In a footnote (1925: 172, n.2) he qualifies his reading by an alternative reading of *farukh*, meaning 'calm, confident', adding that it could also be read as Farrukh, the name of the restorer. This raises the question of the identity of Farrukh. In the *sijills* dating to the beginning of the 17th century there are many citations with the name Farrukh, and we believe that he is indeed the person mentioned in the inscription. It is true that there is no dot in the inscription above the *ha* in order to transform it to *kha*, but this is a common mistake, either of dictation or omission on the part of the calligrapher or the engraver. If this assumption is correct, and it seems most likely, this means that the so-called first phase of restoration was carried out before the year 1030/1620. This surmise is based on the biography of the Farrukh who was governor of Jerusalem and Nablus to the year 1030/1620 (for details, see below under Founder).

With regard to the translation of the word *kamulat*, van Berchem read it to mean 'to be completed' or 'to be finished', and in consequence considered the panel to be a restoration inscription. Another possible meaning for the Arabic verb *kamala* or *kamula* is 'to be perfect or faultless'. If this is the meaning intended here, then the panel can be seen as a building inscription, and correspondingly this would make Farrukh the founder of the second dome of Qubbat al-Nabi. Although it is tempting to accept this interpretation, there is no decisive proof that this is what was intended by the phrase. Perhaps too, if it is a building inscription, it would be more usual to find an emphasis on the construction by using some such phrase as '(there) has ordered the construction of this dome'. Even if construction by Farrukh is not proven, the dome was in all probability restored by him.

The second panel dates to the year 1261/1845. It is situated to the west of the earlier panel described above. It too is carved in marble, and measures 30cm by 18cm. It contains two lines of Arabic and Turkish, written in *ta'liq*. The second line is highly compressed and is thus dissimilar to the first, upper part, which has space enough for diacritical points and for a small flourish of a floral spray carrying a seven-petalled rosette. Its translation reads:

Mediation, oh Messenger of Allah!
The Colonel of the Imperial Army, the gentleman
Muhammad Shakir, 1261.

The *Mihrab*

The first part of the *mihrab* (the niche area reserved and outlined in red marble within the level of the floor) has no inscription, and neither al-Suyuti nor Mujir al-Din (see above) gives a precise date for its construction. However, they both say that this floor *mihrab* replaced the dismantled dome of the Prophet when the Sakhra court was flagged. So the questions are—when this was done, and by whom? Mujir al-Din (1973 2: 70), in his biography of the Amir 'Ala' al-Din Aydughdi the Blind, describes the paving of the platform (*sahn*) around the Dome of the Rock as one of his numerous charitable acts. Since the *amir* died in Shawwal 693/August-September 1294, and the pavement project took more than thirty years to complete (as Burgoyne 1987: 221 inferred, relying on the dated foundation inscription published by van Berchem 1922: 120-3), the date for the construction of the floor *mihrab* can thus be placed between the years 693-726/1294-1326.²

The second *mihrab* can be dated to the year 945/1538-9, for this date is written on the foundation inscription, which was published by van Berchem (1925: 169). The panel is a single piece of marble, measuring 70cm by 25cm, and is set into the stonework which acts as the topmost course on the south side of the *mihrab* (see below). The inscription consists of two lines of Arabic, written in Ottoman *naskhi* script within two cartouches separated by a fillet. The script is fine and with diacritical points. Despite the fact that the panel has a sloping diagonal crack that runs from top to bottom, and is broken at the upper left hand

² Al-'Arif (1961: 203) was twice mistaken, first in misquoting 'Ali 1927 5: 270 and secondly in confusing Amir 'Ala' al-Din Aydughdi ibn 'Abdullah al-Salihi al-Najmi 'the Blind', and the Amir 'Ala' al-Din Aydughdi ibn 'Abdallah al-Kubaki, who died on Friday, 5 Ramadan 688/22 September 1289. See Mujir al-Din 1973 2: 65, 270-1.

section, the inscription is still in good condition. Its translation reads as follows:

This blessed *mihrab* was constructed by our Master, king of the noble *amirs*, Muhammad Beg, the Governor of Gaza and the region of Jerusalem the Noble—may their ranks be augmented—in the year 945.

Both al-‘Arif (1947: 77) and Yusuf (1982: 110) read *al-amir al-kabir* (‘the Great Amir’) in place of *malik al-umara’ al-kiram* (‘King of the Noble Amirs’). Shafi‘i *et al.* (1971: 32) and Sabri *et al.* (1981: 20) confused the numerals 4 and 2 in Arabic and in consequence misread the date as 925.

Founder

The presumed Umayyad founder of the Qubbat al-Nabi is unrecorded by contemporary authors. As explained above, the name of Farrukh is associated with either the founder or with one phase of the restoration of the second, still extant, domed structure. On the binding of Sijill 85: 1 there is inscribed a note recording the departure of Farrukh Beg, governor of Nablus district, from Jerusalem to Nablus on 10 Rabi‘ II 1014/25 August 1605. Sijill 87: 419 records the events of the year 1016/1607-8 and includes an entry dated 17 Ramadan/5 January 1608 which mentions *qudwat al-umara’ al-kiram Farrukh Beg*, the ex-governor of the district of Jerusalem the Noble. A third *sijill* (113:104) also cites the name as ‘Farkh’. Al-‘Asali (1989: 39), who published the latter *sijill*, commented on the name ‘Farkh’, saying that ‘we believe that the correct form is Farrukh’. Indeed, there is another record in Sijill 112:469 clearly giving the name as ‘Farrukh’, which supports the suggestion of al-‘Asali. Farrukh ibn ‘Abdullah, a Turkish Amir, was governor of Jerusalem and Nablus district, and was the *amir* of the Syrian pilgrimage caravan³ in the first quarter of the 17th century (Rafeq 1968: 197-200). Farrukh ibn ‘Abdullah increased his authority to such a degree that he passed it to his son Muhammad Beg, who ruled after him in Jerusalem and Nablus, after the death of Farrukh in 1030/1620-1. (For details of the political activities and the biography of Farrukh ibn ‘Abdullah, see Rafeq 1968: 157, 197-200, Mandaville 1975: 523, *Palestinian Encyclopædia*:1984 3: 453, Manna’ 1990: 141-45, Ze‘evi 1995: 43-45.)

To sum up then, it is possible that the first recessed *mihrab* is the work of Amir ‘Ala’ al-Din Aydughdi, but it is safe to see the second walled niche as the work of the Ottoman governor of Jerusalem and Gaza, Muhammad Beg.

Endowment

Sijill 113: 786, which contains the proceedings of the year 1037/1627-8, includes an appointment document for Mihrab al-Rasul (the Mihrab of the Prophet). It states that the *qadi* had appointed *maulana* Fakhr al-Din ibn Shaikh al-Islam Zakariyya Efendi, the *ex-mufti* of Jerusalem, to the half post of the *sha‘‘al* (the person in charge of lighting) for the lamp of the Mihrab of the Prophet, located to the north of the Aqsa mosque. He was to be allocated one ‘*uthmani* per day from the income of the *waqf* of al-Masjid al-Aqsa. Though the entry does not give definitive information with regard to the name or the location of the relevant *mihrab*, it is most likely that it relates to ‘al-Mihrab al-Ahmar’ in view of the fact that it gives no other definition. In any

case, there is another unequivocal record in Sijill 152: 551 which reveals that Muhammad al-‘Asali was appointed on 2 Muharram 1068/10 October 1657 as an administrator of the *waqf* of Ibrahim Agha the son of Muhammad. That *waqf* was made in the year 1048/1638-39 by the donor for the benefit of lighting of the oil lamp of al-Mihrab al-Ahmar which was located on the Sakhra platform. The caretaker was to receive two *ghirsh* yearly.

A third record is found in Sijill 183: 290 dated the beginning of Shawwal 1091/25 October 1680, which provides a further endowment for al-Mihrab al-Ahmar. The entry states that the *qadi* had assigned Khalil ibn al-Hajj Ahmad ibn Rajab to the position of *al-farrash* (attendant) and *sha‘‘al* (the person in charge of lighting the lamp) of al-Mihrab al-Ahmar which was situated on the platform of the Noble Rock. In return, Khalil was to be given per day two ‘*uthmani*, two bowls of food and eight loaves of bread from the soup kitchen of Khassaki Sultan in Jerusalem. Khalil had replaced his father in this post on the latter’s death. On the basis of these records, it would appear that a portion of the income of the endowment of al-Masjid al-Aqsa and of the *waqf* of Ibrahim Agha were dedicated to the upkeep of the *mihrab*.

Architecture

Exterior

The dome is hemispherical and rests on eight slender, elegant arches. These are constructed of small coloured stones, originally red, black, and white, of which the white stone has now weathered to grey. The eight arches are similar in height and span. A simple iron tie-beam links them at the level of the springing of the arches. The shafts of the columns are cylindrical and are made of grey veined marble; the radius is small, measuring only between 47-57cm. The capitals are fall into four groups.

[Editorial note: All of these are types of *muqarnas* but have different detailing. For the sake of convenience, they are identified as Types A-D in this description, while the columns are numbered 1-8, starting at the NE corner of the base of the floor *mihrab*.

Capitals 1, 2, 7, and 8—that is all those at the northern end of the *mihrab*—are of Type A. These are the most complex and best executed of the capitals, although each one differs slightly, as might be expected from handworked objects. The sharp chiselling, the arrangement of *muqarnas* elements and the detailing are, although somewhat simpler, strongly reminiscent of 16th-century work in Istanbul. The capitals on the columns in the mosque courtyard and portico of the Süleymaniyye or the portico of the Sokullu Mehmet Pasha Cami (Goodwin 1971: pls. 219-220, 273), for example, not only employ a similar carving technique but also a similar veined grey marble. The basic motif used in all the capitals is an almond shape or irregular diaper which has been centered above two wedge-shaped triangles to fill a lancet-shaped niche. The top level of the capital Type A is a square ‘cornice’ with a concave moulding. The whole capital is cut from a single piece of stone and, below the ‘cornice’, the upper section is plain except for the corners, which have been chamfered. Within each slanting cut there is a single large example of the almond-and-triangle motif. The base of these corner motifs forms the top of the next level, where paired almond-and-triangle motifs are angled to each side of a deep recess. The corner is thus further cut away. A similar paired almond-and-triangle motif is introduced at the centre of each face at this middle level. Below again, the base of each of these motifs forms the top of the lowest register. Here the eight projections between the carved niches are outlined by a further cutting away

³ On the Syrian caravan pilgrimage and its importance in the Ottoman period, see Rafeq 1981: 5-28.

of the surface. This occurs twice, to form a stepped recession around the negative shape at the centre of each niche. The niches and corresponding outlines are marked with a sharp horizontal cut across the centre. The capital then meets the top of the column, which is now hidden by a broad metal band.

Type B is used for capital no. 3—the easternmost capital, which is also closest to the Dome of the Rock. The design is much simpler than Type A. The concave upper part is cut from local stone and sits above the marble central section of the capital. Here again, as in Type A, the corners are cut in a chamfer ornamented by the almond-and-triangle motif. Below twelve examples of the same motif run round the capital above twelve plain lancet-shaped niches. The faces of these are left uncarved, although the edge of each niche is cut crisply to continue the wedge-shaped modelling of the main motif.

Type C, which is used for capitals no. 4 and 6, is very similar to Type B. The 'cornice' is again of a different stone and the main difference is one of execution. The almonds are more rounded so that the impression is almost that of a flower motif, rather than a geometric one. They are also more elongated and the T-shaped recesses between the lowest level of stumper lancet-shaped niches is more pronounced.

The final capital, no. 5, Type D, is closest to the *qibla*. Here again the 'cornice' does not form part of the capital itself but is a separate stone. The almond-and-triangle motifs cut the corners, as in all the examples. But here, on Type D, the motif is shortened as if its upper section has been interrupted. The pairs of almond-and-triangle motifs in the next level, set across the corners as usual, are comparatively elongated and this has the effect of making them appear almost the same size as the designs of the four corners set above them. In the centre of each face there is a negative shape, as in Type A, but here the sides are not faceted so that it is a simple recess marked only by a sharp horizontal cut across the centre. The lowest level of twelve lancet-shaped niches, which are marked by a vertical line down their centre, is so arranged that the apex of each lancet meets the stone projection between each motif. This has the added effect of leaving a crisp T-shaped shadowed recess beneath each main motif. The effect is simple but elegant.

The gradation in complexity and execution between the capitals is noticeable. Perhaps the patron could only afford four imported capitals (Type A); perhaps only four were available to him from another site. Or perhaps four of the original eight were fractured in an earthquake and had to be replaced. It is conceivable that such an accident happened at the same time as damage to the columns necessitated the use of metal bands at the top and bottom of each. Not only are the four capitals of Type A the most complex, they are also of the best grade marble and are in one piece with their 'cornice' while all the others are constructed from two different types of stone. The impression that results is not wholly satisfactory, as if local craftsmen tried to emulate a superior but did not fully succeed. SA]

The columns rest on square bases, which each have a square plinth, torus, and apophyge. Where the top of the base meets the shaft, it has been slightly reduced in order to match the cylinder. This reduction is also to be found, and for the same reason, at the lowest part of the capital where it joins the shaft. Although each column is made up of a single piece of marble and match each other, the reduction points to the assumption that the shafts were not originally intended for these capitals.

In order to strengthen the joints, a metal band has been placed recently around the top and bottom of each column at

these junctions. The similarity between the columns probably indicates that they were designed and sculpted by one master, presumably for a specific building, to be re-used either when the dome was constructed or later when it was restored in the Ottoman period.

A cornice made up of a *cavetto* moulding runs around the top of the arched section of the building and marks the beginning of the dome. The dome, which is constructed of a rubble and mortar mixture, is sheathed externally in lead sheets in order to protect it from the elements. It is presumably, therefore, without stone cladding and thus different from other, similar domes of the period. The apex of the dome is crowned by a knopped marble finial in the form of a crescent, and is thus typical of the Ottoman period. It comprises three sections. The lowest section is also the shortest and is plain apart from a central ring moulding. The middle section, the tallest, has a baluster knob at its centre, rising to another ring moulding above. The uppermost section is in the form of an open crescent.

Interior

The building is a centrally planned octagon, surrounded on all eight sides by open arches. It therefore has no main façade, but is designed to be viewed from any angle. Equally, access to the building can be from any side, although the north is the most convenient route in that there is an opening in the wall surrounding the reserved *mihrab*, which is located in the middle of the building and thus directly under the dome.

The first *mihrab* to be constructed (see above) was, as already explained, a reserved area within the level of the floor. Its format is determined by a large slab of white marble, rectangular at one end and terminating towards the south (*qibla*) in a point reminiscent of the profile of the eight arches which surround it. This slab is in turn framed in red marble. A third area of white marble completes the reserved space; at the niche to the south, this outer frame is reduced by being cut into by the curved end wall, so that instead of the pointed profile of the two inner areas, it is semicircular in profile (see note 1 below).

The second *mihrab* to be constructed (see above) is in effect a low wall enclosing the area described in the previous paragraph. Its northern wall is cut to form an entrance of 50cm across to allow easy access into the reserved area to pray. At the southern (*qibla*) end, the outside of the wall has three straight faces, while the internal profile is semicircular. The containing walls to the north, west and east consist of two courses of white marble. The southern, faceted wall is higher than the other three and is more complex, being built with an additional course of red stone sandwiched between the two white courses. The three courses differ not only in colour but also in size, the largest, which measures 70cm by 25cm, forming the upper level. This level contains the foundation inscription described above. The curved inner side of the southern wall has further ornamentation in the form of a series of eleven concave, round-ended gadroons. As far as the author can determine, this design has no parallels in Jerusalem architecture. These are contained by two flanking and integrated colonnettes, each of which has a capital that could be described as a simple *muqarnas* although, as it consists of a single level made up of a concave niche flanked by two half-niches that merge with the wall, it is probably more accurate to see it as a much simplified 'lotus' capital. This impression is strengthened by the fact that the complete niche contains an internal detail in reserve that repeats the shape of the niche and is subdivided in two by a vertical bar. The half-niches to either side are outlined by

a groove and have a faceted cut where they connect to the supporting wall. Both in shape and in the crispness of this chamfering they find a faint echo in the capitals of the eight large-scale columns of the surrounding building. The small colonnettes differ considerably from the columns, however, with regard to their bases, for the colonnettes are supported on a base made up

of two equilateral triangles with a smaller, acute-angled and inverted triangle between them. In each case the triangle has another carved in reserve contained within itself, and a third small triangle, this time solidly in reserve, at the centre. Above the square base a roll moulding marks the transition to the colonnette shaft.

11 RIBAT BAIRAM JAWISH

Name: Ribat (hospice) Bairam Jawish

Date: 947/1540-1

Endowment: The relevant endowment deeds are dated: 948/1541-2; 952/1545-6; 967/1559-60

Variants of name: Al-‘Arif (1961: 307) and al-‘Asali (1981: 327) both give ‘al-Rasasiyya’ as a variant name for the *ribat*, for they mistakenly identified the Rasasiyya as part of the complex (see cat. no. 28). The *ribat* is also currently known also as the Madrasat (school) Dar al-Itam al-Islamiyya because it now forms a major part of that institution.

Modern name: The monument is widely known by the two names given above.

Location

Ribat Bairam Jawish is located at the south-western corner of the junction where Tariq al-Wad meets the streets of Bab al-Nazir to the east and Tariq ‘Aqabat al-Takiyya (formerly al-Sitt) to the west.

Function: According to the *waqfiyya* and the foundation inscription, the Ribat of Bairam Jawish functioned as a residential house for the pious poor (*al-fuqara’ al-sulaha*). This means that the *ribat* in the Ottoman period fulfilled a different function from that under the Mamluks or in North Africa. For a full discussion, see Ch. 36 of this study, under the heading ‘Other buildings’. It is not known when the *ribat* stopped functioning as a hospice for the poor and pious.

The building is at present used for different purposes. The main area of the *ribat*, especially the ground and second floor, are annexed to Madrasat Dar al-Itam al-Islamiyya. The first floor is used for residential purposes, and there are a series of shops in the eastern façade as well as two in the northern façade.

Site and brief description (figs. 11.1-11.6, pls. 11.1-11.8)

The site is an important one within the Old City for several reasons. Firstly, it forms one of the four corners of the junction between Tariq al-Wad and the streets of Bab al-Nazir and Tariq ‘Aqabat al-Takiyya. Al-Wad Street is one of the two main roads that cross the Old City from north to south. Secondly, the site is close to the Haram area; it lies 80 metres west of Bab al-Nazir, one of the main gates to the Haram al-Sharif. Thirdly, the *ribat* is built in the centre of a district which has surprisingly few Mamluk structures, but contains the largest number of prominent Ottoman architectural monuments outside the enclosure of the Haram. The *ribat* is located opposite one of the *sabils* founded by Sultan Sulaiman, Sabil Bab al-Nazir (cat. no. 7), and faces Maktab Bairam Jawish (cat. no. 12) and al-Zawiya al-Muhammadiyya (cat. no. 29). Al-Madrasa al-Mawardiyya, mistakenly known until the present study as ‘al-Rasasiyya’ (cat. no. 28), adjoins the *ribat* to the west, and the soup kitchen of Khassaki Sultan (cat. no. 15) lies beyond, located to the west of the Mawardiyya. The Zawiya Naqshbandiyya (cat. no. 33) and the Zawiya Qadiriyya (cat. no. 35) are situated a few metres to the north east of the *ribat*.

Ribat Bairam Jawish has two façades, the north being the principal one, for it contains the main entrance porch and another simple doorway. The second elevation lies to the east. The *ribat* has three levels, the first and the second of which are the original structures built by the founder Bairam, while the third is a later undated addition. The first level is the ground floor,

consisting of a vestibule, an open courtyard surrounded by small cells to the north, east, and south. The first floor consists of a small open courtyard, a narrow passage, six small cells, and a hall divided into three parts. An archway spanning the lower part of Tariq ‘Aqabat al-Takiyya was built later and leads to the second floor of the *ribat*. The second floor is made up of a rectangular hall divided into two parts by a large pointed arch.

History

Identification

The date of Ribat Bairam Jawish is secured both by an inscription plaque and by various *waqf* documents in the *sijills* (see below).

Date

The year 947/1540-41 is given at the end of an inscription as the date of construction. The marble panel is to be found above the entrance door in the north façade. It measures 60cm wide by 60cm high and has three lines of Arabic inscribed in Ottoman *naskhi* calligraphy. The script is fine and highly compressed with diacritical and auxiliary points. It has been published by van Berchem (1923: 430) and the translation is as follows:

1. This blessed place (is made *waqf*) as a hospice
2. (by) the poor one (by the mercy of God), the Amir Bairam Jawish son of Mustafa, may his glory be perpetuated
3. its date being 20th Rabi‘ I of the year 947 (25 July 1540).

Founder

According to the foundation inscription and the *waqf* documents (see below), the founder of the *ribat* was Bairam Jawish, the son of Mustafa. Until now, as Meinecke noted (1988: 267), little has been known or published about the founder. His name is unusual and, as will be discussed below, it is possible that he originally hailed from Gaza. Biographical sources on local Palestinian secular activities or commercial connections are scarce, especially in the early Ottoman period. The *sijills* of the Shari‘a Court of Jerusalem have proved to be an indispensable source to research the personalities and patrons who enriched the city by building different types of structures. Thanks to the hundreds of records scattered throughout the *sijills* recording various transactions, it is possible to establish an almost complete sequence—albeit with some gaps—of the role played by Bairam and others, not just in the life of Jerusalem but also in other Palestinian cities. The records show that Bairam was a very important person in Jerusalem during the early Ottoman period; he was given many honorific titles which reflect his rank as the prominent holder of a large military fief. *Timarci* (Sijills 12: 360; 20: 448), *subashi* (Sijills 17: 243; 18: 407), and *za‘im* of Jerusalem district (Sijills 28: 417, 437; 56: 649) are among these titles, in addition to *beg* (Sijills 30: 62; 31: 110), and *amir*—as on the inscription plaque already described above.

Bairam’s activity in Jerusalem extended beyond the military sphere to include secular enterprises within the realms of the social, economic, architectural, and administrative. The earliest reference to Bairam in the *sijills* is dated 16 Shawwal 944/18 March 1538, almost three years before the completion of his *ribat*. It appears from Sijill 7: 435 that Bairam spent the sum of 3,600 *‘uthmani* (silver coinage) to restore al-Madrasa al-Mawardiyya, where he then resided (for details see cat. no. 28).

Al-‘Arif (1961: 307), followed by al-‘Asali (1981: 325), thought that Bairam Jawish was appointed a supervisor by Sultan Sulaiman I (926-74/1520-66) for the Jerusalem walls project, and

that Bairam built both the *ribat* and the *maktab* (cat. no. 12) following the completion of the reconstruction of the walls. Unfortunately, neither author supports his statement with a reference. However, Cohen (1989: 470–3), relying on the Jerusalem *sijills*, showed that Muhammad Çelebi al-Naqqash was to provide the funds for the entire project in his capacity as *al-amin 'ala al-amwal al-sultaniyya* (the superintendent of the *miri* taxes). In 1990 Cohen (1990: 33) reaffirmed his conclusion and expanded it, once again depending on information in the *sijills*, to show that Muhammad Çelebi al-Naqqash was *al-amin 'ala sur bait al-maqdas* (the superintendent of the wall of Jerusalem), and further that he was the official responsible for the financial and administrative affairs of the whole project. But it does seem that Bairam had some involvement in the walls project, for a *sijill* (12: 360) dated 18 Rabi' I 947/23 July 1540 states quite clearly that Bairam went to Egypt, probably following instructions by Muhammad Çelebi al-Naqqash, to bring back master builders (*mu'allimin mi'mariyya*) to work on the construction of the walls of 'Jerusalem the Noble'.

On 12 Dhu'l-Qa'da 947/10 March 1541 the *qadi* (Sijill 13: 87) appointed Bairam to the position of inspector (*wazifat al-nazr*) in al-Diyar al-Muhammadiyya in Jerusalem the Noble. It is difficult to know precisely what the duties of this post were, since no further details are given in the *sijill*. Later, on 3 Sha'ban 951/20 October 1544 Bairam, as representative of the 'amir, the supervisor of revenues in Egypt, al-Hijaz, and the Islamic frontiers' (Sijill 17: 257), declared that he had received the assigned quantity of wheat and barley from the village of Qalonia (West Jerusalem) for the year 951/1544–5. In 957/1550–1 Bairam was the caretaker (*mutawalli*) of al-Kashif or al-Kashi building, which is no longer extant today (Sijills 23: 617; 24: 26). He was in charge of the Church of the Holy Sepulchre (*al-mutakalim 'ala qiyamat al-Quds*) in the early part of 960/1552–3. From the *sijills* (Sijills 27: 495; 28: 437; and 31: 110, the latter of which was published by al-'Asali 1989: 98) it is known that Bairam also occupied the post of 'Caretaker of al-'Imara al-'Amira' (*al-'Imara al-Sharifa*—that is, Khassaki Sultan, cat. no. 15). It was one of the most important administrative posts in Jerusalem in the Ottoman period, usually given to élite officers of high rank who came down to Jerusalem from Istanbul. 'The Trustee of the Sanctuaries (*al-Amin 'ala hurmat*) of our lord Musa (the prophet)' near Jericho,¹ was another of the prestigious positions (Sijill 36: 334) enjoyed by Bairam in the year 965/1557–58.

As reflected in the *sijills*, Bairam's main contribution to the life of Jerusalem—aside from those mentioned above—was concentrated in two fields. The first was in the realm of architecture and the second in economic transactions. For the first, his involvement was on two levels—private and public.

Examples of his private constructions are the *ribat* now under discussion, the *maktab* (cat. no. 12), his *dar* (cat. no. 13), and the *Zawiya al-Yunisiyya*.² The *Zawiya al-Yunisiyya* no longer exists but from the *sijills* (Sijill 12: 264) it is quite clear that it was situated in Wadi al-Tawahin Street (Tariq al-Wad) and was in a ruined state in the mid-16th century—in other words, it was restored by Bairam. Bairam attested in the presence of the *qadi* that he had made a *waqf* of 150 gold coins (*qubrusi*) for the *zawiya* in Safar 947/June–July 1540. He stipulated that fifty coins should be used for the necessary repairs to al-Zawiya al-Yunisiyya and that the remaining one hundred coins should be used to erect a stone residence (*bina hajar*) for the poor. In a separate document (Sijill 12: 264), it is recorded that Bairam as inspector appointed Asya ibn Khalifa to the position of children's teacher. Asya had to instruct the children in the reading of the Holy Qur'an for two 'uthmani dirhams per day, and he was not allowed to take any money in payment from the children.

As for his public projects, Bairam's contribution to the rebuilding of the walls of the city has already been mentioned, as well as his repair of al-Madrasa al-Mawardiyya (cat. no. 28). While Bairam was in the post of Caretaker of al-'Imara al-'Amira (cat. no. 15), he contracted a group of builders to pave the floors of the two bathhouses of al-'Imara al-'Amira (Khassaki Sultan complex) (al-'Asali 1989: 98; Sijill 31: 110). Neither bathhouse still exists, but from the architectural description they would appear to have been both impressive and of high quality. Furthermore, Bairam contracted (al-'Asali 1989: 99; Sijill 31: 110) another set of builders (*mi'mariyya*) in Jerusalem to supply a subsidiary canal to run for 150 *dhira'* from the water-distribution point (*maqsam*) situated just in front of the Sabil Bab al-Nazir to the cistern serving the two bathhouses. He also supervised (Sijill 23: 442) the restoration of al-Madrasa al-Finnariyya.³ As for the projects that were carried out beyond the walls of the city, he participated in repairs to the citadel in Bait Jibrin, situated between Jerusalem and Hebron (Sijill 22: 438), and the restoration of Khan al-Lubban (Sijill 24: 69), located on the road between Jerusalem and Nablus. Another aspect of his architectural activity was dealing with the *mi'mariyya* to secure building materials such as gypsum (*jibs*—Sijill 24: 177), and stone (Sijill 18: 10; 39: 480).

Bairam emerges from the *sijill* records as a great businessman, a trader in a wide range of merchandise from the basic necessities of food products to the other end of the spectrum with transactions involving various estates and properties. He was a wholesaler and retailer of olive oil (Sijill 30: 62), sugar (Sijill 26: 41), a great quantity of soap (Sijills 30: 110; 56: 648), pepper (Sijill 30: 208), olives and figs (Sijill 30: 412, 415). It seems that he was one of the great merchants in Jerusalem in the period, if not the greatest. He declared (Sijill 27: 297) on 2 Muharram 961/8 December 1553 that he had undertaken to bring barley, *samn* (cooking butter), honey, and rice to Jerusalem before the arrival of Sultan Sulaiman to the city.⁴ He guaranteed that the

¹ Maqam al-Nabi Musa was—and still is—a big complex. It was extensively enlarged during the Ottoman period. On the history of the *maqam*, see J. Sadan, 'The *maqam* of Nabi Musa' *Hamizrah Hahadash* 28, 1979: 22–38, 220–338, and al-'Asali, *The Nabi Musa Feast in Palestine* Amman 1990 (in Arabic). The position of caretaker for the *maqam*, like other prestigious posts throughout the Ottoman period, was mainly given to al-Ghudiyya family members. For the history of this Jerusalem family and their positions, see 'Abd al-Qadir Juda al-Ghudiyya, *Sulalit al-Ghudiyya* Jerusalem 1991.

² This is a Mamluk *zawiya* mentioned by Mujir al-Din (1973 2: 395). De Jong (1984: 34), basing himself on Kurd 'Ali (1971 6: 149) mistakenly concluded that al-Yunisiyya 'as a construction outlasted the *tariqa* into more recent times'.

³ This monument no longer exists, but it was situated in the eastern section of the north *riwaq* of the Haram. See Mujir al-Din 1973 2: 40–1, 234, 241.

⁴ This piece of information is particularly interesting for it implies an intention—or at the very least a strong rumour of one—on the part of Sultan Sulaiman to visit Jerusalem. In fact, such a visit never took place, for no mention of one is found in any contemporary source; the only Ottoman Sultan to visit Jerusalem in the 16th century was Sultan Selim.

amount of the supplies would be sufficient for the Sultan and his army. Bairam's commercial activities covered not just the Jerusalem area but extended to most parts of Palestine. He rented different estates and land in various towns and villages, for example land (Sijill 23: 234) and a ruined bathhouse (Sijill 24: 97) in Akka, half the (cultivated) land of the villages of Bait Sahur (Sijill 23: 152) and Dair Yasin (west of Jerusalem—Sijill 17: 243), and a *haush* (Sijill 10: 571) and a *khan* (Sijill 23: 396) in Jerusalem itself; he also owned estates in Ramla and Gaza (Sijill 56: 649). As already stated, Bairam appears in the *sijills* as trading in a wide variety of goods, for besides the commodities mentioned above he also purchased houses (Sijills 20: 258; 25: 259; 28: 417), land (Sijill 18: 407, 408), farms (Sijills 17: 117; 18: 162, 185), shops (Sijill 19: 236), stables (Sijill 10: 236), ruined buildings (Sijill 25: 117), and finally slaves (Sijill 21: 169; 23: 503). He also used to loan money to numerous people in several towns, but it is not clear if these loans were interest-free or not. The *sijills* (Sijill 18: 304) record a loan to a Jew, another loan in Syria (Sijill 17: 464), and a third to Qasim the *kikhiya* (deputy) of Hasan Beg (Sijill 22: 20).

The *sijills* also provide information on the personal life of Bairam Jawish and his family as well as details of his wealth and effects. It seems (Sijill 56: 651) that at the time of his death, Bairam's sons were too young to act as trustees, for the inspector of Bairam's *waqf* was to be his daughter Khadija, and Safar ibn Mustafa, Bairam's brother, together with 'Abdi ibn Qubat were to be legal guardians of the children. The list of his effects, auctioned after his death, takes up ten large pages of the *sijill* (41: 55–5). He died most probably between 8 Rabi' I / 5 November and the end of Rabi' II / 26 December 970/1562.⁵ The former seems to be the date of the last administrative action taken by Bairam in his capacity as inspector of his *waqf*. Through his representative, 'Abdi Khalifa, Bairam then assigned 'Abd al-Qadir Çelebi for the duration of his ('Abd al-Qadir's) lifetime as clerk of Bairam's *waqf* (Sijill 56: 650). This raises the question of why Bairam should authorise 'Abdi Khalifa to organise the assignment of the clerk, rather than undertaking to do it himself. It seems possible that Bairam was either sick at the time or had already died, for adjacent (Sijill 56: 651) to the assignment document, there is another dated at the end of Rabi' II of the same year, in which it is stated that Bairam was no longer alive. The term '*al-marhum*' (deceased) is added to his name there. It is likely that this document was written shortly after his death; it was registered in the presence of Safar ibn Mustafa, Bairam's brother, and 'Abdi ibn Qubat, the legal guardian of Bairam's orphans. The document is in fact a declaration from 'Ala' al-Din ibn 'Abd al-Wahhab al-Sukkari. 'Ala' al-Din declared himself willing, being of sound body and mind and under no duress or connivance, to ratify the sale of the soap-factory and the *haush* by his father to Bairam, and that Bairam in his lifetime had paid his father all the money agreed for the transaction.

From these records, it is clear that Bairam was one of the most famous personalities in Jerusalem in the early Ottoman period. He was obviously of such wealth and standing that not only can he be seen as one of the greatest patrons of Ottoman architecture in Jerusalem, but he also contributed to the development of the city's commercial life.

Waqf Documents

Apart from the single-page document published by al-'Asali (1989: 122), up to the present almost nothing had been published—or discovered—about the life or *waqf* of Bairam Jawish. But the fact that his *ribat* and *maktab* (below, cat. no. 12) were charitable projects and required a fixed income in order to function meant that an original *waqfiyya* must have been drawn up to lay down the terms and expenditure by the caretaker in accordance with the wishes of the donor. Before the search through the *sijills* began, some scattered fragments were known which implied that endowments had once been dedicated to the *ribat* and the *maktab*. Al-'Arif (1961: 308) pointed to a *sijill* (44: 538) in the year 971/1563–64 which contains the information that the *qadi* had assigned an inspector for the endowments of Bairam Jawish. Furthermore, another *sijill* (522: 15) cited by al-'Asali (1981: 325) records that Bairam Jawish had bestowed the income of the villages of Bani Nu'aim (Hebron) and Bani Shuja', a soap-factory in Bab al-'Amud Lane (Jerusalem), and, finally, a *haush* near the soap-factory already mentioned, for the benefit of his *ribat* and *maktab* in Jerusalem the Noble. Al-'Asali (1981: 325) also quoted another *sijill* (135: 597) which states that in the year 1054–5/1644–5 the structure of the dome of the *maktab* had deteriorated. There is no longer a dome associated with the *maktab* which can be dated to this period (see below cat. no. 12); as the *qadi* was concerned for the safety of the children who were studying there, he issued an order to restore the dome. But all these documents gave information of a secondary nature, and the main objective of the search was to discover the complete, original and definitive *waqfiyya*.

After a long and exhaustive search, a transcribed copy of the complete, original *waqfiyya* has indeed been discovered in the *sijills*. Although the *ribat* and the *maktab* were built as early as 947/1540–41, the *waqfiyya* was drawn up only in the year 967/1559–60—that is, twenty years after the construction of the buildings. But it was actually copied into the *sijill* of the proceedings of the year 982/1574–5 at the end of Sijill 56 instead of the expected Sijill 18 or Sijill 40. For some reason, it seems that the *waqfiyya* was not registered in Jerusalem's *sijills* when it was drawn up in 967/1559–60. It was only because a controversy arose between Bairam's heirs and the *shaikh* of the *ribat* (see below cat. no. 13) that the *qadi* sent a special envoy (Sijill 56: 652) to the Shari'a Court at Gaza⁶ to bring back to Jerusalem a copy of the terms of Bairam's *waqf*. It is not clear from current research why the document was registered at Gaza but it may point to the possibility that Bairam was originally from there. However, while they were waiting for the news from Gaza, Muhammad Jawish, the legal agent of the heirs of Bairam, presented the *qadi* with the formal terms of the *waqf* and a copy of the official register. Later on, Rihan (the envoy) returned from Gaza with a copy of the official register. It is clear that Muhammad Jawish asked the *qadi* for permission to make a copy of all Bairam's *waqf* documents and that the *qadi* approved the request. It is thus only thanks to the dispute that we have an official duplicate of Bairam's *waqf*.

The *waqf* is without doubt one of the biggest and most important endowments in the *sijills* of the Ottoman period,

⁵ Khadr Salameh (1996: 270), using a special *sijill* (192) which contains the opening pages of most of the *sijills*, has surmised that Bairam died on 6 Rabi' I 970/3 November 1562.

⁶ It is not known why the *waqf* was recorded in Gaza and not in Jerusalem. It is surprising for the *sijills* reveal that Bairam habitually frequented the Jerusalem Shari'a court, and his association with Jerusalem was clearly stronger than that with Gaza. Further research may provide an answer.

second only to the *waqfiyya* of Khassaki Sultan (cat. no. 15). It sheds new light on the monuments that were built by Bairam in addition to giving a great deal of information about his life and work. The official register (*al-sijill al-rasmi*) of the *waqf* of Bairam Jawish contains seven long pages (Sijill 56: 646-52), and is divided into two parts, both being written in a clear, legible *naskhi* script with many diacritical points, although by different scribes. The first part of the *waqfiyya* is divided into two sections; the first contains the terms and list of the endowments, written in direct, straightforward dry language without any prologue or epilogue. It is odd to find the terms and stipulations of the *waqf* twice—first separate from the original text, and second repeated with some further details in the text of the *waqfiyya*. The explanation may stem from the profound wish of Bairam that his conditions be binding.

The second section of the document is the *waqfiyya* itself, drafted in a traditional style and including a short, coherent prelude, as well as details about the endowments, covering their location and boundaries, the terms and stipulations for the administration of the *waqf*, personnel, and financial arrangements. It ends with a summary regarding the durability of the *waqf* and the punishment to be expected by anyone who tries to change, substitute, or diminish it in any way. The second part of the official register is made up of eight documents (*hujja*). The first two of these are concerned with the authorisation of Muhammad Jawish (see below), issued in the Court of Damascus on behalf of Bairam's wife and daughter.

The third document is the appointment of a clerk for the *waqf*, probably the last action taken by Bairam before his death (see above). The fourth is the declaration from 'Ala' al-Din ibn 'Abd al-Wahhab al-Sukkari (mentioned above). Documents 5, 6 and 7 are testimonies by various *qadis* on the legal and lawful status of the *waqf* of Bairam, and the subject of the last is one of Bairam's houses in Jerusalem (see cat. no. 13). The last six documents were written and organised below the signatures of the witnesses of the *waqfiyya*. Because of the importance of the *waqfiyya* and the eight other documents, as well as two other unpublished instruments (see below), a complete Arabic text is provided in Cat. Appendix 1, together with an English summary. Major sections of the *waqfiyya* and the documents will also be translated below.

Endowments

The initial step towards the full endowment of his properties was taken by Bairam for his *maktab* only (see below cat. no. 12); the second stage was taken on 15 Jumada I 952/25 July 1545 (Sijill 17: 127; al-'Asali 1989: 122) when Bairam bestowed 50,000 'uthmani dirhams (silver coins) as a joint *waqf* for the *ribat* and the *maktab* together. He imposed the condition that the inspector (see below) of the *waqf* should deal (*yu'amil*) with the money in a lawful way by investing it with responsible people—probably merchants. The yearly interest (*ribh*) on the money had to cover the various outgoings specified in the *waqfiyya* (see below), and any surplus after this expenditure had to be added to the credit of the initial 50,000 'uthmani dirhams. He further stipulated (Sijill 17: 127; al-'Asali 1989: 122) that if the inspector of the *waqf* were to locate a cultivated property or a prosperous estate he had to purchase it from that capital sum. Sijill 18: 407-8 reveals that Bairam in his capacity as the inspector of the *waqf*, on 4 Ramadan 952/29 October 1546 bought one-quarter (6 *qirat* out of 24) of the whole property belonging to Bani Nu'aim village, as well as the farm which belonged to the village known by the name

'Khutain'. The price was 50 gold pieces from the total of the 50,000 silver coins made *waqf* by Bairam. The final, major stages of the endowment for both his *ribat* and his *maktab* were undertaken in the middle of Dhu'l-Hijja 967/6 September 1560. At that time, Bairam—again in the presence of the *qadi* and other witnesses—made over one hundred *qintar* of soap as a *waqf* for the *ribat* and the *maktab*, its value being equivalent to 100,000 'uthmani dirhams (Sijill 56: 647-8). The completed *waqf* thus reached a total of 150,000 'uthmani dirhams. By any standard this is a huge sum of money. If one compares it with the available information for other *waqfs* (such as the *waqf* of the Maulawiyya (see cat. no. 19 under 'Endowment') or the *waqf* of Islam Beg (see cat. no. 21 under Endowment) it will be seen that it is 3.75 times the size of the two *waqfs* mentioned above, even if the *waqf* of Bairam was to be divided between his two buildings (namely the *ribat* which is under discussion, and the *maktab*, cat. no. 12).

Bairam, as he had stipulated, invested the sum of money in the purchase of various agricultural properties, orchards, portions of village lands, and urban properties in different parts of the country. The properties and estates which made up the endowments of the Ribat and Maktab Bairam Jawish were very numerous indeed. They are listed below according to Sijill 56: 646-9, with the boundary of each item, although much has been changed. Full information is to be found in Cat. Appendix 1. The properties listed in the *sijill* are:

- 1) One-half (12 *qirats* out of 24) of the soap factory situated at Bab al-'Amud (Damascus Gate) in Jerusalem. The soap-factory was equipped to produce soap and it consisted of numerous rooms which were vaulted with stone and lime, a cistern in which to keep oil, a cistern to store rainwater, a lower-level storage house, a dais over which to spread the soap, two stoves, and many basins.
- 2) One-quarter (6 *qirats* out of 24) of the complete *haush* (complex of buildings) consisting of a roof built of stone and lime, and of a lower-level house.
- 3) One-half (12 *qirats* out of 24) of the house, located in Bab al-'Amud district, formerly known as the House of Ibn al-Saigh. It consisted of two floors, an upper and a lower.
- 4) One-half (12 *qirats* out of 24) of al-Jab'a orchard planted with figs and vines in the village of Bethlehem. The orchard was bordered from the south by the orchard of Bardawil, 'well-known as Abu Khalil', and to east, west, and north by open land owned by Sulaiman, who was from the area of Bethlehem.
- 5) One-half (12 *qirats* out of 24) of the orchard planted with figs and vines in the village of Bethlehem in the valley of al-Rahib (the priest).
- 6) One-third (8 *qirats* out of 24) of the land planted with figs, vines and other trees at Bethlehem. This property was bounded to the south by open land, to the east by the orchard of Abu Khalil mentioned above, to the north and west by open land owned by 'Ulaian.
- 7) One-quarter (6 *qirats* out of 24) of the property planted with figs and vines in the village of Bethlehem. Here the land was bordered to the south by planted land belonging to the *qadi* Shihab al-Din ibn al-Muhandis, to the east by open land, to the north by the orchard of the *qadi* Badr al-Din al-Shafi'i, and to the west by open land belonging to 'Abd al-'Aziz and his partners.
- 8) One-half (12 *qirats* out of 24) of all the property planted with figs and vines in the Christian village of Bait Sahur. This property was bordered to the south, east, north, and west by open land owned by 'Abbad ibn 'Ali ibn Ahmad from Bait Sahur.

9) One-half share (12 *qirats* out of 24) of the complete plot of land planted with figs and vines in the village of Bethlehem. This plot was known as 'al-Jab'a' and was bordered to the south by open land, to the east by land belonging to the donor (Bairam), to the north by the land of al-Mahruq, and to the west by an orchard owned by the *qadi* Shihab al-Din ibn al-Muhandis and the *qadi* Badr al-Din al-Shafi'i.

10) One-quarter (6 *qirats* out of 24) and one eighth (3 *qirats* out of 24) of the ground planted with figs and vines in the village of Bethlehem. It was bordered to the south by an open space, to the east by an orchard belonging to Fawwaz, to the north by the orchard of Ahmad ibn Husain al-Tawashi, and to the west by the orchard owned by 'Umar ibn Dawwa, who was from the area.

11) A share of one quarter (6 *qirats* out of 24) of the lands of Bani Shuja' village, known by the name of Bani Nu'aim in the district of Jerusalem, and a quarter share (6 *qirats* out of 24) of its estate (*muzara'a*) known as 'Khutin'.

12) Sixteen Turkish brass bowls (*tasa*), and five Turkish rugs. These were intended for use in the *ribat*, for the *waqfiyya* states that each resident should receive one and that the duties of the doorkeeper included maintenance the bowls and basins (see below under 'Duties of the personnel'). The right to a bowl probably included the right to a meal: it acted like a meal ticket.

13) The whole share of the lands of Saihan village in the district of Gaza the Protected.

14) The share of 14 *qirats* out of 24 of the land of Bait Tafa village at Gaza.

15) The whole *khan* building known as the Dar al-Wakala, once in al-Qayasina Quarter, and located in al-Zaituna quarter at the time of the endowment.

16) All that remained of the mill building and its ruins, together with the land that belonged to it, located on the river of the Prophet of Allah Rupin, in the district of Ramla.

Purpose of construction

The patron (Bairam) had bought these sixteen properties with the 150,000 silver coins that had been made *waqf* by himself. It is noticeable that much of the land was bought from Christian locations. The reason for the availability of this property is not immediately clear, but further research may resolve the question. The income from the purchases was intended to serve the interests of the *ribat* founded and constructed by Bairam and for the benefit of the *maktabkhana* opposite it (Sijill 56: 649). The *ribat* was to function as a dwelling place for the poor and the pious to allow each of them to reside in a separate room (Sijill 56: 649).

Description of the building

The *waqfiyya* (Sijill 56: 649) states '(Bairam) the donor (*al-waqif*) established his *waqf* for the benefit of his *ribat* and his *maktabkhana*. The *ribat* was built and constructed by the donor with his own money (*min malihi wa sulb haliha*). It is located in the city of Jerusalem the Noble, in the lower part of 'Aqabat al-Sitt where the junction of the roads is placed. The *ribat* is near the fountain (*çesme*) (cat. no. 7) and adjacent to the Madrasa Mawardiyya (cat. no. 28) that is situated in Noble Jerusalem the Protected.'

Terms of the Endowments

Bairam reserved for himself during his lifetime the post of inspector (*nazir*) of his *waqf*, the post thereafter to pass to his sons and the sons of his sons, and to the descendants of his family (Sijill 56: 646, 649). The position should be conferred by merit of seniority and competence (*al-arshad fa'l-arshad*). In the event of

the line of Bairam's family dying out, the role of inspector would be filled by the superintendent (*nazir*) of *al-Haramain al-sharifain*—that is, the superintendent of the Great Mosque of Hebron and the Aqsa Mosque in Jerusalem (Sijill 56: 646, 650). This marks a change from the earlier abrogated *waqfiyya*, because the *sijill* (17: 127) published by al-'Asali (1989: 122) omitted any reference to his descendants, Bairam's successor as inspector being named as the commander of the Citadel. In addition, Bairam reserved for himself alone the right to increase or decrease, to add or delete any of the *waqf* properties (Sijill 56: 650). No successor was to have this prerogative. The inspector had to collect the income of the *waqf* deeds in the presence of the *shaikh* of the *ribat* and the *faqih* of the *maktab*, if it was possible for them to meet in person, and if they could not, then one of them was to suffice (Sijill 56: 650). Any surplus income was to be distributed among the descendants of the founder. In accordance with the law, the male members were to take double the amount allotted to the females. The inspector of the *waqf* was to give priority in his administration to the maintenance and restoration of the *ribat* and the *maktab* constructed by Bairam. The inspector (*nazir*) of the *ribat* was obliged to provide dwellings for the needy, pious poor, each to reside in one room (a cell). The *ribat* was not to provide accommodation for a teacher, and the income must be spent as described and stipulated by the *waqfiyya*. Bairam reserved for himself the right to appoint the personnel listed thereafter, and after him the *qadi* of Jerusalem was to decide on the staff in consultation with the inspector of the *waqf*.

Financial Arrangements

The details of the financial arrangements (Sijill 56: 649, 650) were to be as follows:

Position, etc.	Daily figures in dirhams
16 residents of the retreat (<i>mujawirs</i>)	
one <i>dirham</i> each	16
(Literally a <i>mujawir</i> means a 'neighbour'; in the early Islamic period the meaning was extended to someone living in a specific religious site, like Mecca or Jerusalem. In the Ottoman period it took on the connotation of a Sufi resident in a <i>zawiya</i>).	
<i>Shaikh</i> of the <i>ribat</i> and the <i>mujawirs</i>	5
Door-keeper (<i>bawwab</i>)	2
Elementary-school teacher (<i>faqih</i>)	3
Inspector (<i>nazir</i>), if one of Bairam's descendants	4
Clerk (<i>katib</i>)	1
Oil to illuminate the <i>ribat</i> and the tomb in the <i>maktab</i>	1
Total of daily expenses	32
Total of yearly expenses	11,680

Unfortunately the *waqfiyya* does not give any specific information about the income from the endowments. However, to give a rough idea of the level of the yearly income, it is possible to calculate the probable interest on the original 150,000 *dirhams*, according to the rate at the time when Bairam first set up the *waqfiyya* (see above). The interest rate of lawful *mu'amala* (dealing) at the end of the 16th century in Jerusalem stood at 15 percent. This rate would have produced a total of 22,500 *dirhams* yearly; this means that, after the cost of the expenses had been subtracted, a yearly surplus of 10,820 *dirhams* would have been available to be used for maintenance; any residue was divided among Bairam's descendants.

Duties of the personnel

The *waqf* inspector was to provide each *mujawir* (resident), together with his stipend, one of the sixteen bowls (*tasa*)⁷ donated by the *ribat* for use while he was resident within the foundation. If the *mujawir* were to leave, he had to return the bowl to the *bawwab* of the *ribat*. The poor of the *ribat* should be provided with a *shaikh*—he was to be learned, pious and had to recite daily a certain portion of the Qur'an in the northern assembly room (*majma'*) of the *ribat* (Room D). The benefit from the recitation of the Qur'an should be dedicated to the presence of the Prophet (Muhammad), to Ibrahim the Prophet, to the soul of the donor (Bairam), to the soul of the donor's parents and sons, and to all his Muslim brothers. The *shaikh* of the *ribat* was to have the right to live in the *tabaqa* (literally 'upper units'; hereafter it is referred to here as 'the first floor of the *ribat*') built above the *ribat* rent-free for the term of his life. The *bawwab* (door-keeper) of the *ribat* was to clean and sweep the *ribat*, to look after its latrines, to open and close the gate, and to maintain the bowls (*tasat*) and the carpets mentioned in the *waqfiyya*. The door-keeper was to cover the floor of the northern assembly-room with three of the five carpets specified, the remaining two to cover the western assembly-room and the *iwān*. The clerk was to register the income and the expenditure of the *waqf*. The *faqih* (elementary-school teacher) was to teach the children at the *maktab*; he was to be allowed to live rent free during his lifetime in the house adjoining the *maktab* to the north.

Subsequent History

The *sijills* (56: 646; 59: 47) reveal that after the death of Bairam, his daughter *Sitt al-Dunya* Khadija became the legal inspector of the *waqf* of Bairam. Khadija, together with her mother Laila, Bairam's widow, on 16 Shawwal 982/29 January 1575 appointed her husband, Muhammad ibn Qaraquz Jawish, to be their agent (*Sijill* 56: 646). He was fully entrusted to sell any of their part of Bairam's inheritance or estates in Jerusalem, Gaza, Nablus, and Ramla. In 1989 al-'Asali (1989: 265) published *Sijill* 68: 48 which gives the names and daily wages of the personnel of the *ribat* and the *maktab* for the year 975/1657-68. The employees were 'Abdullah Sinan, the *shaikh* of the *ribat*, for five (silver coins); Zakariyya Khalifa, the inspector, for five (according to the terms of the *waqfiyya* it should have been four) silver coins; Shaikh Salah al-Din, the teacher in the *maktab*, for three (silver coins); and Mansur ibn Muhammad the door-keeper, for two (silver coins). Shaikh 'Umar ibn 'Abd al-Wahhab was appointed clerk (*Sijill* 64: 250) for the *waqf* on 8 Rabi' I 993/10 March 1585. A dispute occurred on 6 Muharram 1044/2 July 1634 between Muhammad Çelebi Darwish and Muhammad al-Khalili over the post of inspector of Bairam's *waqf*. It seems that all the posts involved in Bairam's *waqf* continued to cause arguments, for the *Sijill* 202: 128 cited by al-'Asali (1989: 85) contains reference to a dispute over the position of *faqih*. The dispute was between Shaikh Khalaf

ibn 'Uthman and his brother Ahmad; this time the dignitaries of the *maktab* district intervened in favour of Shaikh Ahmad because he was already in post teaching the children, in addition to which he had mastered the rules governing Qur'anic recitation.

Architecture

The building complex is one of the most complicated Ottoman structures in Jerusalem. It consists basically of three engaged levels, but many parts are the result of later restorations, additions, and alterations that were carried out at various times with no documentation to aid interpretation. As a result, the building has a variety of types of stone and masonry dressing and no common factor to unite them. To add further to the confusion, the *ribat* complex, the Mawardiyya and the complex of Khassaki Sultan (al-'Imara al-'Amira), are all today partly merged with one another. All these edifices can be entered through the same doors, and each leads into the other. The Ribat Bairam Jawish and al-'Imara al-'Amira (cat. no. 15) are the largest Ottoman structures in Jerusalem. It is only necessary to take a superficial look at the drawing of the north façade or at one of the plans of the complex to appreciate the puzzling layout.

In the first place, anyone wishing to study the complex of the Ribat Bairam Jawish has to attempt an answer to two basic questions—although there are many others. First—what parts constitute the original structure of the *ribat* as erected by Bairam in 947/1540-1 and which were added later? And second—do the structures which flank the *ribat* to the east (the archway over Tariq al-Wad) and to the west (the Rasasiyya, which it is now known should correctly be called al-Mawardiyya) really belong to the original structure of the *ribat*, as some scholars have believed (see cat. no. 28), although they have cited no evidence? It is possible to some extent to read the phases of construction, especially of the northern façade, and to try to differentiate between them, but this is less than satisfactory, for this stylistic approach remains pure speculation founded on the less than scientific skill of architectural analysis. To answer the questions, it is really necessary to provide firmer grounds. It is therefore particularly gratifying that when eventually I discovered the *waqf* documents relating to the *ribat* (see above) and the *dar* (house) of Bairam (cat. no. 13) in the *sijills*, some of the speculation could be supported with incontestable proof. Once again the indispensability of the *sijills* as a prime source of information for the study of the Ottoman architecture of Jerusalem is demonstrated. By means of the relevant *sijill* and its component documents it has proved possible to follow the development of buildings like this very involved complex and to provide long-awaited answers to such questions as whether or not the mistakenly called Madrasa Rasasiyya is part of the *ribat*. The simple answer is that it is not (see below cat. no. 28).

Exterior—the north façade

The principal façade of the Ribat Bairam Jawish is to the north, facing the southern elevation of Maktab Bairam Jawish (cat. no. 12). What is considered today as the north façade of Bairam's *ribat* is relatively long. It runs 36m from east to west, and for the most part is made up of two levels. The façade can be divided into four vertical sections (A), (B), (C), and (D). Section A is furthestmost to the west, its length being 10m; it lies between the east end of the north façade of al-'Imara al-'Amira (cat. no. 15) which it separates from the so-called Madrasa Rasasiyya. Only the lower part of this section is visible, for its upper part is obscured by an archway dwelling (*qantara*). It is very simple, dominated by

⁷ It is difficult to know the exact purpose of the *tasa*. It could have been merely an empty vessel to be used for eating, or it could mean the right to a share of the food distributed by the soup-kitchen of al-'Imara al-'Amira (cat. no. 15), a close neighbour, as indicated above. It is attractive to consider the second possibility because the early *waqf* (*Sijill* 17: 127) mentions that two loaves of good bread should be given per day to each resident (*mujawir*). Unfortunately this suggestion lacks certain proof, for the final *waqfiyya* contains no mention of the arrangements for food distribution.

three doorways, each surmounted by a semicircular arch. The span of the western arch is the smallest of the three. There are two identical window-openings above the central and eastern arches. Each window has a simple sill and lintel, both of which are fashioned from a single block of stone. This part of the façade is undecorated and is similar in its individual features to the architecture of other domestic Ottoman buildings elsewhere in the Old City of Jerusalem. This would suggest that this Section A does not belong to the original *ribat* building. To a limited extent supporting evidence for this hypothesis can be seen in the *waqfiyya* for it is stated that the *ribat* is adjacent to the Madrasa Mawardiyya (the Madrasa Rasasiya, see above), and the only building which conforms to the layout of a *madrasa* is located to the east of this section. It is believed therefore that this section was probably either built or rebuilt some time in the late Ottoman period. Its interior will not therefore be described here. The upper part of Section A comprises an archway, its entrance gained through the doorway of what it is suggested should be called 'the second floor of al-Zawiya al-Muhammadiyya' (cat. no. 29). It is described and studied elsewhere under the relevant catalogue entry.

The second section (B) to the east of section A has been called up to now 'al-Madrasa al-Rasasiyya' and, as said above, was considered by some to be part of the *ribat*. The correct name is al-Madrasa al-Mawardiyya and it is not part of the *ribat*. It will therefore also form the subject of a separate entry (cat. no. 28).

The third section (C) extends 15.5m from the eastern boundary of al-Madrasa al-Mawardiyya to the west side of Tariq al-Wad. It is this section that is the original area of the *ribat* according to the *waqfiyya* (see above) and it is noticeably taller than the Mawardiyya. Section C is made up of two vertical parts to the east and to the west. The western part runs from the east side of al-Madrasa al-Mawardiyya up to the second, newly-opened, entrance to the *ribat*. It is dominated by a large door, 2m by 3.8m, surmounted by a semicircular arch. This is very simple, being made up of a double tier of voussoirs and springing from the walls to either side; there are no jambs or lintels. The masonry surrounding the door is rusticated masonry of a lesser quality and different in colour from the stones of the eastern part of this section. The simplicity and different natures of the two parts of section C may imply that this section was not part of the original construction of the *ribat*, but was probably built at a later period. Since this part is similar to the western section of the southern elevation of Maktab Bairam Jawish (cat. no. 12)—considered to belong to the original construction—and since the *waqfiyya* (see above, Description of the Building) clearly states that the *ribat* was bordered to the west by al-Madrasa al-Mawardiyya, it is quite correct to consider this part of Section C as belonging to the original *ribat* despite its different appearance. However, the likelihood of a restoration at some later period must be borne in mind. A doorway is located at the east end of this section, leading into the interior of the *ribat*. Simple in form, it measures 1.7m by 85cm; it has recent iron doors and is surmounted by a slab lintel. The door is used today only by the family living in the cells of the *ribat* and the chamber of the second floor. It was opened in late 1967⁸ after the ground floor of the *ribat* was annexed to the newly-opened secondary school named Dar al-Itam al-Islamiyya. The upper western part of section C is blocked by the archway spanning the road of 'Aqabat al-Takiyya (al-Sitt); it runs between the Ribat and Maktab Bairam Jawish.

The western part of section C contains the main entrance to the *ribat*, set into a recessed porch with a pointed arch. The door is rectangular, measuring 1m wide by 1.65m high, and is flanked on both sides by a white stone bench. Each bench measures 50cm wide by 50cm deep by 40cm high. The door is surmounted by a slab lintel measuring 1.35m wide by 40cm high, and two courses higher, directly above the lintel, there is the stone panel described above, giving the foundation inscription. A slightly recessed square marble panel has been inset two courses above the keystone of the pointed arch. It measures 50cm by 40cm and is decorated in relief. The scheme of the decoration is made up of a combination of geometrical and floral motifs which form octagons. Each octagonal element of the design is filled with small roundels separated by a triple-headed leaf. There is a star pattern at the centre of the panel, and the four corners are filled with a vegetal trefoil. The pointed arch of the porch entrance is flanked on both sides by a rectangular window. The two windows are not on the same level, nor are they the same size, but both are surmounted by a slab lintel and are fitted with an original iron grille. The east window measures 75cm wide by 1m high; it has a relief arch made up of three stones, the keystone being trapezoid. It is noticeable that there is a break in the lines of masonry built to the east of this window. This is a clear indication of the alteration to the stone courses that occurred when the fourth section (D) of this northern façade was built. It also indicates the probable point at which this section used to finish before the addition of section D (see below and cat. no. 13). The west window measures 70cm wide by 1.4m high, and almost three courses above there is a small window in the form of an eight-pointed star to light the interior at first-floor level. It seems that the two courses which were built directly above the star mark the end of the first level of this part of the façade and the beginning of the second level of the *ribat's* façade. Although the masonry courses of both levels of this part of the façade (C)—where the first level meets the second level two courses above the star-window—might appear to be coherent and of the same fabric (especially in the drawing) it was in fact apparently built in two phases. There are three reasons for saying this—firstly, the stonework, despite its superficial similarity, is of differing qualities and colour. Secondly, the second level can only be approached through the eastern archway, and this archway is certainly a later addition, for it blocks part of the northern façade and its wall is not engaged with the *ribat* building. And finally, neither this second part nor the eastern archway are mentioned in the *waqfiyya*. On the contrary, it is clear from the text that the *ribat* building once terminated at the level of the western window where the chamber for the use of the *shaikh* of the *ribat* was located (Sijill 56: 652). It is unfortunately difficult to be sure because of lack of information how the first level of the façade was finished before the second level was constructed; but presumably some sort of alteration must have occurred.

The second level of the façade is overlooked by three identical rectangular windows placed five courses above the octagonal star. Each window measures 75cm wide by 1.2m high; they are all surmounted by a slab lintel and fitted with an original iron grille. A buttress 50cm wide by 3.5m high by 25cm deep has been built between the middle and eastern windows, terminating at the same level as this part of the façade. A slit window 20cm wide by 60cm high occurs five courses above the windows at the central point between the middle and western windows. Two shallow domes finished with stone slabs are built above the roof of the second level, each covering part of the two rooms that form

⁸ According to Mr H. Qassas, a current (1995) neighbour of the *ribat*.

the third floor.

Section D is the fourth and last, forming the easternmost part of the façade. It consists of the *qantara* (archway) that spans Tariq al-Wad. Section D represents another separate monument built after the *ribat* was finished. This is the Dar Bairam Jawish (cat. no. 13). A straight vertical break down the courses is clearly visible between Sections C and D, in addition to the discrepancies in the lines of masonry courses east of the window located to the east of the main entrance already described above. These must indicate, as already explained, the additions and the alterations to the façade that took place when Bairam built his house. The *sijill* provided the necessary proof to allow this part of the façade to be treated in a separate entry (see cat. no. 13).

The eastern elevation of the Ribat Bairam Jawish provides a sharp contrast to the north façade, for its masonry fabric is coarse and undecorated. It runs 16.1m from north to south, and five rectangular openings are cut in the lower part of the elevation. These openings, together with the five bays of al-Wad archway, divide the elevation into five similar parts. Each is fitted with a wooden door. Thick black lines of pointing are visible between the masonry courses above the doors, probably the result of recent unskilled repair work. A small rectangular window is to be found in the upper level of each part, with the exception of the fourth which seems to have been blocked later. The measurements of the first three windows (from north to south) are identical, each measuring 55cm by 70cm, and all are fitted with an iron grille. The last window measures 40cm by 53cm, probably indicating a later reduction by partial blocking up. The purpose of these windows was to illuminate the cells built above the five shops already described as a sort of intermediary level between the ground and first floor levels. At the level of one course above the windows the remainder of the elevation is obscured by the western side of the archway that spans Tariq al-Wad. The interior of the cells is rectangular and at present they are used as shops. Unfortunately nothing is mentioned about these shops in the various *waqf* documents of the *ribat*. This is unusual. If these openings were originally built for use as shops, there should have been a reference to the fact in the *waqfiyya*, for they would have provided additional income for the endowments. However, the fact that they are not mentioned in the *waqf*, as well as the extreme simplicity of the openings and the lack of any arch, jamb or lintel, may indicate that these were originally intended to be used as cells to provide accommodation for the poor. Sixteen individual cells were to be available for the inmates according to the terms of the *waqfiyya* already discussed, for each *muwajir* was to have his own cell. If one counts the six cells on the first level H1-H6 (see below under 'Interior') plus these five rooms on the ground floor and then adds the five of the intermediary mezzanine, a total of sixteen cells is reached. It seems that at some later date the intermediary cells were transformed into shops, probably after the deterioration in the *waqf* system in the later Ottoman period, although there is no evidence as to when such a transformation took place. Access to the cells of the lower and upper level is still visible and clear, but how the intermediary cells were approached is not visible today. There are, however, two possibilities—either through the main entrance of the *ribat* in the same way as the rest of the cells, or through Tariq al-Wad in the same way as the shops are entered today. Since there is no indication on the interior of the east wall which might infer a blocked entrance, the access to the mezzanine floor was most probably by way of Tariq al-Wad. It is worth mentioning that, regardless of the original function of

this part of the *ribat*, it was a necessary construction measure to bridge the difference in levels (3m) between the west and east sides of the building because of the slope of 'Aqabat al-Takiyya towards the east.

The Archway (*qantara*) of 'Aqabat al-Takiyya

Two archways (*qantar*as) span the lower part of 'Aqabat al-Takiyya (al-Sitt), the first to the east between Ribat and Maktab Bairam Jawish, and the second to the west between what is proposed here should be called al-Zawiya al-Muhammadiyya (cat. no. 29) and the anonymous building situated between al-Madrasa al-Mawardiyya to the east and the eastern end of the north façade of al-'Imara al-'Amira (section A, in the northern façade discussed above). The latter *qantara* is described as part of the first floor of al-Zawiya al-Muhammadiyya; the former will be studied here. The eastern archway is made up of a long cross-vaulted bay supported by two pointed arches. The arches spring from the northern façade of Ribat Bairam to the south, and from the southern elevation of Maktab Bairam to the north. The four elevations of the eastern archway are visible. The eastern and the western ones can be seen from the road of 'Aqabat al-Takiyya (al-Sitt). To view the southern elevation is a little more complicated—it can be seen either when standing within the *ribat*'s open courtyard, going west by way of the staircase (see below), or, on entering the main entrance of al-Madrasa al-Mawardiyya or al-'Imara al-'Amira complex, by turning east through a complicated series of stairways. The north elevation is visible as the interior of the *qantara* is left by way of the door in the north wall of the archway.

The south façade of the eastern archway is the most elaborate though it was not constructed as a street-front, as was the common practice for such façades. It is built of high-quality white masonry. The main feature of this south façade is a trefoil-arched portal recess which contains the main entrance. The archivolt of the trefoil arch is curved and decorated with a series of plain *muqarnas* lancet panels. The entrance door measures 93cm by 1.9m, and it is flanked on both sides by a stone bench, each measuring 45cm by 50cm by 85cm; it is surmounted by a marble slab lintel. A relieving arch is built directly above the lintel of the door, consisting of seven voussoirs set at an angle. A recessed stone panel measuring 40cm by 50cm is set above the arch, contained within a decorative billet frame. The background of the panel is filled with four glazed tiles. These have a floral decoration consisting of a pair of split arabesque 'petals' in blue, ringed by a turquoise or yellow band. The petals meet at the tips to form a cruciform motif, which contains a secondary floral motif in yellow. The ground is yellow. The tiles are almost identical in pattern, but not in colour, to tiles of the Dome of the Rock which were made by order of Sultan Mahmud II in 1233/1817. A sample of the Dome of the Rock tiles is displayed at the Islamic Museum of Islamic of al-Aqsa Mosque (col. pl. XLIII). The closeness of design may provide a clue as to the construction date of this eastern *qantara*, but it cannot be considered conclusive because the tiles could have been inserted at a later date into an already existing panel. A slit window is placed eight courses above the trefoil arch; it measures 20cm by 60cm. Two courses above this there is a masonry frame marking the apex of the elevation. An irregular vertical break in the masonry marks the meeting point between the east end of this elevation and the west end of the south elevation of the second floor of the *ribat*.

The north elevation of the eastern archway is

undecorated. It has a simple doorway 80cm by 1.6m, and there are two windows east of the doorway, all of them opening towards the north over the courtyard (A) on the first floor of the Maktab Bairam Jawish (cat. no. 12). The windows measure 85cm by 1.4m; they are fitted with an iron grille and surmounted by a slab lintel. A slit window similar to the one in the southern elevation is placed two courses below the summit of the façade. The exterior transition zone begins three courses below the top of the wall. The pointed dome, covered with small flagstones, is set on the octagonal transition zone. No drum can be seen from the exterior.

The west elevation begins with the pointed arch which supports the archway to the west. It is made up of a double tier of voussoirs, and a projecting flat segmented arch is constructed directly above. The arch springs from a two-stepped corbel stone to the south and from the wall of the south elevation of Maktab Bairam to the north. Five flat stone slabs protrude from the course set above the arch and support a large rectangular stone. This flagstone appears to be a floor, the only remaining vestige of a small balcony. Two identical rectangular windows, each measuring 85cm by 1.4m, are placed immediately above the slab. They are fitted with an iron grille and are surmounted by a slab lintel. A relief 'eye-brow' arch of three voussoirs is built above each lintel. The masonry courses, of a high quality black and white stone, continue without interruption from the arches of the two windows to the octagonal transition zone of the shallow dome that covers the main chamber of the *qamara*.

The eastern elevation, although beginning like the western façade with a double-tiered pointed arch, has a different design. It is made up of two parts, divided by a decorated string course that projects slightly. This frieze-like dividing line is composed of double triangles, forming a dentate design of repeated lozenges. The lower part is constructed with fine *ablaq* masonry of red and white now weathered to grey. In this lower section there are two identical rectangular window-openings, 85cm by 1.4m, now blocked; they have fitted iron grilles and white marble lintels. A relieving arch of five joggled red and white *ablaq* voussoirs is built above each lintel. The upper section of the façade is a solid wall of fine white masonry. There is an off-centre slit window which has a trefoil head framed by a finely carved groove cut into the stonework. A single course above the little window the upper part of the building is terminated by a slightly projecting chamfered coping.

Interior—the Ground Floor

Access to the ground floor of Ribat Bairam Jawish, as explained above, is through two gateways. The first is the main entrance with the foundation inscription. It is 75cm below street level and has two steps down, leading to a rectangular vestibule (A). Vestibule A measures 75cm wide by 3m long and runs from north to south. Its floor is paved with old flagstones, and it is covered by a tunnel vault. There is a recessed blind niche in the east wall, 75cm by 35cm, adjoining the first cell (shop) to the north of the five which make up the lower part of the eastern elevation. A door is opened in the southern end of the west wall of the vestibule. It measures 85cm by 40cm. At the southern end of the vestibule there is another door which was supposed to give access to the open courtyard of the *ribat*. It is now blocked with modern concrete blocks to allow vestibule A also to be used as a shop, together with room B.

The second doorway is located to the west of the main entrance; it leads to the antechamber (C) which is square in plan, measuring 2.1m by 2.15m. The ground floor of antechamber C is

paved with flagstones, and steps were built recently, soon after the door was opened in 1967, as explained above. Antechamber C is covered by a cross vault. There is a rectangular window opening (75cm by 70cm) in the west wall giving onto chamber D which is situated to the west. A door in the south-east corner of the antechamber gives access to a small *ivan*, 65cm by 70cm, and opens towards the courtyard of the *ribat* through a semicircular arch. This is simply built with small rough stones. The *ivan* has a cross vault and its floor is paved by modern stone slabs. Chamber B is situated between the two doorways; it is rectangular in plan with internal measurements of 3.65m by 2.35m. It opens towards the courtyard of the *ribat* through an arch similar to the one in the *ivan* of antechamber C. Chamber D has a separate entrance from 'Aqabat al-Takiyya as mentioned above, and forms the westernmost border of the *ribat*—although the ground plan and the façade make it appear to be a separate unit. As already discussed, it is however clear from the *waqfiyya* that it is part of the *ribat* proper. Chamber D is simple in form with no opening apart from the main door and the window in the east wall. It measures 3.3m by 4.2m and its walls are plastered; it has a cross-vaulted roof. It too is used today as a shop. It is not known when this shop came into operation, but in the past it was the place where the residents (*mujawirs*) used to gather to perform the daily recitation of the Holy Qur'an. The *waqfiyya* (Sijill 56: 649) mentions two assembly rooms (*majma'*) in the *ribat* which were built by the donor Bairam. The first is termed the northern assembly (*al-majma' al-shamali*), and was assigned to the residents, so that they could perform their recitation. The second, in the west (*al-majma' al-gharbi*), although mentioned, was not specified as being for a particular function. It is not easy today to locate precisely the position of the western *majma'*, but it is possible that it was the unrecorded area which is situated south of room D, and west of courtyard E.

The open courtyard (E) is rectangular in plan, 9m by 5.2m, and has been recently paved with modern flagstones. Four walls surround it. The north wall is a huge elevation, corresponding to the north façade seen only from the interior. It is masonry-built throughout and consists of two parts. The lower section represents the original part of the *ribat* built by Bairam, including the ground and first floors. There are two windows of different sizes in this lower part; both are rectangular, fitted with an iron grille and with a slab lintel. A slit window (25cm wide by 50cm high) is placed three courses above the lintel of the big window. A clearly visible break in the masonry courses occurs two courses above the slit window. It marks the end of the first floor and the start of the second, and is much clearer here than the corresponding break in the northern elevation. In addition to the break, both the stone colour and the dressing technique of the two parts of the elevation are dissimilar, strongly suggesting that they were built at different times. The upper part is lit by four windows, three placed at the same level and belonging to chamber M of the second floor (see below). They have similar iron grilles, lintels and 'eye-brow' arches. A buttress is built between the eastern and the central windows. Another slit window pierces the masonry four courses above the lintels of the three windows. It is placed off-centre and two courses above the summit of the elevation is reached. The shallow dome is not visible from this point.

The fourth window belongs to the archway (L) and has a different layout. A vertical break in the joints of the masonry courses can be seen one block of stone beyond the eastern jamb; beside this, a little further to the east, the surface of the wall is

slightly recessed. These distortions must indicate that the upper part was not built at the same time as the lower, and that one section preceded the other. Since the only approach to the second floor is through the archway (see below), it is probable that the second floor of the *ribat* was built after the construction of the eastern archway *qantara*. The *waqfiyya* is of considerable help in recognising the different phases and sequence of the construction; probably the architectural units which form the Ribat Bairam Jawish today were built at three different times (see below).

The east wall of the courtyard is conceived as two small shallow *iwans*; each opens towards the courtyard by means of a simple semicircular arch similar to that in the *iwān* of antechamber C. The northern *iwān* measures 1.4m by 3.6m, and the southern *iwān* measures 1.6m by 2.85m; both share the same type of pavement as the courtyard, have plastered walls and are tunnel-vaulted. A relatively large *iwān*, 2.2m by 3.5m, is built in the south wall of the courtyard, opposite the *iwān* of antechamber C. The arch gives onto the courtyard and has a pointed profile, with the springing to the west obscured by the adjoining building. Once again, the *iwān* is covered by a tunnel vault. The west side of courtyard E is taken up with a stairway. It has eighteen steps running 7.5m north-south; its width is 1.15m and it has a central landing. The stairs allow access both to the first floor of the *ribat* and to the entrance of the Dar Bairam Jawish (see cat. no. 13). There is a small open court (area F) built above the roof of the southern *iwān* on the ground floor and it is from here that one enters the buildings of the first floor.

The First Floor

The courtyard (F) on the first floor referred to above measures 3.5m by 6.85m. It is paved with old flagstones of red and white, and is bordered to the south by a wall belonging to a later construction, and to the west by a wall pierced by a doorway 2m by 95cm, which has been fitted with a very simple, modern iron gate. This gives access by way of another stairway to an open courtyard (K) on the level above (see below, the second floor) which in turn gives onto the interior of the eastern archway, to the second floor of the *ribat*, and to the interior of the Madrasa Mawardiyya. At the south-eastern corner of courtyard F, there is another elaborate entrance. It is at present blocked with rough masonry, and as it is above the level of the courtyard, it is likely there were once steps up to it. The function of this entrance was to give access to the Dar Bairam Jawish (cat. no. 13) according to the *sijill* (56: 652). Only the upper part is visible—a semicircular arch composed of counterchange joggled voussoirs of yellow and white. A rectangular recessed foundation inscription, not yet published, is to be found above the arch (see below cat. no. 13 for details). An open passageway (G) runs along the east wall of the first floor, extending 9m from south to north with a width of 1.4m. It is paved with flagstones. The passage leads to six cells (H1-H6) and to the main hall (J) of the first floor of the *ribat*.

Cells H1-H6 are presumed to have been for use by the residents when the *ribat* was still functioning. Cell H1 has two adjoining areas, unlike the other five which have only one and are located above the five cells (now shops) built between the ground and first floor levels. Cells H2-H5 have similar doorways with a simple slab lintel, all opening towards the west and fitted with a door. The interiors are also similar—all have a rectangular plan, are paved with flagstones, and have tunnel-vaulted roofs. A window in each (the only exception being cell H3 where the opening has been closed recently with concrete) opens east towards Tariq al-Wad where the *qantara* of Dar Bairam is situated.

These cells are now used as store-houses while cell H1 is used as a latrine. Cell H6 is approached through the vestibule of the main hall (J) of the first floor. It is bigger than the other cells, for it is located on the north-eastern corner of the *ribat* and is covered by a cross vault. Two windows illuminate the interior, the first opening north and the second east. The floor has the same pavement as the other cells of this floor. Its greater size and better lighting suggest that it had a different purpose to the other cells.

Hall J is made up of a main central chamber, flanked to west and east by two small *iwans*. According to the *waqfiyya* this hall was assigned as the rent-free dwelling for the *shaikh* of the *ribat* (see above), but today it is used as housing for a family. Access to unit J is through a doorway in the south wall of the eastern *iwān* at the north end of passage G. The door has a slab lintel. A relieving arch is set directly above the lintel made of simple voussoirs. The east *iwān* has a simple rectangular plan, measuring 3.5m by 1.6m. It is paved with flagstones and is cross-vaulted. Chamber J is square in plan, and is again paved with flagstones. Two rectangular windows provide light for the interior, the first to the north, being part of the north façade, and the second to the south, opening towards the open courtyard E within the *ribat*. Four pointed arches spring from the four corners of the chamber to support the roof of the chamber. The vault is a double-folded cross vault with a small, shallow saucer dome at the centre. The western *iwān* is similar to the eastern but here there is both a window and a blind niche. The window is in the south wall, measuring 75cm by 1.4m, and is covered by an iron grille. It is surmounted by semicircular arch. A blind niche, 80cm by 70cm, is placed in the north wall. The walls of chamber J have been recently coated with plaster.

The eastern archway and the second floor of the *ribat*

Access to the interior of the eastern archway and the second floor of the *ribat* is, as already explained, through courtyard K. However, it is possible today to reach courtyard K by three main routes. The first is through one of the two gateways of the *ribat*, and then up the stairs to courtyard F. The second route is through the main entrances of al-Madrasa al-Mawardiyya directly into courtyard K; and the third way is through the main north entrance of al-ʿImara al-ʿAmira complex. In courtyard F a door in the west wall leads to a staircase (1.45m wide by 2.8m long) with seven steps, running towards the north and terminating in courtyard K. This open courtyard is made up of two parts, separated by a stone step. The first is to the north; it is higher by 18cm than the second lying to the south, and it runs from south to north. It has a rectangular plan with an internal measurement of 6m by 3.6m. The second part, rectangular in plan and measuring 3.1m by 8.3m, runs east-west. Both parts are paved with small antique flagstones, most of which are broken. It now gives access to the interior of al-Madrasa al-Mawardiyya (cat. no. 28). At the north end of courtyard K, described above, there is the south façade of the eastern archway. The archway leads into the main chamber of this level (L), one of two chambers (L and M) which make up the second floor of the *ribat*.

Today room L is used as a classroom for Dar al-Itam School, but it is the assumption of the writer that its original purpose was to serve as a dwelling place; and, because of its size and position, it was probably the house of the resident *shaikh*. The floor of this large chamber is of uneven height. It is rectangular in plan with internal measurements of 9m by 5.6m and it is paved with good-quality antique red and white flagstones of different sizes. Chamber L is divided into two sections by a huge pointed

arch, running east-west and springing from the east and west walls. The southern section of the chamber, measuring 3.5m by 5.6m, gives the appearance of a small *iwān* or antechamber. A simple opening, later in date, at the western end of the *iwān* connects the mosque of al-Madrassa al-Mawardiyya to chamber L. It can be stated with some confidence that this wall was opened when the main entrance of the mosque lying to the west was closed (cat. no. 28). The *iwān* is covered by a folded cross vault with a shallow ribbed saucer dome at the centre. The second northern part of chamber L is almost square in plan, and measures 5.6m by 5.5m. A later concrete partition divides the chamber into a room and a passage. The passage leads through a doorway opening onto courtyard A belonging to the first floor of the Maktab Bairam Jawish (see above).

In all, as already described, there are six identical windows arranged in the east, the north, and the west walls respectively, and above each pair of windows there are two identical blind (60 cm by 1m) niches. These niches are surmounted by another large blind niche measuring 1.8m by 1m. There are another five blind niches in the lower section of this part of chamber L. Two are in the east wall; the first (45cm by 35cm), to the south, is between the two windows, and the second to the north measures 60cm by 35cm. The third niche is placed in the north-eastern corner of the north wall, and measures 60cm by 40cm. The remaining two niches are in the northern part of the west side; the first is comparatively small, measuring 35cm by 35cm by 1.6m with the appearance of a slit window; and the second, larger, measures 60cm by 35cm by 1.6m. All the lower niches are surmounted by a frame moulding, while the upper niches have semicircular arches. The function of them all was to serve as wall cupboards; they all seem to be original and it is on the basis of this clue that it is proposed here that this chamber was used as living space. This section is roofed by a spacious dome which has a tall pointed profile on the exterior and is expressed inside as a huge, shallow, undecorated saucer. The dome is carried on four large pointed arches, which spring from the four corners of the chamber, and four equally impressive pendentives, which act as the transition from square to octagon.

The second chamber of the second floor of the Ribat Bairam Jawish (M) is approached by way of two steps to the east of the antechamber *iwān* (L). A simple doorway measuring 80cm by 70cm by 1.8m gives onto the interior of rectangular hall M. The current function of chamber M is a classroom for Dar al-Itam School. There can be no doubt that originally, like room L, it was used for habitation, and together with that room made up a residential unit. Room M measures 5.5m by 3.8m and its ground level is raised 1.1m above the level of chamber L, though they share a similar pavement. A big pointed arch divides hall M into two parts. The first is a square chamber roofed by a folded cross vault with a ribbed saucer dome in the centre. Four windows (each measuring 80cm by 65cm) provide light and air for this section, two in the north and two in the south walls, each with a pointed arch and moulding. This western part is covered by a cross vault with a small saucer dome at its centre. The second smaller section to the east is rectangular in plan, 3.8m by 1.8m and it has a similar pavement. This part is lit by two windows placed opposite each other in the north and south walls, each fitted with an iron grille and with the same measurements as the windows described above in the main section of the chamber. There are three blind niches in the east wall, the one to the south measuring 70cm by 35cm by 1.4m, the central one 1.3m by 40 cm by 1.6cm, and the north one 75cm by 40cm by 1.4m.

Sequence of construction: a summary

Following what has been described above, it seems probable that the sequence of construction of the Ribat Bairam Jawish can be summarised thus:

- (1) Al-Madrassa al-Mawardiyya was already standing before Bairam began his various building projects (see above, the biography of Bairam, and below, cat. no. 28).
- (2) In 947/1540-1 the construction of the Ribat Bairam was finished up to the second floor—that is, the equivalent of the first level of the façade—and the Maktab Bairam opposite the *ribat* was renovated (cat. no. 12).
- (3) After finishing the *ribat*, Bairam went on to build his house, probably some time in 959/1551-52—or more safely between 947-70/1540-1562-63—by constructing the archway that spans Tariq al-Wad (cat. no. 13).
- (4) Later, an archway was built over the street of ‘Aqabat al-Takiyya, and some time after this archway had been constructed, the third floor of the *ribat* was added, probably during the 17th century.

12 MAKTAB BAIRAM JAWISH

Name: Maktab (a primary school for orphans) of Bairam Jawish

Date: 947/1540

Endowment: The endowments have three different dates, the first 952/1545, the second 953/1546, and the final, major one 967/1559-60

Variants of name: Different names have been given to this monument. In the *waqfiyya* it is called *maktabkhana* (Sijill 56: 649), *kuttab* (Sijill 14: 155), *maktab* (Sijill 202: 128 and see the foundation inscription described below); at other times it is named *madfan* (Sijill 56: 646; 649). In the Auqaf file (31/64: *passim*) it is called Maqam or Masjid Bairam Jawish and often the title ‘Wali Allah’ (saint) is affixed to the name. Neither al-‘Arif (1961: 307) nor al-‘Asali (1981: 327) differentiates between the buildings of the Ribat and the Maktab, and therefore they both also give al-Rasasiyya as a variant name of the Maktab (see above cat. no. 11)

Modern name: Maktabat al-Sadaqat (The Alms Bookshop).

Location

Maktab Bairam Jawish is located at the north-western corner of the junction where Tariq al-Wad meets Bab al-Nazir to the east and Tariq ‘Aqabat al-Takiyya to the west.

Function

The literal translation of the word *maktab* is ‘office’. According both to Mamluk documents (Amin and Ibrahim 1990: 115) and the *waqfiyya* of the *maktab* under discussion (see below), the meaning here is a place where children were educated, ‘the place where the teaching of writing occurred’. Usually a *maktab*, which was also known as a *kuttab* in Mamluk and Ottoman Cairo (see al-Husaini n.d: 19, 34, 85; Amin and Ibrahim 1990: 115), was annexed to either a *sabil* or a religious structure, in which case it had the further specialised meaning of a place of education for orphaned children. Maktab Bairam Jawish is not only the sole example to have survived in Jerusalem from the Ottoman period, but also from any other Islamic period, including Mamluk or Ayyubid. It is therefore important if only for its uniqueness.

*Maktab*s were usually attached to other buildings. In Ottoman Cairo fifty of the sixty-three Ottoman *sabils* had a *kuttab* (*maktab*) in the upper floor (al-Husaini n.d: 34). The Maktab of Bairam Jawish differs from the norm in that it is an unattached structure. It consists of two large chambers that were originally a single T-shaped space (see below), and in this too it is different from the *kuttabs* of Cairo which consist either of a single square or rectangular chamber (al-Husaini n.d: 87).

The T-shaped chamber is separated by a monumental ashlar arch spanning the opening between the two parts, which is now blocked. This raises the question of function. Were both parts of the room used for the same purpose, or were they used differently? The *waqfiyya* does not specify the original form of the building. Its main function is fixed by the foundation inscription (see below) where it is called a *maktab*. It would seem logical, therefore, to see both parts as being intended for the teaching of children. There is, however, a tomb in the middle of the front of the chamber (GA), and the *waqfiyya* is clear that the intention of the patron Bairam when he restored the building (the *maktab*) was that it was also to be used as *madfan* (burial place) for himself and for his family. It thus seems that Maktab Bairam Jawish was

intended to serve a dual purpose. The first of these was as a family *madfan*, and the second as a *maktab* for orphans. It would be clearer if the building widely referred to in modern writings as Maktab Bairam Jawish were rather to be called the Maktab and Madfan of Bairam Jawish.

Although the function of the two parts of the room is different, Bairam Jawish seems to have wished to combine the two within a single edifice. Doubtless when the children joined their teacher for their lessons, they would recite the *fatiha* in the name of the patron as they passed the tomb on the way to the inner chamber (B) and thus, by his charitable acts, Bairam Jawish would be remembered and the mercy of Allah would be granted to him.

Al-‘Asali (1989: 83, 170), working from the *sijills*, has found evidence for two other *maktab*s in Jerusalem but neither of them still exists. The first dates to the Mamluk period and was located close to the Citadel. The second was Ottoman, and was built by Turghad, the caretaker of Khassaki Sultan (cat. no. 15). Some older Mamluk structures, like al-Madrasa al-Taziyya (Sijill 64: 73) and al-Madrasa al-Jauhariyya (Burgoyne 1987: 70), were used as places to educate children. Qadi Ahmad ibn Nassuh established a *maktab* named after himself in Jerusalem in the middle of the 16th century (Sijill 67: 65) but unfortunately no further details are available. There are other references to the appointment of teachers in *maktab*s in Jerusalem (Sijills 22: 182; 80: 149; 83: 253; 145: 292); but again, no further information is available.

Site and brief description (figs. 12.1-12.2, pls. 12.1-12.8)

Maktab Bairam Jawish is located opposite his *ribat* (for details see above cat. no. 11). The *maktab* is bordered to the east by the main road al-Wad, to the south by the street of ‘Aqabat al-Takiyya (al-Sitt), to the west by an elaborate monument probably to be identified as al-Zawiya al-Muhammadiyya (see cat. no. 29) and to the north by an unrecorded building which was once used to house the teacher of the *maktab*. The *maktab* building has two street frontages. The first, the principal façade of the building for it contains the entrance, is the eastern one; the second is the southern elevation. The *maktab* building today consists of two levels. The lower, namely the ground floor, comprises the large T-shaped chamber, divided into two parts by a monumental ashlar arch which is now blocked. The first (eastern) area (A) contains the tomb of Bairam. This ground level is the original part built and then renewed by Bairam. The second level is made up of a small open courtyard flanked by chambers to the east and the west. It is most probably a later addition.

History

Identification

The dating of Maktab Bairam Jawish to the Ottoman period is established by an inscription plaque and by *waqf* documents (see below).

Date

The year 947/1540, which is given at the end of the inscription panel to be found above the entrance door of the east façade, is a restoration date. It is thus possible to infer that some form of construction was previously on the site, which was renovated and altered to serve as a *maktab*—a primary school of orphans—by Bairam Jawish. The inscription panel measures 40cm wide by 59cm high and is made up of two lines of Arabic written in Ottoman *naskh*. The script is fine, slightly interlaced and greatly

compressed with diacritical and auxiliary points. It was published and edited by van Berchem (1923: 431). The translation is as follows:

- (1) Bairam Jawish has renovated the building of this blessed place and has made it
- (2) a school for (orphaned) children for (the sake of) Allah—dated in the year 947 (1540).

Founder

According to the inscription panel, the founder of the *maktab* is Bairam Jawish. For his biography see cat. no. 11.

Endowments

On 7 Shawwal 948/24 January 1542 Bairam initiated his *waqf* by donating the income of a share of land to his *maktab* (Sijill 14: 155). This share was to be 18.75 *qirat* out of 24 of the whole site, which was planted with olive trees and vines. It was located in the Christian village of Bait Sahur, then known by the name of 'the Monastery of the Shepherds'. At this early stage Bairam distinguished between his *maktab* and the *ribat* (for details see cat. no. 12). For the second and third, major, *waqf* see the endowments of Ribat Bairam Jawish (cat. no. 11). Although the *maktab* was architecturally separate from the *ribat* when both were originally built by Bairam, it is more practical to treat the *waqfs* together, both to avoid repetition and because they appear together in the *waqfiyya* (Sijill 56: 649-51). For details of the *maktab* endowments, therefore, see cat. no. 11.

Purpose of Construction

As already discussed, Maktab Bairam Jawish was constructed with two purposes in mind—a *maktab* for orphaned children and a *madfan* for Bairam and family. This is obvious from the inscription panel (see above) and the *waqf* documents where it is stated that 'the *maktab* contains the *madfan* (burial place) for the donor' (Sijill 14: 155). In another citation it says that 'the *maktabkhana* (*maktab*) which is located at the same site where the *ribat* was built and constructed by the donor (Bairam), is prepared for use as a burial place (*madfan*), to bury the body of the donor, his sons and his descendants' (Sijill 56: 649). Al-'Arif (1961: 307) mistakenly states that Bairam is buried in his *ribat*, when it should rather have been in his *maktab*. It is worth stressing once again that Maktab Bairam Jawish is the only extant example of this architectural type known in Islamic Jerusalem. Apart from the salary and a free house for the teacher, the *waqfiyya* (see above cat. no. 11) gives no further information on the *maktab* with regard to such details as the number of children, the curriculum, and conditions of acceptance. Clues gleaned from the *sijills* (80: 149) relating to other examples of *maktabs* in Jerusalem suggest that the number of children would have been close to ten, and that they would have had to be orphans or impoverished in order to be accepted. The curriculum would have been based mainly on recitation of the Qur'an and the teaching of the *hadiths* of the Prophet.

Description of the building

The building of the *maktab* is briefly described in the *waqfiyya* (Sijill 14: 155)—'as it is situated opposite the *ribat* in Wadi al-Tawahin district, it is bounded to the south by the passable road (*al-dadrah al-salik*), to the east by the road (and on this side is the entrance), to the north by the house of the *waqf* of al-Sharkasiyya, and to the west by the house of the sons of the deceased *al-shaikh* Muhibb al-Din'.

Architecture

Exterior—the East Façade

The east façade is 8.8m long, and although shorter than the south façade, it must be considered the principal elevation the Maktab Bairam Jawish, for it fronts the main street of al-Wad. It also contains the main entrance door, houses the inscription panel and it employs coloured stone. Its upper part is blocked by a *qantara* (archway dwelling) over al-Wad road, constructed some time after the *maktab*. This *qantara* is named today after the Quttinah family, to whom it belongs and who occupy it, and it has no architectural relationship with the *maktab*. The façade is divided equally into two parts, each contained between two of the three piers which support the *qantara* on the west. A rectangular door is opened in the south part, measuring 1m wide by 1.6m high, and surmounted by a stone slab lintel. The inscription panel described above is set one course above the lintel, and only two courses above the inscription are today visible, the rest of the building being concealed by the archway. The stone used for the south section of the east façade is heterogeneous, and the courses are arranged irregularly, which would probably indicate that some of the material, especially the big stones, is in secondary use. Traces of recent restoration, such as the thick bands of pointing between the masonry courses and the new iron door, in addition to the dilapidated state of the *qantara*, add to the unattractiveness of the façade today. A rectangular window measuring 1.29m wide by 1.73m high, fitted with an elaborate iron grille, dominated the north part of the east façade up to early 1992. The height of the window was then increased by 1m when the first four lower courses were demolished. The reason for the enlargement was to transform the window-opening into a door in order to have better access to the interior. The jambs of the window (now a door) are built of *ablaq* dressed stone of yellow, black, and white of the same quality as the jambs and voussoirs of al-Zawiya al-Muhammadiyya (cat. no. 29). The window is surmounted by a slab lintel and directly above the lintel is a relieving arch made up of simple joggled voussoirs. The lintel marks the end of the visible part of this section.

The south elevation of Maktab Bairam Jawish is at present made up of two floors in the same way as the north façade of Ribat Bairam Jawish (cat. no. 11). The street of 'Aqabat al-Takiyya ('Aqabat al-Sitt) runs between the two façades, but an archway was constructed across it at some later date (for its description, see above cat. no. 11). This spans the road, connecting the two fronts at the level of the first floor. The south elevation runs from al-Wad Street to the east along the northern side of 'Aqabat al-Takiyya to the west. It extends 28m in length by 10.8m in height and is made up of two integrated floors. The lower section (the ground floor) was originally rebuilt by Bairam Jawish in 947/1540 (see above). The construction is simple and undecorated, consisting of rough rectangular masonry that was originally white but has now weathered to black. The upper section (the first floor) is a later addition, probably built to serve as a residential area, and its fabric contrasts markedly with the masonry of the lower section, for the stones are finely chiselled and carefully placed, and the depth of the pointing between its courses is thinner than that of the ground floor. Unfortunately it is hard to give a specific date for the construction of the upper level because of the lack of information and of any external precise dating control.

The south elevation can be divided at a glance into three parts—A, B, and C. When the façade was first surveyed ten years ago, and then reviewed recently, the three parts were considered

as belonging to a single structure. However, three separate architectural elements still exist in the third western-most part and this has raised questions about the credibility of this surmise, that is, that the western part (C) originally belonged to the *maktab*. These discrepancies are: the vertical break in the courses of stone down the whole height of the façade; a 25cm set-back along the break in the courses; and the remarkable difference both in masonry fabric and in layout of the western part, as compared to the eastern and middle sections. These doubts, albeit serious, remained without supporting evidence until a piece of information was detected in the *siyills* which indeed gives another pointer to the fact that this part does not belong to the *maktab*, but is rather another monument named ‘al-Zawiya al-Muhammadiyya’ (see cat. no. 29). Thus it is now possible to say with some certainty that the south façade of Maktab Bairam is made up of only two parts—those to the east and to the west (A and B).

The first and eastern part A is longer than part B to the west. It adjoins al-Wad Street, and its lower section is very simple, being unbroken except for a door opening and a single window. The door opening is rectangular, measuring 3.9m by 2.8m; today it leads into a rectangular area used as a shop, and it was apparently opened quite recently, for it has neither jambs nor lintel and the door itself is modern. A rectangular window, measuring 1.13m by 1.83m, is located to the west of the shop-door, set at just 1m above the level of the street. The window is fitted with an iron grille and surmounted by a simple stone lintel. The upper section of the eastern part (which is actually the first floor and was built later above the roof of the ground floor) is partly blocked by the archway (*qantara*). This upper part is also a simple unadorned building, its only feature being a double window. Each window opening measures 80cm by 1.35m, and they too are fitted with an iron grille and surmounted by a slab lintel. An eight-pointed star aperture is set two courses directly above the lintel of the windows; its function is to give added light and air to the interior. The elevation terminates six courses above this star opening.

The western part B, although as high as the eastern section, is narrower, for it is only 4.2m wide. A large simple opening, 2.7m long by 3.5m high with a semicircular arch and a door, cuts the lower section of this part. The opening is fitted with a wooden door, and it gives access to the second chamber of the *maktab*. This opening does not seem to be original because of its simplicity and lack of jambs or lintel, and was probably either cut or restored at a later period. It was probably originally a window which was later converted into a wide doorway. Directly above the arch of the door, five courses higher, this section ends at the same level and height as the eastern section A, which actually marks the end of the ground floor and the beginning of the first floor levels. A double window is placed off-centre in the upper section of the western part, each window measuring 75cm by 1.35m; fitted with an iron grille, it is surmounted by a slab lintel. There is an eight-pointed star aperture two courses above the lintel of the windows and a slit window is located directly above this star, two courses higher. The slit window is rectangular, measuring 30cm by 65cm, and four courses above it is the apex of the building.

Interior

The Ground Floor

The ground floor of Maktab Bairam Jawish consists of two main architectural components, called here respectively the ‘eastern’ (GA) and ‘western’ (GB) chambers, although they were originally

a single T-shaped space, as already described. The function of the former eastern room was to be the burial chamber of Bairam Jawish and family; today it is used as a bookshop. The function of the other western chamber was to provide a place in which the children could study; today it houses a carpentry workshop. The eastern chamber A is a single-vaulted rectangular space with internal measurement of 7.34m wide by 8.58m long; the wall thickness in some parts is as much as 1.1m. It is now reached, as described above, through a door in the southern part of the east façade. At the south-east corner of chamber GA there is a small area measuring 2.15m by 2.3m, today used as a shop (GC), as described above, and separated from the main part of the room by a wall. The ground level of this room GA is raised 50cm above the level of al-Wad Street, the approach being by way of two steps. The room was paved in the early 1980s with modern square flagstones, each measuring 30cm by 30cm. A rectangular stone tomb, four courses high, occupies the centre of the chamber. It has a low cylindrical head-post of stone, probably intended to show the position of the head of the occupant of the tomb, or to represent the hat either worn by him or in use at the period. The head-post and tomb are covered by a green pall set over wooden ribs. Al-‘Arif (1961: 307) identified the occupant of the tomb as Bairam Jawish, the son of Mustafa, the builder of the *maktab* and the *ribat*. Though al-‘Arif gives no reference in support of his claim, he is quite right, for the *siyill* (see above) clearly shows that the main purpose of the *maktab* was to provide a *madfan* for the donor. Chamber GA is covered by a cross vault supported on four huge pointed arches; the north arch is no longer visible, for this side is now blocked by the dividing wall.² The arches spring from four bases, only the two on the south side being visible. The two bases on the north side cannot now be seen, which suggests that the area of the present chamber must have been reduced at some time. A possible explanation might be that a recent building adjoins the north side of the room so that chamber GB is now longer than chamber GA. The recesses of the southern and the eastern arches are deeper than those of the other two arches, so that the impression of the southern recess is of a small, narrow *iwan* or ante-chamber measuring 1.6m wide by 4.2m long. The southern *iwan* is further marked out by having a small window opened in the south elevation (see above). The west side of chamber GA—which constitutes the east side of chamber GB—is now blocked, although it was most probably previously open. A huge pier is integrated into the middle of the north wall of chamber GA; it measures 1m by 1.5m and is built of stone. It is hard to determine its function, but possibly it was added later at the time when the upper ground floor was built to give additional strength and support. The walls of the chamber are built of large-sized stones, particularly at the base, while the vault is constructed of small rubble masonry held together with a mixture of lime and mortar; the vault is no longer plastered. As already described, there are two windows and one door in all which belong to chamber GA—one small simple window to the south, and another, more elaborate and larger, in the east wall to the north of the door.

² Editorial note: The plan, fig. 12.1 is misleading; the dividing wall shown as a dotted line to the west of chamber GA should be removed and the line of vaulting running west from the north-west corner of the cenotaph should continue to the western edge of the blocking wall where it meets room GB. This mistake only became apparent after the initial survey had been completed, during a later visit to the *maktab* after permission had been granted by the current occupier.

This is the only example that I know where a *maktab* is used as a *madfan*. In the majority of Mamluk examples in Jerusalem—the Auhadiyya (Burgoyne 1987: 167-78), the Jaliqiyya (Burgoyne 1987: 184-91), the Kilaniyya (Burgoyne 1987: 325-36), or the Tashtamuriyya (Burgoyne 1987: 460-75)—it will be found that the tomb chamber is covered by a dome supported on an eight- or twelve-sided drum. There are, however, other Mamluk mausolea which are covered by cross vaults like the Maktab of Bairam Jawish—the Sa'diyya (Burgoyne 1987: 195-200), the Arghuniyya (Burgoyne 1987: 356-67), the Taziyya (Burgoyne 1987: 399-411) and the Qiramiyya (Burgoyne 1987: 476-8) for example. But in no example is there a secondary function of a school. This is also true of the wider scene—I know of no *maktab* which is also a tomb chamber in Egypt, where most are either adjacent to, or form part of, a *sabil* (al-Husaini n.d. *passim*).

Chamber GB to the west is reached today by way of the large door in the southern elevation. This was probably originally a window. The ground level here is lower than the level of Tariq 'Aqabat al-Takiyya by 25cm for the road climbs the hill. The chamber is rectangular in plan running south-north; it measures 10.2m long by 4.3m wide and has a recent concrete pavement. The roof is covered by a cross vault. It is noticeable that the chamber would have been badly lit, but it would seem nonetheless to be the place where the children were taught. It is the only alternative to the tomb chamber, and it would seem unlikely that lessons took place within the tomb itself, although the lack of light and air in the now unfenestrated chamber GB is surprising; perhaps enough were filtered through the large archway leading to the *madfan* (Chamber GA), but it would always have been somewhat dark and airless. Although there is no evidence in the *waqfiyya* (Sijill 56: 649-51) to suggest the age group or the size of the classes, the term *atfal* is used which would indicate that the orphan pupils would have been aged approximately between 5 to 10. Their instruction would have included recitation of the Qur'an, principles of the Arabic language and repetition of the Hadith and biography of the Prophet, although none of these is specified in the *waqfiyya*.

With the exception of a rectangular recess measuring 1.6m wide by 0.8m deep in the west wall, the chamber is plain, with no decorative or architectural feature. Chamber GB is used today as a carpentry workshop and, in order to adapt it for that purpose, an attic has recently been built to the north.

The First Floor

The first floor built above the Maktab of Bairam Jawish today consists of a courtyard (1A), a hall (1B), and another hall (1C). The courtyard 1A is reached through the chamber (L) which leads to the second floor of the Ribat of Bairam Jawish (see the description of the archway (L) in cat. no. 11). As noted above, it is difficult to date the first floor of Maktab Bairam Jawish, although it is probable that it was built at the same time as the archway and second floor of the *ribat*, or perhaps some time later. The open courtyard 1A is almost rectangular in plan. It measures 4.2m wide by 9.5m long and its ground has been paved with modern stone slabs, apparently as part of recent repairs.

The hall 1C is located to the west of courtyard 1A. It is a simple elevation built of regular masonry courses. Moving from south to north, there are respectively one window and two doors in the east façade overlooking courtyard 1A. The doors give access to the interior. The first door is located north of the window and measures 70cm wide by 1.95m high; it is surmounted by a slab

lintel. The window is rectangular, measuring 80cm wide by 1.1m high, with a slab lintel and it is fitted with an iron grille. The second door which gives access to the northern *ivan* of hall 1C measures 90cm wide by 2.05 m high.

A single re-used band of ten and a half triangular *muqarnas* panels occurs in the middle of the east elevation. It is 2m from the ground level and 1m in length. Each panel is different. The one common element that unites them is that the uppermost part of each is treated separately from the main rectangular section below.

[Editorial note: Numbering the lancets from left to right as 1 to 11, the rhythm of these upper section is: A, three parallel inverted T-grooves; B (half) rays to right; C, radiating from the centre; D, four petals; E, rays to left; A; A (? worn); and then repeats of motifs B; D; C; A. The lower part of the lancets have: LA, a central hexagon with sunburst, double horizontal triangles above and below (half too worn to discern); LB, a central disc with a whirling rosette, double horizontal triangles above, split double vertical triangles below; LC, a superimposed cross and saltire; LD, a central diaper, edges extended to the corners; and then repeats of LA, LA, LD, LB and LA. SA]

A small, shallow saucer dome covered with stones laid face up covers the centre of hall 1C on the outside. The internal measurements of hall 1C are 4.9m wide by 10.3m long. It is made up of a central chamber flanked to south and north by two small and differently vaulted *iwans*. The northern of these, which is rectangular in plan, is 3.5m wide by 4.1m long, and is separated from chamber C by a pointed arch which has been recently blocked by a wall; access to it is through the door described above. It is lit by a double window within the recessed niche to the north (2m wide by 40cm deep). Each window is rectangular, measures 80cm wide by 1.7m high, and is surmounted by a semicircular arch. Each is fitted with an iron grille. This northern *ivan* is vaulted.

The greater part of the floor of the main, central part of chamber 1C is paved in red, black and white marble tiles laid in geometrical patterns, but unfortunately this floor is in a seriously dilapidated state. The tiles differ in measurement, ranging from 26cm by 15cm to 1.03m by 30cm. The roof is covered by a shallow ribbed saucer dome, the inner decoration of which consists of a central radiating 'pleated' fan, surrounded in an unusual fashion by nine unequal concave divisions. The dome is supported by three pointed arches and a wall, the arches springing from the walls and the transitional zone consisting of *muqarnas* niches.

The south *ivan* is rectangular in plan, measuring 1.95m wide by 4.2m long. A double window opens in the south wall, set within a recessed niche surmounted by a semicircular arch. This double window dominates the upper western part of the south elevation and was described above. Two recessed blind niches are opened laterally in the south *ivan*, the first in the west wall with a semicircular arch measuring 80cm wide by 40cm deep by 1.45m high, and the second in the east wall. The south-eastern and corner recess is the larger, measuring on the east side 1.25m wide by 70cm deep by 1.9m high and is surmounted by a slab lintel. The *ivan* is covered by a cross vault with a central saucer dome which is decorated in the interior with ribs arranged in a whorl pattern.

Hall 1B is built opposite hall 1C, above the tomb chamber of Maktab Bairam Jawish at ground level. It now comprises, like hall 1C, two parts, a northern and southern, and not three parts as hall 1C has. The original north *ivan* is now

separated from the rest of the structure by a blocking wall. Thus originally chamber 1B echoed the layout of chamber 1C. Access to each part is through a single door placed in the west elevation of this eastern unit. The door into chamber 1B measures 75cm by 1.96m high, the depth of the wall being 80cm. The door has a slab lintel and above it, an ogival relieving arch, filled with five recessed voussoirs that radiate from a central semicircle. A rectangular window 1m wide by 1.45m high with a similar treatment is to the south of the doorway. An oculus window is set two courses above the level of the arches, centred between the doorway and the window. There is another small door to the north of the elevation, measuring 70cm by 2.24m, and this gives access to the original north *ivan* of hall 1B. The elevation is constructed of white masonry which has now been toned down to grey and black by the weather.

The interior of hall 1B is another distorted rectangle in plan. Like hall 1C, it is dominated by a square central chamber flanked to south and north by two small *iwans*. There are two identical blind niches (50cm by 40cm) in the internal west wall, one north of the doorway and the second south of the window. Presumably these served as cupboards. The main chamber is paved with old coloured flagstones of various measurements (34cm by 18cm; 40cm by 30cm), and the walls and dome have recently been coated in plaster. The room is covered by a shallow ribbed dome; the ribs take the form of a 'pleated fan' which radiate out from a central knop divided into two sections. The dome is supported on four pointed arches which spring from the four corners of the room. The transition zone is achieved by four pendentives at these corners.

As with hall 1C, the northern *ivan* of hall 1B is divided from the main chamber by a recent wall, with access through the second door mentioned above, in the western wall. The *ivan* is rectangular in plan, measuring 2.1m wide by 3.9m long; it has a cross vault with a small saucer dome in the centre. Room 1E is a recent construction of concrete.

The south *ivan* of room 1B is lit by a double window in the south wall, each window a rectangle measuring 75cm wide by 1.4m high, fitted with an iron grille, and surmounted by a semicircular arch. These windows dominate the upper eastern part of the south elevation. It is vaulted with a small central saucer dome as in the north *ivan*.

The rectangular chamber 1D, consisting of the archway that spans Tariq al-Wad between the eastern façade of the Maktab and the western side of Sabil Bab al-Nazir (cat. no. 7), is located to the east of the hall 1B. It is covered by a folded cross vault. It was constructed some time after the first floor above Maktab Bairam Jawish had been completed. It was therefore not part of the original *maktab* and is indeed much grander both in scale and in vaulting.

All parts of the first floor of Maktab Bairam Jawish are now in use as classrooms for the school of Dar al-Itam. In all probability, they were originally intended as residential units.

13 DAR BAIRAM JAWISH

Name: Dar (house) Bairam Jawish

Date: Probably 959/1551-2 or, more securely, between 947-70/1540-62

Endowment: None known (see below)

Variant of name: None known

Modern name: The house is now known by the name of the families who are currently occupying the property, 'Dar al-Asmar' and 'Dar al-Da'as'.

Location

The House of Bairam Jawish is to be found south of the junction where Tariq al-Wad meets the streets of Bab al-Nazir to the east and Tariq 'Aqabat al-Takiyya (al-Sitt) to the west.

Function

Dar and *bait* are Arabic words which indicate a private house. Jerusalem as a religious centre attracted many people who wished to live within the city limits. Most of them were ordinary citizens, although a small proportion were representatives of the higher ruling class, who administered and governed the city. It seems extraordinary that none of these private houses have so far been identified, apart from Dar Bairam Jawish and Dar al-Sitt Tunshuq¹. It is possible that they still exist and only await identification, although the criteria for defining such medieval houses have yet to be established. Until proper surveys of the *sijills* and the buildings (other than the monuments) of the Old City have been completed, the question of identification must remain unanswered. In the meantime, one answer would be that some of the public buildings in Jerusalem were in all probability used as residential complexes; a similar situation continues today. Being able to identify and date Dar Bairam Jawish is thus of considerable interest, for the house is the first private residence known certainly to date from the 16th century.

Site and brief description (figs. 13.1-13.3, pls. 13.1-13.6)

The house is built directly over the archway (*qantara*) that spans Tariq al-Wad south of Sabil Bab al-Nazir (cat. no. 7). The house is currently bordered to the west by the second floor of Ribat Bairam Jawish, to the east by buildings that have not yet been surveyed, known in the past (see below) as the house of the Nusaiba family, and to the south and north by the open space of Tariq al-Wad. It is constructed over an archway made up of five cross-vaulted bays supported on six pointed arches. The arches span Tariq al-Wad east to west. Access today is gained through a recently opened doorway on the east side of Tariq al-Wad. It now consists of two floors, the first larger than the second. This floor was built by Bairam. The second level is a later addition built some time after his death. Both are now in use for residential purposes.

So far nothing is known or has been published about this monument.

History

Identification

It is possible to identify Dar Bairam Jawish as belonging to the Ottoman period by means of a *sijill* (56: 652). An eroded

foundation inscription, still *in situ*, probably also gives the name of Bairam and the date of 959/1551-2.

Date

An unpublished foundation inscription is to be found above the arch of the original entrance to Dar Bairam Jawish. Its dimensions are approximately 80cm by 30cm; the two lines of Arabic script in Ottoman *naskh* are cut into a recessed stone plaque. The panel (approximately 1.35m by 80cm) is framed by a billet moulding. The inscribed surface is very badly eroded to the extent that only a few words of the text are still legible. However, it would appear to contain the name of Bairam Jawish ibn Mustafa and possibly a date of 959/1551-2.

It is clear enough in the *sijill* (56: 652) that the house was built by Bairam during his lifetime—that is, before he died (*hal hayatihi qabla wafatihi*). As Bairam Jawish built his *ribat* (cat. no. 11) in 947/1540, and as part of the house is built above the *ribat*, the house must have been built some time after 947/1540-1, and before Bairam's death, the date of which is secured by the *sijill* (for his biography, see cat. no. 11) to some time between Rabi' I and the end of Rabi' II 970/5 November-26 December 1562. It is thus possible to conclude with certainty that the house was constructed between 947-70/1540-62, even if the erosion of the plaque makes the reading of 959/1551-2 debatable.

Founder

Both the *sijill* (56: 652), and the admittedly problematic inscription refer to Bairam Jawish as the founder of the house. The *sijill* states that 'Bairam during his lifetime before he died, built and constructed (*'amaraha wa ansha'ha*) the above assigned house, and he had paid for that from his own money.' For his biography see cat. no. 11.

The *sijill* document

The reference to Dar Bairam Jawish contained in the *sijill* (56: 652) is found in the context of a lengthy document (*hujja*) of 47 lines. The script is clear and fine but extremely small and condensed. The document is dated 12 Sha'ban 982/12 December 1574 and is not an endowment for an institution but a legal case presented to the *qadi*. The contestants, two husbands, were the representatives of the two daughters and wife of Bairam Jawish, and the defendant was one Zakariyya Khalifa, the *shaikh* of Ribat Bairam Jawish. The contestants claimed that Zakariyya Khalifa was occupying the house illegally, while the defendant maintained that it was his right to reside there, in accordance with the *waqf* lodged for the *ribat* (see cat. no. 11) for he was the *shaikh* of Ribat Bairam. The details of the case need not concern us here but the reference within the document allows the identification of the previously anonymous building and we can thus add it to the list of Ottoman monuments in Jerusalem. The contents of the document (Sijill 56: 652) provide vital information about the exact location of the house, its architectural components, and the limits of its borders, as well as other data.

According to the document the house was located 'at the lowest part of 'Aqabat al-Sitt at the junction of the roads opposite the fountain (cat. no. 7). The house is built over the Sultan's street (also known as) Khat Wadi al-Tawahin.' For the complete Arabic text and English summary, see Cat. Appendix 1, no. 13.

Description of the House

Sijill 56: 652 describes the house thus: 'The house [of Bairam

¹ See Burgoyne 1987: 485-504, although here the building is better described as a palace than a house.

Jawish] is made up of an open courtyard paved with a well-constructed *mizi*² pavement; within the house there are two halls, a western *ivan*, an eastern kitchen and a bathhouse. The first hall is on the south side; it has a door that opens to the north and a window opens towards the street. The second hall is on the north side, it has a bedchamber (*makhda*) with a door opening towards the south and a window opening to the street (north). There is also a step that extends from south to north; it leads to an open courtyard paved with the same quality of paving as mentioned above. It has a door opening towards the south, a western *ivan* with a door opening towards the north, conveniences (*marafiq*) and a latrine (*manfa'a*).²

The house was reached through the entrance of the *ribat*. The *sijill* continues: 'It is bordered to south by the street, to the east by the house of the Nusaiba family, to the north by the street and within it is the entrance of the *ribat*, and to the west by the *ribat* of the now-deceased Bairam Jawish'.

Purpose of Construction

It is explicitly mentioned in the *sijill* (56: 652) 'that Bairam lived in this house while he was alive, and he used it and later it was included among his estates to be divided as part of his inheritance.' Most probably Bairam also died in it.

Architecture

Exterior—the North Elevation

The west part of the north façade of Dar Bairam Jawish is built above the east side of Ribat Bairam. When the second floor was added over the first floor of the *ribat*, the two façades were so well integrated that at first they appear to be a single unit. However, a long vertical line shows a break in the stone coursework on both sides. This line marks the borderline between the two parts of the façade, and it is a clear indication that the two parts of the façade were constructed at different times. A close examination of the architectural scheme, as demonstrated under cat. no. 11 and here, makes it possible to an extent to discern the different phases of construction of the northern façade, and to attempt to identify them. Further evidence in support of the conclusions was gained with the discovery of the *waqf* documents pertaining to the Ribat (see cat. no. 11) and Dar Bairam (see above) in the *sijills*. By means of the relevant *sijill* and its various component documents it is possible to follow the development of buildings such as this very complicated façade.

The north front of Dar Bairam Jawish is made up of a huge pointed arch, consisting of a double tier of voussoirs. The arch spans Tariq al-Wad, one of the six that spring from the walls to west and east on either side of the street. The arches support an archway (*qantara*) running from south to north, made up of five cross-vaulted bays supported on six pointed arches. Only the northern and southern arches have a double tier of voussoirs visible, but the rest are plastered and it is not possible to see more than the extrados. The eastern profile of this northern arch appears to have been rebuilt, which has resulted in an abrupt stilt just above the springing. This sudden change of angle corresponds to the height of the window on the right, and this window also seems to have been rebuilt in recent times. The apex

of the arch has preserved its original form from the level of the window lintel upwards. The elevation drawing does not reflect these inconsistencies.

There is an octagonal stone panel placed directly above the keystone of the northern arch. The panel is well carved; its decorative scheme is made up of two patterns. The inner one at the centre is composed of a floral rosette motif made of a series of interlocking circles emanating from a central point, and it is enclosed within a thin fillet border. The second outer pattern is made up of eight small circles formed out of and connected to the frame. Two other roundels are to be seen on either side of the extrados. These are smaller and placed one course lower than the inset octagon. The decoration of both is carved in relief and takes the form of a geometric interlace centred on an octagonal star-polygon. It is not easy to see the three roundels clearly, for they are now partly obscured by a grille recently installed over al-Wad junction for security purposes. A rectangular window within a recessed pointed-arch niche is placed directly above the middle roundel. It measures 1m wide by 1.9m high and is fitted with a recent iron grille which most probably replaced an older one. The window is built with *ablaq* stones and has a bevelled sill. A relieving arch of seven joggled voussoirs is constructed above the slab lintel. A pointed chevron arch frames the niche. The extrados of the chevron arch has a reversed volute (*mim*) decoration, and the tympanum is further decorated by a blind oculus window decorated with a recessed rosette. Another rectangular window is to the west of the main window, measuring 80cm by 1.2m, and is also fitted with an iron grille. To either side of the chevron arch there is a roundel, which is similar but not identical. The roundels project slightly and each decorative scheme consists of a carved relief of geometrical patterns consisting of superimposed and interlocking circles, forming a sunburst or flower, with a rosette at the centre. Further west of the western roundel there is a third example with another variant of the design. It occurs two courses above the slab lintel of the second window. Three courses above the level of these roundels, there is an elaborate waterspout to control rainwater, and beside it there is a short band of lavishly decorated stones. Their decorative scheme consists of a series of *muqarnas* niches with geometric motifs. The location of the decorative band at the top of the north elevation might suggest that it was a remnant of the original cornice that marked the top of the original building. But the fact that the band is debased and does not continue along the east side of the façade probably indicates that it is in re-use. A similar band but with a different decorative motif is found in the middle of the eastern elevation of the western unit in the first floor of Maktab Bairam Jawish (cat. no. 12).

Above the decorated band there are now a further nine courses before the top of the façade. As the masonry of these uppermost courses is of a different quality to that of the rest of the façade below, this area would seem to be a later addition. The façade terminates with a parapet partly constructed of clay pipes built up in triangles. This type of construction was used in the late Ottoman period throughout Palestine before concrete prevailed, and this may give a possible date for the later addition. The clay pipes allowed air to circulate but provided an effective screen for privacy for anyone wishing to use the roof, in the same way as the *mashrabiyya* served to screen the interiors of the houses.

The South Façade

The south façade of Dar Bairam Jawish has the same pointed arch as the north façade. Both have the same span, a similar double-

² *Mizi* stone is particularly hard; it is quarried from a deep stratum and is so compact that it is only slightly affected by weathering. There are two varieties: *mizi hilu* (sweet *mizi*) and *mizi yahudi* (Jewish *mizi*). It occurs in blue, red, white and yellow. For further details, see Canaan 1932: 223-47 and Schick 1887: 50.

tier of voussoirs and three decorative medallions. These project slightly, the middle example being larger than those on either side. All three have a geometrical decorative pattern. There is a rectangular window within a tall narrow recess which is surmounted by a trefoil arch directly above the central medallion. This is another fine example of Mamluk revival work and is similar in profile to the northern portal of the Khassaki Sultan complex. The recessed niche is fitted with a modern iron grille. The window measures 1m wide by 2.2m high. It has a bevelled sill, and is surmounted by a slab lintel made of a single piece of marble. A relieving arch of nine joggled voussoirs is built above the slab lintel and directly over this arch there is a decorative medallion, now ruined, surrounded by six joggled voussoirs set in a circle. Two decorative octagons, filled once again with geometric motifs, are placed on either side of the window at the level of the eighth course. A simple relieving arch is built three courses above the trefoil arch, and it marks the beginning of the second floor of Dar Bairam.

A small buttress is to be found to the east of the upper part of the southern elevation. The buttress is partly blocked by a later chamber of the second level (see below). The arched masonry course and the buttress were probably both built to give extra strength and solidity to the second level. Two identical windows are set in the upper part of the south elevation. They are constructed one course above the relieving arch and each is fitted with an identical antique iron grille. Each window is surmounted by a slab lintel of white marble in re-use. Above each there is a shallow 'eye-brow' arch. Nine courses above these the southern façade comes to an end, but the beginning of the transition zone of the main chamber of the second level can be seen at the level of the sixth course. An odd unfinished dome with a truncated pyramidal profile has been constructed over the main chamber of the second floor, covered with small paving stones. Both sides of this southern elevation are obscured by later constructions.

The many architectural features characteristic of the late Ottoman period in Jerusalem suggest that the second floor of Dar Bairam was built some time after the completion of the first level. These diagnostic features are the buttress, the 'eye-brow' arches over the windows, and the semicircular relieving arch. In addition to these features, it is noticeable that the masonry of both parts differs considerably in quality and colour, and finally there is the odd shape of the dome. All this points to later modifications.

Above all, the *waqf* documents describe a single level. Since there was a dispute, it would be expected that a second level would have been mentioned if there had been one. It is unfortunately difficult to say when the upper level was added, but it was probably in the late 17th or early 18th century.

To the east of the upper part of the south façade there is a small rectangular elevation. This belongs to the chamber of the second level of Dar Bairam, and it is made up of seven courses of stone dominated by two rectangular windows, each of which is fitted with an iron grille. A heavy rectangular buttress is in the south-eastern corner. It is noticeable that the north end of the chamber is built over the buttress. This is yet another indication that this part of the second level of the southern façade was built some time after the main part.

Interior

Access to the interior of Dar Bairam Jawish is at present through a doorway situated in the east wall of the southern bay of the archway which spans Tariq al-Wad and carries the dwelling-house. Three recent stone steps raise the door 50cm above street

level. The door is very simple, measuring 90cm wide by 1.75m high. It is surmounted by a semicircular arch of undecorated stones and above it there is an oculus made up of five simple voussoirs. The doorway is fitted with a modern single-panel iron door. The entrance leads to a tunnel-vaulted passage. A staircase of 23 steps with two rectangular landings runs east and then north. The stairs lead to two doors, the first to the north gives access to a small antechamber (H). The chamber measures 3m wide by 3.3m long and gives direct access to another rectangular chamber (I). Both are not part of the original Dar Bairam, for this is not the original entrance, and neither are mentioned in the *sijill* document. The second door to the west gives access to the main open courtyard of the house (A).

Courtyard A is rectangular in plan, measuring 3.4m wide by 5.2m long. It is described in the *sijill* (56: 652) document as an open courtyard, '*saha samawiyya*', and it is unfortunate that the beautifully executed (*muhkam*) *mizi* pavement no longer exists, for it was replaced by a modern pavement.³ The northern hall (B), as described in the *sijill*, is located to the north of courtyard A. It must have been for use by the patron, for in the *sijill* it is described as containing a bedchamber (*makhda*); it is approached through a door opening 80cm wide by 1.75m high. Hall B is divided into two parts by a wall. The first section is almost square, measuring 4m wide by 3.65m. It has a modern floor and the walls have been recently plastered. There are two blind niches in the south wall; the one to the west of the door measures 50cm by 40cm, and the other to the east of the door is 80cm by 40cm deep. A window in the north side, described above, provides light and air for the room. There is an elaborate folded cross vault with a small saucer dome in its centre. The vault is supported on four pointed arches which spring from the corners of the room. The eastern one has a 50cm deep recess forming a shallow *iwān*.

A door cut in the southern section of the dividing wall leads from this chamber to the second part of the northern hall. It is a simple chamber, rectangular in plan, with internal measurements of 4.35m by 3m. It was probably this area that is described in the *sijill* (56: 652) as the *makhda*. It has a new floor, and it is lit by a window to the north. The chamber is covered by a cross vault; both vault and walls have been recently plastered.

The southern hall (C) is located across courtyard A opposite hall B, and it has a similar layout. It is approached through a door in a rectangular recessed niche with a chamfered frame. The recessed niche has a semicircular blocked arch above it. The door measures 90cm by 1.9m, and is surmounted by a slab lintel. Five T-joggled voussoirs are set above the lintel, and directly above the arch there is a rectangular panel. The panel measures 30cm by 70cm, and is carved in relief with a small central vase in the form of a pomegranate, from which four leafy branches emerge in a symmetrical arrangement. The leaves each have a bevelled inner profile. The branches also carry two forms of flower-heads—one type with three petals, the other a more typical rosette. Both forms are marked by a central boss and have bevelled inner profiles. A rectangular window is placed above the decorative panel.

Above the blocked arch, the masonry courses merge into the second level of Dar Bairam. Two rectangular windows with slab lintels and double 'eye-brow' arches are the main features of this part of the elevation. A slit window four courses above is now

³ The description of the courtyard in the *sijill* (56: 652) is *al-mushtamila 'ala saha samawiyya muballata bi'l-balat al-mizi al-mukham*.

blocked. At this level, all four corners of the building are set back to form an exterior octagonal transitional zone for the unfinished pyramidal dome, which has eight sloping sides and covers the main chamber (C) of the second level.

The interior of the first floor hall C consists of two parts divided by a pointed arch. The first, to the west, is rectangular in plan, measuring 4.2m by 3.4m. It has a modern paved floor and its roofing system is the same as hall B, although here the saucer dome is ribbed, and the arches to west and south have a recess 90cm deep, giving the impression more of a small *ivan* than a very deep niche. There is a large window in the south wall, acting as the main source of light and ventilation. This window is flanked by two blind niches, the one to the west measuring 40cm by 35cm while that to the east is 50cm by 40cm. The second part of hall C lying to the east is very simple and undecorated. It measures 3m by 3.35m, and it is cross-vaulted. It has no window, but a door in the south-eastern corner gives access to yet another rectangular chamber, also covered by a cross vault. A window in the west wall here is the only means of fenestration. The window looks west over Tariq al-Wad; it is fitted with an iron grille.

The chamber D is apparently the 'west *ivan*' mentioned in the *sijill*. It is small and rectangular, 2.4m wide by 2.55m long. It is blocked with concrete to the east but it was probably designed to overlook the open courtyard A. There are three blind niches in room D—one in the west wall is original. The other two in the blocked east wall are more recent; both are 25cm deep by 50cm wide. A door in the south wall leads to a small antechamber, 2.2m by 1.8m. It has a blind niche in the west wall and two doors to the south. Each of these gives onto a long, narrow passage, the eastern one 5m long by 70cm wide leading to a tiny square area, used now—and probably in the past—as a latrine. The western passage is 6m long by 90cm wide and it leads to a small space used in the past as an antechamber which was situated directly behind the single main entrance to Dar Bairam. In the *waqfiyya* it is quite clear that access to the house was through the *ribat*⁴ (see cat. no. 11). As mentioned above, this entrance to the *ribat* is today blocked. Both passages are covered with a tunnel vault, and are plastered. It is worth noting that there appears to have been only one entrance, and an inconvenient one at that since it was so indirect. One would have expected a secondary, private entrance.

Access to the second level of Dar Bairam Jawish is by way of the open courtyard A, leading to stairs in the north-east corner. These run north, then east and then west. The second floor consists of a small chamber (B), a rectangular open courtyard (E), a rectangular hall (D), and the main domed chamber (C). The open courtyard E is situated east of courtyard A, and measures 3.5m by 5.4m. It has been recently re-paved, and in the south-eastern section there is a small, modern, concrete-slab structure. It is used as a bath-house for the second level of the house. There is a single step up to the door which leads to the interior of the small chamber B. The door is surmounted by a simple slab lintel. The interior of the room is a square, measuring 3.3m per side, and the paving is modern. Two windows open to the west and provide light for the interior; each is surmounted by a slab lintel and is fitted with a simple iron grille. There are two

blind niches, the first, in the north wall, is large, being 2.3m long by 40cm deep. The second to the west of the door in the south wall is smaller, being 80cm by 50cm deep. The walls are plastered and there is a shallow dome. This is carried on four pendentives.

Two semicircular steps in the centre of the south side of courtyard E lead through a doorway into the rectangular hall D. This long room measures 3m wide by 8.3m long. It is divided into two parts by a recent concrete wall and is covered by a modern wooden roof. The first, northern, part is today used a kitchen, and the second area to the south is a living room. Both parts are a later addition built after the construction of room C. This is evident from the fact that the masonry courses of the two areas are not integrated, but are adjoining.

The interior of chamber C is a square measuring 4.5m by 4.5m; and it is reached through a door in the east wall. The door measures 90cm wide by 1.7m high, and it is flanked by two identical windows, today blocked, each measuring 90cm by 1.2m and surmounted with a slab lintel. Another six identical windows light the interior of the chamber, two in each of the west, north and south walls. Three identical blind niches are placed between the windows, one in each side. Each niche measures 50cm by 70cm. Once again the floor and the walls have been recently paved and plastered. A big ribbed saucer dome covers the chamber, expressed on the exterior, as said before, by the truncated pyramidal dome. The interior dome is carried on four huge pointed arches which spring from triangular wall pendentives.

14 HUJRAT MUHAMMAD AMIR LIWA' AL-QUDS

Name: Hujrat Muhammad Amir Liwa' al-Quds (Governor of the District of Jerusalem)

Date: Probably 956/1549?

Endowment: None known

Variant of name: None is known; the foundation inscription refers to the building as *hujra* ('chamber')

Modern name: Khalwat Muhammad Amir Liwa' al-Quds.

Location

The *hujra* is to be found at the northern extremity of the Dome of the Rock terrace, abutting the eastern pier of the northern colonnade (721/1321).

Function

Hujra or *khalwa* means 'small cell' or 'room'. This cell was usually constructed without a window, and was originally used as a Sufi retreat. From information contained in Mamluk documents, it seems that the cells existed as part of Sufi foundations and *madrasas* in Cairo, Damascus and other urban centres, where they were known as *khalawi li-attalaba* (cells for students) or *khalawi li-sufiyya* (cells for Sufis) (Amin and Ibrahim 1990: 43). During the Ottoman period in Jerusalem too *khalwas* are known to have formed part of a Sufi complex, for example al-Zawiya al-Qadiriyya (cat. no. 35). But on the Haram al-Sharif, at least from 956/1549, a *khalwa*, *oda* or *hujra* is always a separate structure, usually built on two levels, each level comprising at least one chamber. This architectural form was a new building type introduced into Jerusalem at this time and comprises 27 percent of the Ottoman monuments in Jerusalem (15 monuments out of 55), according to the most up to date inventory (cat. nos. 14, 16, 17, 20-25, 34, 41, 46, 51-53). In Ch. 36 these little buildings are studied in general terms, but are treated individually in this catalogue.

The function of Hujrat Muhammad Amir Liwa' al-Quds, to judge by the inscription, was to be for the benefit of 'the people of learning (or knowledge)' (*ulu 'l-ilm*). In the light of this, it is interesting to note that the *hujra* appears under the heading of 'school' on Powell's plan of 1862. Al-'Asali (1981: 44-5) mentions the names of scholars who used to teach in the *hujra* to the north of the Dome of the Rock terrace but gives no further details. These include al-Shaikh 'Ali Yasin, who taught in Khalwat Muhammad Agha (cat. no. 20), and al-Shaikh Abu al-Sa'ud al-Gazi, in the North-Western Khalwa of Ahmad Pasha (cat. no. 22). Sometimes members of the secular community, who worked on the Haram al-Sharif, were allowed to live in these lower cells. One of these people was Muhammad Agha, who lived in Khalwat Junbalatiyya (cat. no. 24).

Site and brief description (figs. 14.1-14.4, pls. 14.1-14.4)

Hujrat Muhammad Amir is located between Hujrat Muhammad Agha (cat. no. 20) to the west and the North-Western Khalwa of Ahmad Pasha (cat. no. 22) to the east, and faces south to the Dome of the Rock. Its western lower wall is constructed against the eastern side of the stairway which is at the southern end of the path leading from Bab al-'Atm to the upper terrace. Like most of the cells, Hujrat Muhammad Amir is a single-unit structure; it consists of two storeys, each made up of two rooms. The lower

storey is rectangular and has a single hall comprising two square rooms. Each of these is covered by a cross vault. As elsewhere, this lower storey acts as a bridge between the two levels of the esplanade. The upper floor is the principal one, and it too consists of two square chambers, but here each is separate and is covered by a hemispherical dome. The *hujra* has been constructed of white stones that have now weathered to grey.

History

Identification

Although it has proved impossible so far to give a firm date to the *hujra*, it is safe to place it within the Ottoman period on the basis of its foundation inscription, its architectural style, and, more specifically, the fact that none of the cells of the Haram has been identified as being pre-Ottoman.

Date

Van Berchem (1925: 187, no. 199) confined his discussion to the chronogram in the second hemistich of the last line of the inscription. The date is not given numerically, and van Berchem commented that although the inscription appeared to be clearly written, the reading of the chronogram gave a date of 896/1490. This would seem too early, for the *ta'liq* script in which it is written—and the framework surrounding the verses—became fashionable only in the Ottoman period. A different and more convoluted reading (doubling the value [60] of the *sin* of *ussisa*, 'constructed', which gives a total of 956 when added to 896) brings the date to a more probable 956/1549. Although van Berchem (1925: 187) confined his comments to that part of the inscription which dealt with the date, reporting only that 'the beginning of the inscription probably contained the names of the founder', a fuller interpretation is given below.

The plaque is marble and is set within a chamfered recess in the centre of the southern façade. Its central position has been carefully selected to underline the fact that the two rooms form a single building under one patron, that is Muhammad, governor of Jerusalem. The plaque measures 40cm wide by 30cm high, and it contains three lines of Arabic script written in Ottoman *ta'liq*, as already stated. The script is slightly interlaced and slender, with diacritical points, and is contained within six rectangular cusped cartouches. Four-petalled floral motifs are inserted in the interstices between the cartouches, two complete motifs in the centre and half-motifs at the outer edges. The full Arabic text is given in Cat. Appendix 2, no. 14; the translation runs as follows:

1. When Muhammad constructed chambers for the people of learning ...
2. The Governor of the District of Jerusalem was considered to adhere to the strong cause !
3. They counted it with figures and dated it (with the words—i.e. the chronogram) 'its construction has been based on piety.'

Founder

Fortunately, though it is very brief, the foundation inscription gives both the name and the status of the founder as Muhammad, Governor of the district of Jerusalem (Amir Liwa' al-Quds).

Architecture

Exterior

The southern façade is the main one of the building, and there are

traces on it of a three-domed portico that has now gone. These remnants include the bases and short sections of the shafts of two of the columns attached to the present dais, the vestiges of two other outer columns, three of the four imposts from which the arches sprang, and the recent rubble infill between them. These architectural traces, as well as the small-scale plan by Powell, amount to proof that a three-domed portico continued to exist at least until 1862. The question remains when and why this portico, as well as those of al-Madrasa al-Ahmadiyya (cat. no. 25), the Khalwat Junbalatiyya (cat. no. 24), and the North-Eastern Khalwa of Ahmad Pasha (cat. no. 23), collapsed. If the plans of these *khalwas* were correctly drawn by Powell in 1862, and they seem to be so although they display minor discrepancies, it means that these porticoes were still extant at that date, and that they have disappeared at some time since that time. Taking into consideration the record of Palestinian earthquakes, it is possible that they collapsed in 1927. The important point, however, is that an elaborate three-dome portico formerly existed and that it made the building much more monumental and impressive than it appears today.

The present south wall of the cell of Muhammad is preceded by a rectangular stone dais measuring 9.18m long and 1.8m wide, which stands 65cm higher than the level of the Dome of the Rock terrace. The dais is both constructed and paved with high-quality white flagstones; some of these are large—one measures 2.8m long by 1.25m wide. Access onto the dais from the level of the terrace is by way of three steps in the north-western corner or by two in the north-eastern corner. Two short sections of the circular shaft of the supporting columns are still *in situ*; they are 1.2m in diameter for the one to the west and 1.15m for that to the east. The south wall is made up of simple masonry with three blocked-up semicircular arches.

For the purpose of an architectural description, the wall can be divided into two identical parts. Each part is pierced by a door and a rectangular window to the east of it. The door in the eastern section of the façade measures 74cm wide by 1.6m high, and the window measures 66cm wide by 1m high. The door to the west measures 70cm wide by 1.5m high, and the adjacent window 70cm wide by 1m high. The eastern door and both windows are surmounted by a simple white slab lintel, while the door to the west, which must therefore be considered the main one, has a lintel of three red stone blocks. The windows are fitted with iron grilles. The inscribed panel, as noted above, has been carefully sited two courses above the lintel of the east door in the centre of the middle arch in order to underline the unity of the two chambers of the *khalwa*. Five courses above the inscription panel the building ends abruptly, without any framing device. The stones of the top corners of the south wall are consistent with the rest of the masonry. Those of the western corner display some recent repair work, while the masonry of the eastern corner is discoloured owing to a chemical reaction to rainwater. The two main domes of the *khalwa* rest directly on the walls of the chambers. Both domes and the roof are covered with small flagstones. Each dome once culminated in a stone crescent finial, although the upper part of the one on the eastern dome is now missing.

The northern elevation is also made up of two sections. Its lower part is on a level with the lower Haram esplanade. It includes two identical doors, each measuring 70cm wide by 1.41m high; these are surmounted by huge slab lintels, the western one being 1.3m wide by 28cm high, while the eastern one is 1.41m wide by 30cm high. Above each lintel there are four

stone blocks forming an incomplete arch. In recent times the eastern door has been partly blocked and converted to serve as a window, following the opening of a huge door in the corner of the eastern elevation (see below). The upper part of the composite northern elevation is plain apart from three similar rectangular window openings. The windows are surmounted by white slab lintels and are provided with iron grilles preceded by a newly fitted wire mesh grille. Each of the two eastern windows of the composite northern façade measures 62cm wide by 97cm high, while the third window to the west measures 60cm wide by 1m high. The building terminates with a projected and chamfered stone cornice which runs round all the elevations except the one to the south, where once there was a portico (see above). The area round a waterspout shows evidence of leakage, for here there is the same black discolouration as on the southern elevation.

The western elevation is very simple; it is undecorated and has a single rectangular window, 70cm wide by 1m high. The first six courses of this elevation are obscured by the stairway of the northern colonnade. The eastern elevation is similar to that of the west, in that it is a solid wall apart from a rectangular window in the upper section which measures 67cm wide by 97cm high. Recently a doorway with a pointed arch has been opened to enable a huge electricity generator to be housed in the lower part of the *hujra*.

Interior

The interior of the upper storey of the building consists of two main chambers. These are similar apart from the layout of the windows and the blind niches. They are both square in plan and are constructed with remarkably thick walls, 75cm deep. The eastern chamber is paved with old flagstones and is raised 19cm above the level of the dais, while the western chamber has been floored lately with modern paving stones and is raised 14cm above the dais. There are three windows, as described above, in the west, north and south walls of the western chamber. All the windows in both chambers have a semicircular scalloped and relieving arch. In the chamber to the west, they begin just above floor level at a height of 48cm, but in the eastern chamber the point of departure is only 26cm above the level of the floor. The northern window is flanked by two identical blind recessed niches, each measuring 35cm wide by 90cm high by 35cm deep, although the depth of the eastern niche is only 28cm. The only break in the eastern wall of the west chamber is a blind niche 53cm wide by 94cm high by 32cm deep. Next to the window in the west wall there is another blind recess, measuring 34cm wide by 1.43m high by 45cm wide. The layout of the niches and of the fenestration of the chamber to the east differs slightly. There are in all, as already mentioned, four windows, two in the north wall, and one each in the east and south walls. Both of these latter windows are flanked by two blind niches with identical measurements of 42cm wide by 70cm high by 30cm deep. The niches flanking the window to the east are identical—47cm wide by 80cm high by 46cm deep. The width of the northern niche is 5cm less than these. There are also three blind niches placed in the west wall of the eastern chamber; those to the north and in the centre share the measurements of 35cm wide by 83cm high by 43cm deep while the niche to the south measures 50cm wide by 1m high by 40cm deep. The niches in both chambers were used for storage—especially necessary at the time when the *khalwa* was used as a place of learning. A hemispherical dome rests directly on the walls of each room. The transition from square to circular form is achieved by means of squinches in the corners. The domes

and walls of the rooms have recently been replastered.

The interior of the lower part of the *khalwa* consists of a single rectangular chamber subdivided into two small square rooms, both of which have been paved with flagstones. The square bays are each covered by a cross vault. Access to the interior was once through the two doors in the lower section of the northern façade, but, as stated above, the door to the east was blocked when the lower storey was adapted to accommodate the generator for the Haram. These walls and vaults have also been replastered recently.

Features

Unfortunately, no information which might have filled the gaps in the history of the building was found in the *sijills* concerning either the *hujra* or its founder. The foundation inscription thus still remains the only available source of information. One of the

major questions still to be answered is the date of construction, and trying to solve this problem through study of the architectural features of the cell alone is not easy. When the attempt is made to subdivide the *khalwas* into categories (see below Ch. 36 under '*Khalwas*'), this example, and those of Qitas (cat. no. 16) and of Parwiz (cat. no. 17), can be grouped together; and indeed they were given the same tentative date by van Berchem. But the layout of Hujrat Muhammad differs from the other two in several respects—notably in the absence of applied decoration such as the trefoils over the windows, the elegant fluting of the windows themselves, the carved roundels, and the presence of a monumental porch—although it is true that they do all share a basic simplicity of masonry fabric. Thus, although it is possible that the *hujra* belongs to the 16th century, a firm date has to await further evidence.

15 AL-‘IMARA AL-‘AMIRA (KHAASSAKI SULTAN)

Name: Al-‘Imara al-‘Amira

Date: Jumada II 959/May 1552 (see below under Date)

Endowment: The first (Turkish) copy of the *waqfiyya*¹ is dated 30 Jumada I 959/24 May 1552; the final full version, which was drawn up in Arabic, is dated 15 Sha‘ban 964/15 June 1557. An additional endowment was made by Sultan Sulaiman at the end of Shawwal 967/24 July 1560.

Variants of name: Throughout the *sijill* as well as in the *waqfiyya* (Sijill 270: 18-27; Stephan 1944: 170-194, al-Husaini 1982: 78-93; al-‘Asali 1989: 127-142) the complex is called al-‘Imara al-‘Amira, ‘the Flourishing Edifice’. More recent references (Pierotti 1864: 150-153; Wilson 1865: 57; al-‘Arif 1961: 307; Burgoyne 1971: 17-20; Burgoyne 1976: no. 140; al-‘Asali 1982: 9-38; and Najm *et al.* 1983: 364) name it after the founder, the wife of Sultan Sulaiman, Khassaki Sultan, who is also widely known as the Khassaki Khurrem (Hasaki Hürrem) (Stephan 1942: 171; Meinecke 1988: 267-8; Skilliter 1986: 66-7; Rogers 1988: 16-20). The current popular name for the complex is the ‘Takiyyat Khassaki Sultan’. This name is derived from the Turkish word *tekke*, which usually indicates a Sufi foundation, but in the dialect of Jerusalem the word *takiyya* denotes a public soup kitchen where free food is distributed to the poor. Al-‘Asali (1982: 23) associated this shift of the meaning to the presence of the kitchen, which continues to function and to provide free food for the poor, whereas in time other elements of the complex have vanished, such as the *ribat* (the fifty-five cells) and the *khan*. In the following pages, in accordance with the *waqfiyya* and the *sijill*, the complex will be referred to as al-‘Imara al-‘Amira.

Modern name: As already explained, most of the ordinary residents of Jerusalem call the complex simply ‘al-Takiyya’, in the sense of a working kitchen. Since the majority of the complex is now given over to the Islamic Industrial Orphanage School and the Islamic Orphanage Secondary School, it is also referred to in concise form as Dar al-Itam al-Islamiyya (‘the House of the Muslim Orphanage’). It should be explained that this last term includes Dar al-Sitt Tunshuq, which is now incorporated into the complex.

Location

The north entrance of al-‘Imara al-‘Amira is located on the south

side of ‘Aqabat al-Takiyya (formerly known as ‘Aqabat al-Sitt), about 15m west of the Haram and directly east of Dar al-Sitt Tunshuq. The south entrance is on the north side of the eastern end of ‘Aqabat al-Saraya.

Site and brief description (figs. 15.1-15.11, pls.15.1-15.26)

The site is certainly the most complicated Ottoman monument still extant and functioning in the Old City because at present not only al-‘Imara al-‘Amira but also Dar al-Sitt Tunshuq (c. 790/1388), al-Madrasa al-Mawardiyya (cat. no. 28), Ribat Bairam Jawish (cat. no. 11), and another later, unidentified building form part of what is called the Islamic Industrial Orphanage School. The intricacy of the development of these individual structures, as well as many other alterations, additions and demolitions, all contribute to the complexity of the site.

By virtue of the *sijills* (see cat. no. 28 under Endowment), it is however possible to differentiate between the eastern border of the complex of al-‘Imara al-‘Amira and the architectural components of the Mawardiyya buildings. The break on the western border, where Dar al-Sitt Tunshuq is located, can be seen on the architectural layout drawn by Burgoyne (1987: 485-6, fig. 48.2), which corresponds to the description in the *waqfiyya*. The north and south sides of al-‘Imara al-‘Amira are defined by main roads today, as perhaps they were when the structure was first built. Thus the complex is bordered by the Tariq ‘Aqabat al-Takiyya to the north, by Dar al-Sitt Tunshuq to the west, by Tariq ‘Aqabat al-Saraya to the south, and by al-Madrasa al-Mawardiyya and an unidentified building to the east.

Today the complex of al-‘Imara al-‘Amira is entered by way of two monumental portals in the north and south façades. The south portal leads immediately to a vestibule in the form of an *iwan* flanked with chambers on either side. The vestibule in turn gives access to two open courtyards—the south-western and the south-eastern. Eight bays in all, including the last bay in the vestibule, surround the south-western courtyard (M1-M8). I believe that the courtyard and its surrounding bays constitute the caravanserai mentioned in the *waqfiyya* (see below). A recent staircase in the south-eastern corner leads to an upper level which is constructed above the southern doorway.

The south side of the south-eastern courtyard is now occupied by a recent building, which houses the printing works of the Islamic Orphanage Industrial School. It was apparently built in 1286/1869-70 as the ‘Department of Justice’ at a time when major repairs took place in the complex. It is my belief that this is probably the site of the ‘fifty-five cells of the poor’ who lived in the complex in the 16th century (see below for more details). A rectangular hall (N) made up of four elaborately vaulted bays and a tomb chamber is built on the north side of the south-eastern courtyard. The hall seems to be original, and although it is now without a *mihrab*, it is possible that this is ‘the lofty mosque’ mentioned in the *waqfiyya*. But while the mosque is mentioned in the *waqfiyya*, the tomb chamber is not. This surprising *lacuna*, as well as the style of the architectural elements and other factors, would seem to imply that the tomb was constructed at an earlier date than al-‘Imara al-‘Amira. At all events, the difference in alignment makes it unlikely that they belong to the same building campaign. A modern staircase has recently been built at the east end of the south-eastern courtyard. This leads to the roof of the tomb chamber where a passageway runs between, and connects, the southern and the northern parts of the complex.

The architectural elements of the northern section of al-‘Imara al-‘Amira are: the small vestibule (A), which also gives

¹ There are two versions of the *waqfiyya* of al-‘Imara al-‘Amira. The first is an initial draft written in Ottoman Turkish, dated 30 Jumada I 959/24 May 1552; it has been published and translated into English by Stephan (1942: 170-94), with valuable comments and insertions of notes from the Arabic version. The second version is in Arabic; it is the final text and is to be found in Sijill 270: 18-49, dated 15 Sha‘ban 964/13 June 1557. Al-Husaini (1982: 78-93) published the text of the *waqfiyya* without comment, while al-‘Asali (1982: 16-28) gave the main outlines of the *waqfiyya* and later (1989: 127-42) published it with some comments. There is a third copy, also in Arabic, which is kept at the Department of Islamic Archaeology, Jerusalem. Rogers (1988: 19-20) pointed to yet another full and final *waqfiyya*, also dated 15 Sha‘ban 964/13 June 1557, kept in the Turkish and Islamic Art Museum, Istanbul (Türk ve İslam Eserleri Müzesi—TIEM no. 2192). The Arabic text is here taken as our authority, with reference to the Turkish version where there is any significant variation.

onto two courtyards—the first being the north-western one, and, following from it, the second and north-eastern courtyard. An elaborate nine-vaulted kitchen (*'imaret*) building is constructed on the south side of the second courtyard, bordered to the east by a rectangular storeroom (C). A bakery (D), and a rectangular hall (E) together with a chamber (F) are built on the north of the courtyard, facing the kitchen building. They are integrated into a single building, and a further upper floor has been built above these structures. The upper level is reached by way of an old (probably original) stairway situated at the north-eastern corner of the north-western courtyard. A water fountain is located on the east side of the north-eastern courtyard.

History

Identification

The identification of al-‘Imara al-‘Amira is secured by a *waqfiyya* as well as by many other records in the *sijills*; there are also a number of inscription panels relating to restorations.

According to the *waqfiyya*, the donor, Khassaki Khurrem, constructed in the ‘Aqabat al-Sitt, one of neighbourhoods (*mahallat*) of the protected and holy town of Jerusalem, the following buildings:

(1) A mosque. It is described in the early Turkish version of the *waqfiyya* (Stephan 1944: 182) as ‘a well-built edifice with strongly-built pillars, a lofty vaulted mosque, and a high praying-place with firm domes.’ The final Arabic version of the *waqfiyya* (Sijill 270; al-Husaini 1982: 81; al-‘Asali 1983: 130) describes the mosque as ‘the noble mosque with the lofty arched opening and high praying-house with strong portico’ (*al-masjid al-sharif al-rafi‘ al-taq wa’l-ma‘bad al-munif al-mani‘ al-riwaq*). The mosque was dedicated to the faithful Muslim people, male and female, who would pray there. Al-‘Asali (1982: 17) states that ‘the location of this mosque is unknown at present.’ An attempt to identify the mosque is to be found below under the description of hall N where a possible relationship with a modern concrete building immediately to its north and west of the *imaret* is discussed.

(2) A public building (*'imaret*). ‘It is located opposite the noble mosque, and consists of a lofty kitchen (*matbakh munif*), bakery, cellar, enclosure (*mahuta*), storeroom (*anbar*), latrines (*kumuf*), and woodshed (*mahtab*).’ These were endowed for the poor and needy, and for the weak and distressed. Although the enclosure (*mahuta*) is no longer extant, the rest of these structures still stand today.

(3) A building with fifty-five cells constructed around the mosque for the sake of Allah. The cells were endowed for those pious permanent inhabitants (*mujawirin*), who were God-fearing and monotheistic people. The building, which can be termed a *ribat*, has completely disappeared.

(4) A spacious caravanserai (*khan munif*) for the use of travellers and wayfarers, and in general for all those who undertook journeys (... *abna‘ al-sabil wa ashab al-safar wa’l-rahil*). The caravanserai is still extant, although it has undergone many alterations.

These four structures formed the basis of al-‘Imara al-‘Amira when it was constructed in the 16th century, but the first Turkish text of the *waqfiyya* (Stephan 1942: 183) includes the mention of a stable in addition to the caravanserai. It seems highly probable that the main hall of the ground floor of Dar al-Sitt Tunshuq was the location of this stable, for it is clear that Dar al-Sitt Tunshuq was incorporated into the complex of al-‘Imara al-

‘Amira from the beginning. Burgoyne (1987: 493, 503, pl. 48.26; 504 n. 19) has published a re-used panel inscription dated 1167/1753. It refers to the site of the restorations that had been undertaken at ‘al-‘Imara al-‘Amira’ instead of at Dar al-Sitt Tunshuq, which might have been anticipated. Pierotti (1964: 152) states that ‘in order to mount to the upper storey it is necessary to leave these rooms (on the interior around the north-eastern courtyard) and go to the door opening into the street, more to the west (the middle doorway of Dar al-Sitt Tunshuq).’

Date

The complex now has no surviving foundation inscription, though there are four large elaborate panels within the complex; unfortunately, these are today without inscriptions. It appears that initial construction work was not long delayed after 30 Jumada I 959/24 May 1552, the date that the first Turkish version of the *waqfiyya* was drawn up. Heyd (1960: 143) summarises an order issued to the governor of Damascus on 23 Rajab 959/5 July 1552, instructing him to send craftsmen to Jerusalem to work on al-‘Imara al-‘Amira. This means that work began in the second half of the year 959/1552. Sijills 30: 170 and 31: 110 show that the complex was still under construction in the years 962/1555 and 963/1555-6 (for further details, see Ch. 36 under ‘Aqabat al-Takiyya, and under ‘Stone’). As Rogers (1988: 19) has shown, it was held to be illegal to draw up a *waqfiyya* before the buildings of a foundation were completed; it must therefore be presumed that al-‘Imara al-‘Amira had been substantially completed by the time the final Arabic version of the *waqfiyya* was drawn up on 15 Sha‘ban 964/15 June 1557. It thus took almost five years to finish building the basic structures of the complex. This is a long period by any standard, especially when compared to the water project, or even the major work on the walls (see Ch. 36); it must also be remembered that this was a royal foundation.

Founder²

The project was sponsored by Khassaki Khurrem, the beloved wife of Sultan Sulaiman I (926-74/1520-66), and was supported by further endowments by the sultan himself. It was, then, yet another royal foundation in Jerusalem, to rank beside the projects of the water supply, the walls, and the refacing of the Dome of the Rock with tiles. As stated by Meinecke (1988: 267) the restoration of Jerusalem in the Ottoman period reached its zenith with the founding of Khassaki Sultan. Among the titles of the Khassaki Khurrem which are included in the *waqfiyya* are ‘*A’ishat al-Zaman*, *Fatimat al-Dauran*, but the most honorific is *hadrat walidat al-sultan Amir Muhammad* (‘Her Highness the mother of Sehzade Mehmed’). She was called Khassaki Khurrem (Hürrem), a name given to both men and women, and to which it is possible to give several meanings—‘cheerful’, ‘smiling’, and ‘joyous’ (Stephan 1944: 171; Skilliter 1986: 66), but she is generally known in Turkish histories as the Khassaki Sultan, the special favourite of the sultan, whose status was above all other concubines (Cengiz Orhanlu 1978: 1100); in the western accounts she is known as Roxelane.

Khassaki Khurrem, who was born in the early years of the 16th century, was Polish—although she has in the past been

² For the biography of Khassaki Khurrem, see the following publications in addition to those mentioned in the text: Stephan 1944: 171-3; al-‘Asali 1982: 14-15; Rogers 1988: 16-20; Skilliter in *EP* 5 1986: 66-7; Çengiz Orhanlu in *EP* 4 1978: 1100.

Table 15.1 Endowments of al-‘Imara al-‘Amira as reported in the *waqfiyya*

No.	Name	Location
1	The village of Amyun and the farm of Qaiqabah	District of Tripoli
2	The village of Ludd (Lydda)	Near Ramla, district of Gaza
3	One share of ten in the village of al-Jib (equal to 2,500 <i>dirhams</i>)	North of Jerusalem
4	The two caravanserais and the shops located at Shaikh Tutmaj quarter, and a plot of land that abuts the caravanseraï	City of Tripoli
5	The Qaisariyya in the quarter of Khan al-‘Udaimi	City of Tripoli
6	The four mills known as Taitariyya situated on the river of the village Rash-hin	District of Tripoli
7	The four mills known as Turabiyya located on the river of Abu ‘Ali of the village Bishnin	District of Tripoli
8	The whole of the two baths on the lane, leading to Bab al-Ghawanima, Jerusalem	Inside the Old City of Jerusalem
9	The whole village of Bait Iksa in addition to the farm of al-Kharruba	District of Jerusalem
10	18 <i>qirat</i> of 24 in the village of Kafr Jinnis	Near Ramla, district of Gaza
11	The whole village of Kafr ‘Ana along with the farm of Kafr Tab	Near Ramla, district of Gaza
12	The whole village of Buqai‘ al-Dan, and the Buqai‘ al-Ghars land	Jerusalem district
13	The whole village of Bait Liqya together with the farm of Bait Nushif and the farm of Rukubis	Jerusalem district
14	The share (18 of 24 <i>qirat</i>) owned in Bethlehem	Bethlehem
15	The share (18 of 24 <i>qirat</i>) owned in Bait Jala together with the lands named al-Juz and Ras al-Haniyya	West of Bethlehem
16	The whole village of al-Kanisa	Sub-District of Ramla
17	The whole village of Bir Ma‘in	Sub-District of Ramla
18	The whole village of Subtara	Sub-District of Ramla
19	The whole village of ‘Annabah	Sub-District of Ramla
20	The share (21 <i>qirat</i> of 24) of the whole village of Safiriyya	Sub-District of Ramla
21	The whole village of Kharabta	Sub-District of Ramla
22	The share (7 <i>qirat</i> of 24) of the whole village of Jindas	Sub-District of Ramla
23	The whole village of Yazur	Sub-District of Ramla
24	The whole village of al-Yahudiyya (al-‘Abbasiyya at present)	Sub-District of Ramla
25	The share (18 <i>qirat</i> of 24 and one third of a <i>qirat</i>) of the whole village of Bait Dajan	Sub-District of Ramla
26	The whole village of Bait Shenna	Sub-District of Ramla
27	The whole village of Rantiyya	Sub-District of Ramla
28	The share (18 <i>qirat</i> of 24) of the whole village of Na‘lin	Sub-District of Ramla
29	The whole village of Qaqun with the farm of Dair Sallam	Sub-District of Nablus
30	One fourth of the farm of Haithan al-Jammasin	Sub-District of Nablus

mistakenly identified as Russian—from Rogatain (old Ruthenia), an area which was exposed to many Tatar raids. Apparently Khurrem was captured as a young girl in one of these raids, and as Rogers (1988: 16) suggests, was presented to Sulaiman as a slave concubine. Later, she persuaded Sulaiman first to free her, and secondly to marry her. Although there is no firm information as to when the marriage took place, it is unanimously agreed that Sulaiman did indeed make Khurrem his legal wife,³ and he is reputed to have remained faithful and devoted to her from their meeting until her death.

After a serious fire in 947/1541 in the Old Palace in Istanbul where the sultan’s women lived, Khurrem moved with her ladies to the Tokapi Sarai, the political centre. This move of Khurrem marks the date in the Ottoman empire when the ‘rule of women’ (*Kadınlar Saltanatı*) begins; this was to continue until the death of the mother of Murad IV in 1061/1651. Many murders

and deaths of the Ottoman élite—figures such as Mustafa, the son and heir of Sulaiman, Ibrahim Pasha, Kara Ahmad Pasha—are attributed to the influence of Khurrem. Together with Rüstem Pasha, then Grand Vizier, she is thought to have planned to destroy Mustafa so that one of her own sons might be sultan after Sulaiman.

In 945/1539, Khurrem began a long series of pious constructions. These comprised a complex foundation in Istanbul, whose scale was unprecedented (*waqf* 947/1540; Rogers 1988: 18-19), consisting of a mosque, a *madrasa*, *maktab* and *‘imaret* (public soup kitchen), to which a hospital was added later (*waqf* 958/1551-2); a mosque at Kagithane (*waqf* 965/1557-8); a *zawiya* for dervishes at Balat (955/1549); and a double bath at Ayasofya. Her foundations outside Istanbul include the following: a mosque at Edirne; a mosque at Ankara; a *zawiya* at Karapınar near Aksaray in Anatolia; an *‘imaret* and four-rite *madrasa* at Mecca (964/1556-7), and the complex of al-‘Imara al-‘Amira in Jerusalem which is here under discussion.

Khurrem died in Istanbul on 26 Jumada I 965/15 April

³ On the role of the Khassaki Sultan and her unique position, see Peirce 1993: 57-65.

Table 15.2 Administrative personnel, their duties and wages

No.	Position	Wage Dirhams per month
1	Administrator (<i>mutawalli</i>) Gold coins	30
5	5 tax-collectors, 6 <i>dirhams</i> each	30
1	Clerk for the <i>waqf</i>	10
1	<i>Imam</i> for the mosque	4
1	<i>Shaikh</i> for the <i>'imaret</i> (the public kitchen)	8
1	<i>Wakil kharj</i> (under-steward) to buy supplies for the kitchen	8
1	Keeper for the store room (Cellar)	5
1	Keeper for the Pantry	5
1	Clerk for the <i>'imaret</i>	6
2	2 cooks, 7 <i>dirhams</i> each, one to be the head cook	14
1	Cook assistant	3
4	4 bakers, one to be head and to receive 6 <i>dirhams</i> , the rest each to receive 5 <i>dirhams</i>	21
3	3 bakers' assistants, 3 <i>dirhams</i> each	9
1	Meat inspector (<i>naqib al-lahm</i>)	5
1	Bread inspector (<i>naqib al-khubz</i>)	5
2	2 persons to wash the dishes, each to receive 3 <i>dirhams</i>	6
3	3 storekeepers (<i>janqaji</i>) to be in control of cups, bowls, and basins, 3 <i>dirhams</i> each	9
1	One man to cleanse the wheat	3
1	One man to cleanse the rice	3
1	One man to weigh the wheat and rice	3
1	One man to husk and grind the wheat	3
1	Miller	6
2	2 persons to sieve the wheat, one to receive 4 and the other 3 <i>dirhams</i>	7
1	One man to crush the wheat (<i>jarushi</i>) (see above)	2
1	Wheat carrier, to carry the wheat from the store to the mill and vice versa	4
1	Water-carrier to fetch sufficient water for the kitchen, and to sprinkle water on front of the <i>'imaret</i>	3
1	One man to guard, clean, and light the lamps of the noble mosque and the living rooms	5
1	Doorkeeper and general servant (<i>farrash</i>) for the caravanserai	4
1	Doorkeeper for the <i>'imaret</i>	4
1	Attendant and cleaner for the <i>'imaret</i>	4
1	Master repairer to carry out important maintenance work on wood and masonry	5
1	Master restorer to maintain the two bathhouses	4
1	One expert in water installation (<i>qanawati</i>) to care for the canal to the bathhouses and to insure the continuity of water flowing within it.	4
1	Money-changer (<i>sairafi</i>)	4
	Oil for the oil lamps	2

1558. She is buried in her mausoleum adjacent to that of Sultan Sulaiman near the Süleymaniyye mosque in Istanbul.

Endowments

The endowment of al-'Imara al-'Amira listed in the *waqfiyya* is very large. It can be challenged in importance only by the *waqf* of the Haram. According to both the Turkish and Arabic text of the *waqfiyya*, the estates were scattered in five *sanjaks*⁴—Gaza, Nablus, Jerusalem, Sidon, and Tripoli in Syria. Table 15.1 is a list of these endowments, each with its share and location.

The endowments of al-'Imara al-'Amira listed above were confirmed by Sultan Sulaiman in Shawwal 967/June-July 1560, just one year after the death of Khassaki Khurrem. A

waqfiyya (published by al-'Asali 1983: 145-51) recorded in the proceedings of Sijill 270: 50, immediately after the *waqfiyya* of Khassaki Khurrem, reveals that Sultan Sulaiman also made *waqf* for the benefit of al-'Imara al-'Amira the following estates, which were all located in the Sidon sub-district in Syria:

- (1) One share of ten of the whole village of Hara. This share amounted to 3,800 *dirhams*
- (2) The share (19 *qirat* of 24) of the farm of al-Kunaisa village
- (3) The whole farm of Sufiyya
- (4) The whole farm of Jalyubiyya.

Rüstem Pasha, the vizier who acted as the agent of the sultan, announced this *waqf* in the religious court. He appointed al-Hajj Agha ibn 'Abd al-Rahim as caretaker for the additional *waqf*. These estates continued to enjoy the patronage of the Ottoman authority, and whenever a problem or a difficulty arose, *firman*s would be dispatched to the person whose responsibility it

⁴ Heyd (1960: 58, n. 2) and Rogers (1988: 42, n. 75) add the *sanjak* of Safad.

was to find a solution. Heyd (1960: 130-2; 143-4) summarised six *firman*s dealing with certain aspects of the estates. In one of them (1960: 143), an endowment in the village (town) of Jericho was exchanged for some villages belonging to the *khass* fiefs of the *begs* of Jerusalem and Gaza. The reason behind this exchange was that at the time it was difficult to obtain the *waqf* revenue since the village was under the control of insurgents. The *firman* is dated 17 Muharram 972/25 August 1564. Another *firman* (1960: 131) dated 14 Ramadan 866/20 June 1559 contained permission to sell the surplus of wheat of al-‘Imara al-‘Amira, and the purpose of another (1960: 132-3) dated 23 Muharram 987/22 March 1579 was to ease the import of rice from Egypt.

Although the majority of the *waqf* properties have been long since lost as endowment income, the soup kitchen still functions today. A turning point in the fortunes of the revenue from the Khassaki Sultan *waqf* occurred when Ibrahim Pasha expropriated the property in 1247/1831 (Stephan 1944: 175). Stephan maintains that when Turkey regained Syria and Palestine ten years later, instead of giving back the *waqf*, the Ottoman administration commuted the revenues at a fixed annual rate of £T1,150.

Personnel and employees

In addition to the endowments, the *waqfiyya* specifies the men to be employed and their duties, as well as the rate of their wages. The level of personnel was high, not matched by any other *waqf* in Jerusalem or in Palestine, other than that pertaining to the Haram al-Sharif. It is interesting to see that additional posts, not mentioned in the original *waqfiyya*, were established by later *firman*s. Table 15.2 gives a list of the employees with their wages as fixed by the donor.

The total number of people employed by the complex was thus forty-eight.

The total yearly expenditure in silver coins was 79, 505 pieces.

The post of administrator (*mutawalli*) was the most important and carried the most influence. He enjoyed autonomy with full power in the daily affairs of running al-‘Imara al-‘Amira, and in particular the *‘imaret* itself. According to the *waqfiyya*, he was to be ‘rational, honest, high-minded, pious, and religious—a man who would not deviate from the right path’. He was to observe with honesty the collection of the various revenues and their expenditure, and to endeavour to make the *waqf* prosper by maintaining and repairing the foundation from time to time without any delay, carelessness or negligence. In the 16th century, the position was held in particular by high-ranking officials who were from the Ottoman élite (for example, see Table 15.3 below nos. 1-5). They usually held titles such as *beg*, *agha*, *za‘im*, *‘ain*, and so on. Some of these men seem to have been efficient, strong-minded, and serious, in that they managed the complex of al-‘Imara al-‘Amira and its *waqf* with such success that it proved possible to expand it on many occasions. In addition, the wheat from its *waqf* was provided in such abundance that a number of orders were received in Jerusalem allowing the administrator to sell the surplus of the wheat to both Muslim and non-Muslim merchants (Heyd 1960: 130-3).

Within a generation, however, and thus before the end of the 16th century, the situation had changed dramatically. The position of the administrator seems to have been debased and in consequence the management of al-‘Imara al-‘Amira suffered from total mismanagement. A record in Sijill 64: 367 dated 16 Rabi‘ I 993/18 March 1585 discloses that Shaikh Muhammad ibn

Mustafa, the *shaikh* of al-‘Imara al-‘Amira, together with a group of the staff who worked there, had come to the religious court and had informed the *qadi* that al-‘Imara al-‘Amira was in complete chaos and had run out of supplies because too many administrators had been appointed for a short period, to the extent that every six months there had been a new appointment. They further informed the court that there was no rice, oil or even salt; in consequence they had closed al-‘Imara al-‘Amira and had delivered its key to the *qadi*. For the whole Arabic text and English summary see Cat. Appendix 1, no. 15/2.

Although the authorities in Istanbul restored the situation to normality following this débâcle and al-‘Imara al-‘Amira was able to resume its activities, it was very shortly to pass through another crucial period. According to Sijill 112: 476, Aslan Beg, who was then administrator of the complex, had left for Tripoli on 8 Safar 1036/29 October 1626 without arranging for a replacement to run the public kitchen after his departure. The supply of food and bread had therefore been suspended, and in consequence a great deal of harm had been done to the poor of Jerusalem. For the Arabic text and English summary, see Cat. Appendix 1, no. 15/6. It seems that the problem was not just the sudden departure of the administrator, but also his earlier misconduct, for no one was able to lay hands on any of the *waqf* money. On this occasion it took the authorities about six months to restore the situation for, although a new administrator was appointed in a matter of weeks, the kitchen was not re-opened for the poor until 3 Ramadan 1036/18 May 1627 (Sijill 112: 476). See Cat. Appendix 1, no. 15/6.

As noted by al-‘Asali (1989: 309), during the last three centuries the administrator of the entire *waqf* has been appointed from the Ghudayya family, known today as al-Juda. This family therefore monopolised the position, together with that of holder of the key of the Holy Sepulchre, the positions being inherited by successive generations. Juda (1990) and al-‘Asali (1989: 308-23) have published many diplomas and *firman*s concerning the personalities who were appointed to these posts. Table 15.3 is a list of the administrators and their main activities, based on the *sijill* records and other available references. Doubtless in time further study of the *sijills* will allow the list to be augmented by many other names.

Another important post to be stipulated by the donor Khassaki Sultan was the *shaikh* of al-‘Imara al-‘Amira. According to the *waqfiyya*, the *shaikh* was to control the condition of the food and always to be in attendance in the kitchen. Among other essential traits he was to be of pure character, God-fearing, conforming to Islamic law, content, trusting in Allah, not greedy, of kind words and agreeable speech, and refraining from hurting anyone’s feelings. A quick trawl through the pages of the *sijills* reveals a number of those who held the position, but almost no information accompanies the names and it is therefore difficult to add anything beyond the reference in the *waqfiyya*. In one (Sijill 64: 367), mentioned above, the *shaikh* of al-‘Imara al-‘Amira is recorded as heading the group of people who delivered the key of the complex after its closure to the *qadi*. Sinan Khalifa, another *shaikh* of al-‘Imara al-‘Amira, was among the team which inspected the expansion of the kitchen (Sijill 34: 31-2). Muhammad Agha, who was *shaikh* of al-‘Imara al-‘Amira in 1042/1632-3, appears frequently in the records (Sijill 28: 54, 83; 27: 90; 30, 150) dealing with estates and financial transactions. It is not clear whether these relate to personal business or to al-‘Imara al-‘Amira.

Other later posts

The *sijills* also give a certain amount of information on the

Table 15.3 Preliminary List of the Administrators of al-‘Imara al-‘Amira

No.	Name	Sijill or Ref.	Date	Note
1	Haidar Beg b. ‘Abd Allah or Haidar Katkhuda	Sijill 28: 106 (Heyd 1960: 156, 182, al-‘Asali 1982: 20)	959/1552, 961/1554	Haidar was appointed before the final <i>waqfiyya</i> was drawn up (964/1557). He purchased wheat for bread before he died.
2	Farhad Çelebi	Sijills 28: 83, 28: 415; 30: 204; 30: 170	961/1554, 962/1544-5	A <i>firman</i> from the Sultan was addressed to Farhad ordering the distribution of bread to indigent male and female inhabitants of Jerusalem. Farhad was active in buying construction materials for the complex (see Ch. 36 under Stones).
3	Bairam Jawish	Sijill 31: 110 (Heyd 1960: 131, al-‘Asali 1989: 98-9)	963/1555-6	For his biography, see cat. no. 11 under Founder. Bairam contracted a group of builders to pave the baths, which formed part of the <i>waqf</i> of the Khassaki ‘ <i>imaret</i> . Bairam died in 970/1562-3.
4	Turghud Beg	Sijills 39: 30-1; 40: 146-7 (Heyd 1960: 131)	967/1559, 968/1560-1	Turghud was ordered to sell grain dating from the time of Bairam. The kitchen was expanded during his tenure.
5	‘Abd al-Karim Beg	Sijill 48: 156; (Heyd 1960: 158, 172)	973/1565, 980/1572	‘Abd al-Karim constructed a western hall in al-‘Imara al-‘Amira with his own finances.
6	Hajji Hasan	(Heyd 1960: 58)	987/1579	Hasan complained to Istanbul of misconduct by the military which was causing the villagers to abandon their farms.
7	Muhammad Bakr	Sijill 64: 2	992/1584	Financial transaction.
8	‘Uthman Beg	Sijill 64: 146	992/1584	-
9	Wali Beg	Sijill 79: 475	1007/1598-9	Wali was ordered to construct a mill inside al-‘Imara al-‘Amira.
10	Aslan Agha	Sijill 112: 476	1036/1626-7	Aslan left for Tripoli without appointing a deputy, in consequence of which the ‘ <i>imaret</i> was shut down.
11	Muhammad ‘Ali	Sijill 112: 476	1036/1626-7	Muhammad ‘Ali was appointed in succession to Aslan Beg.
12	Muhammad Agha	Sijill 120: 259	1042/1632-3	-
13	Musa Agha	Sijill 121: 287	1042/1632-3	-
14	Nur al-Hidaya Khatun bint Jamal al-Din	Al-‘Asali 1982: 21	1043/1633-4	This is the only record of a woman administering the <i>waqf</i> . Her diploma is kept with the ‘Asali papers in Amman.
15	Mustafa Agha	Sijill 151: 240	1066/1655-6	Financial expenditure.
16	Shaikh Fath Allah and Shaikh Muhibb al-Din, sons of Shaikh Musa ibn Ghudayya	(Al-‘Asali 1982: 26; 1989: 313-14 based on Sijill 150: 354)	1065/1654-5	The two men shared equally between them the position of administrator, as well as that of holder of the key of the Holy Sepulchre.
17	‘Ali Efendizada Mustafa Agha	(Al-‘Asali 1982: 28)	1247/1831	-
18	‘Abd al-Qadir Juda	(Al-‘Asali 1989: 309)		Here the position of administrator is preceded by the words ‘ <i>qa’im maqam</i> ’.
19	Shaikh Adib ‘Abd al-Qadir Juda	(Al-‘Asali 1989: 309)	1359/1940	Shaikh Adib was the last administrator before the running of the complex was taken over by the Auqaf Administration.
20	The Auqaf Administration		Since 1940	

appointments to some of the posts given in Table 15.3. In addition to those specified in the *waqfiyya*, Sijill 155: 445 reports on a post to recite certain chapters of the Qur’an (17; 67; 112). Another position, also for Qur’an reading, was set up from the *waqf* of Khassaki Khurrem, but the recitation was to take place at Maqam al-Nabi Da’ud (Sijill 90: 296). These posts were probably established by *firman*s sent to Jerusalem from Istanbul after the death of Khassaki Khurrem, for the benefit of the readings was to be for the soul of Khassaki Khurrem. Al-‘Asali (1982: 25, 37-8) takes Sijill 145: 354 as his authority in a reference to another post

related to the *waqf* of Khassaki Khurrem. The post was that of *mudarris* (instructor) in a *madrassa* named al-Khassakiyya. The location of the *madrassa* is not known, but al-‘Asali presumed that it might be within the mosque of al-‘Imara al-‘Amira. The present writer came across yet another position mentioned in Sijill 155: 433 dated 1067/1656-7. It reports on a post of *farrash* (attendant) in the *madrassa*; this man was to be in charge of lighting the oil lamps. Heyd (1960: 144) summarised orders kept in Mühimme Defteri (Vol. 36, nos. 377, 381 and 375) dated 23 Muharram 987/22 March 1579, showing that the kitchen of al-‘Imara al-

'Amira suffered from a shortage of meat in winter. These *firman*s repeat the orders given by Sultan Sulaiman I and Sultan Selim II for the appointment of a special butcher.

The *wagfiyya* also provides details about the food to be cooked in the kitchen, the size of its rations and to whom it should be distributed. These details are as follows:

1. Two types of soup were to be cooked daily. The first—a rice soup—was to be served at noon. It was to include 20 *mun*n⁵ of rice, 3 *mun*n of clarified butter, 1.5 *mun*n of chick peas, 2 *mun*n of onions, 2.5 *mun*n of salt, 25 *mun*n of sour milk and parsley to the value of 4 silver coins (*dirhams*). 60 *mun*n of firewood was to be used.

The second type of soup, with a wheat (*burghul*) base, was to be served in the evening. This was to contain the following: 4 *mudd*⁶ of wheat, 3 *mun*n of clarified butter, 2.5 *mun*n of salt, 2 *mun*n of onions, 0.75 *mun*n of cumin (*kammun*), and 1.5 *mun*n of chick peas. For this soup, 70 *mun*n of firewood was to be used.

2. 2,000 loaves of bread of the *fudula*⁷ type were to be baked daily. 55 *mun*n of firewood and 3 *mun*n of salt were also needed daily for this bread.

3. Other types of food, called in the *wagfiyya dana birinji* and *zerde*⁸ were to be cooked on the evening preceding every Friday and every night during Ramadan. Each time these dishes were prepared, they were to include the following quantities of ingredients: 62 *mun*n of rice, 35 *mun*n of mutton, 13.5 *mun*n of clarified butter, 2 *mun*n of chick peas, 2 *mun*n of onions, the equivalent of the weight of 40 *dirhams*⁹ of pepper, 4.5 *mun*n of salt, 16.5 *mun*n of honey, and saffron to the value of 14 silver coins (*dirhams*); 90 *mun*n of firewood was to be used to cook these foods.

4. On each 10th day of Muharram ('*ashura*'), 4 large bowls of soup (*gazghat*) were to be distributed among the scholars, the indigent and the citizens of Jerusalem. No further details are given as to the contents of this type of soup.

Khassaki Khurrem stipulated that a portion from the food detailed above should be given out as follows:

(1) Every *mujawir* (poor resident) in one of the cells was to receive a full ladle (*mighrafa*) of cooked food and one loaf of bread at noon and in the evening, and a lump of cooked meat should be added on the eve of Friday.

(2) Every employee of al-'Imara al-'Amira listed in Table 15.2 was to receive the same portion of food as a *mujawir*.

(3) 400 poor and needy, weak and destitute people of Jerusalem were to receive (between two people) the portion of one

mujawir—i.e., one loaf of bread and one bowl of food at noon and in the evening.

No food was to be set aside for any person other than those specified, nor was it to be taken off the premises in a copper bucket. If it were taken outside, it would be considered to have been stolen.

Almost all the volumes of the Jerusalem *sijills* contain a great many records concerning the assignment of a portion of the food or bread of al-'Imara al-'Amira to a certain category of person. This is expressed by the word *tasa* which can be translated literally by 'bowl', or, more specifically, by either *tasat ta'am* ('a bowl of food') or *tasat al-takiyya* ('a bowl of the soup kitchen'). This *tasa* apparently replaced the ladle (*mighrafa*) originally mentioned in the *wagfiyya* (see above). It seems that the right to have food from al-'Imara al-'Amira was linked to the ownership of the bowl itself, for the loss of this special bowl by a woman in 962/1555 led to her divorce (Sijill 30: 193). It is interesting to note that people even had the right to sell (*faragh* or *tafarrugh*) the *tasa*, and to record the sale in the court, as is apparent from Sijill 155: 520 dated 1067/1665-7. In some cases, people had the right to half a *tasa* only (Sijill 120: 153; 155: 242). Both these *sijills* date to the 11th/17th century—1042/1642-3 and 1066/1655-6 respectively.

Subsequent History

Following the construction of al-'Imara al-'Amira and the death of the donor, interest in the institution was demonstrated almost without interruption by most of the sultans and the Ottoman élite in Istanbul and Jerusalem. The information relevant to the later history of al-'Imara al-'Amira is thus rich to a degree unequalled by any other institution in Jerusalem. Various *firman*s issued at Istanbul and many documents recorded in the *sijills* reflect this importance and the elevated rank of the foundation. The documents cover various matters ranging from an order for new construction work and major restorations to an appointment to a small post, or even half of a post. Some of these documents have already been mentioned; a further selection are given below.

According to Sijill 39: 30-31, the kitchen of al-'Imara al-'Amira was expanded in 967/1559, just a few years after its construction. An order was sent from Istanbul to the administrator of the complex and to the governor of Jerusalem to carry out the work. The expansion, which is still extant, was implemented by the current master builder of Jerusalem, Husain ibn Nammar. (For more details, see below under Architecture, Description of the Kitchen.)

Sijill 45: 156 reveals that in 973/1565 'Abd al-Karim Beg, then in the post of administrator, constructed a western hall within the complex. No further details are recorded, apart from the fact that the work was paid for out of his own money. Unfortunately, this lack of information makes it difficult to identify the hall. Could it have been the square chamber with four vaulted bays adjoining the *turba*?

Later still, in 1007/1598-9 (Sijill 79: 475), another order was dispatched to the *qadi* of Jerusalem and to the administrator of al-'Imara al-'Amira, this time for a mill to be constructed within the complex. A group of Muslims had inspected the site of the caravanserai in the presence of the administrator, and had reported that the big rectangular vaulted chamber, which ran from south to north and which was then in use as a stable, was a suitable place for the mill. They had suggested that the south and the north doors be blocked and that a new door should be opened in the east wall from the interior of the complex. (For the full

⁵ The *mun*n was the equivalent of 819 grammes.

⁶ The *mudd* was the equivalent of 1.053 litres.

⁷ Brown bread, each loaf weighing 281.25 grammes.

⁸ *Zerde* is a Turkish food in which rice is coloured and scented with saffron and sweetened with honey.

⁹ The *dirham* weight was equivalent to 1.125 grammes. It is worth noting that the *dirham* is both a unit for weight and at the same time a unit of the monetary system indicating a silver coin. In order to differentiate between these two, the *dirham* is here further defined as a coin or a weight. The *mun*n is 5/6 of a kilogram; it is equal to 260 *dirham*, and each *dirham* is equal to 3.125 gram.

Arabic text with English summary see Cat. Appendix 1, no. 15/3). It is now impossible to identify the site of the mill with certainty, but according to its description in the *waqfiyya*, it is possible that it was in one of the two cross-vaulted rooms located north east of the caravanserai, north west of hall N, called by Burgoyne the 'Orphanage Kitchen' (Burgoyne 1987: 487, fig. 48.3), but these are too small to have accommodated a horse, mule or camel operating a mill. Furthermore, access to those rooms would have been extremely cumbersome. It seems most likely, therefore, that the mill was set up somewhere in the ten-vaulted rectangular hall of Dar al-Sitt Tunshuq, and that the access to that chamber via a new opening in its east wall used a ramp, now gone and replaced with steps. Al-Nabulsi (al-'Asali 1992: 268) visited the mill when he was in Jerusalem in 1101/1689, at which time it was operated by horse-power and this again points to the large ten-vaulted room as the most likely site of the mill.

In 1167/1753 an unspecified restoration took place at the same time as the roofs of the complex were repaired, according to an inscription published by Burgoyne (1987: 493, pl. 48.26, and n. 19).

A century later, in 1286/1869-70 another cycle of repair work was undertaken. It is documented in a rectangular plaque set above the arch of the north wall of the *iwan* of the south vestibule (A1). The plaque gives the information that Muhammad Pasha, then the governor of Jerusalem, initiated repairs to the house of the government (i.e., al-'Imara al-'Amira) in response to the gesture (*bi-sharīṭ*; indication of the wish) of Muhammad Rashid, the governor of Syria in the reign of Sultan 'Abd al-'Aziz. Unfortunately, the repairs are not specified; however from the stylistic viewpoint it seems most probable that the court building called 'the Department of Justice' (i.e., the middle part of the south façade) was among the works that date to this period of restoration. The panel is of marble, measuring 80cm by 1.6m. The text is divided into four vertical sections, each pair of which forms a separate unit of eight lines of poetry. The first section (that to the east) is written in Ottoman Turkish, and the second, western section is written in Arabic. The script is modern slender *naskh*, reserved in relief and with diacritical points. Traces of black paint can be detected on the surface of the script. A translation of the Arabic text is as follows:

The house of the Government resumed its laughter (*dahikat*) after being sad, as the Governor of the Noble Jerusalem initiated its restoration. This Governor was known as Muhammad Pasha, the honest (man) among our tribes. The restoration was in response to the order from Muhammad Rashid, the Governor of Syria, where he enjoyed a good reputation. It took place during the time of 'Abd al-'Aziz, the Sultan and the Crown of Kings—may Allah grant him a life full of victories and make us more powerful under his reign. When the restoration was completed I dated it (chronogram) 'the house, established with illumination as the full moon'. Da'ud al-Karimi made it (inscribed it) proudly in 1281 (the year 1865).

The complete Arabic text is to be found in Cat. Appendix 2, no. 15/1. Because of the difficulties of access, the Turkish text must await further study.

According to a recent inscription dated 1342/1923,

when the Supreme Muslim Council took over the complex of al-'Imara al-'Amira from the British Mandate authority in 1922, further repairs and renovations were undertaken. The stone panel is located below the one mentioned above. It measures 88cm by 48cm, and its translation reads as follows: 'The Supreme Legislative Muslim Council renewed this *madrasa* in the year 1342' (= 1923).

To this period of restoration it is possible to attribute the upper part of the middle part of the south façade, the reduction of the south-western courtyard, and the staircase in the east side of this courtyard. Traces of paint and whitewash can be seen on the south façade, and the paint on the roundels around the *iwan* vestibule may date back to this renovation.

Because the complex of al-'Imara al-'Amira was used for different purposes in the course of the last two centuries, it is inevitable that it saw a succession of alterations, additions and reductions over the years. Most of the work was not documented, and it is thus necessary to rely on a close investigation of the architecture to reach even a speculative conclusion, and many insoluble problems remain.

Conclusion

It is clear from the information already described that al-'Imara al-'Amira was the most prestigious, as well as the largest, Ottoman charitable project ever to be constructed in Jerusalem or, for that matter, anywhere else in Palestine. Although there were interruptions and difficulties at times in obtaining part of the *waqf* revenues and in providing food for the poor, it is still true that al-'Imara al-'Amira was at times throughout its long history a prosperous institution, continuing to play an important role in the social and economic life of Jerusalem. When al-Nabulsi was in Jerusalem in 1101/1689, he left a positive image of its activities, writing that its storage rooms were well filled. The administrator of the complex enjoyed a high rank from the time of its construction until 1831, when Ibrahim Pasha took control of the city. The administrator was one of those individuals, as were the *qadi* and *mufti*, to whom *firman*s and other communications from Istanbul were addressed. This gives some indication of his importance. Although most of the *waqf* revenue of al-'Imara al-'Amira has been lost, it still functions today, albeit on a reduced scale. Soup is still distributed daily, and meat with rice and vegetables every Tuesday and daily during Ramadan.

Architecture—exterior

The south façade

The south façade of al-'Imara al-'Amira, as recorded in the recent survey,¹⁰ is longer than the north elevation, for it extends about 45.1m from west to east, whereas the length of the north elevation is only 32.35m. The south façade contains three separate architectural sections—eastern, central, and western. The eastern part extends 12.1m, and has badly deteriorated. It is dominated by a simple door flanked to the east by a double window (each part measuring 75cm by 1.6m and 2.3m from ground level), and

¹⁰ The survey was the result of collaboration between the British School of Archaeology in Jerusalem and the Department of Islamic Archaeology of the Auqaf Administration. David Myres, Hamish Auld, Euan Miller, Sophie Skoug and Elizabeth Jackson were engaged in the survey over the summer of 1993. I deeply appreciate their efforts and thank the British School for furnishing me with a copy of their drawings for my research.

to the west by a small slit window (21cm by 1m). The door itself measures 98cm wide by 2.05m high, and is surmounted by a lintel. It is now reached by four steps. Above the lintel there is a semicircular arch. The entrance leads to a group of rooms built on either side of an open courtyard. Most of the courtyard is taken up by recent, haphazardly constructed buildings of concrete which have reduced the space to a narrow passageway. There are no noteworthy architectural or decorative elements either on the façade or in the interior which suggest a 16th-century date. Instead, the structures are typical of the local Palestinian architectural style found throughout late Ottoman Jerusalem. It is difficult now to be sure if this entire section once marked the easternmost border of al-ʿImara al-ʿAmira because of the many alterations that have taken place. Indeed, it seems likely that it should, rather, be associated with the tomb chamber (see below under Tomb Chamber).

The second, central, section of the south façade extends 17m, and consists of an upper and lower part. The lower part is constructed of rusticated masonry and is made up of a central recessed entrance which is flanked on either side by three large identical windows. The door is raised by two steps (42cm high) from the sloping street level. It measures 1.25m by 2.87m and is surmounted by a slab lintel. The lintel has a triple fillet moulding. An inscription plaque of white masonry is set directly above the lintel. It measures 1.05m by 60cm, and is framed by a plain fillet moulding, which is twisted at the four corners to form a 'mim' device. From the corners a trefoil leaf emerges. An inner double fillet, which is cut away at the corners to form a concave curve, frames the text, and the entire panel is also framed on a grander scale by heavy flanking jambs. The text is in a typically Turkish script of a single line which has been left in relief against a worked ground. There are a few auxiliary and diacritical points which add elegance to the clear, legible, Turkish text. The inscription reads '*adliye dairesi*'—'the Department of Justice'.

Each of the six windows, which all measure 96cm by 2.32m, has powerfully projecting jambs and is surmounted by a semicircular arch. The sides of the uprights are chamfered except for the top and bottom which gives the effect of a residual capital and base to each. The stones of the arch have been treated to produce a central groove ending in a point over the 'capital', the angle of the point echoing that of the triangular top and bottom of each side chamfer. Four courses above the arches of the windows (which corresponds to three courses above the inscription plaque), a projecting masonry cornice cuts across the façade. Six courses of rusticated masonry, similar to that below the cornice, appear above the moulding. It is at this level the lower part of the central section of the complex ends, as is made obvious by a radical change in the method of dressing the stonework. Seen as a whole, this portion of the façade is marked by successive frames right down to pavement level.

The upper section of the middle part of the south façade is constructed of masonry of different quality; it is finely dressed, the stones being both smaller and less ornate, with no mouldings, rustication or framing to the windows, which are the only break in the solid wall. There are four of these, all identical, simple rectangles. Each window measures 80cm by 1.28m and is surmounted by a lintel. The wall terminates three courses above the lintel of the windows. There is a fifth window in the easternmost end of this upper level, but a vertical break in the joints of the courses and a reduction in the overall height suggest that this part was added some time later.

Although the lower section of the central part of the

south façade is not dated, the inscription panel with its date of 1286/1869-70 (see above under Subsequent History) probably reflects the time of its construction, for the architectural style and overall design is that of the 13th/19th century. The section would thus correspond to the period of major restoration on the complex, carried out by the then governor of Jerusalem. The section, with its vigorous fenestration and heavy rustication, together with the emphasis on the wall, owes more to Europe than to the Islamic world and shows how Western culture had begun to infiltrate Jerusalem at this time. The upper part was constructed some time later, probably in 1923 when the Supreme Muslim Council took over the complex from the British Mandate authority, as one of the inscriptions implies (see above under Subsequent History).

The third part of the south façade is that furthest west. It extends to a length of 15.3m with an emphasis on the central section which slightly skews its alignment. This part is built with masonry of a similar quality and dressing technique as that of the north elevation, and of the north elevation of the kitchen, although its differences may indicate that, despite being constructed at the same time—in the 960s/1550s—they are the work of two different building teams. After all, one entrance was the formal face which the complex offered to the world, while the other was a utility entrance only.

Instead of the recessed trefoil-arched portal of the north elevation, which will be discussed below, a large pointed arched doorway opens in the middle of the section. The arch, which measures 4.1m wide by 5.45m high, springs from a shallow impost on either side. The imposts are not identical, although each is constructed of three tiers of lancet *muqarnas* niches. The niches are decorated with a floral motif consisting of a small palmette. The arch itself is made up of simple masonry blocks framed by a frieze of small lancet niches, each with the same palmette motif (see Grammar of Architectural Ornament). The keystone of the arch is embellished with a carved boss in strong relief, made up of interlaced fillets which form lozenge-shaped recesses at the sides and terminate in a reserved six-pointed star marked by a six-petalled rosette at the apex. All in all, then, this is a significantly more imposing entranceway than was the norm in Ottoman Jerusalem.

There is a masonry roundel on either side of the pointed arch, both of which consist of a twelve-pointed star. A different roundel is set two courses above the keystone of the arch. It has a geometrical pattern, made up of a series of relief carved lines giving the impression of a woven straw-basket. The remaining two roundels are of the same general type though not identical for the west one has a more complex central section, and both are situated four courses from the springing of the arch (for a fuller discussion on the decoration, see Ch. 24). Their scheme of decoration is made up of geometrical interlacing which forms twelve-pointed stars enclosing a central small rosette.

In all there are seven window-openings in the south façade, five on the higher level and two on the lower level, one on either side of the doorway. The east one measures 1m wide by 2m high and is 1.5m above ground level. It is surmounted by a slab lintel and directly above the lintel there is a pseudo-relieving arch made up of three simple voussoirs. The middle stone is decorated by a trefoil leaf. Traces of modern black and red paint and whitewash remain on the masonry courses above the relieving arch. This seems to have been done lately to give the impression of *ablaq* masonry, and was probably implemented at the time when the Supreme Muslim Council renovated the site in 1923.

The west window measures 1.13m wide by 2.05m high and it is 50cm above ground level. It is surmounted by a semicircular arch and thus differs from the eastern window of this part. A rectangular aperture (70cm wide by 47m high), which has the appearance of a small window, is cut through one course above the arch of the window; it is now covered by a modern iron grille and it is clumsily finished. The asymmetry of the windows and the rough finish suggests that at some time alterations must have been carried out on this section of the façade.

One of the windows is a double window, set immediately over the central stone roundel three courses above the entrance arch. It is covered by a wire mesh grille. Thin iron struts intended to support a wooden balcony project at the level of the window sill; the design of the cast iron would seem to indicate a recent date. Each part of the double window measures 1m by 2.35m and is surmounted by an arch with a slightly pointed profile. The arches spring from the wall and from a column at the centre of the window. A carved stone frieze runs round the voussoir blocks of the two arches. It is decorated with a carved geometrical pattern made up of a series of small squares divided into four small triangles placed to each side of a central rib. Exactly above the keystone of each arch, the frieze loops to form a *mim*, and another loop terminates it at each end. A stone medallion is placed above the central column (and thus above the medallion centred over the entrance arch). Again of geometric design, it is made up of a ten-pointed star, the outer points consisting of a series of irregular hexagons.

To either side of the double window there are two rectangular windows. The eastern pair are identical, each window measuring 1m by 1.25m; those to the west are also identical and each measures 90cm by 1.25m. The four windows are also similar in that they are all fitted with identical iron grilles and are surmounted by slab lintels and pseudo-relieving arches. An eight-pointed star aperture is set five courses above the lintel of the western windows with the function of allowing additional light and air into the interior.

Three courses above this aperture and the roundel over the double window, this section of the south façade terminates with a slightly projecting frame. The frame breaks downwards in the eastern section of this main part of the south façade, to drop three courses below the summit of the masonry. This feature occurs only here, which is surprising, for the two sides of the façade are symmetrical and it is to be expected that they would also finish in the same way and style. This dissimilarity must be due to the rebuilding of the east side of the upper floor (for more details see below under the Upper Floor).

The north façade

The north façade is 32.35m long, but it does not have a unified height, for the entrance porch has always been higher than the rest of the elevation and the road level anyway rises steeply towards the west. The elevation is made up at present of an elegant entrance portal and two further sections—an upper and lower, or, more precisely, an original and a more recent section. The original part includes the courses up to and including two above the top of the slit window, where a vertical break is visible. It is built with fine dressed masonry, made up of square and rectangular stones of yellow and white although some have now weathered to grey and black. There are minimal joints. The courses of the masonry are both coherent and consistent for they are arranged in straight level lines in the same way as the original part of the south façade and the north elevation of the kitchen building (see below).

The lower part of the north elevation is a solid wall apart from the slit window already mentioned and two further rectangular windows. The slit window, which measures 25cm by 75cm, is located to the east of the portal; it is fitted with a recent iron grille and is surmounted by a very small trefoil arch. The two rectangular windows are set at the same level, with their apex one course lower than the bottom of the slit window. Each measures 65cm by 95cm high, and each is fitted with an antique iron grille. A pseudo-relieving arch made up of voussoirs set at a slant is built above the slab lintel of each window. There are five voussoir stones to the arch of the western window and these are bigger than the seven of the eastern window, occupying a depth of two courses instead of one. Here, therefore, the stone roundel is set directly above the relieving arch, unlike the stone roundel of the eastern window which appears one course above the voussoirs. Once again, the medallions are not identical. The one above the western window is smaller than the eastern one, its diameter being 34cm, and its decoration consists of a ten-part division, the points of the ten-pointed star linked and interlaced to form a rosette. The eastern roundel is 38cm in diameter; it has a combined floral and geometrical decoration of an eight-pointed star laid over another from the tips of which emerge well-executed trefoils. It has a central rosette made up of eight petals. The decorative motif of this roundel recalls those of the entrance portal.

The new upper part of the façade consists of the top thirteen courses built above the central section of the elevation. These raise the level so that the section appears as a rectangular feature, similar to a *pishtaq*. The stones of these courses are of a different quality, tone and size, being smaller than the original masonry. The new section is also a solid wall with the exception of three identical rectangular windows, which are each surmounted by a slab lintel and measure 63cm wide by 90cm high with a modern iron grille. Three courses above the slabs of the windows, the elevation suddenly terminates without frame or moulding. This sudden cessation, as well as the flat roof which covers the building (for which the northern elevation constitutes a wall) and the change in masonry, all confirm that the upper part of the elevation is a later construction. It probably dates from the time when the upper part of the bakery building was constructed (for further details, see below under the Upper Level of the Bakery [the prison]).

The entrance portal is located at the boundary between the Khassaki Sultan complex and the Dar al-Sitt Tunshuq, at the west end of the façade where the road rises steeply westwards from the valley in which Tariq al-Wad is set. The valley separates the Haram to the east from what Mujir al-Din (1973 2: 65) termed the *'aqabat al-suq* or Market Hill to the west, but which later came to be called after the complex of al-'Imara al-'Amira, or the *'Aqabat al-Takiyya*. There was a reason behind the siting of the portal. The topography with its steep change in the street level makes it difficult to centre the porch in the middle of the façade. In addition, in the present arrangement, the north entrance is built broadly on the same axis as the southern one. This is, however, only to be expected with entrances at either end of a roughly rectangular block. If there had been a deliberate wish to make them on the same axis, the entrance from *'Aqabat al-Saraya* would have been centred in the south façade. It is also possible that the much more impressive entrance to the Dar al-Sitt Tunshuq (Burgoyne 1987: 496, fig. 48.6) was incorporated into the Khassaki Sultan and acted as the main entrance from the north; after all, the main rectangular chamber of the earlier foundation probably now accommodated the mill.

Although the north portal of 'Imara al-'Amira is less imposing than the adjoining east and west portals of Dar al-Sitt Tunshuq (see Burgoyne 1987: 496, fig. 48.6), it is—if only modestly—decorated, and impressively tall. The porch is dominated by a trefoil arch of monochrome masonry framed by an ogee moulding. The moulding twists above the keystone of the arch to link to a rectangular frame that returns to connect with the moulding of the arch. Because the loop resembles the Arabic letter *m*, recent references in Arabic refer to it as *mim* or *jift* decoration (see Amin and Ibrahim 1990: 29). The moulding continues downwards from the springing of the arch to run round the two stone benches flanking the recessed porch. Each bench measures 54cm wide by 70cm deep by 80cm high.

The doorway measures 2.3m wide by 3m high. It has jambs of eight stones, of which the top one on either side has a frame moulding similar to an impost. There is a modern wooden door of two leaves which is surmounted by a well-built course of five joggled voussoirs. The final voussoirs at either end are decorated with identical stone roundels which project slightly. The medallions are 43cm in diameter and have a relief floral pattern that consists in the main of an eight-petalled rosette in the centre, surrounded by a concave-sided octagon from which trefoils emerge; interwoven with this are the stems of eight split-palmettes that both frame the trefoils and carry buds between them. A small whorled roundel (12cm in diameter), similar to those found on Sabil Qasim Pasha (cat. no. 2), is carved into the stones close to the main roundels. A third medallion is carved on the keystone of the joggled course; this is smaller than the ones just described, having a diameter of 25cm. The decorative motif consists of a flat rosette in a central roundel surrounded by two sets of five petals with other smaller petals between (for a discussion on this decoration, see Ch. 24). Directly below this medallion, a small iron ring is fixed; this was probably used to suspend one of the oil lamps implied by the reference to money for the supply of oil among the list of expenditures in the *waqfiyya* (see above).

A slightly recessed rectangular panel is set directly above the joggled course. It measures 2.2m wide by 1m high and is at present concealed by a large notice which probably dates to post-1982, for al-'Asali (1982: 10) published a photograph showing a blank panel here. The present notice reads 'General Auqaf Administration, The House of the Islamic Orphanage'. The original stone panel is framed by an engraved geometric interlace enclosing hexagons. The panel probably originally carried either a foundation inscription or a decorative plaque, but, like the panels of the southern entrance, it is now blank. Had any inscription survived to the end of the 19th century, it would have been noted by van Berchem (1923: 308), who published the nearby inscription on the façade of Dar al-Sitt Tunshuq. Two courses above the panel there is a rectangular window. It measures 70cm wide by 90cm high and is fitted with a modern iron grille which must have replaced an older one, for the empty holes of the previous grille can still be seen.

Seven courses of dressed stones are set immediately above the moulding that frames the porch. A slit window, blocked at present, and a band of small lancet *muqarnas* niches decorate this part of the porch. The apex of each niche is decorated with either a three- or a five-headed leaf. This part must have been constructed at the same time as the porch, for the masonry of the face and the rear of the façade is similar and is integrated into the fabric of the porch. There are eight original masonry courses above the *muqarnas* niches which are surmounted by modern

concrete blocks. The size, colour and dressing of the masonry blocks, as well as the breaks in the courses to the rear of this area, indicate that this section of the wall was built some time after the porch had been constructed.

Interior—the northern block

The vestibule (A)

The north entrance portal leads directly to a trapezoid vestibule (A), which is covered by a barrel vault, a rather modest form of roofing given the elaboration of other vaults in the complex. The lower part of the walls is constructed of masonry blocks and the upper part, like the vault, is plastered. It measures 4.2m long by 3.15m wide at the south end, but narrows to 2.7m towards the north. The inner face of the vestibule opens onto the north-western courtyard by way of a pointed arch built of fine ashlar blocks. One course above the arch, off-centre towards the west, there is a rectangular window, which measures 75cm wide by 1.17m high, and is fitted with a simple modern iron grille. This replaced an earlier, perhaps original, one. The window is surmounted by a concrete slab lintel which suggests that the lintel was damaged and rebuilt recently. It seems strange that this window is off-centre *vis-à-vis* the arch, nor is it symmetrical to the two slit windows above; it might therefore be a later construction. These two slit windows are set six courses above the lintel, and are at present blocked from the interior. They are identical, and terminate in a small semicircular arch. Two courses above them, the nature of the ashlar masonry changes; the blocks are of a different colour and appearance, being whiter than the lower courses. This would imply that these upper courses are a later addition. They extend to the east face where there are four additional slit windows. Access to this upper part of the vestibule is by way of the upper floor of Dar al-Sitt Tunshuq. A vertical break in the joints of the courses can be seen to the west of the windows. The break, which starts at the level of the sill of the rectangular window and continues as far as the two courses constructed above the slit windows, is five blocks from the upright of the rectangular window and three blocks from the western slit window. Both the colour of the upper part of the masonry courses, and the break in the joints, confirm the assumption that the last phase of the north entrance porch was built some time later, and was not part of the original complex. It is clear too that the area of masonry located west of the break was built at the same time that the last part of the porch was added, for it was constructed to support the new addition.

The north-western courtyard

The vestibule gives access to the north-western courtyard, which is almost rectangular in plan—although the north-eastern angle is not a right angle. The maximum length of the courtyard is 13.1m by 10.6m. It has been paved recently with modern flagstones, and it is bordered to the west by Dar al-Sitt Tunshuq, to the south by a two-storeyed, modern building (built in the 1950s) with a concrete roof, and to the east of a single-storeyed flight of twelve steps. There are two stairways in the north-western courtyard. The first, in the south-eastern corner—which is very recent—leads immediately to the roof of the kitchen of al-'Imara al-'Amira. From this roof it is now possible to reach al-Madrassa al-Mawardiyya (cat. no. 28) and the southern entrance of al-'Imara al-'Amira across the roof of the tomb chamber. Before the construction of the stairs, access from the north-western courtyard to the southern part of the complex was probably

through the doorway which is preceded by two semicircular steps and leads through the modern building to what is called here Hall N (see below). It is also possible that entrance was through Dar al-Sitt Tunshuq but this too had its problems for in the 1860s, according to Pierotti (1864: 152), 'a heap of filth covered up several steps of the stairs' of the north entrance of Dar al-Sitt Tunshuq and in consequence it was suggested that it would be 'better to go round the valley to the south gate and avoid the nuisance'.

The second stairway in the north-western courtyard gives the appearance of being older. It gives access to the upper floor, which has been built above the bakery building, and to a chamber constructed over the vestibule of the north entrance.

A chamber (B) is built in the north-eastern corner of the north-western courtyard, 1.7m east of the vestibule. It is entered through a door opening in the south wall. The door (80cm wide by 1.9m high) is very simple, and is surmounted by a slab lintel. Above the lintel, the ashlar are placed haphazardly and have a clumsy finish; they are surmounted by ugly courses of concrete blocks which suggest that there has been a rebuilding. The southern and northern sides of the chamber are not set at right angles, and it therefore has a trapezoidal plan. It has been paved and plastered recently, and it is today used as a latrine.

Two beautifully executed, semicircular steps lead to what must have been an impressive entrance in the south side of the north-western courtyard at the point where the north side of modern building now stands. Two holes for what must have been door-hinges are also still evident here. It is difficult to speculate on the type of building that once stood on this site, but it is possible that it was the mosque mentioned in the *waqfiyya* or in some way related to the four-bayed building (N), whose ground level seems unnaturally high (for more details see below).

The north-eastern courtyard

The ground level of the north-eastern courtyard is 2.5m lower than the level of the north-western courtyard. The difference is due to the topography of the site, and is bridged by means of twelve steps. These seem to be original and each measures 6m wide by 21cm high. The north-eastern courtyard is almost rectangular in plan, with maximum measurements of 6.1m wide by 9m long. It is paved with old flagstones of low quality.

The present shape and size of the north-eastern courtyard raise a question as to its original dimensions. Was this the original shape, or has it been reduced at some point? It should be remembered that this courtyard in particular was both the busiest and the most frequented place in the complex, for the free kitchen and the bakery are both located here. Twice a day it was thronged by some five hundred people, including residents and indigent people from outside, in addition to the employees of the complex. If one also takes into consideration that the whole southern elevation of the bakery building was recently rebuilt so that it projects into the courtyard, and also the manner in which the three halls (D, E, and F) are roofed, it is possible that this courtyard was originally bigger. If this is so, then the steps in the north-east angle of the north-west courtyard must have either abutted against something, or they were free-standing at the lower level, where now they abut chamber D. If this surmise is correct it would make possible an alignment of the northern façade of the south-eastern courtyard with the vestibule entrance.

The north-eastern courtyard is bordered to the south by the kitchen of al-'Imara al-'Amira, to the east by a water cistern, to the north by what is called here the 'bakery building', which

includes halls D, E, and F, and a recent upper storey. The exterior and interior of these buildings will be described immediately below. It will be obvious from the illustrations that the two main elevations which border this courtyard—the north elevation of the kitchen and the south elevation of what is called the bakery building—are very different. While the former elevation is well-built and has decorative features which date back to the 16th century, the latter is an undecorated wall of re-used masonry. This is a clear indication that the two elevations were built at different times.

The Kitchen—exterior

The north façade

Only the north façade and a small part of the eastern elevation of the kitchen building are visible. Both are built of fine ashlar blocks of the same quality as the masonry of the north elevation and the south façade of al-'Imara al-'Amira complex. The north façade of the kitchen is 14.5m long, and a door (1.52m wide by 2.7m high), which is surmounted by a segmented arch, is placed in the centre. To each side of the door there is an identical stone roundel and a rectangular window. The roundels, which project slightly, are placed at the level of the springing of the arch of the door. Each roundel measures 34cm in diameter and its decorative pattern is made up of a central star with eight lozenge-shaped points from which emerge a larger eight-pointed star. The star is enclosed within two intersected squares which form eight triangles at the circumference.

The two windows are also identical, each measuring 1m wide by 1.54m high. They are fitted with an iron grille and modern iron shutters, and are surmounted by a slab lintel. A beautiful small niche and stone basin to contain water are constructed in the wall one course below and slightly to the east of the eastern window. The niche is surmounted by a narrow stone moulding in the form of a trefoil arch, carved within the slab lintel that surmounts the niche of the basin. Although the purpose of this basin is not clear, a narrow pipe leads from the bottom of it into the kitchen, making it probable that water was fetched from the nearby fountain and poured in to provide water for cooking. There is no pipe in the exterior wall or the terrace at present to serve the pipe in the basin and this lack would tend to support such a thesis. It certainly would have been more efficient to procure water for the kitchen in this way rather than having it carried into the building, and the elegance of the niche and basin point to an original date. Exactly centred over the door and four courses above the keystone of the arch, there is a third stone roundel. The decorative scheme is identical to that found on the roundel set above the eastern window of the north elevation of the complex.

Three courses above the roundel, the top of the façade is marked by a slightly projecting cornice, with a sloping chamfer at its lower edge. It extends across the width of the façade to the eastern elevation. The drum of the dome over the central bay rises directly from the roof of the kitchen. As explained already, the roof is reached today either from the roof of the tomb chamber or by way of the modern staircase recently constructed at the south-eastern corner of the north-western courtyard. The drum has eight sides, each cut away to form an arched window opening. A cavetto moulding runs around the drum immediately above the voussiors of the windows, marking the beginning of the dome. The hemispherical dome is made of rubble set in mortar with no exterior cladding or finial. The dome is flanked to the west by a recent chimney, built apparently of fired red brick, and to the east

by a recent aperture which was opened to give light and ventilation to the interior of the kitchen. The east end of the kitchen roof leads to al-Madrasa al-Mawardiyya and to Ribat Bairam Jawish. To the south of the dome, there are three huge chimneys of truncated pyramidal form that have been plastered recently. These are the chimneys constructed by the local master builder, Husain ibn Nammar (see below).

Interior of the kitchen

The interior, which is entered from the door in the north façade, is almost square in plan and measures 12m wide by 12.4m long. It is made up of nine rectangular bays. The modern floor is of concrete, and on a single level—with the exception of the western bay (no. 4) of the central portico, and the eastern bays (nos. 3, 6) of the north and the central porticoes. The floor of bay 4 has been lowered 67cm below ground level by way of two steps to allow for an oven consisting of two circular fireplaces. Bays 3 and 6 are raised by 59cm, probably as a result of later adaptation to enable use of them as rooms by the employees.

The kitchen has three types of vaulting (a cross vault, a groin vault, and a dome), and the size of the three bays to the south are smaller than the others to the north and in the centre. The reason behind this difference in size is probably due to the limited space into which the kitchen could expand. The only space available was located between the chamber (P)—which precedes the tomb chamber—and the kitchen itself. The difference in the ground level between these two areas, and the fact that the tomb chamber and its surrounding area were probably fixtures before the construction of the kitchen, offer a convincing explanation for the smaller size of these southern bays. The height and the type of the vaulting of the southern bays were determined by their function—they were intended to act as chimneys, to allow smoke to escape without causing inconvenience to the attendants. The cross vault was the normal vaulting for square or rectangular spaces. It is difficult to understand the function of a dome in a kitchen, unless it was a method of allowing better ventilation for a busy kitchen; this is discussed below.

With the exception of the central bay itself (no. 5)—which is covered by a hemispherical dome—the other bays to the north (nos. 1, 2, 3) and centre (nos. 4 and 6) are all covered with some type of cross vault. Some of these vaults have square or rectangular recesses at the centre. The vault of the central northern bay is clumsily finished, for the four corners do not meet at the centre. A recent chimney cuts through the vault of the central bay to the west, and a square aperture measuring 90cm by 90cm pierces the middle bay to the east. This serves as a roof opening to provide light for the interior. The drawing of the chimney and the aperture on the plan is slightly misleading—it appears on the plan that the vaulting is groined while in fact they are cross vaults.

The central dome, which covers bay no. 5, and is a typical Mamluk construction, is carried on an octagonal drum pierced by eight windows, one on each side. The windows are surmounted by semicircular arches from the interior, as on the exterior. The transitional zone from the almost square area of the bay to the octagonal drum is achieved by four courses which form the octagon. The drum and the zone of transition are carried on four pointed arches which spring from the four pillars. Perhaps this domical vault with its many openings functioned as an outlet for smoke, especially given that the kitchen lacked its present set of three northern bays when it was first constructed. A parallel to the form of the dome is to be found in Turbat Turkan Khatun

(753/1352-53, see Burgoyne 1987: 322). The use of a Mamluk instead of an Ottoman method of construction for it indicates that the local techniques continued in Jerusalem in 959/1552. For more details on the influence of Ottoman architecture on Jerusalem building methods, see my concluding remarks.

The third type of roofing is found in the southern bays (nos. 7, 8, and 9). It is a groin vault with a central rectangular recess. Here the walls reduce until they terminate in a central rectangular opening measuring 1.4m by 1m. They give the appearance of truncated cones and can be likened to a huge chimney. These southern bays are higher by 3.35m than the others.

Sijill 39: 30-31, dated 6 Rabi' I 967/6 December 1559 provides the explanation for the shape of the southern bays (nos. 7, 8, and 9) as well as providing a date and the name of the patron. The record makes it clear that the original kitchen, apparently only six bays deep (nos. 1-6), was too small and in addition there were no chimneys to allow the smoke from the fire to escape. This bad planning resulted in a complaint from the attendants of the kitchen to the authority in Istanbul, claiming that the situation was causing them distress. In response to this situation, an order from the sultan was received in Jerusalem—probably after an application had been submitted—to the effect that the kitchen of al-'Imara al-'Amira was to be expanded. Husain ibn Nammar, the chief builder in Jerusalem at the time, constructed two fireplaces (*mauqid*), one to cook rice and the other to cook wheat, and two chimneys (*shawarikh*) on the south side of the kitchen. For the complete Arabic text and the English summary see Cat. Appendix I, no. 15/1.

The vaults of the kitchen are supported on four central pillars and by the walls. The pillars are constructed at the four corners of the central bay of the kitchen, and they show slight variations in scale. The south-eastern pillar measures 90cm by 1m, the north-eastern 90cm by 90cm, the north-western 80cm by 85cm, and the south-western 80cm by 90m. Transverse arches span the vaults; apart from those which support the dome, each arch springs from a pillar and from the wall.

As already explained, an entrance and two windows are set in the north façade of the kitchen. From the interior they are simplicity itself; they are surmounted by arches, but the voussoirs of the arch of the eastern window are not visible, for they have been recently plastered. A door and two windows once cut through the central and northern parts of the west side of the kitchen, but today they are blocked. There is a blind niche measuring 1.5m wide by 1.2m deep 55cm above ground level which is surmounted by an arch, located at the end of the west side. A blind niche which projects into the room, measuring 1m deep by 1.4m wide, is built in the south-western corner of the kitchen. It is surmounted by a semicircular arch. Its roof acts as a dais that once was approached by way of a door which previously existed in the upper part of the south side of the kitchen. This door leads to the interior of the tomb chamber, and to the hall (N) located near it to the west. The jambs of the door and the lintel are still *in situ*. The dais would have provided a suitable point from which to oversee the workers while food was being prepared and dispensed to the poor.

The killar, or storeroom of the kitchen (C)

The storeroom (C), which is called the *killar* in the *waqfiyya*, is situated to the east of the kitchen. It abuts the western border of al-Madrasa al-Mawardiyya, where the central chamber (S) is located (see cat. no. 28). Access to the storeroom is through a

door in the north elevation, and it is constructed of small, undressed masonry blocks in the upper level, but the lower masonry, where the door is located, resembles the fabric of the north elevation of the kitchen. This would imply that the upper part has been restored at some later period. The door measures 1.17m wide by 2m high; it is fitted with a modern iron door and is surmounted by a slab lintel, above which there is an arch. The floor in front of the door is raised 40cm above the ground level of the courtyard. There are two windows, located to the east of the door. The first measures 1m wide by 1.25m high; it is surmounted by a semicircular arch and is fitted with an iron grille. The sill is at the same level as the arch of the door, whereas the sill of the second window is set one course higher. This higher window is also bigger than the lower one, for it measures 85cm by 1.25m.

The interior of the storeroom is rectangular in plan with a total measurement of 5.1m by 8m. Its floor is made of concrete, and it is roofed by a cross vault. There is a small aperture in the south end of the roof, probably intended to guide rainwater into a cistern; it is now blocked. The walls of the chamber are plastered, but they are now in a poor state. A large opening (1.2m deep by 2m wide) connects the storeroom to the kitchen. It terminates in an arch and is most probably a later addition. To the south of this opening, there is a window which is surmounted by an unfinished arch. It measures 80cm wide 90cm deep and 1.67cm high. On the east side there is a large, blind niche measuring 40cm deep by 5.1m wide by 1.67m high. The articulation of the north elevation is expressed by an arch for the door, and by semicircular arches for the windows. The storeroom is still in use today; in the past it was used to store the raw ingredients for the food cooked daily in the kitchen.

The water fountain

The fountain is located at the east end of the north-eastern courtyard. It is built entirely of white dressed stone, similar to the material of the north and the south elevations of the complex. Three elevations of the fountain are visible, to west, south and north; those to south and north are unadorned, but that facing west is more elaborate. It consists of 13 courses, making an elevation 4.23m high, whereas only seven courses (2.37m high) are visible of the south and north elevations. Eight courses of the western elevation are built below the ground level of the courtyard. A stairway of seven steps leads down to the base of the fountain. Directly above the first course, four marble panels are set in a shallow recess. Each panel has an aperture to allow the water to flow out, and is surmounted by a rounded apex. At the north-western corner of the fountain, where the north and west sides meet, the angle is chamfered and ends with a sloping top. Apart from a small rectangular opening in the north side, the fountain is a solid masonry structure. The roof of the fountain is covered with small dressed stones of various sizes. A sill on the southern edge of the roof may suggest that some sort of structure once stood above the fountain, or that the fountain was originally made up of two sections. It is not easy to determine the nature of this hypothetical structure from the remains on site. The roof of the fountain is reached by an exterior stairway of eight steps which abuts the southern elevation. The interior of the fountain is rectangular in plan, measuring 2.8m wide by 3.8m long; its floor at present is covered in earth, its walls are covered by an ancient *qusurmil* plaster (ashes and lime), and it is roofed by a barrel vault. Securing enough water for al-‘Imara al-‘Amira was an important matter from the moment that the construction of the complex began. Khassaki Khurrem personally intervened at one point to

solve the problem. According to a *firman* summarised by Heyd (1960: 147, and n. 8) Khassaki Khurrem sent 2,000 florins (Italian gold coins) to cover the expense of adding water from the Wadi al-Bi’ar to Qanat al-Sabil (see Ch. 36, note 16 for more details).

The bakery building (opposite the kitchen)

A bakery (D), a rectangular spacious hall (E), and a large chamber (F) are constructed opposite the kitchen. They lie between the north-eastern courtyard and the northern elevation of the complex. A second floor is constructed above these three structures, and a simple elevation links the two storeys. For the purpose of description, it is here called ‘the south elevation of the bakery building’.

The south elevation of the bakery building

The elevation, which looks south, extends 16m from west to east but 12.1m from the western corner it is recessed 70cm. Access is through four doors (one is partly blocked), and there are also two slit windows, and one rectangular window in the lower part, plus four rectangular windows in the upper part. These various windows occur irregularly across the façade. The door measurements from west to east are respectively 1.05m by 2.05m, 1m by 1.93m, 96cm by 1.92m, and 1.15m by 2.2m. All the doors are surmounted by a round-headed arch with a double extrados. They are fitted at present with iron doors which have replaced the old wooden ones. The fourth door is situated at the easternmost end of the south elevation and is surmounted by a semicircular arch. It is today blocked by concrete slabs, but a small aperture recently pierced through the blocking wall has revealed a rectangular open space filled with earth and sewage, and, to the north, a fine pointed arch supporting an upper room. The form of the arch would indicate that it is probably Ottoman. The room must have been constructed at some later date, after the completion of the complex, for its entrance is separate from that of al-‘Imara al-‘Amira, and its masonry is different from that of the arch and the bakery building it adjoins. This area was apparently part of the original complex of al-‘Imara al-‘Amira, for it is contained within the line of the north elevation. But it is not easy to guess what was here before, and what function this area once fulfilled.

The lower rectangular window lies to the west of the west door; it measures 64cm by 1.07m and is surmounted by a white lintel. Directly above this there is an arch made up of seven voussoirs. It is fitted with the thin bars of an iron grille. To the east of the arch of this window, there is the first slit window. It is adjacent to the eastern termination of the arch of the window and it is at the same level as its summit. The slit is simple and measures 20cm by 70cm. The second slit is similar, but it starts two courses below the level of the western one.

The four upper windows are identical, and fitted with recent iron grilles; each measures 67cm by 1.8m, surmounted by a white slab lintel. The level of the third easternmost window is one course lower than the level of the other two. Three courses above the lintel of the upper windows (four for the one furthest east), the elevation terminates with concrete plaster in place of the projecting cornice found elsewhere. The roof of the building is flat, paved with small flagstones, and shows signs of having been recently rebuilt. It slopes slightly towards the south to drain rainwater into the north-eastern courtyard. A modern chimney of red fired bricks to extract smoke from the oven of the bakery is located to the west side of the roof.

Parts of the western and eastern elevations of the bakery building are visible. Both were constructed with the same quality masonry, and they are both solid wall apart from a doorway in the west wall, with two rectangular windows (75cm by 96cm) and one small slit window (25m by 40cm) in the upper part of the east elevation. The windows are fitted with modern iron grilles.

Dating the elevation

The masonry of this elevation is of relatively small size and consists in the main of white and grey stone with the occasional red and yellow block. Some of the stone appears to be in secondary use to judge by the differing hues and sizes, similar to that visible in the eastern and western elevations of the bakery building. Nor are the stones graded according to size, for some relatively large blocks are placed next to smaller ones. There are some inscribed and carved stones too, similar to those found on the inscription frieze which runs along the apex of the second floor of the Ashrafiyya Madrasa (887/1482). This inscription records one of the sayings of the Prophet. Yet the fact that so many of the masonry courses run evenly across the façade disposes of the possibility that all the stone were in re-use.

Some of the stones for the 'Imara al-'Amira were, it seems, robbed from the Ashrafiyya after the *madrasa* was partly demolished by earthquake in 952/1546.¹¹ The *sijills* (see Ch. 36 under Stone) reveal that there was a brisk trade in used stone in Ottoman Jerusalem. A large quantity of the material was bought on 10 Rajab 962/31 May 1555 from al-Bimaristan al-Salahiyya by Farhad, the then administrator of al-'Imara al-'Amira (Sijill 30: 170). It could therefore be assumed that this elevation was built at the same time as the other major parts of the complex in the 960s/1550s. This date is certainly possible, but then another question arises: why should this elevation differ in fabric from the north elevation of the kitchen, from the lower part of the north elevation and from the south entrance of the complex? The masonry of all these elements is better laid and cut, more coherent and consistent, and in addition it is decorated with roundels. The elevation of the bakery and the upper part of the north exterior elevation of al-'Imara al-'Amira both terminate without a cornice or framing device, and in their architectural style too are a contrast to the rest of al-'Imara al-'Amira. This must sow some doubt as to whether this part is indeed of 16th-century date. It is difficult to see it as part of the original, royal construction. It is probable therefore that it dates to the period of construction of the upper storey of the bakery building (for more details see below). Perhaps here too the builder re-used existing masonry.

It is not clear when this took place. The northern elevation had reached its present appearance by the 18th century, for it was drawn by Elzear Horn in *Ichnographiae Monumentorum Terrae Sanctae* (ed. Hoade 1962; see Burgoyne 1987: 503 fig. 48.15). Until further evidence comes to light, the exact date of this construction has to remain an open question.

Interior of the bakery building

The door furthest west of the south elevation of the bakery building gives access to the rectangular hall D. It is divided into

two unequal parts by a large pointed arch, and both parts are roofed by a barrel vault; the floor is covered by a modern pavement. The southern area of the hall measures 4.8m-4.6m wide by 7.7m long; it then narrows to 4.3m by 2.5m to the north, where the roof is slightly lower than the southern section. The hall is still in its original use as a bakery for bread which in the past was distributed to the poor. Today it is run by the Alms Committee of the Auqaf Authority. The bakery was recently renovated after a period of closure and neglect. There is now new paving for the oven and new tiles on the walls among a number of other innovations introduced to maintain the bakery and to bring it up to a functional standard.

Hall E, which although similar to the bakery D is not identical to it, is located directly to the east. It is entered through the central door of the south elevation. The hall is used today as a storeroom for the wood used by the carpenter's shop of the Islamic Orphanage Industrial School. It is divided into two parts, and is covered by a barrel vault. The interior of the hall, which is 45cm below the level of the north-eastern courtyard, also has a trapezoidal plan, for once again there are slight variations between the northern and the southern parts. The south wall of the southern section measures 4m, the west wall 4.8m, the north 4.6m, and the east wall 4.6m. The width of the northern section to the south is 4.6m, while the west wall (which is not aligned) measures 5.4m, the north wall 4m, and the east wall 6m. The ceiling of the northern section is in the form of a deep, pointed arch, and the walls have recently been plastered.

A short, narrow passage (1.9m long by 75cm wide) leads off the east side of the northern section of the hall to an ancillary chamber. This has a trapezoidal plan with a total measurement of 4.4m in length and a maximum of 2.2m in width. It is lit by the eastern window of the north elevation of the complex, and is covered by a barrel vault. The function of this chamber, which is dry and cool, was probably as a storage place for the corn supplied by the *waqf* of al-'Imara al-'Amira, though its dimensions are very modest.

The east door of the façade gives access to the rectangular chamber F. This measures 2.3m by 5.4m. Its concrete floor is on the same level as the north-eastern courtyard, and it is covered by a barrel vault. There are three identical blind niches in the east side of the chamber, each measuring 65cm wide by 1.7m high. The walls of the chamber have recently been plastered and it is used today, like room E, as a storage place for wood.

There are two rooms to the east of Hall F. Both seem originally to have been located within the borders of al-'Imara al-'Amira, but at present they belong to an unidentified building, which is situated between al-Mawardiyya (cat. no. 28) and the Khassaki Sultan complex. The first of these two rooms to the south is without a roof; the opening which allowed access to it from al-'Imara al-'Amira is now blocked with concrete slabs. The room is some 3m lower than the level of the complex. The second, northern, room is covered by a tunnel vault. Both rooms are now approached through the unidentified building, and both have undergone many alterations.

The upper floor of the bakery building, the prison

The northern block: upper floor

Eight rooms (G1-G8) divide the area above the bakery building into three sections, north, middle and south. At present this floor is used as a residence and classrooms for the Islamic Orphanage

¹¹ Mayer (1931: 85-97), taking his authority from a sequel to the chronicle of Mujir al-Din, suggests that the earthquake must have occurred in 902/1497. Burgoyne (1987: 42 n. 32) argues in support of the earlier date, basing himself on the use of the stone and the *firman* summarised by Heyd (1960: 143).

Secondary School, but many of the officials in the school confirm the oral tradition that this place was used as a prison in the late Ottoman period. This would explain the odd layout of the floor and the low height of the rooms, which is a mere 2.6m. The vaults of the rooms are mainly supported by the walls, in addition to which there are three piers in the centre of the north and middle sections. Originally there was no partition between these two sections, but there have been many dividing walls constructed recently with openings between the three parts. The reason for these additions was to convert the rooms into living space and three classrooms for use by the Islamic Orphanage Secondary School.

The rooms are reached by a stairway constructed in front of the north-western corner of the west side of the upper floor. It has fourteen steps, each measuring 2m wide by 40cm deep and 16cm-20cm high. The steps seem to be old and they run northwards. They lead to a door in the north end of the west wall. This measures 1.17m wide by 1.88m high, and is surmounted by an arch built of fine ashlar blocks, resembling the arches above the three doors of the lower part of the bakery building already described. This door provided the only entrance to the upper level until a modern door was added recently. The new door is located to the south of the former door, and measures 1m wide by 1.83m high. It is surmounted by a lintel of small masonry blocks similar to the jambs.

The room G1 is nearly rectangular in plan, with maximum measurements of 3m wide by 5.9m long. It is divided into two by a modern wall. Four doors lead off the antechamber in addition to the entrance doors—two in the east, and one in each of the north and south sides. They all give onto the divisions of the space, with the exception of the door in the north, which provides access to the roof. All the doors are surmounted by an arch of good-quality masonry. The door in the north measures 90cm by 1.55m and starts 45cm above ground level of the room G1; the door in the south wall measures 87cm wide by 1.8m high and leads to the southern section of the upper floor (rooms G2 and G3). The door in the northern end of the east wall measures 90cm wide by 1.8m high and gives access to the northern section, whereas the one to the south measures 1.17m. by 1.88m high, and leads to the middle section. The south part of room G1 is paved with modern concrete slabs while the northern part retains its older, smaller flagstones of different colours.

The southern section of the upper floor is made up of two units (G2 and G3) which are divided by a modern wall. Each unit consists of two bays covered with a cross vault which is supported by the walls. Each bay of this section is lit by one of the four windows of the south elevation of the bakery building described above. The east bay G3 has another small slit window. There is a rectangular blind niche (50cm deep by 2.5m high) in the north wall of this bay. The niche and the wall behind it have been recently pierced by a small opening to serve as a door for the second unit of the southern section. Each unit is currently used as a classroom.

The second, middle section is entered from the south opening in the east wall of the antechamber. It too is made up of two bays (G4 and G5), and they are roofed in a similar way to the southern bays but the vaults are here supported by the two central piers and the wall. A modern wall of concrete separates the eastern from the central bay of the middle section, beside which there is a small new cell built with concrete blocks in the central bay. In addition, another recent wall separates the central and west bays of the middle and the north sections. There are two

rectangular windows in the east wall of the eastern room G5, each measuring 75cm by 96cm and each fitted with a modern iron grille. A pointed arch runs transversely between the eastern (G5) and the north-eastern rooms (G8), both of which now form a classroom used by the school. The room G4, which consists of two parts, acts as a passageway.

The three rooms of the north section (G6, G7 and G8) share the same roofing system, and each is illuminated by a window that overlooks the street of 'Aqabat al-Takiyya, in the upper part of the north elevation of the complex, as already explained. The floor of the first two rooms running from west to east is paved with old flagstones, and the walls are plastered and whitewashed. A recent wall separates the central and eastern rooms.

From this description, it will be clear to the reader that the author believes that this floor with its elevations (i.e., the upper part of the north elevation of al-'Imara al-'Amira, and the south elevation of the bakery building) is not an original construction. The quality of the fabric and architectural features, the layout, simplicity and original function of the upper floor as a prison, all point to the fact that they were adapted when the complex came to house the seat of the governor and the justice department (the court). This means that the changes were made in 1286/1869-70 for the single surviving inscription asserts that major restoration work was carried out at that time (see above under Subsequent History). It is not now possible to reconstruct the original appearance of this part of the complex.

The chamber above the entrance vestibule (H)

The staircase, which gives access to the upper floor of the bakery building also leads to a small open courtyard preceded by a modern concrete wall. Part of the courtyard, which is paved with large slabs, is concealed under recent buildings, but by way of a further stairway in the north-western corner it is possible to reach the small chamber H. Room H is constructed above the vestibule of the northern entrance of al-'Imara al-'Amira and is entered through a door (90cm wide by 2.05m high) in the southern section of the east wall. The room is rectangular in plan with a total measurement of 4.5m long by 3m wide. It is divided into two by a pointed arch, the northern section of which is roofed by a complex cross vault with a small saucer dome at the centre. The southern section is the smaller of the two and is also roofed by a complex barrel vault. This vault is supported by the pointed arch to the north and by two semicircular arches to the south, which resemble those supporting the roof of the chamber T on the upper floor of the south entrance. In all there are three windows which light the interior of the chamber, two of which have already been mentioned in the discussion of the south elevation of the north vestibule. The third window is located in the eastern wall of the chamber and measures 78cm by 1.17m; it is fitted with an iron grille. There is a small blind niche in the east wall between the window and the door, measuring 62cm wide by 42cm deep by 1.2m high. Opposite this niche there is a larger one on the west side of the chamber. It measures 70cm deep by 2.25m long and terminates in a pointed arch. Two further blind niches flank the window to the south; these are identical, each measuring 40cm wide by 30cm deep by 82cm high.

The southern block

Interior (the south entrance)

The entrance in the southern elevation (A1, 4.15m wide; fig. 15/2) leads to the central vestibule which is square in plan with

sides of 4.1m. It is covered by a cross vault which is supported on four pointed arches. These spring from the four corners of the vestibule. The south and east recesses are deeper than those to north and west. To the south, immediately inside the door, is located a narrow porch to accommodate the doorman and perhaps visitors awaiting admittance. It measures 4.15m wide by 2.4m long. Immediately inside the entrance and on either side of this southern arch there is a blind niche. The eastern one measures 1.1m wide by 1m deep by 2.03m high, and that to the west measures 1.1m wide by 60cm deep by 1.92m high. Their interior is constructed with high quality masonry. The two niches at present contain fire equipment but their original function in the 16th century is not clear. When this southern section of al-Imara al-‘Amira was the seat of the Jerusalem governor (*mutasarrif*) in the late 19th and early 20th centuries (see van Berchem 1923: 310-2), doormen would have occupied these two niches.

The eastern arch is 90cm deep. A door (1.3m wide by 1.96m high) gives access to an eastern chamber. This is a rectangle measuring 3.8m by 4.9m and its floor is covered by a modern carpet which conceals the pavement. The original roof too is hidden behind modern wood panelling. This room has served as the office of the director of the Islamic Industrial Orphanage School since the 1960s.

The door leading to the eastern chamber is surmounted by an arch, and a rectangular panel is centred five courses (1.65m high) above the level of that arch. The panel measures 1.38m by 1m and is framed with a series of three engraved chevrons which have recently been painted green. Originally the purpose of this panel, as well as the others in the west and north wall of the central part of the vestibule (see below), was presumably to carry a foundation inscription or decorative plaque. They seem however to have been blank for some time and it is not certain that they were ever filled. Meinecke (1988: 268) pointed out that these panels display a decorative motif which was current in Damascus in the 16th century, as demonstrated on the façade of the Lutfi Pasha Mausoleum dated 940/1534. In the 1950s a modern inscription was prepared to fill the panel, taken from the Qur’an (IX: 105). The script is a modern *naskh*, and it is signed by the late Shaqib al-Qutb, a contemporary local calligrapher. It is now painted black.

There is a stone roundel to either side of the panel in the course below and a third example is to be found above it. Those on either side are identical and carry a six-petalled rose of three layers of over-lapping petals centred on a small six-petalled flower. The one above centres on another form of six-petalled flower that develops into a geometric device and has traces of recent paint.

A chamber to the west complements the director’s office and is entered through a door off the vestibule measuring 1.6m wide by 2.03m high. It is a trapezoid in plan, its south side measuring 3.4m whereas the north wall is 4.5m and that on the west 3.8m. The floor of the chamber, which was once paved with a *mizi* pavement of grey, is now completely covered with a rug. As in the director’s office opposite, a recent wooden roof covers the vaulting. A similar arch, complete with panel and roundels almost identical to those already described, is above the door of the western chamber. There are two minor changes—the first is the script of the panel, for it is a traditional saying of the Prophet (Hadith) and not Qur’anic; and the second is that the centre of the two roundels consists of two concentric circles in place of the six-petalled rosette. The design of the upper roundel is identical to its opposite number, but the treatment of the inner rosette

differs in the technique of execution.

North of the central and cross-vaulted part of the vestibule is a passage closed by double doors. It is rectangular in plan, measuring 3.2m wide by 1.7m long. Both doors are surmounted by identical arches, one opening south towards the vestibule and the other north into the south-eastern part of the south-western courtyard. The first arch, which has two tiers of voussoirs, springs from two brackets decorated with a frame moulding. The lower has ten large, white blocks, while the second has smaller, darker ones. An identical roundel to the two on the west side of the central part of the vestibule is placed to either side of the extrados of the arch, the one to the west being seriously eroded. A third roundel is placed one course below the apex of the pointed arch which supports the vault of the main vestibule. It is in such bad condition that it is difficult to read the design but it appears similar to that of the two upper ones set above the panels; for a discussion on a possible significance of these roundels, see Ch. 24). A large recessed panel crowns the two roundels; it terminates in a moulding at both ends and is contained within a frame of three engraved lines which are interlaced to form a geometric pattern. The frame is in bad condition and much of its decoration has eroded. The panel itself is blank with a modern plaque in its centre, superimposed recently by the Supreme Muslim Council. It measures 88cm by 48cm, and it records that the Supreme Muslim Council carried out repairs in 1342/1923-4. Another panel (mentioned above under Subsequent History) dated 1286/1869-70 is placed below the Supreme Muslim Council plaque measuring 80cm by 1.6m. This last panel records the restoration undertaken by the governor of Jerusalem in that year.

The caravanserai

The passage just described leads to the south-western courtyard, which is surrounded by *riwaqs* to the north, west, and south; to the east it is enclosed by a massive wall. Together with the courtyard and the upper floor constructed over the south entrance, the *riwaqs* must have formed the ‘lofty caravanserai’ mentioned in the *waqfiyya* (see below). The courtyard is a rectangle measuring 13m long by 9.1m wide. The area of the courtyard was recently reduced to almost half of its original size when two concrete bays were built in the western section. The wall to the east is now 2.8m deep—the stairway which was built recently has increased it to twice its original depth of 1.4m. The stairs now lead to the upper floor of the southern section, and separate the south-western from the south-eastern courtyard.

The caravanserai comprises two floors. The first, the ground floor, is the larger of the two and is made up of a central vestibule, described above, and an open courtyard, called here the south-western courtyard, surrounded by eight bays built on the south, west and north sides of the courtyard (M1-M8). The second, smaller upper floor includes at present a group of chambers and rooms (S, T, V, X, Y, W, and Z). Originally stairs located east of the bay M8 led from the ground floor to the upper level of the caravanserai. These were replaced by a later stairway situated immediately on the east side of the south-western courtyard. The ground floor of the caravanserai is not aligned, especially the northern side which is not set at a right angle, with the result that the caravanserai is trapezoidal in plan. This is a result of the contours of the rock (see below). The layout of the caravanserai and the irregularity of the scale of its bays give a strong impression that the plan was restricted by the limited availability of space. Since the building which borders the

caravanserai to the east is recent, it is impossible to be sure that the line of the eastern side of the caravanserai is original, or if it results from the construction of the justice department. Bays to the east, however, might have been expected to echo those found in the west.

There are only two extant caravanserais in Jerusalem apart from the one under discussion. These—Khan Tankiz and Khan al-Wakala (or Khan al-Sultan) published by Burgoyne 1987: 280-83, 479-84—date to the Mamluk period. A comparison of the three complexes will show that they share some common features, although each has its own identity and plan. These features characterise *khans* in general—they are all built on two levels, each has an open courtyard surrounded by a hall and other rooms, and each is approached through a vestibule, regardless of its length, with rooms on both sides. The caravanserai of al-'Imara al-'Amira is not, however, located in the middle of a market, unlike the Mamluk examples, nor is its stable original, for it made use of the existing Mamluk stable of Dar al-Sitt Tunshuq (see below). When compared with caravanserais in other Palestinian cities, such as Khan Yunis (the *khan* of Yunis al-Dawadar, see Abu Khalaf 1983: 178-86), or with the caravanserais in Galilee, such as the Khan al-Tujjar and Khan Jubb Yusuf (see Marjorie *et al.* 1992: 55-94), the *khan* of al-'Imara al-'Amira will be seen to be on a smaller scale; and neither is it fortified nor has it a garrison. This, of course, is because it is built within the city of Jerusalem and not on the trade or pilgrimage route.

The south-western courtyard of the caravanserai is decorated with eight masonry roundels decorating the four walls of the south-western courtyard, which is, to be more precise, the original courtyard of the caravanserai. The roundels all face the interior space of the courtyard, and are placed five courses below the top of the walls. Some of them are so seriously eroded that the decorative motif is almost lost. The distribution is as follows: three roundels on the east wall, two on each of the north and the south walls, and one on the west wall. To identify their position, design and current state more fully, there follows a clockwise description beginning at the north east of the courtyard.

[Editorial note: The designs of the decorative roundels fall into four distinct categories. Roundel no. 1 is partly concealed by a step of the later stairway. It is thus only a part roundel but enough is visible to determine its design, here described as type A. It consists of six interlocking circles which surround a central hexagon. This central area is filled with a six-petalled rosette, the details of which are left in reserve, and each element of the design, which is clearly differentiated from its neighbour by a deeply-cut groove, is similarly decorated. Each of the six 'petals' has a saltire divided by a vertical bar, while the interstices between them each has a two-leafed device.

Roundel no. 2, half of whose decorative scheme has eroded, has a diameter of 36cm. The main decorative element, type B, consists of eight trefoils, those in the cardinal positions being smaller than the intervening ones. They are arranged alternately, as if emerging from two interlocking lozenges which surround a central octagon. Once again, the design is in reserve and the various elements are deeply grooved. The background within a fillet border is cut away.

Roundel no. 3 is in perfect condition and also has a diameter of 36cm. There are two parts to its design (type C)—the central area and an encircling frame. The central motif consists of a rosette of five rounded concave petals superimposed on five other, larger petals. The marginal decoration is two bands of

interwoven foliage, one band with split palmettes and the other with trefoils. The bands run in a counter-clockwise direction, which is emphasised by the leaves which have been cut with a central groove

Roundel no. 4 is so badly eroded that it is hard to read its decorative scheme. However, it is possible to make out a central 6-pointed star from which emerge grooved arms enclosing six alternate hexagons and double-kites (type D). It therefore has the same design as the roundel above the inscription plaque in the west wall of the vestibule described above. These are both similar to geometric roundels on the walls at the Damascus and Jaffa Gates (see Ch. 24).

Roundel no. 5 is also in bad condition, but it is possible to identify the decorative scheme as type A. This is similar to roundel no. 1 but differs slightly from it in that there is a secondary outer border, and the central element is a circle rather than a hexagon. In roundel no. 5 the interstices between the 'petals' are left undecorated, which concentrates the eye on the daisy-like form of the design.

Roundel no. 6 is not in good condition, but, from what remains of its decoration, it is possible to recognise that it is close to roundel no. 2, that is type B. This is the only roundel still existing on the western side but in view of the many later changes, this was probably not always the case, particularly in view of its location on an east-west axis with roundel no. 1. It seems highly probable that two other roundels were once placed to balance roundels nos. 2 and 3. As there is no discernible logic to the arrangement of the various types, however—other than that there now exist two examples of types A, B and C—it is not possible to suggest what form these missing designs might have taken.

Roundel no. 7 is so badly eroded that its decoration has largely vanished. The last roundel is no. 8, type C, which is similar but not identical to roundel no. 3. SA]

It is curious that the western side of the courtyard has only one roundel; there is no trace of any others that have been removed or have become defaced. When the normal principles of symmetry and balance are taken into account, it might be supposed that the three roundels on the east would be matched on the west yet there is only one—at the very least there should be two. Presumably one or two of the roundels may have been lost or they may have been arranged haphazardly, which seems unlikely. Roundels nos. 5, 6, and 7 cannot now be seen from the courtyard because of the recent construction of the additional two bays. It is possible to view them (but with difficulty) from the interior of these new buildings.

There are eight bays—M1 to M8—within the three *riwaqs* of the caravanserai, all of which are covered by a cross vault. The southernmost bay M8, which is aligned with and corresponds to the vestibule, has a more elaborate cross vault with a transverse ridge-rib, just like the main vestibule. The vaults are supported on the six square pillars on one side and by the wall on the other. Transverse arches create these vaults, each also springing from a pillar and from the wall. A plain *muqarnas* niche adorns the springing of the arches with the exception of that of the south-eastern bay (M8) where the apex of the lancets is decorated by three- and five-headed leaves. This extra complexity is sufficiently explained by its public nature as part of the entrance complex. Two pointed arches in each *riwaq* once opened onto three sides of the courtyard; the fourth side to the east is formed by the dividing wall between the courts. Only two arches are still visible from the exterior—those of the south-eastern (M8) and the north-eastern (M1) bays. The two arches have the same span

(4.9m) and are constructed opposite each other. They also share a masonry type although bay M1 is 1m deeper than bay M8, for this acts as the entrance to the caravanserai from the stable of Dar al-Sitt Tunshuq.

The north wall of the north *riwaq*, which includes the bays M1, M2, and M3, marks the division between Dar al-Sitt Tunshuq and al-‘Imara al-‘Amira complex. However, the reader is again reminded that the two buildings were incorporated into one, as noted by Burgoyne (1987: 486). It is noticeable that the wall is very far from being aligned at a right angle. Burgoyne (1987: 488) explained this as being due the contours of the rock, of which outcrops can still be seen on site. He does not go into detail but merely supposes that the *riwaq* was part of a caravanserai built by Khassaki Sultan (Khurrem) in the middle of the 10th/16th century.

There is good reason to believe Burgoyne, and there are other points that can be introduced in support of his thesis. First there is the open courtyard (i.e., the south-western courtyard) in close proximity, and a large stable stands immediately behind the *riwaq*. There was originally easy intercommunication between the stables of Dar al-Sitt Tunshuq and the *khan* whether the animals entered from the north or the south portal of the complex. These stables were the main hall at ground level of Dar al-Sitt Tunshuq, which was used as a stable in both the later Mamluk and in the Ottoman periods. Sixty-six iron rings still exist in the hall for tethering the animals. The site is easily approached from the north by way of the ‘Aqabat al-Takiyya, and from the south from the ‘Aqabat al-Saraya. A cistern nearby provided water for the animals. An upper floor is built over the south entrance. These features are also found in the other two extant *khans* in Jerusalem (Khan Tankiz and al-Wakala, see above). Further support is found in Pierotti (1864: 152), who described the south part of the complex of al-‘Imara al-‘Amira when he visited it in the 1860s. He writes: ‘On the south is a fine pointed doorway, ... leading into a spacious hall. Beyond this is a very large court surrounded by a cloister with pointed arches. The hall, the cloister, and the court, are now only used to shelter the camels and horses of first comers.’

A small door, 80cm wide by 2m high, opens onto the east side of the south-eastern bay (M8) of the south *riwaq*. It leads to a small rectangular cell, which measures 90cm wide by 3m long. This cell at present has no opening apart from the door, and has no ventilation. Its southern part is covered by a barrel vault, and an opening in the roof suggests that in this area a staircase once led to the upper level over the south entrance. An official in the administration of the school confirms that a staircase once existed before the present one was built (see below). Pierotti (1864: 152) described the staircase in the 19th century as ‘a spiral staircase in the north-east corner of the hall [that] leads to the upper floor’.

There is a recess (I), 1.4m by 2m, in the north-eastern corner of the courtyard, introduced after the construction of the stairway which now leads to the upper level. The recess is used at present as a place of ablutions. A rectangular chamber (J) (2.4m by 4m) lies directly north of the recess and east of the north-eastern bay. Half of it has recently been divided by concrete blocks into four small cells to serve as latrines. The concrete floor of the north-eastern bay M1 has probably recently been raised 17cm above the level of the courtyard. Three steps (48cm) on the north side of the bay give access to the main, ground-level hall of Dar al-Sitt Tunshuq. The hall is used today as the carpentry shop of the Orphanage School.

An almost square room (4.4m by 4.2m) is located to the south of the central, southern bay (M7). It is covered by a folded cross vault with a small saucer dome at the centre. The vault springs from the four corners of the room. There is an undecorated off-centre *mihrab* niche on the *qibla* side (93cm wide by 66cm deep by 2.3m high). The scallop of the niche terminates in a pointed arch. There are two stone corbels above the *mihrab*, and directly above them there is a slightly projecting frieze of fifteen small *muqarnas* niches. These are covered in black paint, which makes it hard to identify the details of the lancet decoration, but it appears to be similar to that found in bay M8, described above. One course above the frieze, there is a central masonry roundel. Unfortunately erosion makes the motif illegible, although it is possible to make out a central six-petalled rosette.

There are two unusual elements to the arrangement of the *mihrab* wall. The first is the presence of two corbels, and the second is the method of construction of the *muqarnas* frieze. One of the problems is the function of the corbels, for such elements usually support something—but in this case it is hard to imagine what. Are they merely a decorative extra, or are they intended to ‘support’ the rather clumsy *muqarnas* frieze? This is not correctly aligned with the rest of the masonry, unlike other bands of its type. The idea that they have a supporting function seems unlikely, for the weight of the frieze does not warrant so massive a support. In any case, both corbels and frieze appear to be a later addition. The room is used today as a darkroom, and an additional roof has been introduced recently directly above the scallop of the *mihrab*.

This is the only *mihrab* still extant in the whole complex. It is difficult to accept, however, that this was the only mosque in the complex, or that it is the mosque mentioned in the *waqfiyya*. It is much more likely that this diminutive room functioned as the *masjid* of the caravanserai. Although the description of the mosque in the records is very concise and contains the usual rhetorical expressions, it does not accord with the area under discussion. The *waqfiyya* (Sijill 270; al-Husaini 1982: 81; al-‘Asali 1983: 130) records that ‘the donor (Khassaki Khurrem) has founded various types of charitable edifices; among them is the noble mosque with the lofty arched opening and the high praying-house with the strong portico (*al-masjid al-sharif al-rafi‘ al-taq wa ‘l-ma‘bad al-munif al-mani‘ al-riwaq*)’. The Turkish text as translated by Stephan (1944: 182) is slightly different, for it adds pillars and domes to the description.¹² It says ‘... a well-founded edifice with strongly built pillars, a lofty vaulted mosque, and a high praying-place with firm domes ...’ Neither of the descriptions, Arabic or Turkish, can be seen to correspond to the area under discussion, for here there is neither *taq* nor pillars, or even one full-scale ‘firm’ dome. Furthermore, the *waqfiyya* states that the above-mentioned mosque which she built ‘opposite the kitchen’ (*wa minha al-‘imarat allati banatha itijaha al-masjid al-mazbur*), and this small mosque cannot be said in any way to be ‘opposite the kitchen’. The inference must therefore be that the area under discussion is not the mosque described in the *waqfiyya*. It seems probable that this area was built either as an annexe to the caravanserai, as suggested above, or—though this is much less likely—was added later when the main mosque of the complex ceased to function. The clumsy inclusion of the frieze

¹² For the Arabic translation of Stephan’s English text, see al-‘Asali 1982: 17.

and the corbels above the *mihrab* niche would support the latter supposition, if they were taken from the earlier mosque, but on the other hand the well-built *mihrab* and the roundel both indicate that the small mosque may after all have been original and built as part of the caravanserai. The question as to the location of the main mosque described in the *waqfiyya* remains. This conundrum, and the question of when and why it ceased to function, are discussed below.

A recent stairway situated at the south-eastern corner of the courtyard gives access to the upper floor. It comprises twenty-seven steps (each measuring 1.3m wide by 30cm deep by 20cm high) and two landings. It runs towards the east, then turns northwards and leads to the upper floor of al-‘Imara al-‘Amira complex and to the upper storey of the incorporated Dar al-Sitt Tunshuq, which has been studied by Burgoyne (1987: 488-9).

The upper storey of the caravanserai

The upper storey of the caravanserai comprises a group of chambers and rooms of different quality and design; they are covered with a number of different types of vaulting. These vaults are:

- (1) a folded cross vault with a saucer dome at the centre; this covers the main part of chamber S;
- (2) a barrel vault with recessed double triangles at each end; this covers the northern part of chamber S;
- (3) a simple barrel vault, found in rooms X and V;
- (4) a vault with a saucer dome at the centre with a triangle at the four cardinal points; this covers chamber T;
- (5) and, finally, a flat roof.

The vaulting of chambers S and T is both well built and ingenious, and dates from the 16th century. Parallels of the folded cross vault are to be found in cat. nos. 11, 12, 13, 19 and 25. It is similar to the type of vaulting used in Bab al-‘Amud (Damascus Gate), and is a typical Mamluk feature which continued to be employed in early Ottoman architecture. The simple barrel or tunnel vault is used in cat. nos 2 and 11. A parallel that is similar but not identical to the saucer dome listed above under (4) is found in the ancillary chamber of cat. no. 22.

Exterior from the courtyard

The upper storey at present consists of the central chamber (S) and the group of rooms and cells in close proximity to it. These rooms are used today as offices of the employees of the Islamic Orphanage Industrial School (*dar al-itam al-islamiyya al-sina’iyya*), but their original function is unclear. Since these chambers and rooms were connected by a narrow staircase, it is most probable that the rooms were used as part of the caravanserai. A rectangular open space, paved with flagstones, is constructed in front of the northern elevation of the upper floor. This elevation is dominated by a pointed arch built with *ablaq* masonry of yellow and black voussoirs. The keystone of the arch is decorated with a palmette. The span of the arch is now blocked with masonry, presumably from the period of major restoration and renovation in 1286/1869-70. As a result, in place of an open arch, the new wall contains a central door, flanked on each side by a rectangular window. The door measures 1.3m wide by 2.5m high, and each window measures 60cm wide by 1.5m high. The windows are fitted with iron grilles and each is surmounted by a lintel. A string course of masonry blocks is constructed above the level of the window lintels, extending across the span of the arch.

Above the door, the central blocks have a chamfered edge. One course above the string course there is a rectangular window (1.28m by 75cm) with a frame moulding, surmounted by a small circular window (25cm in diameter) which is framed by a narrow billet moulding. The elongated format of the two windows, the quality of the ashlar (which differs from the masonry on either side of the arch) and the string course all underline the remarkable change undergone by this façade. This is also evident from Pierotti’s description of this upper part (1864:152). He mentions that there was ‘a Gothic window of two lights, with a marble column as mullion, crowned by an elegant arabesque capital’ in this upper floor.

The south elevation of the upper floor forms part of the overall southern façade of the complex and has already been described. The west elevation is not visible because it is hard against its abutted neighbour, and the east elevation, although large in scale, is a solid, plain wall of small-scale masonry with two double windows opened in its upper part. The jambs of the windows and the arches are built with rusticated blocks.

Interior

Three steps, each 6m long by 30cm deep and 55cm high, precede the door giving access to the interior of the main chamber (S). A pointed arch subdivides the interior into two sections, the southern part of which is square in plan, measuring 4m by 4m, and is roofed by a folded cross vault, with a saucer dome at the centre. The vault is supported by four arches springing from the corners of this square section, the east side of which is not properly aligned. Here there is a recess of 90cm-1.1m. The northern section of the chamber is rectangular in plan, 4.1m by 2.2m, and is roofed predominantly by a barrel vault, although the two ends of the vault are complicated by a recessed double triangle. The two sections share a common ground level raised 20cm by a step at the entrance. The floor is paved with large flagstones of good quality, and which appear to be original, some measuring 1.8m by 52cm. In addition to the two windows in the north wall, the main chamber is illuminated by a double window in the south wall (described above under the South Façade). It is preceded by a large, rectangular masonry dais, which measures 2.15m long by 60cm deep by 37cm high. There are two blind niches in the northern part of the chamber, the first in the west wall (1m wide by 90cm deep), and the second opposite in the east wall (90cm wide by 50cm deep). The walls of the main chamber have been plastered recently, but unfortunately it has been so clumsily executed that the lines of the folded cross vault have been distorted.

The ancillary room (T) to the west is approached through a small door (86cm wide by 1.8m high and with the customary lintel) which leads directly to a small, rectangular vestibule. This is 1.5m wide by 1.25m and carries a hexagonal drum supporting a small, shallow dome. An inner doorway (85cm wide by 1.85m high) gives onto the main chamber (T). The plan is almost square, measuring 4m by 3.8m, but the angles of the walls are distorted. The floor is paved with modern square tiles and the walls have been recently plastered. There are four blind niches in this chamber, two in each of the west and east walls. Each niche measures 90cm wide by 1.75m high. Their depth is identical at 50cm, apart from the south-eastern niche which is slightly deeper (60cm). There are three windows, two to the south giving onto ‘Aqabat al-Saraya, and a third, now blocked, in the north wall west of the doorway. Apparently this was done when a room (V) was built to the north. Room T has an elegant saucer

dome at the centre of four depressed triangles at the cardinal points, which give the impression of a rudimentary star. The dome and the triangles are supported on eight semicircular arches constructed in the upper part of the walls. This method of roofing appears to be original, for it resembles that found in the southern section of chamber H, constructed above the vestibule of the north entrance to the complex. They probably date to the second half of the 16th century, and it is possible that they are examples of the work of the same master builder.

The plan shows that the ancillary structures to the east of the upper storey comprise a vestibule (W), and rooms X, Y, and Z. Room X is approached through vestibule W, lying to its north. The vestibule is very plain; it is a simple rectangle in plan measuring 2m wide by 3m long. Room X is also very simple, but is square, measuring 4.3m by 4.3m, and is lit by two windows in the south wall, similar to the windows of the western room T, and by a simple double window in the east wall. It has no niches, unlike room T. The floor is covered with modern tiles and the roof is flat. A further opening in the east wall of the vestibule (W) leads to another room (Y), which is a long narrow rectangle of 5.5m long by 2.4m wide, covered by a barrel vault. There is a double window identical to the one in room X in the east wall and a blind niche in each of the south (1m wide by 50cm deep) and north (70cm by 35cm) walls. The last room of this eastern part (Z), which is now used as a latrine, is built north of room W and west of room Y; it is rectangular in plan (2.1m by 2.75m), and is approached from the north by way of a simple doorway. It is lit by a window in the west wall. A short covered passage to the north of room Y leads to a paved way running between the various rooms of the complex, most of which are of more recent construction.

Dating the upper floor of the caravanserai

There are two types of construction in the upper storey of the caravanserai. The first type features among other things traditional vaults and arches, as well as old paving stones, and is confined to the chambers S and T. The second type is much more simple and almost featureless, and is found in the remaining rooms—that is in the vestibule W and in rooms X, Y, and Z. In addition there is a break in the masonry courses as well as a change in the quality of the ashlar and the height of the roofs. These details all point to buildings of a different date. An analysis of the layout of the areas in the centre (Chamber S) and west (Room T only) of this floor shows a surprising lack of symmetry, taking into consideration the balance of the two sides of the upper storey of the south façade. There must once have been an identical chamber to room T to the east of chamber S. Only the south wall—apart from the upper three courses—remains of this hypothetical eastern room. This has already been discussed under the South Façade. The room itself either fell into ruin or was dismantled at some later period and was replaced by the present buildings. This means that only the main chambers (S and T) date to the original construction of al-‘Imara al-‘Amira in the 960s/1550s. The rest of the upper storey was presumably built at the time of the work in 1286/1869-70, which has already been discussed above.

The south-eastern courtyard

A passage (2.25m by 2m) leads from the courtyard of the caravanserai (the south-western courtyard) to the south-eastern courtyard. A step now divides the courtyard into two approximate rectangles, the western section measuring 8m wide by 17.7m

long, and eastern 4.5m by 6m. The level of the western part is the same as that of the caravanserai courtyard, and shares the same quality of paving; the eastern section is concrete and is 25cm lower. These differences, taken together with the straight line running between hall N and the building of the justice department on the west, and the tomb chamber and the vernacular buildings to the east of the justice building, suggest that the western section of the south-eastern courtyard belongs to the original ‘Imara al-‘Amira. The eastern end of the south-eastern courtyard would thus have constituted the original eastern border of the complex. The courtyard is here bordered to the south by the justice department (so named on a plaque and apparently built in 1286/1869-70), and to the north by the large rectangular hall with four bays (N). A small, new, concrete building stands in the south-eastern corner of the courtyard, and there is a square well-mouth (55cm by 55cm) in the middle of its northern section.

The four-bayed hall (N)—the putative ‘Mosque Building’

The four-bayed hall (N) is the present heart of the al-‘Imara al-‘Amira complex. It is bordered to the west by the three vaults which now house the orphanage kitchen and which were part of the original Dar al-Sitt Tunshuq, to the north by a two-floored, modern concrete construction which seems to have replaced a structure that was possibly related to the hall, to the east by the domed tomb chamber, and to the south by what we have called the western section of the south-eastern courtyard. The western half of the hall is now used as the refectory of the Islamic Industrial Orphanage School, and the eastern half acts as a storeroom for the same institution.

Like the bakery building (discussed already) and the domed tomb chamber (to be discussed below), the hall is problematic. So far no sources have been found to elucidate it. Neither its date nor its function is explicitly reported in either the *waqfiyya* or the *sijill* records. In addition to this lack of information, the hall itself has been much altered, as have the buildings which surround it. Doors, windows, and walls have been blocked off and then opened in a different place, its south façade is now integrated into the adjoining entrance belonging to the Dar al-Sitt Tunshuq, and an upper floor has been constructed later. None of the three doors which now give access to the interior seems original. The interpretation of this structure thus has to rely in the main on speculation on its architecture, and on the brief statement in the *waqfiyya*.

The south elevation

Two elevations of the hall are still visible—the southern and the eastern. The south elevation, which appears to have been rebuilt clumsily at some still unspecified time, is divided into an upper and lower section. The lower part is built with rusticated masonry and is dominated by three doors and three windows. The western door is huge (directly to the south west of hall N). It measures 3.6m wide by 4.7m high, and is surmounted by a semicircular arch. This door leads to the southernmost vault of the three belonging to Dar al-Sitt Tunshuq, which now houses the orphanage kitchen. The vault was thought by Burgoyne (1987: 489) to be a later addition. It is most probable that the vault was rebuilt at the same time as the doorway—and thus at the same time as the rest of the southern elevation of hall N—for they all share the same architectural fabric and are integrated. It is difficult to be sure when this took place, but it seems to have been in the late Ottoman period and probably at some time before

1282/1865, for the upper part of the south elevation was most likely built after 1286/1869-70.

The middle door, which leads into the southwestern bay of hall N, is curious, for it measures 1m wide by 2.7m high, and its jambs have holes in which to insert the bars of an iron grille. This feature is also found in the vertical part of the frame enclosing the windows. This would suggest that the 'door' was originally a window which was then enlarged, which would mean that the jambs are in secondary use; it is surmounted by a lintel made up of simple masonry blocks. The eastern door measures 95cm wide by 2m high and is surmounted by a slab lintel; immediately above it there is a rectangular window 95cm wide by 63cm high. All three doorways are fitted with a modern iron door. Two of the three windows flank the eastern door; the one to the west measures 82cm wide by 1.54m high, and the one to the east 93cm by 1.54m. Each is surmounted by a slab lintel and fitted with a simple iron grille. The grille and the jambs of the windows seem to be in secondary use for there are piercings for a grille at the point of the joints of the courses. A third window is located west of the central door, and seems to be a later addition, for its jambs project slightly from the façade. It measures 80cm wide by 1.54m high and is surmounted by a semicircular arch; it too is fitted with a modern iron grille.

The east elevation

The eastern elevation cannot now be seen except from the recently constructed covered passageway O which runs between hall N and the tomb chamber. This elevation is well-built compared to the southern one. Most of the masonry is dressed, and the jambs and lintels of the fenestration seem to be old. However, some of the ashlar are rusticated which might indicate repair or rebuild. There are two doors and three window-openings, which at present are all blocked with rough masonry. These openings would suggest that it was once possible to approach hall N from the east. The two doors are identical, sharing the same dimensions of 92cm wide by 2m high, and two of the three windows, each to the north of a door, are also identical at 92cm wide by 1.5m. The doors and windows are all surmounted by an elaborate slab lintel, above which there is a pseudo-relieving arch of the 'eye-brow' type with three voussoirs. Each window has an old iron grille. The third window seems to be more recent, for the jambs are dressed in a modern style into which the grille does not fit perfectly. This window is located in the upper northern section of the elevation. Part of the upper and the lower courses of the elevation are hidden by the awkward roof built recently to enclose the passageway, and by an accumulation of earth on the ground.

The hall is today entered through the south face by way of any of its three openings, none of which, as has already been explained, seems to be original. The interior plan of the hall is almost square, measuring overall 10.1m by 10.3m, and is made up of four identical bays. The floor is covered with modern paving stones, and the level is raised considerably from the original, for the springing of each arch begins only 78cm above the present ground level. Each bay is roofed by a folded cross vault with a small, circular dome in the centre. The dome in three cases rests on a low, octagonal drum with no intervening transitional zone. The exception is the dome of the south-eastern bay, for here there is no drum. The four domes, originally open, are now blocked; those of the western side (the north western and the south western bays) were blocked when the upper floor was constructed probably in 1865. Each vaulted bay is supported on four pointed

arches which spring from a square central pillar and from the wall, or just from the walls of the hall. The width of the arches which spring from the central pillar is double that of the arches at the sides of the hall, namely 80cm as compared to 40cm. All the arches have a similar span of 4.4m and their apex stands at 3.75m above the present ground level. They are built of *ablaq* blocks of yellow and grey.

In addition to the openings described above in the south and east walls, there are three blind niches and an elaborate porch in the north wall. The first niche is located in the north side of the north-eastern bay; it is rectangular, 40cm deep by 1.4m wide. The porch, which must originally have been the main entrance to the hall, is in the centre of the north side of the north-western bay. It measures 1.5m wide by 90cm deep and is 3.75m high. However, it was originally higher before the ground level was raised to its current height. The porch is now blocked with concrete slabs; it abuts a two-floored concrete building of recent construction. An iron grille has been clumsily fitted to the inside of the porch. The grille has been cut at the top to conform to the curve of the scallop, which would suggest that it is not original. The porch was probably connected with the doorway discussed above, to judge by the two old hinges and steps situated on the north side of the modern building in the north-western courtyard. An identical, well-built blind niche frames the porch to either side, each niche measuring 62cm wide by 1.5m high and surmounted by an arch. At some fairly recent time, possibly at the instigation of the Supreme Muslim Council in 1923, two large openings were pierced through the thick (1.1m) west wall of the hall where it adjoins the three vaults of the Dar al-Sitt Tunshuq. They are located in the north-western bay (2.2m wide by 2.8m high) and the south-western bay (2.4m wide by 3.35m high) of the hall, and allow easy access between the kitchen and the refectory. A modern partition wall of concrete blocks separates the two eastern bays from the western ones.

Function

It is clear that considerable alterations have been made to hall N, in particular to the exterior and at ground level. The interior, although it has suffered from these changes, still retains its original layout and beautiful proportions. It is not easy to be sure of the original function of the hall. The situation is not helped by the modern concrete building which obscures what originally stood to the north between the two elaborate doorways still *in situ*. But the importance of hall N with its vaults and bays is not in question and it deserves a serious attempt at identification.

It will be remembered that the early Turkish version of the *waqfiyya* (discussed above under History: Identification) described the mosque—one of the four major buildings of the Khassaki Khurrem complex—as 'a well-founded edifice with strongly-built pillars, a lofty vaulted mosque, and a high praying-place with firm domes'. The final Arabic version described it as a 'noble mosque with a lofty arched opening and a high praying-house with a strong portico (*al-masjid al-sharif al-rafi' al-taq wa'l-ma'bad al-munif al-mani' al-riwaq*)'. The descriptions closely resemble hall N—all the elements of these texts are still represented, for the building really is a 'well-founded edifice', it has many 'pillars' at the sides as well as a large central pier, and the arches and the vaults are indeed still 'lofty'; in addition, the entrance porch in the north well deserves to be called a *taq* or arched opening. I therefore suggest that the main function and reason behind the construction of the hall was that it was to be the main mosque of the complex where the poor were expected to gather for prayers.

In addition to the close agreement between the existing features of hall N and the literary description of the mosque, the *waqfiyya* contains two further points about the location of the mosque which help to identify it. The *waqfiyya* (Sijill 270; al-Husaini 1982: 81; al-'Asali 1983: 130) states that the mosque was built 'opposite the kitchen', and that 'the fifty-five cells (*hujra*) for the poor' were built around it. Hall N is located in close association with the original kitchen, though by no stretch of the imagination is the hall opposite the kitchen, and it is highly likely that most (if not all) of the cells were built in the area now occupied by the justice department, immediately to the south of the hall. If the cells were not here, it is difficult to imagine where they could have been located. It would have been the most appropriate site for them; in addition, where the *waqfiyya* does not state unequivocally that the cells were built by the donor (Khassaki Khurrem), it is possible that some of the cells were located on the second floor of Dar al-Sitt Tunshuq, which would place the hall/mosque firmly in the midst of them.

There are, however, problems to this theory. One cannot ignore the absence of a pulpit or a *mihrab*. Although the absence of a pulpit is understandable, because of the proximity of the Haram al-Sharif with the Friday Mosque of al-Aqsa, and it is in any case not an integral part of the structure of any mosque, the *mihrab* is always essential. This raises the immediate question—if hall N was indeed the mosque, where was the *mihrab*? The width (1.1m) of the south wall makes it possible that one of the doors here was originally a *mihrab*, which was later enlarged to serve as a door when the mosque ceased to function and was converted to serve for some other purpose. But this proposal seems unlikely for two reasons—first, because there is no evidence for such a change and second, neither door is in the central position in a *qibla* wall that is the norm for a *mihrab*.

If hall N is indeed the mosque mentioned in the *waqfiyya*, it must be a 16th-century structure. It would be logical then to see within its architectural fabric some of the decorative elements which mark out the other constructions of the original 'Imara al-'Amira, such as roundels, decorative panels, and lancet niches. It is possible that the decorative elements prevailed on the exterior elevations which, it has been shown, have been much altered. It is also possible that the decoration was removed during the subsequent periods of major work, yet all these assumptions are not supported by any material evidence. Furthermore, the lack of any similar four-bayed hall which could have served as a mosque either in the city of Jerusalem or in Palestine as a whole to act as an external control, reduces the feasibility of this theory.

The conclusion must be, therefore, that, although the structure of hall N conforms with many features of the mosque as recorded in the *waqfiyya*, the absence of the *mihrab* as well as the other reasons mentioned above make it almost impossible to view hall N as the main mosque of the complex. This conclusion once again opens the question of the function of hall N, and adds the further question of where was the location of the lofty mosque described in the *waqfiyya*?

Although the complexity of the case and the lack of information might deter a further attempt at answering this central question, it seems that the only remaining possibility for the location of the mosque is the area, now occupied by a two-floored, modern concrete building, situated immediately to the north of hall N. Three points support this hypothesis. The space is large enough to accommodate a 'lofty' mosque, it is precisely 'opposite' the kitchen, and the well-executed design of the original entrance way, with its handsome steps, indicates that it

gave access to an important structure. Unfortunately, it is impossible at this stage to go further with this hypothesis for lack of evidence.

With regard to the function of hall N, if one considers that the north and the south wall were once open, it is possible that the hall was used as a double-vaulted passage which connected the putative mosque just described and the rooms of the Sufis.¹³ It will be recalled that the present writer believes that these cells were located on the site of the location of the department of justice. Another possible function for this area could be a place where the poor ate their portion of food. It has already been mentioned that the donor (Khassaki Hurrem) made a proviso that 'no food was to be set aside for any person other than those specified, nor was it to be taken off the premises in a copper bucket. If it were taken outside, it would be considered to have been stolen.' It is interesting to note that part of this hall is now used as a refectory for the orphans of the school.

The Tomb Chamber

Many saints chose to be buried in Jerusalem, as in other religious centres. There are so many Muslim burial places in the Old City of Jerusalem that al-'Asali (1982) published a book on the subject. It appears from the writings of Mujir al-Din (1973), Burgoyne (1987), and al-'Asali (1982), that these sites took different forms over the centuries, from the simplest interment of the body beneath the ground with no superstructure—such as the tomb of 'Ubaida ibn al-Samit, the companion of the Prophet—to the most sophisticated style of stone tomb in the middle of a specifically built tomb chamber—such as the Turbat al-Sitt Tunshuq. The tomb in the complex of al-'Imara al-'Amira is one of the latter category. All the parallels to it in Jerusalem date to the Mamluk period. Examples of similar, although not identical, tombs and domed chambers were published by Burgoyne (1987)—Ribāt 'Ala' al-Din (1987: 120, 125), Turba Kubakiyya (1987: 141-3), Turba Auhadiyya (1987: 166-73), Turba Jaliqiyya (1987: 186, 188), Turba Sa'diyya (1987: 197-98), Turbat al-Turkan Khatun (1987: 322-23), Turba Kilaniyya (1987: 468), Madrasa Tashtamuriyya (1987: 468), and Turbat al-Sitt Tunshuq (1987: 507).

There are few Ottoman burial monuments in Jerusalem. This makes it difficult to compare them with the tomb under discussion or with the Mamluk examples. The Ottoman examples either securely dated to the 16th century or likely to be from that period are the tomb of Bairam Jawish (cat. no. 12), the tombs of the Maulawiyya (cat. no. 19), the tomb of Sitt Qamra (cat. no. 32), and the tomb of al-Shaikh 'Ala' al-Din al-Khalwati (Masjid al-Shaikh Rihan). The tombs at the Jaffa Gate (Bab al-Khalil) are not dated. The only other example known to me is the tomb under discussion here, which is the only one of those just listed with a domed chamber. The tomb chamber of Bairam Jawish is cross-vaulted, those of the Maulawiyya and Sitt Qamra both have simple vaults, and the tombs at Bab al-Khalil are not covered. The

¹³ A discussion with Dr Michael Burgoyne in September 1998 led to his suggestion that the walls which now enclose room N are later additions, and that originally it was a four-bayed pavilion providing a shady place for recreation or study. This would explain why none of the doors appear to be original, for none was original. I am deeply grateful to Dr Michael Burgoyne and Dr Sylvia Auld for their valuable comments, raised during their discussions with me when we toured the complex together.

other difference between the Ottoman tombs and the one at al-‘Imara al-‘Amira is that they are either shorter or longer, and have a different head post. The only exception is the tomb of Bairam Jawish. These factors will help in dating the tomb chamber, which will be discussed below.

Finally we come to the tomb chamber itself, which is located in the eastern corner of the south-east courtyard. It is separated from hall N on the west side by the narrow passageway (O), and from the kitchen of al-‘Imara al-‘Amira to the north by a rectangular room (P). The tomb chamber is bordered to the east by a storeroom (Q), and to the south by the south-eastern courtyard. This means that only part of its southern elevation is visible from the outside. Al-Nabulsi (al-‘Asali 1991: 268) is apparently the first and only traveller who described his visit to the tomb and identified the occupant. This took place when he was in Jerusalem in 1101/1689, when his route took him past al-‘Imara al-‘Amira (al-Takiyya). Al-Nabulsi has left only a brief report. He wrote that ‘... the miller (of the Takiyya) guided them to a place there which has a door leading to a dome. The dome is built with dressed masonry and has sides and lintels, and within that dome is a prestigious tomb. We [al-Nabulsi] asked about the occupant of the tomb; it was said to us that this is the tomb of the warrior, the Shaikh Sa’d al-Din al-Rusafi, the owner (author) of *Al-manhal al-safi wa’l-mashrab al-wafi*.’

A rectangular opening (1.7m wide by 3.2m high), fitted with a recent iron door, gives onto the passage O. The passage is trapezoidal in plan, measuring 7.5m long and 1.7m wide to the south, while the north is only 90cm wide. Three steps of 43cm each lead from the ground level of the eastern section of the south-eastern courtyard. Its floor is buried under dry earth, and it is covered by a barrel vault. However, because the roofed space is so narrow, the vault is incomplete. A rectangular room (P) separates the tomb chamber from the kitchens of al-‘Imara al-‘Amira. It has recently been roofed in concrete. The walls are not in right-angled alignment and it measures 6.3m long by 2.7m wide. An opening in the north-western corner, now blocked, once led to the masonry dais built in the south-western corner of the kitchen. It is most likely that the dais, which has already been discussed, was approached from the north-eastern bay of the hall, which adjoins the tomb chamber.

Exterior

The south elevation is built of monochrome masonry which has partly weathered to grey or black. The courses are both finely dressed and carefully laid, suggesting that they were cut and built by a skilled master. A window (1.5m wide by 2m high) with a pointed arch and rectangular gadrooned moulding is placed at the centre of the elevation. The window opening begins 10cm above ground level. This would suggest that this eastern section of the south-eastern courtyard was raised some time after the building of the tomb chamber. The window is fitted with an iron grille and with modern iron mesh.

A recent staircase of two flights runs to the east before turning north and leads up to the roof of the tomb chamber, giving access to it. The staircase is in front of room R (which is constructed to the south-east of the tomb chamber) so that it conceals part of the southern elevation, with its northern end integrated into the masonry at the point where the top of the arch of the window is situated. The staircase is now used as part of the passage connecting the southern to the northern part of al-‘Imara al-‘Amira complex.

On the roof, the staircase gives directly onto a hemispherical dome supported on an eight-sided drum. The drum rises directly from the roof, which is paved in stone, and terminates in a *cyma reversa* cornice. There are eight rectangular windows in the drum, one on each side. Each window measures 50cm wide by 74cm high, and is surmounted by a slab lintel. The windows are now all blocked, but originally they must have provided light and ventilation to the tomb chamber. The dome is faced with small flagstones to protect it from rain, and it culminates in a stone finial.

The north façade and the interior of the chamber can now be reached only by crossing the narrow passage located to the west of the building. The north façade is constructed of white, dressed masonry and it is dominated by a recessed niche with a gadrooned semicircular arch. The niche measures 2.8m wide by 4.1m high. The façade terminates in a simple cornice. A doorway (1m wide by 1.64m high), constructed of nine courses of white and black stone, gives access to the interior. This doorway is surmounted by a slab lintel and five courses above it there is a small, square window.

The west and the east elevations of the tomb chamber are identical. The masonry is of mediocre quality and both elevations are decorated with a recessed panel which terminates in a gadrooned, pointed arch. There is a rectangular window (93cm wide by 1.64m high) in the lower section of each panel, surmounted by a slab lintel. The windows are built of white and black masonry, and until recently both were fitted with iron grilles; the west one has now been removed. The eastern window has been blocked with concrete, probably at the time room Q was constructed (see below).

Interior

The tomb chamber, which is not aligned with the surrounding structures, is entered today from the west from the passage O. Although the plan gives the appearance of a square, the chamber is in fact rectangular, for it measures 4.2m by 4.7m. The floor is 80cm lower than the level of the south-eastern courtyard. A stone tomb, 1.6m long, 1.04m wide and 59cm high, occupies the centre of the room. As already explained, according to al-Nabulsi (al-‘Asali 1991: 268) it marks the grave of a warrior called al-Shaikh Sa’d al-Din al-Rusafi. No further details are given by al-Nabulsi. The stone tomb has four corner posts of white marble (the western ones slightly larger than the eastern ones at 14cm by 14cm as against 12cm by 12cm). All are decorated with inscriptions and geometric patterning. The inscriptions are illegible for they are partly obscured by the top of the tomb, which must have been augmented at some unspecified time.

There are three windows in addition to the entrance. The window in the south wall is surmounted by pointed arch, while the other two and the entrance door have slab lintels above which there is a simple arch built of small, white blocks. Above the arches there are four small identical windows intended for ventilation, each measuring 50cm by 80cm. The hemispherical dome sits on four identical shallow arches which have a pointed profile and spring from the corners of the chamber. Between the arches, four triangular pendentives make the transition from the almost square base to the octagonal drum. The eight windows of the drum, as mentioned above, are blocked, and the dome is built of rubble stone, which has received a recent coat of plaster, like the walls of the chamber.

Dating the tomb chamber

The date of the tomb chamber and its relationship to the complex of al-‘Imara al-‘Amira present difficulties. The chamber is undated, and it is not mentioned in the *waqfiyya* of al-‘Imara al-‘Amira. So far no information has emerged about it in the *sijills*. The reference by al-Nabulsi remains not only the earliest but the only piece of information, and this was made some one hundred and forty years after the construction of the complex. Although the architectural elements are not conclusive—for they are not idiosyncratic enough to point to a specific date, being found in both pre-Ottoman and Ottoman buildings—the location of the only entrance and the elaborate elevations may provide clues to its date.

Any attempt to date the tomb chamber and to show a connection with the construction of al-‘Imara al-‘Amira will obviously allow for three possibilities—that the tomb chamber was built at the same time as al-‘Imara al-‘Amira complex, or that it was built later, or that it was built earlier. The location of the elaborate entrance and the narrow space between the tomb chamber and hall N make it unlikely that the tomb chamber was constructed at the same time as al-‘Imara al-‘Amira, for it is pointless to go to the trouble of building a beautiful, decorative entrance which will be both hidden and difficult to approach. And it would be even more odd to construct the tomb chamber on this site with its particular layout *after* the construction of al-‘Imara al-‘Amira complex, for it would be expected in this case that the entrance would have been placed on any side other than the northern façade, cramped as it is *vis-à-vis* the kitchen of the complex. The elimination of these two hypotheses then leaves the third possibility—that the tomb chamber was built *before* the complex of al-‘Imara al-‘Amira. The alignment of hall N and the modern building of the justice department, the different levels of the ground between the tomb chamber and the buildings of the ‘Imara al-‘Amira complex, and the location and the style of the entrance all support this third hypothesis.

How the tomb chamber was originally entered and from where, and when it was built, remain further questions. As already explained, no independent information has been found to help with an answer, but it may be supposed that the tomb chamber was approached either from the south, where the third part of the south façade of al-‘Imara al-‘Amira now stands, or from the north, which is the direction of Tariq ‘Aqabat al-Takiyya. With regard to the date of construction, I think that the tomb chamber was constructed between 885-933/1482-1527—a period of almost fifty years, between the last Mamluk building of al-Ashrafiyya in 885/1482 and the first Ottoman building of Sabil Qasim Pasha in 933/1527 (cat. no. 2). I tend towards the conclusion that the tomb chamber might have been built in the same period as al-Madrassa al-Mawardiyya, which is after all

situated close by. (For a more detailed discussion, see cat. no. 28 under Dating the building.) The striking resemblance between some of the shared architectural elements—such as the gadrooned arches and the *ablaq* masonry—would seem to support the link between the Mawardiyya and the tomb chamber.

The rooms (Q and R)

There are two rooms to the east and south of the tomb chamber (Q and R). Both are simple, undecorated rooms and, to judge by their architecture, they appear to be of recent construction. The first room to the south (R) is approached through a simple door in its west wall overlooking the south-eastern courtyard. The door, which measures 90cm wide by 1.75m high, is surmounted by a modern slab lintel. The ground level of the room is 60cm lower than the eastern part of the south-eastern courtyard, and it has a modern pavement. The interior of the room is equally plain, and since its alignment is not true, it has a trapezoidal plan (west 6.5m, south 4.2m, north 4.9m, and east 6.9m). The walls have been recently plastered and the roof consists of two cross vaults.

The second room to the north (Q) is also trapezoidal (south 3.4m, north 4m, east 8.30, and west 9m). It has in effect no western wall, for it has been constructed against the eastern wall of the tomb chamber. The room has the same roofing system as R. Both rooms were probably intended for storage. They have been built recently and it is possible that previously the tomb chamber was approached from the south through the space now occupied by the two rooms.

Concluding remarks

It will be clear, not only from the foregoing description of the architectural components of al-‘Imara al-‘Amira but also from its history, that the complex was and still is the largest and most complicated within the Old City of Jerusalem. The development of the complex has been continuous since the Mamluk period up to the present with additions and modifications to sections of it. It is noteworthy that the Auqaf Administration in collaboration with the Welfare Association have raised \$3 million for the restoration and rehabilitation of the whole complex. It is fortunate indeed that such a sum of money has been secured and even more fortunate that this research and documentation should have been completed before any further alterations have taken place. The complex of al-‘Imara al-‘Amira is unique not only within the architectural history of Jerusalem but within Palestine as a whole. It is a sultanik building with wide horizons, and in order to put it into context with other similar complexes elsewhere within the Ottoman empire—for example the ‘Imaret of Haseki Sultan at Aksaray in Istanbul or the Tekke Süleymaniyye at Damascus—comparisons have been made in Ch. 36, under Other Buildings.

16 KHALWAT QITAS

Name: Khalwat Qitas

Date: 967/1559-60

Endowment: None known

Variant of name: None known.

Modern name: *Maktab Haras al-Haram al-Sharif* (The Office of the Guards of the Noble Sanctuary). For a general discussion of the names given to the *khalwas* of the Haram, see below.

Location

The *khalwa* is situated in the north-western area of the Dome of the Rock esplanade, next to Khalwat Parwiz (cat. no. 17).

Site and brief description (figs. 16.1-16.4, pls. 16.1-16.7)

Khalwat Qitas is located between Khalwat Parwiz (cat. no. 17) and Khalwa Junbalatiyya (cat. no. 24). It is built on the line to the north of the Haram which marks the change between the two levels of the esplanade, the northern façade of its lower storey being on the lower level and its main façade on the upper terrace, facing south towards the Dome of the Rock and al-Aqsa mosque. The cell is a free-standing structure but is linked to a vestibule entrance to the west. The building consists of two sections, each made up of two small chambers. Those of the lower storey are covered by a cross vault, and are used today as a residence for some of the Haram staff—it is likely that they have always served a similar purpose. The upper chambers are covered by a shallow dome and together with Khalwat Parwiz (cat. no. 17) serve as the office of the Haram guards.

History

Identification

The history of Khalwat Qitas resembles that of Khalwat Parwiz (cat. no. 17), for all that had been known until now about either of them is contained in the short account by van Berchem (1925: 187-8). An inscription published by him securely places the *khalwa* within the Ottoman period, but at that stage the date and the name of the founder remained uncertain. An entry in the *sijills* (see below) now confirms the tentative date and the name of the founder suggested by van Berchem.

Date

The plaque on which the inscription appears is attached to the wall in the centre of the southern façade between the two rooms. This siting has been carefully chosen to show that the two domed chambers belong to a single building. The marble plaque measures 80cm wide by 40cm high. It consists of two lines of Arabic written in a slender, elegant Ottoman *naskh* with diacritical and auxiliary points. The lines are set within two rectangular cartouches separated by a fillet. The Arabic version of the inscription is in Cat. Appendix 2, no. 16, and my translation (which differs somewhat from that of van Berchem) is as follows:

(There) has constructed this (*khalwa*), in order to bring himself closer to the Master of good deeds and of favours, Qitas Beg. The date (is by these words—the chronogram) ‘In their strength the reward is complete’.

The numerical value of *fi ‘izzihim fa’l-‘ajr tamm* amounts

to 967 (1559-60), which led van Berchem to propose that date, albeit with some diffidence. It seems, however, that this date is indeed appropriate, for it is identical to the date of Khalwat Parwiz (see cat. no. 17) and it also corresponds to the facts known about the identity and career of the founder (see below).

Founder

The name of the founder appears in the inscription in a puzzling form. Van Berchem (1925: 187-88) attempted to read it and proposed a possible ‘Fintas’ as a first choice. Other proposals were ‘Qintash’, ‘Qantash’, or ‘Qatas’. With the discovery of the entry in the relevant *sijill*, it is now possible to be more certain, and it is proposed here that probably the correct reading is ‘Qitas’—a name close to the ‘Qatas’ proposed by van Berchem, who rejected ‘Qitas’ only because of the absence of two dots under the second letter of the name, leading him to read this as a *nun* rather than a *ya*. Van Berchem also believed that the two dots—which in the reading adopted here are seen as belonging above the first letter (*qaf*)—belonged rather to the first and the second letters, hence the *fa*’ and *nun* in Fintas. There are, however, many records in the *sijills* with the name of Qitas. In *Sijill* 39 dating to the year 967, there were two sultanlic orders (*amr*) sent to *maulana* (‘our master’) Qitas Beg, the governor of Jerusalem district (*mir liwa’ al-Quds al-Sharif*).

The first (*Sijill* 39: 30) was for the expansion of the kitchen of al-‘Imara al-‘Amira (for further details see cat. no. 15), and the second (*Sijill* 39: 249) concerned the restoration of al-Zawiya al-Adhamiyya, which was outside the walls of Jerusalem. More entries in the same *sijill* (39: 42) show that Qitas manumitted his slave, as well as the arms and horse that belonged to him, for the sake of Allah. The records (39: 80; 39: 635) contain references to the financial transactions undertaken by someone called ‘Qitas *timar*’ at the village of Bait Ta’mar. *Sijill* 66: 155 reveals that on 2 Rajab 994/9 June 1586, when another order reached Jerusalem requesting that the *za’ims* and the *timars* in Jerusalem join the sultanlic journey (*al-safar al-sultani*), ‘Qitas the son of the deceased (*ibn al-marhum*) Parwiz’ was so seriously ill that he was unable to move. This reference adds considerably to our knowledge, for it reveals the name of his father (Parwiz), and that Qitas was a *timar* holder.

Further references to Qitas appear in *Sijill* 83 (pages 132, 171, 175, 208, 276, 359, 455, 459, 468, and 474), which includes the proceedings for the year 1010/1601-2. All these entries record financial transactions and raise the question as to whether they all refer to the same man. The reason for this doubt stems first from the fact that ‘Çelebi’ was added to the name so that it becomes ‘Qitas Çelebi the son of Parwiz Beg the *za’im* in Jerusalem the Noble’. Secondly, we have just left Qitas seriously ill in the year 994/1585-6—unless, of course, he was unwilling to accompany the sultanlic tour and was using illness as an excuse. Did he recover and continue to live until 1036/1626-7 as *Sijill* 112: 270 would imply? If one accepts that both names belong to a single person, it means that Qitas continued to live some seventy-three years after he became governor of Jerusalem in 967/1559-60. This is plainly unlikely. In any case, whether all the later entries refer to our Qitas or not is irrelevant to the main point, which is the new light shed on the founder of the *khalwa* under discussion here, and on the name of his father, who was the patron of the neighbouring *khalwa* (cat. no. 17). It is particularly interesting to note that the son followed his father in the endowment of buildings with charitable purposes.

Purpose of the building

The reason behind the construction of almost half the *khalwas* and *hujras* erected on the upper terrace of the Dome of the Rock (cat. nos. 17, 25, 46, 51, 52 and 53) is not recorded. This is also true of Khalwat Qitas. The original purpose is recorded neither on the foundation plaque nor in any of the references in the *sijills* discovered so far. Such information is, however, given for other *khalwas* in Jerusalem, either by means of a foundation inscription or in the relevant *waqfiyyas*, and this information appears under the individual catalogue entries.

As a general rule, these cells were established for one of two reasons. They either served as a place for teaching—e.g., Hujrat Muhammad (cat. no. 14), the North-Western Khalwa of Ahmad Pasha (cat. no. 22), the North-Eastern Khalwa of Ahmad Pasha (cat. no. 23), and al-Madrasa al-Ahmadiyya (cat. no. 24); or as a site in which the Holy Qur'an was recited—e.g., Hujrat Islam Beg (cat. no. 21), Khalwat Bairam Jawish (cat. no. 34), and Hujrat Muhammad Agha (cat. no. 20). But a third, if subsidiary, function for the cells was as a residence—e.g. the Junbalatiyya (cat. no. 24). Further information can be found in the *sijills*, which give additional insight into the original function of the cells. Sijill 51: 157 reports that one of the *khalwas*, which is no longer standing, was used to store the shoes (*wazifat hafz al-an'al*) of visitors to the Haram, while Sijill 77: 453 contains an entry which reveals that the chief architect of Jerusalem and the Haram, 'Abd al-Muhsin ibn Nammar, used to keep his equipment in one of the cells. Sijill 72: 375 indicates that some of the cells were used as offices for the employees of the Haram, as is still the case today. In all probability, the unrecorded cells were originally intended for some similar purpose.

The travellers who visited the Haram al-Sharif during the Ottoman period assigned a number of different names and purposes to these structures. Al-'Ayyashi (al-'Asali 1992: 210) called them 'houses (*buyut*) for worshippers'. Al-Madani (al-'Asali 1992: 320) called them 'chambers (*odas*) for students who sought knowledge' (*talabat al-'ilm*). It is al-Nabulsi (al-'Asali 1992: 259) who uses the term *khalwa* for these small buildings. He wrote: 'We have found these various *khalwas* with domes on the edges of the platform of the Mosque of al-Sakhra (the Rock) these are built with columns and coloured stones ... some of the *khalwas* are inhabited, some are not, and some are blocked.' Al-Saddiqi (al-'Asali 1992: 304) and al-Luqaini (al-'Asali 1992: 302) followed al-Nabulsi in the use of the term *khalwa* to refer to the buildings and, according to their separate accounts, both stayed in a cell during their visit to Jerusalem. Al-Qayati (al-'Asali 1992: 325-26) described them both as 'chambers' (*oda*) and cells (*khalwa*). He reported that they were used as dwelling places by those who resided within the Aqsa Mosque (the Haram al-Sharif) in order to study, and by foreign visitors. Al-Qayati went on to report that one of the *khalwas* had been offered to him for his use during his visit. And finally, in the early years of this century, al-Qasimi used the term *hujra*, *hujurat* ('room/rooms') for the buildings (al-'Asali 1992: 338). This latter visitor to Jerusalem also recorded that the majority of the occupants offered to share their *hujra* with him.

It is unfortunate that none of these accounts give enough information to allow an unequivocal identification of the fifteen listed *khalwas*. Apart from the facts given here, almost nothing more has been recorded, other than the names of certain of the cells, which reflect the patronym of the patron or the occupant—such as Khalwat Jaralla, Khalwat al-Dajani, al-Khalwa al-Bairamiyya, or the Summer (*al-saif*) Khalwat al-Saddiqi (al-'Asali 1992: 299-300).

Architecture

Exterior

The southern façade has two different sizes of stones employed in its construction; the upper courses are of small white dressed masonry above four courses of larger, coarser stones. It is simply conceived, the main element being the division of the wall into two parts with the inscription plaque at the centre of the upper section. A rectangular window measuring 80cm wide by 1.1m high pierces the western part of the wall; it is surmounted by a stone lintel. Immediately above this there are three decorated stones; the central one is carved into the approximation of a cup-shape and is darker in tone than the rest of the wall. It is decorated with a shallow relief arabesque which is continued in the stones to either side of it. The whole forms a triangular device reminiscent of a cusped book flap or manuscript illumination.

[Editorial note: It is highly likely that the stones are in re-use. The upper border is cusped, a groove running parallel to the outer edge. The design does not match precisely across the three stones. The outer two are from the same building, being similar in colour and technique, while the central one does not match. The outer two contain elements of a split-palmette motif, with dart-shaped cinquefoils between them. The central stone appears to have been reversed, for here similar cinquefoils point towards the centre rather than outwards. The technique of carving is close to certain stones re-used in the fabric of the Khassaki Sultan (see cat. no. 15), which were probably taken from the Ashrafiyya of Sultan Qa'itbai. It is possible that these stones came from the same source. SA]

A door measuring 75cm by 1.6m gives access in the eastern section. It too is surmounted by a slab lintel and above it is a relieving arch similar in design to that above the window of the Khalwat Parwiz (cat. no. 17). Two small slit windows to the east of both door and window give light to the interior. Both are crowned by a lintel in the centre of which, over the window, there is an elegant fluted motif, its outline accentuated by a groove running round its profile. The wall comes to an abrupt end without a cornice or parapet. Above each section of the *khalwa* there is a shallow dome, which is now covered with flagstones, and which has a very short stone finial.

The northern elevation is also divided equally into two identical parts but in place of the inscription plaque, the middle section is marked by a carved roundel.

[Editorial note: This has an eight-petalled rosette in the centre, from the cardinal points of which emerge four heart-shaped motifs made up of split-palmette foliage. Each contains a trefoil. In the spandrels between the four main elements of the design, further split palmettes emerge to curl back on themselves, meeting at the centre. The design is close to the familiar four-part *rumi* motif found on metalwork and carpets, but has been adapted, for the elements of the pattern do not emerge from each other, but are treated separately. This is unusual, and may reflect a copy, being reminiscent of certain roundels on the city walls—the north-west façade of tower 18, for example. The carving is crisp, and is contained within two stones, the break occurring across the centre of the design. SA]

The style of this panel and the joints of the courses unite both parts of the northern elevation, and it seems that the roundel has been as carefully positioned as the rectangular inscription plaque on the southern wall. There is a door (75cm by 1.5m) in each half of the northern façade, surmounted by a shallow double arch. Above the keystones of each arch there is a slit window measuring 17cm wide by 28cm high, each with the same

charming little apex as the slit windows in the main façade to the south. The keystone of the upper east door is decorated with a roundel.

[Editorial note: The roundel is contained within a single stone. It has a groove round the circumference which is bisected by the tips of a six-pointed *khatam Sulaiman*. Within each tip, a secondary small equilateral triangle has been outlined by a groove. The inner hexagon formed by the bases of the outer triangles contains another roundel. The border of this is in relief. Within this circle there is a five-petalled flower, with a small five-pointed star at its centre. It is unusual to find a change in number like this; it would be more usual to have a six-petalled flower within a six-part overall motif. In addition, it is more difficult to produce a design with five parts than with six, and the change must therefore be deliberate. There is, perhaps, a connection with the five-petalled motif found on the Khassaki Sultan (see cat. no. 15). The position of Qitas Beg as *timar* holder and governor (*mir liwa'*) of Jerusalem may be relevant for it may be further evidence that the five-part design is an official sign of some sort. SA]

A rectangular window measuring 73cm wide by 1.04m high is placed two courses above each slit window; each is fitted with a simple iron grille and surmounted by a slab lintel. An 'eyebrow' relieving arch consisting of three voussoirs is built above the lintel. Each voussoir is decorated with a carved trefoil. Three courses above the arch the building ends abruptly. Neither the western nor eastern elevation is either broken or decorated.

Interior

While the exterior fabric of Khalwat Qitas convinces the viewer that it was built as a single entity, the elements of the interior have almost nothing in common. The upper and lower storeys of the *khalwa* are separated from each other by heavy masonry, and each has its own entrance and lighting and ventilation system. There is now, however, an internal connection between the two parts, for a recent opening in the upper portion (62cm in depth) runs between them. This was done in 1980 when it was first converted to house the guards of the Haram. The interior of the lower part is made up of two small chambers, the eastern one being rectangular in plan. It is now paved in flagstones and covered by a cross vault. On the western side, there is a blind niche, and ventilation and light are provided only by means of the door and a slit window. This makes the chamber an ideal place of retreat and solitude—or a good storage place, as it is today. The chamber to the east is similar to that on the west, but it is square in plan and larger.

The interior of the two sections of the upper storey are also similar. Both consist of a single chamber that is square in plan and is covered by a hemispherical dome resting on four large-scale pendentives with no zone of transition. The whole interior has been plastered and whitewashed. Access to this pair of chambers is through a door in the eastern chamber preceded by two steps, but also from the west through an inner vaulted vestibule, which has been built between this *khalwa* and the neighbouring Khalwat Parwiz (see cat. no. 17). The door at the eastern end of the vestibule, which leads to the interior, measures 76cm wide by 1.81m high and is surmounted by a lintel made up of three blocks. The floor of the western chamber was repaved in 1980, using flagstones measuring 20cm by 30cm. There are two windows in the chamber, and two blind niches for storage are placed to the north and south of the door, the former measuring 78cm wide by 1.91m high, and the latter 60cm wide. The interior of the eastern chamber is similar, but with minor variations in the

windows and the blind niches; in all there are two windows (one in the north side and one in the east side) and five blind niches (two in each of the west and the south sides and one in the east side) in this eastern chamber. The door is reached by means of a stone dais. At present this room is kept locked and access is by way of the recent opening that connects the two upper sections.

17 KHALWAT PARWIZ

Name: Khalwa (cell) Parwiz

Date: 967/1559-60

Endowment: None known

Variant of name: Khalwat Barviz, Parvin, Parwin or Barwin

Modern name: 'Maktab haras al-Haram al-Sharif' (Office of the Guards of the Noble Sanctuary).

Location

The *khalwa* is located at the north-western corner of the terrace of the Dome of the Rock, abutting the northern end of the north-western colonnade.

Site and brief description (see figs. 16.1-16.4 and figs. 17.1-17.2, pls. 17.1-17.6)

Khalwat Parwiz is built at the edge of the boundary between the two levels of the Haram al-Sharif. Like other *khalwas* built on the upper esplanade of the Haram, the northern façade of the lower part of the building is on the level of the esplanade, while the southern façade of its upper part is on the level of the terrace of the Dome of the Rock. The cell is a single-unit structure and is unconnected to another building, except at its south-west corner, which adjoins the north-western colonnade. The building consists of two sections; each is made up of a single small chamber. The lower one, now used as a storage space, is cross-vaulted, while the upper room has a shallow dome. In association with Khalwat Qitas (cat. no. 16), it now provides office space for the Haram guards.

History

Identification

Khalwat Parwiz is identified as dating to the Ottoman period by an inscription which could be read either as a construction or a restoration text (see below).

Date

The cell is dated by a chronogram contained at the end of the last line of the inscribed panel. The numerical value of *fakhr bi-'izz abada* amounts to 967 (1559-60). The text of the inscription was published by van Berchem (1922-3: 188), although he had misgivings about the interpretation of the date. The text is located on the southern façade to the east of the window. It is inscribed on a marble plaque measuring 27cm wide and 30cm high, and consists of two lines of Arabic written in Ottoman *naskh*, in a fine, slender, slightly compressed script with diacritical and auxiliary points. The text is contained within two rectangular cartouches separated by a fillet moulding. The translation is as follows:

1. (There) has constructed and built it anew (or restored—*jaddadaha*), Parwiz the perfect *katkhuda*
2. At a time whose date is (the chronogram)
'honour with glory forever'.

The word *jaddadaha* used in the inscription is confusing, for it has two meanings in Arabic; the first, 'built anew', has been preferred here since it is accompanied by the word 'constructed' (*ansha*). The second meaning is 'restored', and this is the interpretation that was chosen by van Berchem (1922-3: 188). It is, however, difficult to envisage how the cell could have been 'constructed' and 'restored' at the same time. But why the double statement of 'constructed' and 'built anew' is used it is difficult to explain, unless it represents a linguistic mistake.

The word *ansha*, in order to be correct grammatically in reference to a building, needs the suffix *ha* ('it'). It is possible that the calligrapher, because of lack of space, confined himself to a single *ha* to serve both *ansha* (constructed) and *jaddada* (built anew).

Instead of the name 'Parwiz' (see below), van Berchem read it as 'Parwin'. He thought *na'am* was a name, commenting that it should have been written as *Nu'aim* in the masculine form (1925: 188, n. 3). It is considered here to be an adjective describing the noun *katkhuda* for it appears to be made up of an unusual combination of Arabic and Turkish. The calligrapher has filled the space, despite its limitations, with many decorative slashes as if he were afraid to leave any space undecorated.

Founder

Previously, nothing was known about this cell or its founder apart from the short account by van Berchem. Even the correct spelling of the founder's name was not confirmed, as already mentioned. Van Berchem thought the name might be Barwin or Parwin. However, an entry in the *sijills* (see above, cat. no. 16) has now shed some light at least on the name of the founder, in that it determines that the final letter of his name is *za*' rather than *nun* or *ra*', thus giving the name 'Parwiz'. This name occurs frequently in Sijill 66 as the father of Qitas (cat. no. 16). It is possible, therefore, that the *khalwa* was founded by Qitas for his father Parwiz, but it is more probable, to judge from the inscription, that it was built by Parwiz himself. The epithet *al-katkhuda* was translated by van Berchem (1922-3: 188) as '*le commandant*' (commander), but Cohen (1990: 38), who was basing his argument on the *sijills*, considered it to mean 'the deputy of the *dazdar*' (the commander of the citadel); Parwiz is thus identified as acting as a deputy for the commander of the Citadel of Jerusalem. Other possible translations could be 'the responsible employee', or 'the authorised deputy', or 'the entrusted person'. In any case, the founder was probably one of the ruling élite in the second half of the 16th century in Jerusalem, if not in Palestine as a whole.

Purpose of the building

The plaque described above does not give a name to the building, nor is there one contained in any other reference uncovered so far. The travellers, who visited the Haram during the Ottoman period, have given different names—but all with a similar meaning—to the structures scattered around the north and west sides of the Dome of the Rock terrace, assigning to them a variety of purposes. Al-'Ayyashi (al-'Asali 1992: 210) called them 'houses' (*buyut*) for worshippers. Al-Madani (al-'Asali 1992: 320) called them 'chambers' (*oda*) for students who sought knowledge (*talabat al-'ilm*). It is al-Nabulsi (al-'Asali 1992: 259) who uses the term '*khalwa*' for these little structures. He wrote: 'We have found there various *khalwas* with domes on the edges of the platform of the Mosque of al-Sakhra (the Rock); these are built with columns and coloured stones ... some of the *khalwas* are inhabited, some are not, and some are blocked up.' Al-Saddiqi (al-'Asali 1992: 299-300) and al-Luqaini (al-'Asali 1992: 304) followed al-Nabulsi in the use of the term *khalwa* to refer to the buildings. According to their travel accounts, both men stayed in one of the cells when they visited Jerusalem. Al-Qayati (al-'Asali 1992: 325-6) described them as 'chambers' (*odas*) and as 'cells' (*khalwas*); he reported that they were used as residential units for those who resided inside al-Aqsa Mosque to study, and also for foreign visitors. He went on to report that one of the *khalwas* had been offered to him for his own use. Al-Qasimi, in the early part of the century, used the term *hujurat* ('rooms') for them (al-'Asali 1992: 338), and he also recorded that many of the occupants of the

rooms offered him the possibility of sharing their *hujra*. It is unfortunate that none of these accounts give enough information to allow an assured identification of the sixteen listed cells. Almost nothing has been recorded over and above the information given here, apart from the name of some of the cells which have been called after the patronym of the patron or user—such as Khalwat Jaralla, Khalwat al-Dajani, Khalwa al-Bairamiyya, and the Summer (al-Saif) Khalwat al-Saddiqi (al-‘Asali 1992: 299–300).

Architecture

The south elevation is the principal one of the building, and faces the Dome of the Rock. It is a simple façade, built of small white stones like most of the *khalwas* on the upper terrace; its first course is constructed at the level of the terrace of the Dome of the Rock itself. A rectangular window, measuring 73cm by 1.03m, is placed at the centre of the façade; it is surmounted by a slab lintel and directly above the lintel there is a relieving arch made of three voussoirs. Each voussoir is decorated by a trefoil. The relieving arch, instead of the more normal ‘eye-brow’ shape, has a small horse-shoe break at the centre. The plaque with the inscription described above is placed to the east and at the same level as the arch of the window. A small slit window is set slightly to the west, above the keystone of the arch. It measures 20cm wide by 30cm high, and it is also finished by a small incised trefoil. One course above the slit window, the building terminates without the usual projecting cornice. Since the upper part of this façade has been treated with recent concrete and with a different quality of stone, it is probable that there was originally a cornice which was damaged at some time, and has been replaced. The small hemispherical dome rests directly on the roof of the *khalwa*, and both roof and dome are now covered with small stone slabs. Unlike most other domes in the Haram, this one has no finial, so it is likely that it too had been damaged at some point and has been removed.

A stone dais measuring 1.82m long by 67cm wide and 56cm high, preceded by two crude steps to the west and three fine steps to the east, leads up to a rectangular area which acts as a vestibule. This measures 1.92m in width and 2.95m in length. The vestibule is used for both Khalwat Parwiz and for the western chamber of Khalwat Qitas (cat. no. 16). It is covered with old flagstones of various colours and sizes, the biggest of which is 46cm wide and 64cm long. The roof of the vestibule has been constructed recently, for it is flat and made of concrete. It is difficult to be sure of the original appearance of the roof—if, indeed, it existed at all. To judge from the fabric of the masonry of both *khalwas*, Parwiz and Qitas, and comparing their entrance to others on the upper terrace of the Dome of the Rock, it seems probable that the vestibule was never roofed. A column has been built in the centre of the south side. The shaft is a marble cylinder, and measures 56cm in diameter. It has no base and its capital is a type of modified Corinthian, presumably in re-use here. Unpublished, although known to Walls and Abu’l Hajj (1980: 29), a dated commemorative inscription is carved into the shaft of the column. It is composed of seven lines, most of them made up of two words written in a fine, sloping, Arabic script that is a form of very slender *naskh*. The Arabic wording appears here in Cat. Appendix 2 (no. 17) and its translation runs thus:

Praise be to God, it is written (by one) who is in need of the Exalted God, Ibrahim Abi [?] Hasan for (the sake of) remembrance. The year nine hundred and thirty nine (1532–3).

The north elevation is taller than the one to the south, for it is built at the ground level of the Haram esplanade and, as a result, consists of two sections. The lower part is built of stones larger in size than those of the upper part, a phenomenon that characterises all the *khalwas* of the Haram. A door in the centre of this part leads to the interior; it measures 70cm wide by 1.4m high, and is flanked to either side by a heavy stone jamb. The door is surmounted by a double arch, each section of which is made up of simple masonry blocks. Directly above the keystone of the second arch there is a stone roundel with geometric decoration. It is surmounted by a slit window, similar to the one mentioned above in the southern façade.

[Editorial note: The roundel is carved on a single stone, and is somewhat worn. It appears to be in re-use, for both the top and bottom of the fillet border running round the circumference of the medallion have been cut—the top by the bottom of the slit window and the bottom by the upper of the two relieving arches. The motif is in reserve, the spaces between having been cut away to leave the lines standing proud. It is difficult to read, and the interstices may once have been coloured with paint. The design is based on an octagon, the lines from each angle running to the centre and thus forming an 8-part star-polygon. The triangular wedges of the eight sections thus formed are filled with the triangular points of another star polygon, the tips of which touch the octagonal frame. Between this frame and the outer circumference there are narrow segmental spaces. Because of the wear and lack of colour, the basic clarity of this design—which is ultimately derived from two interlocking squares (see El-Said and Parman 1976: 8–9 and especially the first drawing of fig. 28)—is lost and the lines appear at first sight as a meaningless jumble. SA]

The upper level of the northern elevation is similar to that to the south apart from there being no inscription plaque, and the fact that the arch above the lintel of the window has an ‘eye-brow’ shape.

The western and eastern elevations are solid undecorated walls built in the same way and with the same features as the northern elevation, but without the door and the decorated roundel.

Interior

A door located in the east leads to the interior of the upper level, which consists of a single domed chamber, square in plan, with an internal measurement of 2.9m. The floor of this chamber is raised 57cm above the level of the terrace. It is paved throughout with 30cm square black and grey paving stones which have been laid in a geometric pattern. The quality and layout of this paving suggests that it dates from the Mandate period (1336–68/1917–1948). As described above, there are three windows placed in the centre of the walls to south, west and north, which are similar on the inside and have a semicircular arch with scalloped designs. The chamber is covered by a shallow dome which sits directly on the four walls. Small pendentives in the four corners serve as a transitional zone. The walls and the dome have been recently plastered and whitewashed.

The interior of the lower level is an almost square chamber measuring 3m by 2.9m; it is raised 10cm above the ground level of the Haram esplanade and its floor is paved with traditional flagstones. There is a blind niche in the north corner of the east side measuring 40cm wide and 30cm deep. A slit window in the centre of the western wall measures 20cm wide and 30cm high. It provides the only light source for the interior when the door is closed; the cell is thus a perfect place for a retreat. The chamber is covered by a cross vault, and is plastered.

18 SABIL BAB AL-MAGHARIBA

Name: Sabil Bab al-Maghariba (Fountain of the Gate of the Maghribis)

Date: Undated, but probably between 948-87/1541-79

Endowment: First endowment 987/1579, second endowment 1137/1724-5

Variants of name: Sabil Jami' al-Maghariba, Sabil Ahmad al-Kutahi; al-'Arif (1947: 94) refers to it as Bi'r al-Qubba (The Well of the Dome).

Modern name: Sabil Bab al-Maghariba

Location

The *sabil* is located within the Haram esplanade, about 15m east of Bab al-Maghariba.

Site and brief description (fig. 18.1, pls. 18.1-18.4)

The Sabil Bab al-Maghariba is a free-standing structure, close in design to the layout of the Well of Ibrahim al-Rumi (see below). It is simply constructed, consisting of single room which is square in plan and is covered by a shallow dome. A door in the eastern wall gives access to the interior, which is constructed around the mouth of a cistern. This, which was given the number Cistern 19 in the Ordnance Survey list (Warren and Conder 1884: 222), is certainly earlier in date than the building itself. While it was still functioning as a well-house, water was drawn from the cistern and distributed among three basins located inside the building, in front of the three windows. Although the cistern still contains water and a modern waterpipe was recently connected to the *sabil*, it no longer functions as a water distribution point. The cistern was converted from part of an inner passage that led from the Herodian gate now known as Barclay's Gate to a domed chamber, before turning south to slope up to the ground surface opposite Robinson's Arch. The gate is known as the Bab al-Nabi (Gate of the Prophet) from a late¹ Muslim tradition (Mujir al-Din 1973 2: 31) which claims that here the Prophet Muhammad tethered his steed al-Buraq, before visiting the Masjid al-Aqsa. Al-Nabulsi's description of the site (1101/1689) corresponds to the present layout (for a translation of the text, see Elad 1995: 101-2). Some time in the Ottoman period, before al-Nabulsi, part of the passage was adapted for use as an underground mosque, known as 'Masjid al-Buraq'.

History

A brief reference to the *sabil* was published by al-'Arif (1947: 94) when he listed it as one of the extant cisterns of the Haram, calling it Bi'r al-Qubba. Al-'Asali (1982: 294) also referred to it as one of the *sabils* of the Haram but called it 'an anonymous *sabil*', attempting to link it to one of the three fountains rebuilt by Daniyal Pasha, cited by Evliya Çelebi (Stephan 1980: 93-4). A third and more recent reference appears in *The Tübingen Atlas* (Bieberstein and Burgoyne 1992: no. 136) where it is again classified as 'an anonymous *sabil*', and dated tentatively to the 14th century without further elaboration. This date goes against a slightly earlier reference in 1988 by Taha (1988: 78), who considered the *sabil* more likely to have been constructed in the Ottoman period because of its layout and its decorative scheme. Taha, however, did not comment on the similarity between Sabil

Bab al-Maghariba and the Well of Ibrahim al-Rumi (see Burgoyne 1987: 542) dated 839/1435-6 (see also below for a full discussion of the possible date).

Endowments

There are two document in the *sijills* which seem to relate to Sabil Bab al-Maghariba. The first is short and imprecise but could be interpreted as referring to the *sabil* under discussion. It is in Sijill 59: 43 which includes the proceedings of Dhu 'l-Qa'da 987/December-January 1579. It states that 'in the presence of Muhyi al-Din Efendi al-Hanafi, the *qadi* of Jerusalem, Khalil ibn Zuraiq has acknowledged that his deceased mother, Asil the daughter of Muhammad ibn Hubaish, during her lifetime before she died, made a legal *waqf* of a big copper bowl to pour water from the *sabil* in front of the mosque of al-Maghariba. This was registered upon his (Khalil's) request.' The second document is a long *waqfiyya* recorded in Sijill 220: 33-4 dated Jumada I 1137/January-February 1725. It reports that 'Ahmad Efendi al-Kutahi, the former *qadi*² of Damascus, has endowed through his legal agent, Abu 'l-Wafa' al-'Alami, the whole half (12 *qirat* out of 24) of the shop that is located in Bab al-Qattanin district (the borders are given) for the benefit of the *sabil* which is located in al-Masjid al-Aqsa opposite Masjid al-Maghariba'. Ahmad al-Kutahi stipulated that the inspector of his *waqf* was to collect annually the rent from the shop, which amounted to eight *ghirsh* (gold coins). The inspector was to retain 3 *ghirsh* in recompense for his supervision, and he was to allocate each year 3 *ghirsh* to pay a water-carrier for the *sabil*. The water-carrier was to fill the basins of the *sabil* with water daily from morning until evening without omission. If he neglected his duty for one or two days, the inspector was to replace him. The surplus of the income, that is 2 *ghirsh*, was to be allocated to the cost of buckets and ropes for use in the cistern located below the *sabil*. In the event that the *waqf* could no longer be applied to the *sabil*, it was to be devoted to the poor anywhere. The donor also stipulated that the inspector was to make the *waqf* and its maintenance his first priority, and he appointed al-Shaikh Ahmad the son of Muhammad, the *imam* of the Malikiyya *sayyids* in the Maghariba mosque, inspector for his *waqf*. The position of the inspector should go after him (Ahmad) to any one who was the *imam* of the Maghariba mosque.

Architecture

Exterior

The four external walls of the building are identical. They are built of finely dressed stone blocks, both square and rectangular, of which the majority are white although there are also some which have weathered to black. Each of the four walls measures 3.55m wide and 4.2m high, and they are unbroken except for three identical windows set into the northern, western and southern façades. The windows share the same measurements of 1.03m wide by 1.48m high, they have the same sills and lintels, and they are now all fitted with iron grilles made from four vertical and six horizontal bars. The grilles of the windows to south and west appear original, but the grille covering the window to the north has been renovated, for the vertical bars are flat rather than cylindrical, and their upper ends stop short of the lintels rather than being inserted into them as in the other two windows. Below the sill of the northern window there is a rectangular stone measuring 74cm wide by 50cm in height; once

¹ On the traditions concerning the site where al-Buraq was tethered, see Elad (1995: 99-102).

² According to Sijill 215, which includes the proceedings of the years 1131-2/1718-20, Ahmad was *qadi* of Jerusalem.

this was pierced by a small circular aperture in the lower half, but the hole is now blocked and concealed. The block resembles one in the same position in the 'Well of Ibrahim al-Rumi 839/1435-6 (see below), and it is hard to guess its function. But it may once have acted as an overflow for any surplus water in the cistern. A stone dais, measuring 2.15m long by 84cm wide by 91cm high, runs along the eastern wall. Three steps lead up to it from the north and it serves to give access to a simple wooden door. The door opens into the interior; it is rectangular and is constructed of a single panel measuring 85cm wide by 1.48m high.

A stone cornice in the form of a *cyma recta* moulding runs around the top of the building, marking the roof level and the beginning of the dome. The dome has a shallow profile and is set directly onto the four walls without a transitional drum. It is capped with flat stones as a protection and terminates with a stone finial constructed in three sections. The upper part of the finial is in the form of a circle, facing south-north. Two plain roll mouldings serve both to mark the central section and to separate it from those above and below.

Interior

The floor of the interior of the *sabil* is raised about 1.1m above the level of the Haram. The head of the cistern is in the centre of the floor, surrounded by a white flagstone pavement. At the level of the window sills there are three similar but not identical marble basins. The basin to the north is covered by a white stone slab measuring 41cm wide by 86cm long by 11cm thick with a hole 15cm in diameter cut in the centre. The basin to the west measures 39-49cm wide by 72-82cm long by 22-24cm deep, whereas the south basin measures 46-58 cm wide by 66-76cm long by 33cm deep (the variations in measurement relate to the external and internal sizes). These basins must have held water drawn from the cistern, and cupfuls of water could then have been passed through the windows. The door and the three windows are each surmounted by an arch, constructed of five simple voussoirs, and above the arches there are rectangular niches. The niches all have an almost identical height (80cm) and width (52cm) but their depths differ, for the recesses to west and north are 30cm deep and those to south and east 20cm and 26cm respectively. The saucer dome is ribbed and rises directly from the walls with no intervening drum, the transitional zone being achieved by four small pendentives in the corners. The walls and dome are plastered and whitewashed.

Features and dating the *sabil*

The *sabil* has no foundation inscription and no incontrovertible contemporary reference to it has yet come to light. The present appearance of Sabil Bab al-Maghariba and the Well (*bi'r*) of Ibrahim al-Rumi 839/1435-6 are strikingly similar in many respects. With the exception of minor architectural variations such as the style of the cornice, the blocked up arches of the windows, and the measurements (see Burgoyne 1987: 542) the buildings are identical. One similarity among many is the location, for both are built close to one of the western gates to the Haram, and both are built over a cistern. Each consists of a single square room raised above the level of the Haram esplanade, covered by a ribbed dome carried on pendentives without a transition zone, and each has three windows. The problem is when Sabil al-Maghariba was first built.

There is no visible evidence that the present structure replaces an earlier building; neither al-'Umari (c. 745/1345 1924) nor Mujir al-Din (c. 900/1494-5, 1973 2)—the two most

informative authorities on the monuments of the Haram in the pre-Ottoman period—makes any mention of a building on the site. Burgoyne's *Mamluk Jerusalem* (1987) also makes no reference to the *sabil*, which appears anyway to be a single integrated construction. It is for these reasons the *sabil* is listed here among the Ottoman monuments, although there is no definitive evidence either to prove or disprove its Ottoman attribution.

There are, however, three references which might suggest an Ottoman attribution. The first, recorded in the relevant *sijill* (al-Husaini 1982: 109-10,15), reports that in the year 948/1541-2, Muhammad Çelebi al-Naqqash announced the completion of the restoration of an aqueduct and nine *sabils*. The aqueduct used to conduct water from the Pools of Solomon to nine public fountains in Jerusalem, in addition to others on the Haram precinct, and to certain *hammams* (bathhouses) in the city. Six of the nine *sabils* are known (cat. nos. 4-9) but three remain unidentified—and it is possible that Sabil Bab al-Maghariba is one of these.

The second reference is by Evliya Çelebi (Stephan 1980: 93-4) who states '... near the water-basin of el-Imam esh-Shafi'i is the Dome of Moses and the public fountains of the great Imam Abu Hanifa and of the Imam 'Ali. These [three *sabils*] were rebuilt by Danial Pasha in honour of the Imam 'Ali.' Unfortunately Evliya Çelebi gives no more information, nor does he specify when this rebuilding took place. However, there is a water-basin still extant which abuts the south side of the Mastaba of the Dome of Moses, which is dated 647/1249-50 (the Dome of al-Salih Najm al-Din Ayyub). This is probably the water-basin of al-Imam al-Shafi'i. There thus remain two *sabils*—those of Abu Hanifa and the Imam 'Ali—to be identified. This might conceivably be taken as additional evidence for an Ottoman date for the Sabil Bab al-Maghariba in the event that perhaps Sabil Bab al-Maghariba was once called either the Sabil Abu Hanifa or the Sabil al-Imam 'Ali.

The third statement, which has been already discussed, is the record in the *sijill* that a copper bowl was made a *waqf* for the *sabil* in the year 987/1579, although this does not necessarily mean that the *sabil* was not already in existence at that date. From the shreds of information garnered above, it seems likely that Sabil Bab al-Maghariba is an Ottoman building, possibly constructed some time between 948-87/1541-79.

19 AL-KHANQAH AL-MAULAWIYYA

Name: al-Khanqah al-Maulawiyya

Date: (A) The date of conversion of the earlier Crusader church into a mosque is unknown (see below)

(B) The minaret is undated, but must have been built before 995/1586-7

(C) The first (ground) level and the mezzanine level are undated, but are before 995/1586-7, the date of the second (roof) level

(D) The main chamber of the roof level is dated 995/1586-7

Endowment: The first endowment is dated 995/1586-7, and the second 1036/1626-7

Variants of name: The monument appears under several related names. In the *sijill* (see below) it is called either 'al-Khanqah' or 'al-Zawiya al-Maulawiyya'. Some of the records in the *sijills* refer to it as 'al-Saifiyya' following the *nisba* of its first *waqif*, Khudawirdi Beg Abu Saifain. The 16th-century plaque records the name as 'al-Khanqah al-Maulawiyya' (see below). Al-Nabulsi (cited by al-'Asali 1992: 271) and al-Saddiqi (al-'Asali 1992: 295) both call it 'al-Takiyya al-Maulawiyya'. Al-'Arif (1961: 500-1), al-'Asali (1981: 314) and the Auqaf File 30/17/29 refer to it as 'al-Zawiya al-Maulawiyya', but it is also designated both as 'Jami' and 'al-Masjid al-Maulawiyya' in Auqaf File 30/17/29, Burgoyne (1976 no.117), al-Husaini (1977: 20), and Najm *et al.* (1983: 367).

Modern name: Masjid or Jami' al-Maulawiyya.

Location

The complex of al-Khanqah al-Maulawiyya is located in the northern section of the Old City, to the north of the midway point on 'Aqabat al-Maulawiyya which runs between Tariq al-Mi'dhana al-Hamra' to the east and the main thoroughfare of Harat al-Sa'diyya to the west.

Site and brief description (figs. 19.1-19.8, pls. 19.1-19.8)

The complex at present consists of four levels. The first, the basement, is at street level, and access to it was possible for a short time recently. At ground level there is an entrance vestibule, followed by an open courtyard, a mosque that was originally built as a church, a tomb chamber, and a cluster of rooms grouped to the east and west of the courtyard. The mezzanine level contains a series of rooms, a courtyard occupied recently by a modern structure, and two staircases. The fourth and roof level consists of a staircase and the upper main reception chamber (*al-sama' khana*). The minaret is located in the south-eastern corner of the complex with its base at ground level; its apex rises above the level of the second storey.

To the west, the site is bordered by the street and to the east, north, and south by unsurveyed buildings which are presumed to be secular and to belong to the Ottoman period. Some of these are surmounted by domes which culminate in elaborate stone finials. The fact that these domed buildings are clustered round the *khanqah* might lead to the supposition that they are connected to it in some way. However, similar finials are to be found on many of the domes of secular buildings in the Old City of Jerusalem, and this may indicate that the finials were for the purpose of decoration rather than with any religious significance. The minaret and mosque still function, with daily

prayers recited in the mosque. There is, however, no longer a Sufi presence in the *khanqah*, and the other buildings in the complex are used for domestic housing.

History

Identification

The architectural layout of what is now the mosque confirms that it originated in the Crusader period. Western scholars from the first half of the 19th century to the recent past (for a complete list see Bieberstein and Bloedhorn 1994 2: 318) have attempted to identify the church with St John, with St Peter and finally with St Agnes. Vincent and Abel (1926 2: 164) were the first to identify the building with St Agnes, and Pringle (1982: 97) is the most recent scholar to support this identification. Al-'Arif (1961: 500) wrote concerning the site that 'it appears that the ground floor was originally a convent containing a Catholic church; after the Muslims took it over, it was converted to a mosque. This took place after the conquest of Salah al-Din'. Al-'Asali (1981: 340) gave the name of the Crusader church as St Agnes, but thought that it was the Ottomans who had converted it into a mosque. Al-'Arif and al-'Asali do not cite any supporting evidence for their opinions.

One *sijill* (66: 551) reference writes of '... the Khanqah al-Maulawiyya, which was constructed by our master (*maulani*) the donor Khudawirdi in Jerusalem the Noble, located in the neighbourhood of Bani Zaid of the Bab al-'Amud (Damascus Gate) district ...' In another record (*Sijill* 107: 302 and see below) it is recorded that 'the *waqf* income should be for the benefit of the *sayyids* of al-Maulawiyya who reside in Jerusalem in their own *zawiya* which is named after them, situated in the city of Jerusalem the Noble.' A foundation inscription confirms the identification of the main reception chamber (*al-sama' khana*) as being early Ottoman and equally the style of the minaret, which is cylindrical, is typically Ottoman (see below).

Al-Nabulsi (al-'Asali 1992: 271), who visited al-Takiyya al-Maulawiyya in 1101/1690, has left a detailed description. His rhetorical style is redolent of his period and it is striking that he makes no reference to the minaret despite the fact that it had been constructed before he visited the monument.

His account runs 'From there we set out in the direction of al-Takiyya al-Maulawiyya ... until we reached it with our brothers and we went up the stairs and entered the first level. It is a spacious courtyard with high walls. Then we climbed the second stairs to another courtyard smaller than the first. At this point we continued through up the third stairs reaching an open space smaller than the second courtyard. As we ascended we nearly reached the heavens (sky). All of these (buildings) are constructed with big stones and (have) strong arches of large boulders. From here we entered a spacious *diwan* (hall) paved with fine flagstones (*dufuf manhuta*) and surrounded with benches made for seating; and it (the *diwan*) is provided with a high attic (a small upper room—*al-sidda al-'aliya*). In the *diwan* there is a small fountain made of fine white marble; the water flowed within it as if it were a net (*shababik*) of pearls and sapphires. The whole *diwan* is covered by a cross vault of fine stone; it is surrounded by windows opening onto the entire Holy City. We were received by its pious Sufi Darwish Shaikh and by his brothers (colleagues). We were placed in front of the *diwan* and they performed the noble (*sama'*) for us, accompanied by the finest musical melodies. We enjoyed it.' In 1122/1710, al-Saddiqi (al-'Asali 1992: 295) also visited al-Takiyya al-Maulawiyya, but he gives no details of the building.

Date

The minaret¹

Burgoyne (1987: 416-7) writes that 'it [the Maulawiyya minaret] bears an unpublished inscription recording that it was built in 995/1586-7.' First, the inscription is not on the minaret but is above the lintel of the door of the *sama'* chamber. Secondly, the inscription was published by al-'Arif in 1961 (1961: 500) but his reading was, I believe, mistaken (see below), and finally there is no reference to the minaret in the inscription panel. The Minaret al-Maulawiyya is thus undated, contrary to the opinions of al-Husaini (1977: 20), Najm *et al.* (1983: 367) and finally Burgoyne (1987:416-7); not only is there no reference to it in the inscription but it also does not appear in any known contemporary account.

It is important to date the minaret correctly because the dates of the other three Ottoman minarets—the minaret of al-Hamra' (cat. no. 3), the minaret of al-Nabi Da'ud (cat. no. 1) and the minaret of al-Qal'a (cat. no. 26) are all much harder to establish with any degree of accuracy. Therefore, unsatisfactory as the situation is, they depend to a high degree upon the Minaret al-Maulawiyya for their dating. This in turn is because, in spite of the difficulties, the Minaret al-Maulawiyya is the only one whose date might be considered to have any textual support (see below). Yet this is only circumstantial.

In the absence of any solid external dating control, architectural technique has to provide a tentative answer. The south-eastern corner of the second floor—namely the *sama'* chamber—abuts the cylindrical shaft of the minaret as well as its octagonal transitional zone. The outer wall of this upper chamber at the point of intersection with the minaret is not a right angle like the other three corners at this level and the right angle of the same corner at ground floor level, but is instead built to encircle part of the shaft of the minaret. This suggests that the minaret was already built before the construction of the second floor, and further that it was built either at the same time as, or after, the ground floor. The date of this upper level is confirmed as 995/1586-7, first by the foundation inscription (see below), and second through the unpublished *waqfiyya* (see below under Endowment) which has been discovered in the *sijills*. It follows therefore that it is most likely that the minaret was indeed built some time before 995/1586-7. Another clue in the *waqfiyya* (Sijill 66: 551) confirms this suggested date. The donor stipulated that two of the five Sufis were to be *mu'adhdhins* in the minaret which stood in the *khanqah* (*wa ithnan mu'adhdhinnan bil-manara al-ka'inatu bil-khanqah al-madhkura*). Since Mujir al-Din (1973 2) mentions neither the *khanqah* nor the Maulawiyya order, and since the growth of the Sufi orders is associated with the coming

of the Ottomans to Jerusalem, the Minaret al-Maulawiyya is thus most likely to have been built during in the 16th century, some time before the year 995/1586-7.

The *Sama'* Chamber

The chamber is dated by the inscription plaque. This measures 85cm wide by 26 cm high and is placed above the lintel of the door leading to the main chamber in the second storey. It has a recessed frame with chamfered edges and consists of a single block of Arabic, disposed on four interconnected levels and written in Ottoman *thulth*, enclosed within a rectangular cartouche. The script is elongated, and its words are linked by dramatic *lam-alif* ligatures and by examples of the letter *ya* written with a strong horizontal termination running backwards. The style of the script is almost identical to the inscription recording the foundation of the Hujrat Muhammad Agha (cat. no. 20), and it is possible that the two plaques were designed by the same calligrapher. Van Berchem (1922-5) did not record the inscription but it has been published by al-'Arif (1961: 500). According to his reading, the translation of the inscription is as follows:

(There) has ordered the construction of this place that is called the Khanqah al-Maulawiyya, the Commander of the Noble District of Jerusalem, Khudawand Kar Beg (in the) year 995 (1586-7).

Al-'Asali (1981: 314) and Najm *et al.* (1983: 367) accepted the reading by al-'Arif without question. Although the decipherment of both the name of the monument and the date are correct, it would appear that there is an error over the name of the founder and his position, for the space is too narrow for all of these words. According to our version (see also the Arabic text in Appendix II, no. 19, below) of the text, which reads *ansha'a al-maqam al-sharif al-musamma bi'l-khanqah al-Maulawiyya amir al-umara' al-kir[am] Abu Saifain ghazi fi sanat 995*, the translation should be as follows:

(There) has constructed the noble *maqam* (place) that is called the Khanqah al-Maulawiyya, the prince of the esteemed princes, the warrior Abu Saifain, in the year 995 (1586-7).

For a comment on the epithet *al-ghazi* and the *kunya* Abu Saifain, see below under 'Founder'.

The rooms of the ground and first floors are not dated and it is impossible to suggest a date for them from their structural technique. But since the upper level can only be reached by way of the ground and first floor levels, these were obviously in existence some time—if not in their present form—before 995/1586-7. The details of the conversion into a mosque of what seems from its layout to have been a Crusader church are not known, as already explained, but the diversity in building technique and style would seem to indicate a slow development over a long period.

Founder

Just as the date of the conversion into a mosque, and the date when rooms were also added on the ground floor, are not known, so too the name of the patron is lost to us. The name of the patron of the upper level *al-sama'* chamber (the *khanqah*) is however recorded as *amir al-umara' al-kiram ghazi* Abu Saifain. The *waqfiyya* (Sijill 66: 551) is even more informative on the founder. It states, after listing a long series of epithets, that the donor and the patron of the *khanqah* is '*malik al-umara' al-kibar maulana*

¹ The term *khanqah*, which is used in the inscription, does not necessarily indicate that a minaret was part of the building. Three *khanqahs* that date from the pre-Ottoman period still exist in Jerusalem. These are, in chronological order: (a) al-Khanqah al-Salahiyya (*waqf* dated 585/1189); (b) al-Khanqah al-Dawadariyya (dated 695/1295); and (c) al-Khanqah al-Fakhriyya (before 732/1332). Of these three, only the Salahiyya has a minaret, perhaps because of its position, which is remote from the Haram area in what was traditionally a Christian neighbourhood, where a symbol of Islam was considered to be desirable. Similarly, the existence of the Minaret al-Hamra' (cat. no. 3) seems to stem from the need for a visible symbol of Islam in its district. The presence of the minaret on the site of the Maulawiyya may result from the fact that there was already a mosque there; it is also located in a area relatively remote from the Haram. It would appear that a either minaret was a standard feature of a *khanqah* or was present if a religious building was located at a distance from the Haram al-Sharif.

Khudawirdi Beg *al-shahir bi* (known as) Abi Saifain, the Governor of the district of Jerusalem the Noble'. In addition to the *waqfiyya*, there are many other records in the *sijills* under the name of Abu Saifain (see below under Endowments), but most of these records deal with the *waqf* rather than the person of the patron.

There is one, however, which gives further information on the life and work of Abu Saifain in Jerusalem. This record is to be found in *Sijill* 69: 486 which dates to the end of Jumada II 998/5 May 1590. It reveals that 'Khudawirdi Beg Abu Saifain, the former Governor of Jerusalem District, and the son of Muhammad Agha' (see cat. no. 20), had been killed by insurgents; unfortunately a precise date is not recorded for the event. In the religious court, Bayan, the *subashi*, accused Mahmud ibn Muhammad, one of the *timar* holders of Jerusalem, of collaborating with the Arab rebels (*al-'arab al-'usa*, the Bedu), and with highway robbers (*qutta' al-turuq*); they had killed Khudawirdi Beg and his companions, and had robbed them. Mahmud had taken the mule of Abu Saifain as part of his share. The final judgment found that the *timar* holders were not involved in the incident, and Abu Saifain the son (*walad*)—Muhammad Agha—had been killed by 'Ahmad al-Tüfekçi'.

Heyd (1960: 91) has summarised an interesting Order preserved in the Mühimme Defteri dated 16 Rajab 995/22 June 1587, which was sent to the vizier Sinan Pasha at Damascus. Sinan Pasha was informed in the Order that Khudawirdi (Hudaverdi) Beg of Jerusalem, had been exempted from taking part in the forthcoming campaign (see Heyd 1960: 92 n. 3) in order to guard the Holy Land. Khudawirdi had reported that the Bedu tribe named Kallaniyya (*sic*) had taken up a dominant position near Nabi Musa; he had fought fiercely against them and as a result seven rebels had been taken prisoner, thirteen had been killed, and more than twenty men had been wounded.

These two documents are interesting, for they provide information on the activities of Khudawirdi during his governorship of Jerusalem as well as throwing light on the state of security in the country, and they help too towards understanding the motivation and the circumstances which lay behind the string of epithets that appear both in the foundation inscription and in the *waqfiyya*. Our concern here must be focused on the last of these, namely the titles of Khudawirdi Beg, specially on the *kunya* Abu Saifain. This means literally 'the father of two swords'. The epithet *al-ghazi* is comparatively common in border contests especially in earlier periods, and denotes a Muslim warrior of the *jihad* or Holy War. Nevertheless, such a title does seem unusual in Ottoman Jerusalem. Other similar titles are given in the *waqfiyya* such as *ahad arkan al-daula al-mashhur bi-shiddat al-'azm wa'l-rujula wa'l-asad al-usud al-battal al-ashadd hamil rayat al-majd wa'l-fakhr*—'one of the pillars of state, known for [his] extreme might and courage, the lion of lions, the strongest hero, the bearer of the banners of pride'. It is true that such exaggerated claims are common in the period, but the events concerning Khudawirdi as reported help to place these epithets in their historical perspective.

The founder of the second endowment of 1036/1626-7 was a man called Muhammad Pasha, the then governor of Jerusalem. There are many records in the *sijills* concerning the architectural works in Jerusalem sponsored by Muhammad Pasha. One of his important projects was the construction and endowment of al-Zawiya al-Qadiriyya (1043/1633-4). Muhammad Pasha continued to live in Jerusalem after he had retired from office; while he was governor of the area, the Sabil Sha'lan was restored by means of a donation from Bairam Pasha, the vizier of Egypt. For more details on his biography see cat. no. 35 under 'Founder'.

Endowment²

Early period

Evliya Çelebi (Stephan 1980: 60) records that Sultan Selim, among other measures undertaken when he conquered Jerusalem in 922/1516, confirmed the chief of the Maulawi dervishes, Maulana Akhfash-Zade, in his office and granted him 500 *akçe* as voluntary alms (*sadaqat*). This is the earliest reference to the Maulawiyya order in Jerusalem. There is no suggestion that it was an endowment, and there is no mention of the *khanqah*. *Sijill* 10: 425 includes a brief record dated 16 Shawwal 945/10 March 1539 of the lease of a house 'located in Jerusalem in Bani Zaid neighbourhood by the beginning of the staircase of al-Maulawiyya'. This short reference once again gives no further details, but it is an indication that construction of al-Maulawiyya had begun well before its first endowment dated 995/1586-7.

The Endowment of Khudawirdi Abu Saifain

The first endowment discovered is the *waqfiyya* registered in *Sijill* 66: 551-2 under the year 995/1586-7. It is made up of three parts consisting of almost one thousand words and is dated to the beginning of Rajab 995/7 June 1587. The first part is an introduction concerning the rewards and the importance of a charitable donation according to religious teaching, and the last part as usual covers the validity and legality of the *waqf* after the donor, in the presence of the *qadi*, changed his mind and asked the *waqf* to be returned to his ownership. The middle section is the most important one for this study because it contains historical and architectural data on the monument. Some of this information has already been cited above, and the remainder will now be examined.

This section deals with the type of endowment, the stipulations, and the personnel together with the financial arrangements. The *waqfiyya* states that 'maulana Khudawirdi surnamed Abu Saifain, Beg of Jerusalem District, has attested in the religious court, while sound in mind and body, that he has made *waqf* the whole sum of 400 silver *ghirsh* equal to 500 *sultani*. The donor has handed over all the money to the Administrator of the *waqf*, and has made it a condition that the Administrator should make each ten of this money yield eleven and a half. This means that the *mutawalli* was obliged to lend out the money at an interest rate of 15 percent (*ribh*) provided that he avoided usury (*riba*). The money should be handed over for this purpose (the transaction) to a person who was to be trusted, pious and honest, either having a flexible mortgage or valid guarantees.' According to specialists in Islamic law in the religious court of Jerusalem, such as *al-shaikh* 'Abd al-'Azaim Salhab (the head of the Supreme Muslim Council), this practice would have been illegal, i.e. *riba*, and the words 'should transact legally' (*mu'amallat shari'a*) were blatantly misleading. It is worth noting that most of the *waqfiyyas* in the *sijills* repeat the same stipulation if the *waqf* was for a stated sum of money. Recently a number of Arabic Egyptian newspapers published a *fatwa* against the current *shaikh* of al-Azhar in Cairo, stating that the interest rate of the banks was legal and that there was no difference in principle between the Islamic banks and any others. It is clear from these divergent opinions that this matter is still a matter of dispute between scholars of Muslim law.

The *waqf* instrument states that the profit, which was to be 75 *sultani*, should be allocated for the benefit of five members

² In 1380/1961 the Director of the Auqaf asked the Chief Judge of the Shari'a Court in Jerusalem to provide him with a copy of the *waqfiyya* of al-Zawiya al-Maulawiyya in order to enforce compliance with the terms of the donor. The *qadi* suggested that an employee of the Auqaf be sent to search for the document, but it was not found.

of the Maulawiyya Sufi order, who were followers of 'the leading savant, the sultan of all the saints, *maulana munla* Khunkar'. They were to be residents in their *khanqah* in Jerusalem which had been constructed by the donor. The first of the five should be a *shaikh* for the *khanqah*; he was also to be *imam* and reader for the book of al-Mathnawi, attributed to 'the sultan of all the saints *maulana munla* Jalal al-Din—may Allah hallow his mighty secret.' Two of the five Sufis were to be *mu'adhdhins* in the minaret which was situated in the *khanqah*; one should be in attendance and in charge of lighting the lamps, and one Sufi should be the *bawwab* (door-keeper). The donor stipulated the following conditions:

(1) Shaikh Mustafa Muslih al-Din who was well-known and was called 'al-shaikh 'Alami Dida', the *shaikh* of the Maulawiyya order, was to be the '*shaikh* of the *khanqah*', *imam* in the mosque that was situated within the *khanqah*, and reader for the book of al-Mathnawi. He was to be allocated seven '*uthmani*' each day, three in recompense for the office of *imam*, and four for the position of *shaikh* and the reading.

(2) The donor has appointed *maulana darwish* 'Abd al-Qadir al-Maulawi, the son of Ahmad Çelebi al-Khalwati, on account of his honesty and piety as the Administrator of the *waqf*. He was to be allocated one '*uthmani*' per day, and after him the position was to be given to anyone provided that he possessed the same qualities.

(3) Qadi Muhammad, son of the deceased Qadi Badr al-Din al-Shafi'i, was to be the Inspector of the *waqf* during his lifetime and after him the position was not to be filled.

(4) The Administrator of the *waqf* should spend what had been assigned above for the personnel; he should pay the following:

Position	Salary in 'uthmani dirhams per day
The Administrator	1
The <i>shaikh</i> , <i>imam</i> , and the reader	7
2 <i>mu'adhdhins</i> (each two ' <i>uthmani</i> ')	4
The Attendant and the <i>sha'al</i> (lighter of lamps)	2
The door-keeper	1
Total expenditure per day	<u>15</u>

(5) Each of the five Sufis should be of the Maulawiyya order, a Turk, and of no fixed abode (*affaq*).

(6) Maulana 'Alami Dida had the authority to appoint and to dismiss; he was in addition to supervise the Administrator as well as the Inspector. After him, the post was to be given to anyone provided that he had the same qualifications.

From the various records in the *sijills*, it seems that the *waqf* of Abu Saifain for the benefit of al-Khanqah al-Maulawiyya proved to be unusually prosperous, and that the Administrator kept to the stipulations of the donor. Sijill 67: 161, dated 1 Jumada I 996/29 March 1588, reports that Amir Muhammad ibn Amir Hasan, the *subashi* at Ramla, owed a certain amount of money (not specified) to the *waqf* of Abu Saifain and al-Khanqah al-Maulawiyya called al-Saifiyya. A record in Sijill 72: 436 dated Muharram 1000/October–November 1591 shows that the master builder Mahmud, the son of the master builder Husain ibn Nammur, owed the sum of 23 gold coins to the *waqf* of Abu Saifain, in return for which he had mortgaged in its entirety his orchard, which was located outside Jerusalem. It appears that most of the money of Abu Saifain was lodged with Jews living in Jerusalem. Sijill 72: 295 dated 7 Rajab 999/1 May 1591 records that a group of Jews owed the *waqf* of Abu Saifain 400 gold coins and 60 coins as a profit. Cohen (1995: 181, 192, 195, 197, 199)

has recently summarised many citations from the Jerusalem *sijills*³ with respect to the money owed by Jews to the endowment of Khudawirdi, Beg of Jerusalem.

Another detailed document has been located in Sijill 91: 99 indicating that the interest on the money dedicated by the *waqfiyya* yielded so great a profit that there was a surplus of additional funds. The *qadi* therefore ordered 'Abd al-Qadir Zain al-Din, the Administrator of the *waqf*, at the request of the *shaikh* of the Maulawiyya, Muhammad ibn Nuh, to spend the surplus on buying food for the Sufis resident in the *khanqah*, and to appoint a *da'i* to perform petitioning prayers after *al-sama'*. It should be noted that these last two stipulations were not mentioned in the original *waqf* of Abu Saifain; they were an innovation and give a good idea of how the conditions of the *waqf* were altered, and how later it deteriorated.

The endowment of Muhammad Pasha on the Maulawiyya

In addition to the endowment of Khudawirdi Beg Abu Saifain, Sijill 107: 302-3 includes a *waqfiyya* dated 3 Rabi' II 1036/22 December 1626. It is relatively short, and was drawn up by the governor of Jerusalem, Muhammad Pasha. His name and some of his titles appear in the *waqfiyya* as '*amir al-'umara' al-kiram kabir al-kubara' al-fikham sahib al-'izz wa'l-majd wa'l-ihitiram maulana* Muhammad Pasha, Governor of the Noble City of Jerusalem'. The *waqfiyya* states that 'Muhammad Pasha, while sound in body and mind, attested in the religious court of Jerusalem in the presence of the *qadi*, Mahmud al-Husaini, that he has made *waqf* the whole *hakura* (vegetable garden) which contains planted trees (*ghiras*) of fig, rose, almond, and so on. It is situated in the Damascus Gate (Bab al-'Amud) neighbourhood in the Noble City of Jerusalem. The *hakura* is bordered to the south and to the north by passable roads, to the east also by the road but it is here that the door is, and to the west by the house of Ibn Firkah.'

Muhammad Pasha stipulated that the *hakura* was to be *waqf* for the benefit of *al-sada* al-Maulawiyya who were resident in the *zawiya* named after them, located in the Noble City of Jerusalem. If this were not possible, the *waqf* should be for the Muslim poor of the nation of Muhammad. Muhammad Pasha assigned *maulana* Muhammad Efendi, the *shaikh* of the Maulawiyya order in Jerusalem to be Administrator of his *waqf* during his lifetime and, after him, whoever was the *shaikh* of the Maulawiyya. In the case of the *waqf* being changed to benefit the poor, the Administrator of the *waqf* was to be appointed by the *qadi* of Jerusalem. No further details are given with regard to income or expenditure, but from a later *sijill* (179: 40) dated the last day of Dhu 'l-Qa'da 1087/3 February 1677 it is clear that the *waqf* of Muhammad Pasha at that time was devoted to feeding the Maulawiyya Sufis. 'Ali Efendi, *shaikh* of the Maulawiyya order, is also mentioned there as the Inspector of both the Maulawiyya *waqfs*—the first being that of Abu Saifain, and the second of Muhammad Efendi (Pasha) 'which is allocated for the feeding of the Maulawiyya Sufis'. Sijill 179: 40 dated the beginning of Dhu 'l-Hijja 1087/4 February 1677 confirms the above information for it states that 'al-Shaikh Kamal al-Din ibn al-Khalili, the Administrator of the *waqf* of Muhammad Efendi, which is allocated for the feeding of the Maulawiyya Sufis, asked the *qadi* to nominate a salary for him, for the post of Administrator demanded time and effort. The *qadi* assigned to him two '*uthmani*' per day'.

Later history

Both *waqfs* dedicated to al-Maulawiyya began to suffer from

³ The numbers of these *sijills* are 67: 222; 77: 448, 298; 78: 66; and 79: 43 respectively.

mismanagement at the hands of their administrators. Muhammad Efendi, holder of the post in the year 1076/1665-6, reported to the *qadi*, according to Sijill 165: 101, that part of the original capital money (that is the 400 *sultani*) had been lost during previous administrations. The *qadi* agreed to the request of Muhammad Efendi to raise the percentage of interest on the *waqf* money from eleven and a half *ghirsh* per ten to twelve *ghirsh*, in accordance with the rate of all transactions at that time (that is to 20 percent).

Sijill 220: 143, which includes the proceedings for the year 1137/1724-5, contains a document concerning the restoration of many parts of the *khanqah*. This had become necessary owing to the seriously dilapidated condition of the complex. The *sijill* reports on some of the architectural elements in the *khanqah* that were badly in need of repair and it implies a decline in the level of income from the *waqf*. The repairs which had been carried included: new plaster for the *sama'* chamber with new wood for its windows and door along with a new *takhtabush* (balcony), rebuilding the latrines, rebuilding the house below the latrines, and rebuilding the wall of the kitchen. According to the estimate made by the master builders, these works cost 150 *ghirsh asadi*, including the price of lime, wood, iron, *kittan* (flax or linen, probably used in plastering the walls), tools and carpenters. However, Muhibb al-Din, *naqib al-ashraf* (head of the descendants of Muhammad), who donated the money for the repairs, had managed to do all of the restoration work for only 115 *ghirsh asadi*.

A list of the men who acted as *shaikhs* of the Maulawiyya order can be drawn up from the *sijills* cited above.

Name	Year	Sijill no.
Mustafa Muslih al-Din ('Alami Dida)	995/1586	66: 551
Muhammad ibn Nuh Efendi	1019/1610-1	91: 99
Muhammad Efendi	1036/1626-7	107: 302
Muhammad Dida	1043/1633-4	121: 326
'Ali Efendi	1087/1676-7	179: 40
Danish 'Ali Efendi	1096/1684-5	187: 45
Al-Darwish Rasul	1137/1724-5	220: 143

The Administrators of the Maulawiyya *waqf* also feature in the *sijills*:

Name	Year	Sijill no.
'Abd al-Qadir al-Maulawi	995/1586	66: 551
ibn Ahmad al-Khalwati	999/1590-1	72: 295
'Abd al-Qadir Zain al-Din (surnamed ibn Da'ud)	1000/1591-2	72: 436
	1019/1610-1	91: 99

	1076/1665-6	165: 101
Kamal al-Din ibn al-Khalili ⁴	1087/1676-7	179: 40

⁴ Sadr al-Din al-Dajani was the last person to be appointed *shaikh* of the Maulawiyya order and also caretaker of al-Khanqah al-Maulawiyya in Jerusalem according to an authorisation (*ija'za*). This is dated 1383/1963 (Auqaf file 30/17/29: 76-7) and is signed by the three main *shaikhs* of the Maulawiyya order in Damascus, Aleppo and Homs as well as more than twenty other *darwish*. It is possible from it to get an idea of the duties and activities of the Maulawiyya order in modern terms. The specific duties are to serve the members of the Maulawiyya order when they visit Jerusalem by providing them with full board and lodging, as well as travel expenses to the nearest town with a Maulawiyya *zawiya*. The *shaikh* is to perform the *dhikr*, to recite the Qur'an every Monday and Friday night, as well as the nights of Islamic festivals, and to give the summons (*ibtihal*) on the minaret before the '*isha*' (night prayer).

From the same *sijills*, the Inspectors of the Maulawiyya *waqf* can be listed as follows:

Name	Year	Sijill no.
Muhammad ibn Badr	995/1586	66: 55
al-Din al-Shafi'i	999/1590-1	72: 295
'Ali Efendi	1087/1676-7	179: 40

Recent Waqf

Al-'Arif (1961: 500), without quoting his reference, or the date, or giving any further detail, records that 3kg (1 *ratl*) of bread and 2 *ratls* of meat were assigned to al-Zawiya al-Maulawiyya, probably daily, but that the allowance was later reduced to 1,470 *piastres* a month to feed all the members of the order.

Various estates are listed in the Auqaf files⁵ (30/17/29: 95) as endowments to provide income for the running costs of al-Khanqah al-Maulawiyya. These include: two houses, a single room, a stable, three chambers, a storage place, and a plot of land. All the estates are located either in the complex of al-Maulawiyya itself or in its vicinity.

Architecture

The Khanqah Maulawiyya is one of the more complicated sites in Ottoman Jerusalem. The plan of the site and the remains which still survive of the architectural fabric of the building make it obvious that the site had a long history before its Ottoman development began in the 16th century. The church (B—the mosque) clearly originated in the Crusader period. The basement was opened for a short period in late 1998, when a restoration project was initiated by the Welfare Association in collaboration with the Auqaf administration. The basement certainly needs further investigation, but the present study cannot wait any longer for its result. However, it might be dated either to the Crusader or the pre-Crusader period, and would thus fall outside the chronological scope of this book.

The site is located in a core residential area, at a relative distance from the Haram al-Sharif, and this has exposed it to alteration and modification. The difficulty, added to the topography of the area where the site is located, explains why the development of the Maulawiyya site formed a challenge for the developer. The transformation of the church into a mosque was relatively straightforward, involving as it did the insertion of a *mihrab* in the south wall and the blocking of part of the apse in the east wall. But when it was decided to build a minaret, it was no easy matter to reach the bedrock of the site or to integrate the body of the minaret within the fabric of the former church. Therefore the minaret, and in particular its base, is so to speak out of place. It is a massive base to serve such a modest minaret. When further development occurred, namely when the hall of the second floor (the *sama' khana*) was being built, the developer, for reasons that are not now obvious, instead of using the complete

⁵ File no. 30/17/29: 95 in the archives of the Auqaf Administration, as shown above, includes information about various aspects of al-Khanqah al-Maulawiyya. The earliest entry in the file, which contains some two hundred and fifty pages, is dated 22 Dhul 'l-Qa'da 1380/6 May 1961, and the most recent 30.11.1411/12 December 1991. The file deals among other things with the usual information on recent personnel and maintenance work relating to the building. In addition to the information given above, it notes that the Judge of the Shari'a Court made the Director of the Auqaf Administration caretaker of al-Zawiya al-Maulawiyya after 'Adil al-Maulawi, the last *shaikh* of the Zawiya, took up residence in Tarabulus (Tripoli).

space available used almost half of that space, leaving the whole appearance of the south façade of the prayer hall looking very odd. Finally, if one compares the plan of the basement with the plan of the ground floor, it becomes clear that the size of the former church was reduced, probably when it was transformed into a mosque. This surmise is based on the size of the last two piers of the prayer hall (namely those at the west end), for they are unfinished. Thus the site of the Maulawiyya has many inherent difficulties. These difficulties have continued to prevail until today, and the addition of a new house built of stone and concrete well illustrates the negative development of an historic site.

Exterior

The western street façade

Al-Khanqah al-Maulawiyya has one façade which forms the eastern support of the arched passageway which bears the name Qantar al-Maulawiyya. The *qantara* is undated, but it is obviously a later addition built after the façade. It is made up of four vaulted bays (three of them cross-vaulted) supported by five pointed arches. The arches span the passageway from east to west (3.4m wide by 3.25m high), apart from the northern arch which measures 2.1m wide by 2.3m high. The bays are all rectangular in plan, but they have different measurements. Only the north and the south arches of the *qantara* are visible externally, and although both are built of a double tier of voussoirs, surmounted by a rectangular window, they have a different span, as mentioned above, owing to the irregularity of the street alignment.

The masonry of the western façade consists of regular courses of simple, square, roughly dressed stone, and its upper part is largely obscured by the above-mentioned *qantara*. The façade is 18.45m long by 4.8m high, and it has five doorways. The first, to the north measures 1.05m wide by 1.4m high; it is surmounted by a pointed arch built of mainly square and occasionally rectangular stones. The door is blocked with stones of a quality similar to that of the arch and the courses above it. Formerly this opening gave access to the northern aisles of the basement (the undercroft of the church), but then the level of the street was raised and this explains why it is now only 1.4m high. It is not known when it was blocked, but taking the type of stone as a guide, it seems that the blocking took place some time ago. The second door measures 1.53m wide by 1.47m high; it has finely-dressed, white stone jambs with a slab lintel. Directly above it there is a relieving arch surmounted by a slit window, 22cm by 66cm. This door once led to an underground basement through the central aisle, but it has recently been blocked by concrete blocks. These blocks were removed recently to do a quick survey. The third opening is hard to see, for much has been changed there, but its place seems to be where two recent pipes now stand. The fourth, central doorway gives access to the interior of the *khanqah*. It is raised 87cm above the level of the street by means of four steps. The steps end in a rectangular landing measuring 90cm by 64cm which is paved in stone. The door is itself rectangular, measuring 80cm by 1.75m and it is surmounted by a simple slab. Twelve stone steps, each 28cm wide and 95cm high, lead onto an open courtyard. This serves today as the main entrance to the *khanqah*. The fifth door measures 1.05m by 1.9m and is fitted with a modern iron door; it too is very simple, and is surmounted by a lintel. It leads to a storage room which might once have been used as a shop. There are two further doors to the south, the first (the sixth in succession) measuring 83cm wide by 1.08m high, leads to the western rooms of the *khanqah*; these are built above the *qantara*. Here there are seventeen steps and the

passage is roofed by a barrel vault. The second door (the seventh in succession) leads to chamber K through a residential house known as Dar Tutah.

Interior

The Basement

The basement level, as mentioned above, was opened in late 1998 for a short time to enable a quick survey to be made. The survey was done by Riwaq for the Welfare Association with the approval of the Auqaf. I managed to obtain a copy of this survey,⁶ but was unable to spare the time to conduct a thorough investigation of the site. One may hope that in the near future such a study will be made.⁷ The plan shows that the basement—i.e. the undercroft of the Crusader church—comprises three aisles running from west to east. The central one is the largest. Six piers divide the three aisles into twelve unequal cross-vaulted bays. It is not known what the original function of this basement was. It is worth noting that the recent level of the street, though it was lately raised by the addition of a new pavement when the sewage system was renovated, accords with the level of the basement. This level was approached by the two openings described above which are set in the west façade of the mosque (i.e. the transformed church).

Ground (First) Level

The open courtyard (A1-A3)

The courtyard is irregular in shape, and is now divided into two by a stone wall. Access to each part is through a separate doorway. The first part (A1), which is nearly rectangular in shape, is approached through the sixth door described above (no. 33). Courtyard A1 contains two architectural components: the first is the staircase in its centre which leads up from the street level. The second part (A2) is a small room almost square in plan, built of stone, and located at the south-eastern corner of the courtyard. A door with a slab lintel in the northern wall gives onto the interior of the room. In the western wall there is a semicircular opening which is now blocked except for a door opening. The interior of the room is simple. There is a rectangular well-mouth in the floor and a square blind recess in the northern wall adjacent to the door. The chamber is roofed by a cross vault. Its extreme simplicity combined with the lack of any further information makes it hard to date with any certainty, or even to be sure if it constituted an original part of the *khanqah*.

Access to the second part of the courtyard A3 is through the main entrance of the *khanqah*, namely the fourth, central door described above in the discussion of the west façade. The floor of the second part of courtyard A3 to the north is paved with stone slabs of different colours. Its eastern section, lower by 60cm than the western part, is reached by means of three steps. To the north, it is bordered by the southern façade of the mosque and by the base of the minaret, to the east by various rooms and cells used today for residential purposes, and to the south by the tomb chamber G of the *shaikhs* of al-Khanqah al-Maulawiyya. Here

⁶ I am deeply grateful to Dr Shadia Tuqan, the Director of the Technical Office for the Restoration of the Old City of Jerusalem, for her kindness and generosity in allowing me to publish this plan together with other plans and sections of the site of al-Khanqah al-Maulawiyya.

⁷ Simona Ricka, a freelance architect, who supervised the survey, has kindly informed me that he is considering publication of a report on the basement and the mosque (the former church) of the *khanqah*.

there are also steps leading to the upper floor. There is also a stone tomb within this section of the courtyard, and close by there are two walled areas with plants. The first of these small gardens is square in plan and measures 1.6m by 1.6m; the second is more rectangular in plan and measures 3.8m by 2.1m. The tomb is surrounded by plants and is constructed of two courses of stonework on a rectangular base, the top being covered by a half-cylindrical block. The western end has a tomb marker in the form of the head-covering (a turban) of a Maulawiyya *darwish*; it has a funerary inscription on a stone plaque. This is rectangular and measures 22cm by 60cm. It has five lines of Arabic in simple Ottoman *naskh*; the exception to this is the one word *ruhichün*, which is written in Ottoman Turkish. The script is slender, well-cut and clear with diacritical points. The translation runs as follows:

1. He (Allah) is the Creator, the Eternal—
2. The late—he who has been forgiven—
3. Maulawi *shaikh*
4. al-Hajj 'Ali -
5. Say the *Fatiha* for his soul (in the) year 1271(1854-5).

The mosque (B)

The southern façades

The main—and indeed the only façade—of the mosque faces south. It is on a large scale, measuring 15m long by 7.4m high, and it is constructed throughout of regular courses of white, roughly chiselled stone. The façade is undecorated and is made up of two sections. There were once three window openings in the lower part; two of the three are still identical; each measures 90cm by 2m and is surmounted by an arch of three voussoirs. Modern iron grilles have now been fitted to these windows. The third window, to the east, was converted into a door at some point. Its measurements are now 90cm by 2.5m, and it is surmounted by a similar arch to the others. The jambs,⁸ the arches, and the grilles of the two windows and the door opening are similar to some on other buildings which date to the late Ottoman period, but which predate the modern architecture of the city. This suggests that the windows were either made recently or at least have been recently restored. West of the central window there is a blocked-up door surmounted by a double pointed arch, and vestiges of a further opening between the present central window and the door can also be seen. Perhaps the blocked-up door was originally a window or a door in the church, and the reason it was blocked, following the change in function, was to provide space for the *mihrab*. Below the western window there is a rectangular opening now closed with modern concrete blocks. The upper part of the façade is solid wall apart from three slit windows for illumination and ventilation, each of which measures 20cm wide by 80cm high.

The other façades of the mosque are obscured behind later buildings, although a further three slit windows are visible in the upper part of the western elevation.

The interior of mosque B is raised 70cm above the level of the courtyard and access is by means of two rectangular stone steps. The floor is paved with white flagstones. The interior consists of a rectangular hall divided into three aisles by four massive piers. A further two roughly finished piers form the west

end of the hall. They were probably reduced in size when alterations took place to modify the church to serve as a mosque. Square in plan, the isolated piers measure 90cm by 90cm. They are constructed of masonry blocks and there is an engaged column with the debased type of Corinthian capital with thick-leaved foliage typical of the Crusader period at the four corners of each. Below the capital, each pier is decorated at its apex by a *cyma recta* moulding.

The central aisle is subdivided into three square bays, each covered by a cross vault carried on four pointed arches. These vary slightly in span and spring from the four piers and from wall-brackets. The narrower side-aisles are also divided into three bays but here these are rectangular in plan. There are, as described above, three arched windows. The six small windows expressed externally as slits open out to appear inside as lancet arches. A concave *mihrab* niche now occupies the space once taken up by the door to the church in the centre of the south wall. The niche measures 80cm wide by 40cm deep, and is built of dressed masonry. It is surmounted by a semicircular arch of five white stone voussoirs decorated with a simple chamfered splay moulding at their lower edge. The arch is supported by two identical columns, each consisting of an octagonal marble shaft, a debased Corinthian capital of the thick-leaved type, and a square base with two torus mouldings enclosing a scotia. New repointing in black indicates a recent restoration of the niche.

The eastern wall of the mosque retains its original church layout; it is thus still dominated by three large blind recesses that correspond to the eastern ends of each of the three east-west aisles. The central niche (originally the apse) is the largest, as would be expected of the recess corresponding to the main aisle. The only minor modification that has occurred to this wall is that three stone platforms 80cm above floor level have been built within the recesses to act as benches. The northern wall is unbroken except for a slit window placed in the upper section of the north-western bay. The western wall too is now broken only by the three slit windows, but in the south-western bay there are traces of an earlier opening which may indicate that there was once a door here. There are also two engaged piers in the western wall; their function is probably to reinforce the wall.

The minaret (C)

The minaret is located to the north of the main courtyard (A) at the south-eastern corner of the mosque (B). It is constructed throughout of white masonry of varying sizes of stones, both square and rectangular. The elevation has four main parts. First there is the cubed plinth which has an octagonal zone of transition leading to a cylindrical shaft, which is subdivided in two by a ring moulding. The shaft is topped by the *sham'a* (lantern) which is, as usual, slimmer and shorter than the shaft.

The plan of the plinth is square, measuring 2.6m by 2.6m. It is 4.7m high. It is integrated into the south-eastern corner of the prayer hall, part of its western and northern sides merging into the corresponding walls of the mosque. The stones of the plinth differ in size and chiselling technique from the stones of the shaft, being both larger and rougher than the masonry of the rest of the minaret and of the upper storey. The masonry resembles that of the mosque, which would suggest that the outer walls of the mosque were rebuilt when the minaret was constructed. The plinth is solid and undecorated. It is remarkably massive to serve such a modest minaret, and is especially bulky when compared to other minarets of the period within Jerusalem. It is difficult to offer a reasoned explanation for its bulk.

⁸ Similar jambs can be seen flanking the windows of Sabil Sha'an (cat. no.36); they date to the last phase of restoration carried out sometime after 1831.

A chamfered triangle transforms the cube of the base into an octagon to support the cylindrical shaft. Such triangles serve only as the first step of the transitional zone, for the builder has constructed another, supplementary element in the eight solid faces that rise for six courses above. The first part of the transition is similar to that of the minaret of al-Nabi Da'ud (cat. no. 1) and the minaret of al-Qal'a (cat. no. 26), although the example here is clumsier. The triangles in al-Maulawiyya differ from those used in the construction of the minaret of al-Hamra' (cat. no. 3) and the minaret Bab al-Asbat (restored 1007/1598-9), for these achieve a greater grace. The only explanation, of course unsubstantiated, is that the difference is due to the relative skills of the master builder.

A roll moulding encircles the main cylinder of the shaft, dividing it into two unequal sections, with the upper one shorter than the lower; the lower section consists of fourteen courses of plain masonry 3.20cm in height. The only entrance to the minaret is to the north east of the lower section of the cylindrical shaft. Its location is thus different to the entrances of the other Ottoman minarets in Jerusalem—al-Hamra', al-Qal'a, al-Nabi Da'ud, and Bab al-Asbat—for in each of those cases it is located beneath the zone of transition.

The entrance to the minaret of al-Maulawiyya is rectangular and measures 60cm by 1.55m. The approach is by way of a stairway with 30 steps. This leads from the ground up to the first floor. The minaret is reached along a balcony which abuts the eastern wall of the main chamber of the third wall. It is supported by an iron corbel and has a modern metal barrier. The entrance gives immediately onto a spiral staircase which rotates round a cylindrical stone core. The stairs consist of twenty-nine steps, and terminate in the door (71cm by 1.7m) leading to the gallery for the *mu'adhdhin*.

The upper storey of the minaret is featureless apart from an oculus window placed two courses above the level of the roll moulding. There is a triple moulding at the head of the shaft which acts as a simple corbel. While the first levels of this are a simple *cyma recta*, the uppermost level is broken by a series of toothed recesses. The gallery for the call to prayer is set immediately over the summit of the shaft; it has a circular stone parapet of five courses measuring 1m in height, and it is topped by a slightly projecting cornice. Directly above this there is an additional parapet of stone slabs, 7cm thick, linked by iron joints reaching a height of 70cm. The gallery for the *mu'adhdhin* has no shelter. The uppermost part of the minaret is the *sham'a* (lantern), which is typically Ottoman in form, being a shorter, slimmer cylinder than the shaft. It rises directly from the gallery and is built of small stones of the same quality as the main fabric of the minaret. The lantern consists of two parts separated by a stone roll-moulding. The lower level acts as a support for the upper which is crowned by a small ogival dome. There is still a trace of what was once presumably a stone finial at the apex.

The cells and the chambers of the ground floor

The rooms are located to the east, south and west of the courtyard (A3) and the main prayer-hall. They were probably intended for use by members of the Maulawiyya community who lived in the city, or who were visiting Jerusalem. All the cells are today occupied by local people. Both the style and technique employed in their construction are simple, most of the masonry being undecorated. Usually only the elevation with the entrance door can be seen, and most of the cells and rooms are poorly lit and badly ventilated, for they rarely have a window. They are truly

representative of the local domestic buildings of Ottoman Jerusalem rather than of the public or commemorative architecture of the city. This makes it difficult to date them, particularly as there is no supporting literary evidence. To add to the problem, the use of the rooms as domestic dwellings has meant that for the last fifty years they have been constantly restored or modified to bring them up to standard. Most of the old floors have been replaced, the walls have been replastered, new doors and windows have been fitted, and so on.⁹

Room D is located to the east of the mosque at the northernmost point of the second (eastern) section of the courtyard A3. Access to it is gained by way of a door (80cm wide by 1m high) with a slab lintel in its southern wall. The interior is rectangular in plan measuring 6.85m long by 3.6m wide, and it is divided into two unequal bays by a pointed arch, which springs from an engaged pier to either side. Both sections have been recently paved and plastered, and each is covered by a cross vault. A recessed niche with a pointed arch dominates the eastern wall of the eastern section.

Rooms E1, E2, and E3 are situated to the east of the courtyard and to the south of chamber D. A large round-headed arch of simple masonry leads into room E1 which is rectangular in plan, measuring 2.3m wide by 3.5m long and 1.95 m in height. The room has a barrel vault, and a doorway at the east end leads to room E2. This is nearly square in plan, 3.55m wide by 3.35m long. There is a blind recess, 1m wide by 60cm high, in the north-eastern corner of the north wall under a semicircular arch. The room is illuminated by a slit window in the eastern wall. Both rooms E1 and E2 have been recently paved and plastered.

Room E3 is approached through a doorway in the east wall of room E1. It is nearly square in plan, measuring 3.35m by 3.55m, and is roofed by a cross vault. A blind niche measuring 1.1m wide by 60cm deep is opened in the north east corner of the room, and there is a splayed window in the east wall to provide light and ventilation.

Rooms E2 and F occupy the south-eastern corner. They are rectangular, 3.9m long by 3.55m wide, and are approached through two semicircular arches built into their western elevation. The arches are supported by a central pier and by the walls of the room to either side. The floor has recently been paved with geometrical tiles of various colours of a type which was popular in Palestine during the British Mandate, and has a double cross vault. A doorway in the north wall connects this chamber to room E1. In the eastern wall the traces of a door opening are still visible, although it has been recently blocked. It once led to unrecorded rooms situated to the east; these are now sealed, for they are full of rubble.

A tomb chamber is to be found in the south-eastern corner, 1.6m below the level of the eastern section of courtyard A. It measures 6.95m long by 4.4m wide. Four steps lead down into it and it is entered through a simple door measuring 1.1m wide

⁹ On a visit to the site in early November 1995 it was clear that a good deal of new construction had been undertaken at the *khanqah*. The character and features of the rooms and cells have been radically altered, and the plans will thus show a great many discrepancies from the current state of the complex. This is true of many of the monuments under discussion besides the Maulawiyya—al-Masjid al-Qaimari, al-Zawiya al-Muhammadiyya and so on—are continually being modified. The changes between the descriptions of this catalogue and the present state of the buildings will serve to document some of the recent rapid changes within the Old City of Jerusalem.

by 1.6m high in its northern wall. A semicircular arch precedes the doorway, and is so constructed that it provides support for the stairs to the south which lead up to the first floor. To the east of the door there is a small blind niche measuring 35cm wide by 60cm high by 30cm deep, which once contained the candles and oil-lamps that used to provide light for the chamber, as was the custom in some tombs in Jerusalem. The tomb chamber is rectangular in plan, 4.4m wide by 6.1m long, and it has a floor of high-quality white marble paving-slabs, 60cm by 80cm. The crisply cut edges of the slabs probably denote a recent restoration. Three identical rectangular stone tombs occupy the south-western corner of the room. Each has a cylindrical stone headpost with a cloth wrapped around each post (15–25 cm in diameter, and 65 cm tall), the form of which is probably intended to represent the tall hat (*kutah*) worn by members of the Sufi Maulawi order. The heads of the posts and the tombs are covered by a green pall. The three tombs are contained within a wooden enclosure. Although, unlike the tomb in the courtyard mentioned above, they have no inscription to help in the identification of their occupants, they probably belong to members of the Maulawiyya order. The tomb chamber has a barrel vault and its walls as well as the roof are plastered.

The *qantara* spanning the street is located to the west of the mosque hall and contains chambers H, J, K, L, and the vestibule I. The *qantara* was built at a later date, and most likely does not belong to the *khanqah*, for there is no evidence to associate it with the Maulawiyya complex. However, for the record, it is fully described in a separate footnote.¹⁰

The cells and rooms of the mezzanine floor

Access to the mezzanine floor is by way of two staircases. The first is situated in the northern part of courtyard A. The flight is split

between a first section of six steps running east, and a second section of nine steps running south. The lower section has been recently demolished. The second stairway is located to the south of the open courtyard (A). It has nine steps running east. It leads through a rectangular vestibule (1m wide and 3.6m long) to the open courtyard of the mezzanine floor (A). Courtyard A is a rectangle measuring 3.4m wide by 1m long, and it almost corresponds in size and situation to chamber F of the floor below. The ground of the courtyard is paved by good quality flagstones, and it is flanked to the north by chamber B, to the east by cells C, D, and E, and the south by rooms F, I, and K. This section of the courtyard was roofed in October 1995 with concrete and walls were built within it to create new residential space. This comprises room no.18, room no. 22, and room no. 23.

Since chamber B of the first storey is built over chamber D on the ground floor, it shares the same layout. A door 75cm wide by 1.95m high in the south wall gives access to the interior; it has the customary slab lintel. To the west of the door, a rectangular window measuring 94cm wide by 1.5m high illuminates the interior. It has a grille and a slab lintel, and directly above it there is a semicircular arch. The interior of the room is rectangular in plan (6.85m long by 3.6m wide), and, like the floor below, is divided into two rectangular sections by a pointed arch that springs from the northern and southern walls. Both sections have been recently paved and plastered, and each has a cross vault, although the eastern one is clumsily finished. A blind recess with a pointed arch, which serves as a cupboard, dominates the east wall of the eastern section.

Cells C, D, and E form the eastern side of this first-storey level. They are all approximately square with small variations in size and accuracy of construction, and are all reached through simple doors opening to the west. The original entrances for cells D and E were round-headed arches, but these have been recently blocked, leaving only the door openings constructed of concrete, probably to provide more privacy for the inhabitants. The cells have been recently paved, and they are tunnel-vaulted.

Cell F is located at the south-eastern corner of courtyard A. Although its entrance faces north, it resembles that of the three cells described above in that it was once an open arch but has

¹⁰ There are three chambers to the west of the mosque, located off the north-western section of courtyard A1. Together they make up the bridge-house (*qantara*) built on the archway above the entrance to the *khanqah*. Room H is, like the others, built of stone. Its approach is through the fourth entrance to the south in the only, western, façade of the *khanqah*, by way of the stairs leading to courtyard A1. A door in the east wall leads into the interior. It measures 80cm wide and 1.67m high, and is surmounted by a slab lintel. Two rectangular windows give light to the interior of the room; the one to the south, 85 cm wide by 1.15m high, opens onto the main road. It has a slab lintel and is fitted with an iron grille. The second window to the west is less elaborate, but it has the customary stone lintel and measures 55cm wide by 80cm high. It is splayed. Both are expressed on the inside by semicircular arches. The room is rectangular (4.25m long by 3.05m wide) with a modern paved floor, newly plastered walls and a shallow saucer vault.

Access to the other three rooms—J, K and L—is from a rectangular vestibule I (which is surmounted by a relieving arch. Room J, which is better described as a cell, is lit by a small, rectangular, splayed window to the west measuring 50cm wide by 50cm high with a slab lintel. Like the rest of the complex, it has been recently paved, and has a cross vault. Room K occupies the main part of the archway to the north of vestibule I and cell J. It consists of a rectangular plan 5.3m long by 3.75m wide, and it too has modern paving; it is covered by a tunnel vault to the north end and by a cross vault, to the south. The northern wall is pierced by a rectangular window (95cm by 1.35m) which is surmounted by a slab lintel and is fitted with an iron grille. There are five niches of various sizes in the room for storage. Chamber L lies between mosque B and room K. It now has a door in the western wall but this appears to be recent, for it is comparatively low at only 1.60cm in height and is only 65cm

wide; there seems to have been a doorway, now blocked, in the south-eastern corner of the chamber. There is a lancet window in the wall to the south, 80cm wide by 1.2m high. The interior of the room is rectangular, measuring 5m long by 3m wide, and is divided into two by a pointed arch. The floor has been recently paved. The section of the room to the south is covered by a domical vault, while that to the north has a different vault, spindle-shaped in ground plan. A bathroom and a small additional room (M) have been built to the north of room L, with access to both through an opening in the northern wall. The additional room is small, only 1.2m long by 1m wide, and is lit by a small square window in the north wall, 50cm by 50cm. The purpose of the room is not clear; it was perhaps intended for storage or as a dressing-room. A narrow door 60cm wide by 1.3m high leads to a rectangular vestibule measuring 1m wide by 3m long. Ten terracotta openings in the tunnel vault of the roof provide air and light. A blind recess 70cm wide by 1.35m high with a semicircular arch acts as storage space in the north-western corner of the vestibule. The bathroom is located to the east of the vestibule and to the north of the small additional room described above. It consists a small single square room, 1.5m wide by 1.5m long. High-quality square white flagstones with a black slab in the centre provide the flooring. The walls are still covered in new plaster. A shallow dome carried on four pendentives is pierced by sixteen irregular round terracotta tubes which provide illumination.

recently been blocked. The interior is square (3.45m long by 3.35m wide) in plan and is covered by a cross vault.

Chamber I is constructed above the ground-level tomb chamber. Access to it is through a door, 85cm wide by 1.5m high, surmounted by the usual slab lintel. The interior is rectangular in plan measuring 6.75m long by 4.45m wide, and the floor is covered in concrete. There is a rectangular skewed and splayed window in the south wall to give light, and the only other feature is a recess in the west wall. The chamber is covered by a cross vault supported on four pointed arches, with the recess formed by them to the north being deeper than the others. The walls and the roof have been newly plastered.

Chamber K is located south of chamber I. It is possible that it was once approached from the open courtyard (A3). Access to Chamber K is now through a doorway situated a few metres south of the sixth door in the west façade of the *khanqah* at street level, and was described above. The access doorway leads up stairs and once gave access to several units, including a small open courtyard. This is now covered by a roof. At present these units serve as a house for a family and together are known as Dar Tutah. The south elevation of chamber K is located in front of the small courtyard previously noted. This elevation is stone-built like the rest of the chamber, with a door and a double window. The door is 90cm wide by 1.7m high; each part of the double window measures 70cm wide by 1.3m high and each has stone jambs of dressed stone, surmounted by a slab lintel and fitted with an iron grille. A slit window pierces the upper section of the façade.

The interior of chamber K is rectangular in plan (6.35m long by 3.1m wide), divided into two parts by a pointed arch. There are four blind niches, two in each of the western and eastern walls. The first niche (to the north in the western wall) is large—2.1m wide by 50cm deep—and begins only 50cm above floor level. It is contained within a semicircular arch. It would appear that this niche might have originally been a window, for a slab lintel and jambs are still visible at the same level on the external western wall. The second niche is located on the same wall to the south; it is smaller, measuring 1m wide by 30cm deep, and starts even closer to the floor at a level of 30cm. It too is framed by a round-headed arch. The first niche in the northern section of the eastern wall measures 1m wide by 30cm deep; it also has a round-headed arch. The second niche in this wall, which is located to the south of the niche already described, also has a round-headed arch, but is larger at 1.8m wide by 30cm deep.

The northern section of room K is covered by a cross vault with a small saucer dome in the centre. The southern section, which is nearly square in plan, has an elaborate dome, expressed on the inside as a shallow saucer of multiple flutes. The transition from square to circle is achieved by a way of four pendentives at the corners and eight folded triangles, each one representing one side of the octagon. The whole of the roof has been recently plastered and stylistically resembles the Northern Khalwa of Ahmad Pasha (cat. no. 22).

The second floor (roof level)

This floor contains chamber A, an open courtyard B, and a rectangular balcony D (described above) which leads to the entrance of the minaret. Access is by way of a flight of eleven steps, followed by eight steps, each measuring 1.1m wide by 34cm high. The stairs run north from the floor below, leading to an open rectangular courtyard (B). This courtyard measures 8.1m wide by 4.2m long and is paved with old flagstones of high quality. To the

north, east, and south it is surrounded by a wall of stone and concrete blocks. At present two recent small rooms (B1 and B2) of concrete occupy the courtyard, and constitute the northern part of it. The western room measures 3.15m long by 2.05m wide, and access to it is through a door in its south wall; a square window is situated to the east of the door. The eastern room measures 2.65m long by 1.85m wide, and is approached by a simple door in the south wall. These two rooms appear to have been constructed during 1995, for a survey by the Department of the Islamic Archaeology (which was finished in 1979) shows that there used to be a square building in the north-western corner of the courtyard.

The principal façade of the main chamber (A) is to the east. It has the only door giving onto the interior. The door has a heavy white slab lintel with the inscription plaque described above, which is 85cm wide by 25cm high, set directly above it. To the south of the door, there is a large rectangular splayed window with a slab lintel, covered by a modern iron grille. With the exception of the door and the window, the façade is featureless, the courses of the stones showing no variation to the level of the roof, which rises in a curving arc at the centre of each side of the building and is covered by small flagstones. The remaining three elevations, to the south, west, and north, share similar masonry and design, the only difference being in their fenestration. While the northern elevation is unbroken, the façade to the west has three identical window openings,¹¹ each with a slab lintel and crowning semicircular arch; all are fitted with iron grilles. The southern elevation, like the one to the east, has a single large window.

The interior is a single rectangular space with an internal measurement of 5.55m wide by 5.65m long; in some places the wall is 90cm thick. The floor is paved with dressed flagstones. The chamber is covered by a cross-folded vault with a saucer dome in the centre. The vault sits on four massive pointed arches. The arched recess to the south is deepest and measures 1.6m wide by 3.95m long. As already described, there are five windows in all—one window in each of the eastern and southern walls, and three windows to the west.¹² The windows and the vault conform in general terms to the description by al-Nabulsi (see above). There are two blind niches, the first 65cm wide by 1.8m high, in the eastern wall between the door and the window. The second is in the southern wall to the west of the window, 65cm wide by 1.3m high. There is also a blocked-up door¹³ in the south-eastern corner of the chamber that once gave access to the minaret. The walls, arches and vault have been plastered and whitewashed.

It will be clear from the description of the Maulawiyya complex that the site is complicated by reason not only of its different levels, but also because of the varying types of construction, building materials, and the size and arrangement of the rooms. It would appear that one reason for this complexity is that the buildings were used as housing first for the Sufis and then, later, for ordinary residents. With the exception of the mosque, the minaret and the *sam'a khana* at the second floor level, it is difficult to discern any clear function for the various components of the site other than use as residential rooms. At the

¹¹ The Welfare Association plan suggests that one of these windows is a door.

¹² The Welfare Association plan suggests that there is a blocked-up window to the north.

¹³ The Welfare Association plan suggests that this door is a window.

end of the 16th century, to judge by the evidence in the *waqfiyya* (which was discussed above under the section marked 'Endowment'), it would appear that the number of Sufi residents in al-Khanqah al-Maulawiyya in Jerusalem was limited, never being more than ten persons. It is not known how many Maulawi Sufis arrived periodically as *affaq* (wanderers or guests), but it is probable that once it became known that the *waqf* was rich and earning a good deal of profit, the number of the Sufi residents increased significantly. If a comparison is made between al-Khanqah al-Maulawiyya and al-Zawiya al-Qadiriyya (cat. no. 35), it will be seen that the latter has survived almost intact as it was built by its founder Muhammad Pasha, unlike the former, whose components, apart from the *sama' khana*, mosque and minaret, are almost impossible to identify. Unfortunately nothing has remained of al-Zawiya al-Khalwatiyya (cat. no. 3) to allow its comparison with al-Khanqah al-Maulawiyya.

Although the fabric of al-Khanqah al-Maulawiyya lacks decoration apart from the moulding on its minaret, this is not exceptional. Most of the architecture of the Sufi foundations—and, indeed, of the Ottoman institutions in Jerusalem as a whole—are without significant decorative elements. The Sufi institutions, such as al-Zawiya al-Khalwatiyya (cat. no. 3), al-Zawiya al-Qadiriyya (cat. no. 35), al-Khanqah al-Maulawiyya, or al-Zawiya al-As'adiyya on the Mount of Olives (*waqf* 27 Muharram 1033/20 November 1623) appear austere when compared with the imperial monuments, such as the walls of Jerusalem or al-Imara al-'Amira (cat. no. 15), or even the *khalwas* of Ahmad Pasha on the esplanade of the Haram al-Sharif (cat. nos. 22-25). This could reflect the principles of the Sufis who, as their name implies, originally concentrated on a modest lifestyle of strict simplicity, seeking to avoid luxury or extravagance.

20 HUJRAT MUHAMMAD AGHA

Name: Hujrat (chamber) Muhammad Agha

Date: 996/1588

Endowment: See below

Variant of name: Khalwat Muhammad Agha

Modern name: Most recent authors who have compiled lists of the monuments of Jerusalem have called the cell 'Khalwat Muhammad Agha' contrary to the evidence of the foundation inscription and the *sijill* documents, both of which use the term *hujra*. It is also known today as 'Maktab Ra'is Haras al-Haram al-Sharif' (Office of the Chief Guard of the Noble Sanctuary).

Location

The *hujra* is to be found to the north of the Dome of the Rock terrace, abutting the west side of the north-western colonnade (738/1336-7).

Site and brief description (figs. 20.1-20.4, pls. 20.1-20.7)

Hujrat Muhammad Agha is built on the north side of the terrace of Haram al-Sharif. The lower part of the north façade is on the same level as the Haram itself, while the south façade is at the higher level of the terrace and faces the Dome of the Rock. It is raised, indeed, 50cm higher above ground level. The *hujra* abuts the north-west colonnade to the east, and the Odat (chamber) Arslan Pasha to the west (cat. no. 41). The building consists of two parts; the lower area is made up of a square room, while the upper consists of a domed chamber preceded by a two-domed portico. Access to the upper part is through a small antechamber. The upper chamber of the *hujra* is used today as the office of the chief guard of the Haram, whereas the lower chamber still serves as a dwelling for one of the custodians.

History

Identification

Hujrat Muhammad Agha is identified as belonging to the Ottoman period by a foundation inscription. An entry in the *sijills* (115: 166) confirms this identification.

Date

The date of the *hujra* is inscribed at the end of the last line of the foundation inscription as 996/1588. The plaque on which the text is inscribed is attached to the eastern part of the southern façade; it is of marble and measures 80cm in width and 60cm in height. It contains four lines of Arabic written in Ottoman *naskh*. The calligraphy is of high quality, slender and condensed, and is placed within a rectangular cartouche. It has been published by van Berchem (1925: 189-90). Its translation is as follows:

1. (There) has constructed this elegant chamber, opposite the Sacred Rock, a man famous in his time and the most distinguished among
2. The notables—our master Muhammad Agha, who has achieved the renown of the highest glory in the august house of the Sultanate (= the imperial palace at Istanbul).
3. By the hand of him whose benefits are world-wide and whose good deeds endure for ever, the most accomplished of princes and the most perfect in his time among the governors,
4. Our master Khudawirdi Beg, surnamed Abi (*sic*) Saifain, in the year nine hundred and ninety six (1588).

Van Berchem (1925: 190) instead of 'Abi Saifain' read 'the second Sufyan', and connected it with two prominent characters, the first Sufyan al-Thauri, and the second Sufyan ibn 'Uyaina. However, another close reading of the inscription, backed by the evidence of the *sijills* (67: 161; 69: 486; 72: 295, 436; 76: 224; 179: 40; 165: 101) would indicate that van Berchem was mistaken.

Founder

It appears from the foundation inscription that Muhammad Agha had asked Khudawirdi Beg to construct a *hujra* for him in the Haram. The relationship between the two men is not made clear in the inscription, but the *sijill* (69: 486) reveals that Muhammad Agha was the father of Khudawirdi, and that Khudawirdi was the governor of Jerusalem district (*mir liwa' al-Quds al-Sharif*). Further details of his role and activities in Jerusalem are given in cat. no. 19. The role of Muhammad Agha in the life of Jerusalem is not, however, clear because of a dearth of information. Nevertheless, it can be inferred from the foundation inscription that he was associated with Istanbul in some way.

Endowments

Some form of endowment, whether in the form of cash or an estate, must have been made *waqf* for the benefit of the Hujrat Muhammad Agha. *Sijill* 115: 166 shows that on 17 Jumada I 1038/12 January 1629 the *qadi* appointed 'Ali Efendi, son of Husain Beg, to the position of reader of the Qur'an. 'Ali Efendi was to recite Qur'an Sura 36 (*Ya Sin*) every morning within the upper room (*al-hujra al-fuqaniyya*) of the Hujrat Muhammad Agha, and the merit of the reading should be for the soul of the Prophet Muhammad. He was to be paid twelve gold pieces a year, and to be allowed to dwell in the lower room (*al-hujra al-tahtaniyya*) of the building; he was also permitted to cultivate and use (*al-intifa'*) the small garden that belonged to the *hujra*. 'Ali replaced his father Husain as *shaikh* of the Noble Sanctuary of Jerusalem immediately following the latter's death. A *waqfiyya* must have been drawn up to set out the conditions and financial arrangements for the *hujra*, but so far a careful search of the *sijills* in Jerusalem for the years close to the date of construction has yielded no trace of one. Perhaps, in view of Muhammad Agha's connections with Istanbul, it was recorded there. It is unfortunate that there is no information on funding arrangements. It seems possible that funding either came directly from the donor in Istanbul, or it could have been arranged in Jerusalem by his son, Khudawirdi Abu Saifain, who was governor of Jerusalem in 995/1587 (see cat. no. 19 under Founder).

Architecture

The principal façade of the *hujra* is the one to the south, facing the Dome of the Rock. This was the express wish of the patron, Muhammad Agha, as is made clear by the foundation inscription and in the *sijill* (115: 166). The masonry façade is raised above the level of the Dome of the Rock terrace by means of a rectangular stone dais measuring 5.8m long, 2.1m wide and 50cm high. The dais is paved with high-quality white flagstones similar to some of the slabs covering the terrace itself. The façade is fronted by a double-domed portico carried on two pointed arches of the same height and span. The arches spring from two identical piers and from a central column situated half-way between them. The shafts of the two piers are made up of eight square masonry courses whose chamfered edges terminate at top and bottom in a triangular cut. The shaft of the column is constructed from two octagonal fragments; a third acts as a high base which has been

reduced in size at its upper edge to allow it to conform to the octagonal stone above it. Four shallow recesses are cut into its corners. A roll moulding marks the beginning of the capital of the central support, and the capital itself is decorated with four lotus leaves. The square plinths and the astragal mouldings of the piers and the column are similarly plain, apart from a *cyma recta* carving on the astragal. A billet moulding runs around the top of the portico and, directly above, a stone cornice projects forward to mark the level of the roof. The two small domes of the portico are just visible from the ground level of the upper terrace. These domes are therefore rather shallow. In order to provide protection from the weather they have been covered in flagstones. The domes are expressed on the interior as two small plastered vaults with thirty-two ribs each, carried on three lateral arches which spring from three brackets projecting from the south wall, and from the two piers and column that support the portico. The brackets are identical; each is made up of two undecorated parts, the lower with a frame moulding and the upper with a *cyma recta*. The transition zone is achieved by way of four pendentives at the corners of each dome.

The south wall, which is shared by the portico and the main chamber, is built of undecorated masonry, interrupted only by two rectangular windows and the foundation panel described above. Each window measures 74cm wide by 1.3m high, and is surmounted by a slab lintel. Iron grilles are preceded by a recent wire mesh grille. The inscribed panel is situated one course above the window to the east.

A low antechamber was built some time after the *hujra* itself, for the walls are not integrated into the main fabric of the building. The antechamber is raised above the level of the Dome of the Rock terrace by 40cm, and two large steps lead to its interior. Its entrance is comparatively wide, measuring 3m, and was once open but has recently been closed by a wooden door. The entrance is surmounted by a pointed arch which springs from two pillars. The stones of these, now black, have been discoloured by the overspill from two waterspouts at the top of the pillars. A small dome with external flagstones is set directly over the four walls of the antechamber.

The east elevation of the main *hujra* is constructed in two sections. The lower plain part has ten stone courses, and, owing to the slope of the stairway, these reach a height of 2.67m at the north-east corner and 1.4m at the south-east corner. The difference reflects that between the two levels of the Haram, namely its terrace and its esplanade. At the level of the eleventh course a chamfered cut (15cm deep) connects the upper part of the façade. The heavy base of the building is intended to provide a suitably solid foundation for the upper section and has the added feature of acting as a buttress to the terrace above. The feature of such a solid base is to be found in most of the *khalwas* built at the divide between the two levels of the Haram esplanade.

Two similar rectangular windows are set in the upper part of the east façade. They start immediately above the chamfered recess and measure 75cm wide by 1.2m high; they are fitted with simple iron grilles and wire mesh. The windows are each surmounted by a lintel and directly above the lintel there is a relieving arch made up of three voussoirs decorated with a relief moulding. A blind oculus window is centred above; it is made up of eight voussoirs encircling three stones set in the form of a 'T'. A simple stone cornice projects round the building on the east, north and west sides. The portico has a different and, as is fitting, a more elaborate, denticulated cornice. A plain masonry parapet is built above the cornice of the main *hujra*. The main dome of the

hujra rests directly on the four walls of the building. The dome and the roof are both covered with small flagstones. The dome culminates in a simple stone crescent finial.

The north elevation is also made up of two sections. Its lower part, which measures 6.1m wide by 3m high, includes a door opening into a small room. The door measures 85cm wide and 1.55m high and is surmounted by a remarkably white stone lintel slab measuring 42cm in height and 1.97m in width. A very narrow slit window measuring 15cm wide by 48cm high is set above the lintel to give minimal light and ventilation to the interior. The upper part of the north elevation is dominated by two rectangular windows. These windows are placed at the same level as those on the eastern façade but here they are bigger, with a width of 80cm and a height of 1.2m; each lintel is surmounted by a relieving arch consisting of three voussoirs. The courses of this façade continue the same arrangement as the eastern one to the level of the stone cornice.

The western elevation is both the simplest and the heaviest of the four. It is made up of an undecorated wall unbroken apart from a small slit window of the same dimensions as the one in the northern elevation. Although the façade is plain, it is divided into three components. The lower one has the appearance of a buttress, measures 1.5m in height, and is recessed about 40cm. The middle part is 60cm in height and is also recessed, but at the same level as the eastern and northern elevations. The upper part is featureless; it is 1.6m in height, and is built of the same masonry courses as the rest of the *hujra*.

Interior

Access to the upper chamber of the *hujra* is through the antechamber that lies to the west of the building. The interior of the antechamber is very simple. It is rectangular in shape and measures 3m by 2.75m. The floor is flagged. The room is covered by a cross vault with a small shallow dome at the centre, and it has been replastered recently.

Access to the upper chamber of the *hujra* is through a small vestibule in the north-east corner of the antechamber. The vestibule measures 1m wide by 2.2m long, and is covered by a tunnel vault. To its west it is surmounted by a slab lintel and on the eastern side, that of the interior, by a pointed arch. The interior of the chamber is square in plan and is constructed with noticeably thick walls 85cm in depth. It is raised 37cm above the level of the vestibule by means of two steps. The six windows, as already mentioned, open to the south, east, and north; their frames have been recently plastered and they are surmounted by a segmental arch. They begin just above floor level at a height of 20cm. A blind rectangular niche, 1m by 35cm, is opened in the west wall. The hemispherical dome rests directly on the four walls, and on four pendentives at the corners of the chamber without an intervening circular drum. A slightly recessed blind roundel decorates the north wall of the chamber.

The interior of the lower chamber of the building is almost square in plan, measuring 3.8m by 3.9m, and its wall depth is 1m. The floor is not paved and the roof is covered by a plastered cross vault. Three identical blind niches are opened respectively in the east, south and west walls, each measuring 92cm wide, 1.20 m long and 65cm deep. They are surmounted by arches and hoods, and are raised 25cm above floor level. The door is flanked inside by two blind recessed niches; the eastern one measures 45cm in depth by 47cm in width by 65cm in length, the western 40cm by 40cm by 65cm.

21 HUJRAT ISLAM BEG

Name: Hujrat Islam Beg

Date: 1002/1593-4

Endowment: 1002/1593-4

Variant of name: None known

Modern name: None is known, though the lower part is now used as an office of 'Lajnat Zakat al-Quds' (The Jerusalem Alumnus Committee), and the upper part is the Finance Office of the Aqsa Mosque Restoration Committee.

Location

The *hujra* is found at the extreme western edge of the upper terrace of the Dome of the Rock, opposite Bab al-Hadid.

Site and brief description (figs. 21.1-21.4, pls. 21.1, col. pls. XLIV, XLVI)

The cell is built between the North Colonnade of 721/1321 and the Khalwat Bairam Pasha (cat. no. 34) at the edge of the upper terrace. At the level of the esplanade, it looks west across to Bab al-Hadid and, at the level of the upper terrace, east to al-Zawiya al-Muhammadiyya (cat. no. 43). The *hujra* is similar to others on the Haram in that it is constructed in two sections. The small, lower level chamber is cross-vaulted, while the upper chamber is covered by a hemispherical dome. The entrance to the upper chamber is preceded by a portico of two domed bays also built at the level of the terrace. The *hujra* is a single-unit masonry structure. While the main east façade has remained light in colour, the north and the west elevations have been discoloured by a black substance. It is not possible to identify this without chemical analysis but it would appear to be related to damp, and may be a fungal growth. The same discolouration is also seen on the Madrasat Ahmad Pasha (the Ahmadiyya, cat. no. 25) and Khalwat Bairam Pasha (cat. no. 34).

History

As already mentioned more than once, the *sijills* are a vital primary source for the history of Jerusalem's architecture in general, and for the history of the *khalwas* constructed around the Dome of the Rock terrace in particular, for to date these buildings have not been studied and the majority are not listed even as anonymous structures. For Hujrat Islam Beg, the unpublished *waqfiyya* (Sijill 76: 129-30) is the only source of information available to date. It takes the customary form of *waqf* instruments made for such purposes. It comprises three sections. The first consists of an introduction about the deeds of philanthropists and the rewards which await them according to religious teaching and principles. The next section consists of a text which is directly associated with the historical or architectural information needed for the cell and its endowments, in addition to the conditions that have been set up by the donor. The last section is about the validity of the *waqf* after the donor has presented his donations and the *qadi* has pronounced it legal and valid. The *waqfiyya* is dated 8 Shawwal 1002/22 June 1594, and as usual the concentration in this commentary is on the architectural and historical information, although the whole Arabic text is reproduced in Appendix I, no. 21.

Identification

The *waqfiyya* informs the reader that Islam Beg has established his *waqf* (see below) for 'the benefit of the upper chamber, on the

construction of which he has just started. It is located in the Noble Aqsa mosque, abutting the west side of the platform of the Noble Rock.' There are five cells to the west of the Dome of the Rock. Three are simple structures (cat. nos. 51, 52, and 53), identified as being built after 1222/1807, and two are more elaborate with decorative architectural elements. One of these two is explicitly identified as the Khalwat Bairam Pasha (see cat. no. 34). Thus the description in the Islam Beg *waqfiyya* must relate to the cell under discussion, since this is the only remaining possibility. Furthermore, the basic architectural plan resembles the style of the chief master builder of Jerusalem of the period, 'Abd al-Muhsin ibn Nammār *al-mi'mar* (for further details see Chapter 36 under the Ibn Nammār Family and under *Khalwas*).

Date

The cell of Islam Beg is not dated, but from the *waqfiyya* (Sijill 76: 129) it is evident that some time shortly before 1002/1593 Islam Beg began (*shara'a*) to build his cell; and while it was still under construction he established a *waqf* for its benefit.

Founder

The founder, Islam Beg, was, as his *waqfiyya* (Sijill 76: 129) shows, from a family that had taken over a number of important posts in the Ottoman administration. For example, in 1002/1593 the founder's brother, Zairak, was Agha at Bab al-Sa'ada (head eunuch of the sultan's harem) and at the same time, the patron himself was the governor of Jerusalem district (*mir liwa' al-Quds al-Sharif*).

Endowments

According to the *waqfiyya* (Sijill 76: 129-30), Islam Beg attested in the council of the religious court of Jerusalem, while living and sound in mind and body and in full legal competence, that he had made a *waqf* of 500 *sultani* (gold coins), of which each one was equal to 40 *qit'a misriyya nisf* (silver coins). He made over the money as *waqf* in perpetuity for certain philanthropic purposes, as discussed below. Islam Beg stipulated that the *waqf mutawalli* (trustee) should administer the money of the *waqf* in consultation with the *shaikh* of the reciters (who was listed below), for a lawful yearly profit (*murabaha*) of eleven and a half *sultani* against every ten, equal to 15 percent, and that he should avoid usury or illegal interest (*riba*). The total profit per year was to be 75 *sultani* or the equivalent in silver currency.

The *mutawalli* was to distribute the income of the *waqf* as follows:

<i>Position, etc.</i>	<i>Yearly allowance in sultani gold coins</i>
Administrator of the <i>waqf</i> (<i>mutawalli</i>)	9
Chief reciters (<i>shaikh al-qurra'</i>)	9
7 reciters (4.5 <i>sultani</i> each)	30.5
Attendance clerk (<i>katib ghaiba</i>)	4.5
Petitioner (<i>da'i</i>) and distributor (<i>mufarriq</i>) of the Qur'an volumes	4.5
Oil for lighting the two chambers (per year)	4.5
Fees (<i>rasm</i>) for notarising documents and signatures	3
Total	<u>65.0</u>

In the *waqfiyya* the total is wrongly calculated as 75 *sultani*, and although there is a mention of the post of *sha'al* (the one who lights the oil lamps), no stipend was allocated for him or

for the maintenance of his task in the *waqfiyya*. Islam Beg made it a condition that the reciters were to be perfect in performing their reading, and a *shaikh* was to be in charge of the reciters; his duty was to start and finish the Qur'an recitation. The reciters together with their *shaikh* were to meet daily in the chamber which the donor had just started to construct and which was located on the west side of the Aqsa mosque. Each reader was to recite the whole part of the venerated Qur'an; they were to finish with the traditional petitioning prayers, and the merit of all this was to be dedicated to the brother of the founder, Zairak Agha, to the founder himself, to the dead of the founder's family, and to all deceased Muslims.

In addition, Islam Beg stipulated that

1. the *darwish* 'Ali ibn Khadir was to be the administrator of his *waqf* during his life-time, and, after him, his descendants in order of maturity and competence (*al-arshad fa-'l-arshad*);
2. the Shaikh Abu'l-Su'ud, the descendant of 'Umar ibn al-Khattab (the third caliph) was to be *shaikh al-qurra* during his life-time, and after him a member of his family in order of maturity and competence (*al-arshad fa-'l-arshad*);
3. the seven reciters were nominated (the names were provided), and after each reciter the post was to go to his son, provided the son was among the descendants of al-Shaikh Abu 'l-'Aun, but if he was not, then the aforementioned al-Shaikh Abu 'l-Su'ud, in consultation with the *qadi*, would appoint someone to replace him;
4. the founder had also appointed al-Shaikh 'Abd al-Haqq as attendance clerk, al-Shaikh Muhammad al-Ghazi as distributor of the Qur'an volumes and as petitioner, and Salih the son of 'Ali to light the lamps in the two cells;
5. and finally the *mutawalli* must not hand out money to anyone who was an offender or an unjust (merchant).

Architecture

Exterior

The eastern façade is constructed at the level of the Dome of the Rock terrace. It consists of a solid white masonry wall and a portico made up of two domed bays. The portico is rectangular, measuring 2.2m wide by 4.6m long, and the north bay is 10cm longer than the south bay. Each bay is covered by a small saucer dome, carried on three pointed arches and a wall, the arches springing from the three columns mentioned above and from three imposts on the east wall. Four small pendentives in the corners of each domed area act as the transition from square to circle. The domes are covered with small flagstones on the exterior to prevent water damage. Two slightly pointed arches are carried on three cylindrical columns. The arches are identical in height, but the span of the arch to the north is, as already stated, 10cm more than that to the south. The shafts, although similar in appearance, differ with regard to diameter. This implies that they are in secondary use. That to the south measures 1.26m, the one in the centre 1.1m, and the one to the north 1.4m. The columns are stone. The column to the south is carved from a single block, while the one in the centre is constructed from three blocks, and the one to the north from seven. The capital and abacus of each column are a continuation of the fabric of the shafts; they are undecorated apart from a slight curving flare at the summit. The shafts rest directly without a base on the stone dais built in front of the *hujra*, although a fillet roll moulding is visible at the bottom of the central shaft, probably to mark the end of a crude base.

A stone cornice in the form of a moulding marks the summit of the portico and the springing of the two small saucer domes. The east wall is built of dressed stone; it is a solid wall with the exception of a door leading to the interior, and a rectangular window (now blocked) situated to the south of the door. The window is surmounted by a low blind arch. Only the apex of the main dome is visible from the east, since the elevation of the porch is higher than that of the upper chamber.

The western elevation is constructed in two sections. The lower part is featureless with the exception of a door opening, which measures 74cm wide by 1.7m high. The door is approached by way of two recent steps—probably replacing older ones—leading from the Haram esplanade to a dais 60cm high in front of the door. To the south of the dais there is a small raised flowerbed with an olive tree. The door is surmounted by a lintel, and directly above there is a relieving arch with the voussoirs set and cut differently to north and south. A recessed course with a sloping chamfer cut separates the two parts of the elevation.

The principal scheme of decoration of the upper part consists of an elaborate rectangular recessed panel made up of two windows and two tiers of *muqarnas*. The panel comprises white, black and occasionally red stones. Two identical rectangular windows measuring 70cm wide by 90cm high are placed in the lower part of the recessed panel. They are fitted with iron grilles and, recently, with wire mesh. The windows are surmounted by a lintel and above them are two 'eye-brow' relieving arches. Three courses above the windows, the panel is crowned by two tiers of elegant *muqarnas* moulding. The *muqarnas* has its upper tier divided into four horizontal panels made up of double niches, flanked to either side by a single niched panel. The lower tier contains a series of twenty pendant stalactites. A band of flat lancet-shaped niches is carved into the course of stonework immediately above the *muqarnas* moulding. The hemispherical dome sits directly on the roof of the building with no intervening drum. It is finished with a stone finial in three parts. The middle section is a baluster and the apex is broken and partly missing.

The southern and the northern elevations are built with mainly dark-coloured masonry, and are similar but not identical. Both are solid walls apart from a slit window measuring 55cm by 20cm in the lower section, and a rectangular window surmounted by a slab lintel with an 'eye-brow' arch above in the upper part. The slit window has a rounded top in each case, with a moulded frame in the upper section. Both elevations are finished with a frame moulding, and above there is a low stone parapet. In addition, the northern façade has a rectangular window placed immediately below the slit window. It measures 85cm by 1.14m and is fitted with a recent iron grille. The lintel above the window is made up of slabs, and above these there is a relieving arch with the voussoirs continuing beyond either end of the lintel below.

Interior

The interior of the lower part of the building is a simple square chamber raised by 60cm above the level of the Haram esplanade. It is reached by means of two steps. The floor has recently been paved and the walls are covered in wooden panels. The chamber is cross-vaulted. A simple stone *mihrab*, probably of the same date as the cell, measuring 73cm wide, 50cm deep and 1.65 in height, occurs in the south wall. The *mihrab* has a pointed arch and its scallop-shell tympanum is decorated by a geometric scheme made up of triangles.

The interior of the upper part is also a small chamber, square in plan. Its floor is paved with old flagstones, and the

chamber is roofed by a hemispherical dome resting on four pendentives. Both the walls and the dome are plastered. Each window to south and north, measuring 70cm by 90cm, is flanked by a blind recessed niche. There is a further blind recessed niche

measuring 45cm deep by 47cm wide and 90cm high between the two windows on the west side, and another measuring 79cm wide by 56cm deep and 63cm high in the east side to the south of the door.

22 THE NORTH-WESTERN KHALWA OF AHMAD PASHA

Name: The North-Western Khalwa of Ahmad Pasha

Date: Awakhir Muharram 1007–Ramadan 1009/August–September 1598–March/April 1601

Endowment: Ramadan 1009/March–April 1601

Variant of name: The cell is sometimes known locally as al-Khalwa al-Mamlukiyya ('the Mamluk Cell'), for it is built in a Mamluk style. The name has no historical basis.

Modern name: The office of the director of al-Aqsa Mosque

Location

The *khalwa* is located at the northern extremity of the Dome of the Rock terrace, abutting the western pillar of the northern colonnade.

Site and brief description (fig. 22.1, pls. 22.1–22.9, col. pls. XLVI, XLVII, LIV, LX, LXIII)

The North-Western Khalwa of Ahmad Pasha is situated between the North-Eastern Khalwa of Ahmad Pasha (cat. no. 23) to the east and the Hujrat Muhammad Liwa' al-Quds (cat. no. 14) to the west. It is free-standing except for its north-eastern corner which abuts the western pillar of the northern colonnade. Its lower eastern wall is constructed against the western side of the stairway at the southern end of the path leading from Bab Hitta to the upper terrace of the Haram al-Sharif. The lower western wall is close to a recent path used occasionally by motor vehicles. There is an open space in front of the northern elevation at the level of the esplanade, while its southern façade is at the level of the upper terrace, facing the Dome of the Rock.

The cell is an impressive structure. All four elevations are intact and are lavishly built to a high standard with *ablaq* masonry and with decorative accents of floral and geometric details. The *khalwa* consists of two floors, like all the cells on the upper terrace of the Haram. The lower storey has two sections. To the east there is a square chamber covered by a cross vault, and to the west there are two small rooms. The room to the south is rectangular in plan while that to the north is an approximate square. Both rooms are covered by cross vaults and they now house a large generator which produces electricity for use throughout the Haram. The upper part consists of an antechamber, a large main chamber, and a smaller ancillary chamber. Each unit is covered by a dome. The principal southern façade is preceded by a three-domed portico supported on three arches. The *khalwa* is constructed throughout with masonry of varying hues of yellow, red, black, and white that have now weathered to either black or grey.

History

Until recently no information, even in the form of an authentic name, was available about the history of this elegant and decorative building. It is only the architectural style of the cell and the fact that it was not described by either al-'Umari or by Mujir al-Din that pointed to an Ottoman date for it. It was therefore not included by Burgoyne in *Mamluk Jerusalem* (1987). Thus it was an exciting moment when a relevant document was discovered in the *sijills* (97: 312). That first discovery made it possible to trace many other facts relating to this cell and to the other cell of Ahmad Pasha to the north-east. These records, despite the fact

that the main *waqfiyya* still has to be found, have produced the primary facts such as the name of the founder, the date and the original purpose behind the cell's construction.

Identification

The relevant entry, dated to the last days (*awakhir*) of Muharram 1007/August–September 1598, is to be found in *Sijill* 79: 312. It consists of a single page of thirty-four lines. The record is a legal contract regarding a lease between Nasuh Jawish, the representative of Ahmad Pasha, the governor of Gaza district, and al-Shaikh 'Abd al-Qadir ibn Muhammad, the deputy inspector of the *waqf* of al-Masjid al-Aqsa. Shaikh 'Abd al-Qadir, backed by a supporting *fatwa* (legal religious opinion), is recorded as having leased from the religious council of Abu Bakr—the Hanafi *qadi* of Jerusalem—two plots of land belonging to al-Masjid al-Aqsa. The wording of the question which had led to the *fatwa* raises an interesting point—'What do the learned scholars of religion—may Allah grant mercy to them all—rule on al-Masjid al-Aqsa if it has a vast courtyard, all of which is not necessary for the prayers of the people, and the mosque itself is in need of repairs for which there is no (money)? If the inspector leases a plot of it for a fixed rent and a fixed period to allow the leaseholder to have a cell for the invocation of Allah and for the study of religious science, would this be a lawful transaction? Furthermore, if you say yes, would the leaseholder own any cell he might construct? Please inform us—may Allah reward you with Paradise.' The *fatwa* was addressed to Maulana (our master) Shaikh al-Islam Sharif al-Din, the son of 'Abd al-Qadir al-Hanafi al-Azhari, the *mufti* of the Hanafi school at Gaza. The answer was returned that 'yes—it is a lawful lease and if the leaseholder were to build a cell it would be numbered among his possessions.'

Although it is an interesting issue, the main concern here is not with the *fatwa* itself, but rather with the information on the site and the purpose of the construction. The document (*Sijill* 79: 312) is carefully specific as to the plots for lease. It describes them as 'the whole two plots (*jami' al-buq'atain*) of the lands of the Noble Aqsa Mosque that are situated next to the northern side of the platform of the Noble Rock. They are separated by the *mawazin* (the north-eastern colonnade) located opposite Bab Hitta, one of the gates of the Noble Mosque. The measurement of the western plot from south to north (*qibla bi-sham*) is nine *dhira'*, and from east to west seven *dhira'*. The eastern plot measures seven and two-thirds *dhira'* from south to north by seven and two-thirds *dhira'* from east to west.' The two sites were to be leased for sixty years to allow the aforementioned *muwakkail* (the mandator—Ahmad Pasha) to exploit his lease by building on each plot a cell (chamber) for the purpose of recitation of prayers, to conduct the invocation of Allah, and to study religious science. The complete Arabic version of the document is to be found in Appendix I, no. 22/1.

To judge by the *sijill* (167: 422) and the still-extant structures—that is, the North-Western Khalwa of Ahmad Pasha (cat. no. 22), and the North-Eastern Khalwa of Ahmad Pasha (cat. no. 23)—it took Ahmad Pasha only two and a half years to build his two cells on the sites detailed above, rented through his agent Nasuh Jawish, who was governor of Jerusalem.

Founder

Ahmad Pasha is not only the patron of these *khalwas* but also of a *madrassa* named after him—al-Madrassa al-Ahmadiyya (cat. no. 25). In addition, Ahmad Pasha contributed to the architectural work of the Haram. He contracted 'Abd al-Muhsin ibn Nammar

al-mi'mar (the master builder) to build the Khalwat Junbalatiyya (for details, see cat. no. 24), and Mastabat al-Jauza (the almond tree) in al-Masjid al-Aqsa for ten *sultani* (gold coins). In the presence of Ahmad Pasha, 'Abd al-Baqi, the inspector of the Haram, contracted a company of master builders to rebuild the minaret of Bab al-Asbat (for details, see Chapter 36 under Minarets). It would appear from all this that Ahmad Pasha was one of the major patrons of architecture within the city in his day, his fame being equalled only by Bairam Jawish (see cat. no. 11) and Bairam Pasha the Vizier (see cat. no. 34) in the high Ottoman period. Their work was surpassed only by the projects executed by order of the sultan himself, Sulaiman, and of his wife, Khassaki Khurrem (Haseki Hürrem). In addition to the work in Jerusalem, at his own expense Ahmad Pasha restored the caravanserai at Khan Yunis (Heyd 1960: 41), and built an elegant house in Damascus at Bab al-Barid (Muhibbi 1869 1: 188).

The full name of Ahmad Pasha is recorded in one of his *waqfiyyas* (Sijill 85: 41) as 'Ahmad Pasha ibn Ridwan Pasha ibn Mustafa Pasha'. Normally his name appears in the *sijills* in a concise form, either as Ahmad Pasha (84: 1; 85: 1; 112: 469; 187: 127; 187: 223) or Ahmad Beg (78: 1; 80: 28; 80: 100), which suggests that there was no difference between these two titles, or that at least the scribes of the court did not differentiate between them. Although the abridged form of his name causes some confusion with other, similar names, it can be identified because it is always preceded with a long list of epithets, according to the protocol of the time, which point to his rank as a governor. He was in fact the governor of Gaza (see above citations and Muhibbi 1869 1: 187), as well as *amir al-hajj al-Shami* (the *amir* of the Syrian pilgrimage) as specified in Sijill 198: 109. Both positions were of considerable importance, the latter post in particular.

Heyd (1960: 185-6, Appendix I) translated a petition submitted to the Ottoman government about the establishment of a fortress at Khan Yunis. The document is kept in the Turkish State Archives in Istanbul (catalogue of Ibn al-Emin, *Dahiliye*, cat. no. 478). The petition is signed by 'The humble servant Ahmad retired (*al-mutaqa'id*) at Gaza'. In footnote no. 2 Heyd (1960: 186) comments on the name of the petitioner by adding 'he was ... probably a former Sanjak-Beg of Gaza.' The information discovered in the *sijills* in Jerusalem makes it clear that Ahmad Pasha was indeed governor of Gaza. Heyd (1960: 96-7; 98-9; 108-109; 148-49) also translated and summarised four *firman*s registered in the last quarter of the 16th century, all of which contain references to Ahmad Beg. From them it transpires that Ahmad Beg played an active role in maintaining security and the safety of travellers on the road to Egypt.

It seems that Ahmad Pasha was able to maintain a good relationship with the city of Jerusalem and its administrative élite, through it is not clear from the *sijills* whether Ahmad Pasha ruled Jerusalem. It is known that his son Hasan—the inspector of his father's *waqf*—was governor of the city in 1036/1626-7 (Sijill 112: 1; 112: 469). According to Muhibbi (1869 2: 16 and 88), Hasan and his son (the grandson of Ahmad Beg), Husain, both served as *begs* of Gaza. The family of Ahmad Beg as noted by Heyd (1960: 42, 50-51, 57, 58, 79, 88, 186 Appendix I, n. 2); Rafeq (1968: 164, 199-200, 208) and Ze'evi (1996: 39-41) was rooted in Palestine and ruled Gaza district for several generations. The grandfather of Ahmad Beg, Kara Shahin Mustafa, a slave of Sultan Sulaiman Qanuni, and his father Ridwan were also both *begs* of Sanjak Gaza. In any case, it seems that Ahmad Pasha managed to keep up sufficiently good relations with Jerusalem to allow him to set up his projects in the course of a succession of

short visits to the city. On the binding of each volume of the *sijills* there are notes written by the *qadis*, probably to recall important events or dates. As Cohen (1984: 239) noticed, these dates relate to the arrival at and departure from Jerusalem of various governors and judges. *Sijills* 78: 1A, 84: 1, and 85: 1 record the events of the years 1006/1597-8, 1010-11/1601-2, and 1013/1604. The opening pages of these *sijills* include records of Ahmad Pasha's visits to the city. It is curious that, in the last entry, it is noted that Ahmad Pasha had a son and named him Sulaiman.

Needless to say, Ahmad Pasha had to be extremely rich to be able to carry out his projects in Jerusalem. This is confirmed by one entry in Sijill 80: 28 dated 14 Sha'ban 1007/12 March 1599. It shows that when the *waqf* of al-Masjid al-Aqsa and the Great Mosque of Hebron ran out of olive oil for illumination, causing the custodian and worshippers considerable anxiety, Ahmad Pasha was able to help. Through his legal agent, he lent the inspector of the *masjid* ten *qintars* of oil, against the promise of future repayment from the *waqf*. The price of the oil was specified as 600 *sultani* gold coins, which is equal to 24,000 *misriyya* silver pieces. The whole Arabic text is provided in Appendix I, no. 22/2.

It should be borne in mind that the *sanjak-beg* (the governor) of Gaza had an official income of over half a million *aspers* a year (Heyd 1960: 41). He was the highest-ranking governor in Palestine, and was the only Palestinian *sanjak-beg* who could rise to the position of a *beglerbeg*. A further example of the huge wealth of Ahmad is to be found in the petition (mentioned above) in which he volunteered at his own expense to restore the Khan Yunis *caravanserai* in the form of a fortress. Muhibbi (1869 1: 187-9) records that Ahmad Beg served as governor of Gaza for almost thirty consecutive years. Heyd (1960: 186, n. 2) presumed that Ahmad Beg died in 1015/1606-7, having in 1009/1600-1 resigned in favour of one of his sons. Sijill 80: 28 dated 14 Sha'ban 1007/12 March 1599 (see Appendix 1, no. 22/2) and Sijill 85: 1, which record the events of 1013/1604, refer to Ahmad Pasha as 'recent governor of Gaza'. Ze'evi (1996: 40), on the other hand, states that Ahmad Pasha had grown old before he was given a province to rule in 1009/1600-1. If Ze'evi is correct, this would raise doubts about Heyd's view and point to Ahmad Pasha being in office later than the date proposed by Heyd.

All in all, the records in the *sijills* and the structures themselves provide the most convincing evidence in support of al-Muhibbi's comment (1869 1: 188) that Ahmad Beg 'is an intellectual who has many friends who are scholars and poets, and he is generous to them.'

Endowments

It is certain from the proceedings of the *sijills* (see below) that Ahmad Pasha assigned endowments for the benefit of his North-West and North-East Khalwas (cat. nos. 22, and 23) as he did for his Madrasat al-Ahmadiyya (cat. no. 25). The *waqfiyya* was dated Ramadan 1009/March-April 1601, but the attempt to locate it in and around that date in the *sijill* records has so far proved unproductive. It would appear that the *waqfiyya* was not registered in the Jerusalem *sijills*, for after Ahmad Pasha was dead, the *qadi* (Sijill 167: 422), at the beginning of Muharram 1077/July 1666, ordered the transcription of a copy of the information from the *waqfiyya* concerning the western *khalwa*. This order was executed when the *qadi* appointed al-Shaikh Nusrat al-Islam to the post, after it had fallen vacant, in the North-Western Khalwa of Ahmad Pasha. The information copied (Sijill 167: 422) is short and can be divided into two parts. The

first is a preface, recording that 'this is a legal summary taken from the *waqf* instrument of the deceased Ahmad Pasha, the governor of Gaza, who constructed and endowed cells in the mosque of Jerusalem. He has appointed to each cell a group of scholars from Jerusalem and allocated expenditure as certified by his enduring *waqf* dated Ramadan 1009/March-April 1601.'

The second part is a quotation from the *waqfiyya* itself. It begins 'Our master the legal judge, who has affixed his signature (*al-wad' khattahu*), has ordered a copy of that which concerns the western *khalwa* from the aforementioned *waqfiyya*.' The copied text specifies that Ahmad Pasha 'assigned the western cell and the cell below it to our master, al-Shaikh Abu'l-Su'ud al-Gazzi, for the whole of his lifetime. From the yearly income of the *waqf* he assigned him 600 silver *misriyya*. Following Abu'l-Su'ud al-Gazzi the position should be given to whoever is the *shaikh* of the Qadiriyya order in Jerusalem, provided that he is from the family of al-Shaikh Muhammad Abu'l-'Aun. He (Ahmad Pasha) designated the position of *al-bawwab* (the door-keeper) and *al-farrash* (attendant) for the two said cells (that is, the lower and upper cells of the North-Western Khalwa) to al-Shaikh Nusrat al-Islam, the son of al-Shaikh Abu'l-Huda al-Gazzi, as long as he lives; and he was allocated 100 silver *misriyya* per year. And after him the position would be held by anyone chosen by the *shaikh* of the Qadiriyya order, provided that he is from the family of al-Shaikh Muhammad Abu'l-'Aun. And he was allocated 80 *misriyya* silver pieces for the oil to illuminate the oil-lamp (*qandil*) of the door of the upper cell between the setting of the sun (*maghrib*) and the evening (*'isha*). He (Ahmad Pasha) designated 40 *misriyya* silver pieces per year for the restoration of the doors of the two cells. End. These stipulations and this appointment are written in the *waqf* document dated as mentioned above—may Allah grant the aforementioned donor mercy. Amen.' For the full Arabic text of this document, see Appendix I, no. 22/3. For details of the endowment of the North-Eastern Khalwa of Ahmad Pasha, see cat. no. 23.

Architecture

Exterior

The principal façade of the *khalwa* is to the south, and faces the Dome of the Rock. It is raised above the level of the Haram terrace by means of a rectangular stone dais measuring 8m long, 1.77m wide and 64cm high. The dais is similar to the majority of the other examples on the Haram, for it is paved with high-quality traditional white flagstones. The façade is constructed in two parts; the first is the three-domed portico, and the second is the main entrance to the upper floor of the *khalwa*.

The portico is carried on three arches, which have a narrow horse-shoe return and terminate in a slight point. The arch to the west is 20cm taller than those in the centre and to the east. Both arches and spandrels are built with fine stone in red, black and white, and they spring from four columns. The shafts of the three to the west are white-grey marble while that to the east (cat. no. 4) is of stone. Shafts numbers 1 and 4 are cylindrical with a radius of 65cm and 75cm respectively, while the two inner shafts (nos. 2 and 3) are octagonal. Although similar in height, there is a small difference in height between the shafts which, from west to east, measure 2m, 1.9m, 1.9m, and 1.97m in height. An aluminium band reinforces the joints at top and bottom of the two central columns (nos. 2 and 3). The western shaft (no. 1) is also supported at the joints and has an additional metal band around its centre. The shaft to the east (no. 4) is supported at the apex only. These bands are the work of the Aqsa Restoration

Committee in 1980, and replaced older iron bands which had rusted. It is not known when these iron bands were first used, but it is possible that they were the work of the Supreme Muslim Council after the earthquake of 1927. There are two types of plinth. Those of shafts nos. 1 and 4 are stone and square in plan, each measuring 40 cm by 40cm. Where it meets the shaft, the plinth has a torus moulding and below is a square abacus with reversed lancet chamfers at the four corners. The second type of plinth, used on the central shafts 2 and 3, is octagonal.

[Editorial note: The columns are numbered from left to right; their capitals are among the most elaborate and best carved in Jerusalem of the period. Three of them—nos 1-3—are varieties of *muqarnas* and relate closely to similar work in Istanbul, as might be expected of a founder who was as rich and as well connected as Ahmad Pasha. They will be described one by one.

No. 1. This is the simplest and perhaps the most effective of the three *muqarnas* capitals and is cut from a lovely, pale creamy-grey, crystalline marble. The design is conceived as two stalactite elements of two tiers to each face, divided by deep recesses which coincide with the corners and centre of each side. The top level is framed by a chevron moulding, cut as a series of V-shaped grooves. From the bottom of each V, further grooves are cut vertically to act as frames for each *muqarnas* element. Each niche thus has a pointed profile, and, to allow for extra emphasis, is slant-cut towards the centre. A lozenge is reserved in the tympanum of each. This diamond-shaped boss is surrounded by a groove to give the impression of a fillet setting, and is itself diamond cut—that is, each boss is subdivided into four and the facets thus created are cut to a point at the centre, as if it were a real jewel set in a crown. After rain, the stone sparkles in the light to add extra credence to this conceit. Between each element, the deep recess adds both emphasis and drama to the design. Beneath this upper tier, the stone is cut away sharply into 'hanging' pinnacles which are sharply angled to take advantage of light and shade. A somewhat similar use of light is found in the portico of the Selimiye Cami, Konya (Goodwin 1971: 121, pl. 113), and on the portico of the Süleymaniyye Mosque, Istanbul (Goodwin 1971: 228, pl. 220), although in both cases the buildings are far grander, and the much larger size and greater distance of the capitals from the viewer somewhat modifies the impact—for it is an overall impression of grandeur that is produced, rather than an intimate emphasis on each detail. The inner faces of these stalactites are decorated with three lancet-shaped niches. The upper half or tympanum of each niche is filled with a repeated chevron V, while the lower half is left blank but with both sides cut at an angle so that the top appears as a dark triangle. The lowest level, where the capital meets the column shaft, is a three-dimensional eight-pointed star-polygon. This part is roughly finished, and it seems highly likely that the capital was not executed on site, but imported and adapted to fit the shaft. This impression is underlined by the fact that two of the four shafts are octagonal rather than cylindrical, and that all the bases are clearly in re-use. Base no. 1 is unremarkable because it is comparatively plain except that it, like the others, is an inverted capital.

No. 2 has an octagonal shaft. It too resembles an earlier form of capital in that it is close to a design used in a prime position, in front of the *mihrab*, in the 14th-century Mahmut Beg Cami, Kasabaköy (Goodwin 1971: 25-6, pl. 17), although here the capitals are of wood. Capital no. 2 of Ahmad Pasha's *khalwa* is cut from the same fine marble as no. 1. It is much more complex. There are three tiers of *muqarnas*, all cut from a single piece of stone. The topmost tier is finished with a band of carved

decoration which is somewhat incongruous as it is derived from foliage, while the rest of the capital is strictly geometric. However, the foliage has been reduced to a series of crisply cut Turkish triangles, arranged as a kind of debased acanthus. The upper tier of *muqarnas* is a series of seven lancet-shaped niches per face, with a larger and more deeply cut splay-faced niche at each corner. The seven niches are of the usual type, that is the pointed tips of the tympana project forward and are shallower than the slant-cut lower parts. Below this level, there is a series of more deeply recessed stalactite niches, three to each face, and doubled at the corners to continue the chamfered effect. Once again, the 'hanging' pinnacles are created by sharply angled facets, and between them, facing each other, there are paired lancet-shaped niches. At this level, the tympana, which are again splay-faced, are filled with a series of Vs to add texture. The lowest level acts as a support, as it were, for the stalactites above. A series of simpler projections alternate with lancet niches, each of which is once again decorated with incised Vs in the upper sections.

The base of no. 2 continues the profile of the octagonal shaft. It is clearly a reversed capital, not least because the decoration points downwards instead of upwards. The faces alternate between a squat *muqarnas* element with a series of rays in the inverted tympanum, and paired triangles above (now below) two sets of three tear-drops or cypress shapes. The most curious detail of this base is a triangular protuberance between these, which splays out at the four corners where the capital-base now meets ground level.

Capital no. 3 is more effective than no. 2, if only in that it is deeper cut and less complex. It too has three tiers and is cut from the same marble as nos. 1 and 2. The topmost tier is almost flat-faced, with only the corners chamfered by means of a single lancet-shaped niche which has been left undecorated except for a deep groove running vertically down the centre. This corner niche is further emphasised by being framed by a deep groove running parallel to its profile. A series of five niches per face are incised between the corners, which are further emphasised by a repetition of the central groove in the middle niche, cut into a recess and again surrounded by a grooved frame. To either side of this central point there is a flat lancet. Here the tympanum of each is filled with an incised triangle with a triangular recess at the centre. Below there is a six-pointed star in reserve with a hexagonal recess at the centre. The emphasis on this *khatam Sulaiman* style of star may point to them having a significance beyond the merely ornamental, for the same stars are found inlaid in key positions on the east façade and over the door from the vestibule into the main chamber. This is discussed more fully in Auld, Chapter 24. Perhaps this capital no. 3 was especially cut for Ahmad Pasha, or perhaps—and this is more likely—an earlier capital was adapted for this building. Beneath this uppermost tier, the *muqarnas* capital is unremarkable; the middle tier has paired lancet-niches at the corners, allowing an effective chamfer cut. The middle section of each face is recessed with paired lancet-niches set facing each other. The tympana of these is decorated with the now familiar Vs. Plain lancets are the last element of decoration; they alternate with the niches already described, so arranged that they fall to either side of the corners. Their only ornamentation is a crisp cut across the base of the tympana. Finally, similar lancet-niches decorate the lowest tier, which converts to a circle above the octagonal shaft, which, in turn, is set above an inverted capital acting as a base, just as in no. 2.

The last capital, no. 4, breaks the pattern created by the other three. The stone is different, and the form is not *muqarnas*

but a sort of debased Classical form, half-way between Corinthian and Ionic. Four single splay-faced and plain 'leaves' create the basic shape. They are in reserve, and the space between them is recessed. Above each, at the corners, there is a shallow stem that curls round to enclose a small, projecting, circular boss. It is probably intended to be a form of lotus. The effect is more ancient Egyptian than Ottoman, although there is in the simplicity of the design something of the same strength that is found in the triangular-cut capitals of, for example, the *medrese* of the Mihrimah Complex of 1562-65 or the Court of the Black Eunuchs in the Topkapi Sarai, Istanbul (Goodwin 1971: 252-4, pl. 243b and 323, pl. 323), which probably date to after 1665 when a fire caused major damage. The shaft of no. 4 is cylindrical, to balance no. 1, and the base too is square rather than octagonal. Once again it is an inverted capital, decorated with a running stem bearing trefoils. SA]

A billet moulding runs around the top of the portico and is broken by an elaborate stone water-spout located slightly to the east of the central arch. The three small domes are barely visible from ground level because of their shallow profile. They have been covered in flagstones to provide protection from the weather. The domes are expressed on the interior as small plastered vaults carried on four lateral arches, which spring from four *muqarnas* brackets projecting from the south wall, and from the four columns supporting the portico. The brackets are similar but not identical; each is made up of three tiers of *muqarnas*, some of which have been eroded. It is noteworthy that they include lancets of both the curvilinear 'Syrian' and the angular 'Egyptian' types (see Burgoyne 1987: 98, fig. 13). The zone of transition is made up of four pendentives. A metal tie-beam runs between the openings at the level of the springing of each arch of the outer and the lateral arches.

The south wall is divided into three identical horizontal sections. These are lavishly decorated, with the exception of the lower part of the western section. This is an unbroken and undecorated wall. There is a rectangular window in the two eastern bays; these are recessed and set within an elaborate double-roll moulding divided by a quirked ogree that surrounds both the window opening (each measuring 72cm wide by 1.17m high) and the decorative scheme connected with it. Each window is surmounted by a grey marble slab lintel. Directly above each lintel is a shallow retaining arch made up of seven joggled true (rather than veneered) *ablaq* voussoirs built in alternating red and white with a black cup-like keystone. The tympanum below the retaining arch, although also *ablaq* and carrying through the red and white of the upper joggling, does not have this central black accent. Iron grilles are preceded by modern iron shutters. Three identical rectangular panels are placed in the centre of each bay, exactly one course above the level of the frame of the two windows. Each panel measures 40cm by 60cm and is framed with a band of three engraved chevrons. The purpose of these panels was in all likelihood to carry a foundation inscription or decorative plaque, but as they are now blank it is hard to be sure if they were once filled and were subsequently defaced, or if for some reason they were never completed. Similar although larger panels are to be found in the upper part of the east, north, and west walls of the antechamber behind the southern entrance of Khassaki Sultan (cat. no. 15). Another panel also exists on the northern entrance of Khassaki Sultan. It is possible therefore that these panels represent a revival in deliberate imitation of early Ottoman features. It is worth drawing attention to the fact that there are also two similar plaques on the south facade of Khalwat

Junbalatiyya. This is particularly interesting, for both were probably built by the same architect, and therefore would appear to be something of a trademark for him.

The second part of the south façade contains the entrance doorway to the antechamber. It is raised above the level of the dais by 53cm, and two steps lead into its interior. The entrance is comparatively wide at 1.77m and is now fitted with a modern wooden door in two sections, which has probably replaced a previous one. The entrance was built at the same time as the rest of the *khalwa*, for the courses on both sides are homogeneous with the rest of the masonry of the façade, but not with the top of south-western corner of the west façade.

From the level above the buttress a problem manifests itself. Below this level the courses are keyed, but from this level upwards the courses do not seem to match, particularly at the top of the building. This mismatch may indicate a later restoration phase, perhaps carried out in 1203/1788-9, for this date is recorded in the antechamber described below. Another possibility is that the entrance level was lower than the building of the *khalwa* itself, as some of other *khalwas*, such as the Junbalatiyya (cat. no. 24), and the North-Eastern Khalwa of Ahmad Pasha (cat. no. 23). The outer limits of the entrance are marked by an elegant chamfered cut. The apex of the doorway is in the form of a slightly pointed arch which springs from two identical *muqarnas* brackets placed to either side of the entrance. Each bracket is made up of two tiers of lancet niches. The only one with any decoration is the scallop of the middle niche in the upper section, which has a ribbed motif. The stones of the arch are yellow and red while the keystone is white, and are surmounted by two string-courses, the first being of red stone and the second of grey marble. These emerge as it were from the voussoirs, for the grey marble keystone of the retaining arch cuts through to join the upper course, while the red flanking voussoirs merge with the red masonry. This conceit is continued in the yellow and red courses below, which also merge with the corresponding voussoirs. Three tiers of elaborate and prominent *muqarnas* crown the top of the entrance, but are now badly eroded. The central section of this *muqarnas* is the dominant one and it is surrounded by a ribbed scallop, now partly eroded. Two smaller single units flank it to either side. The upper row is made up of a series of single lancet niches with two similar elements forming the row below, and a single niche of the same dimensions as the pair forming the lowest row. All the niches are finely chamfered.

Directly above the *muqarnas* panel there is a thin projecting frame moulding which marks the top of the entrance chamber. Above it there is a course of stone which serves as a parapet; to judge by the quality of the stone, it would appear to be of recent date. A shallow saucer dome, barely visible from ground level, is set directly over the four walls of the antechamber. Two rectangular stone panels decorated with geometrical patterns are set into the section of wall that acts as a support for the entrance at the western corner of the cell. The lower panel is a little eroded and measures 20cm by 40cm. It is placed at the level of the two string courses of uniform grey. The second panel is set one course above the first. It measures 25cm by 50cm and is in a better condition.

[Editorial note: The design of both panels is based on an octagon. In each, the central point is marked by the negative shape of an eight-pointed star polygon. Around this narrow fillets form another star with irregular kite-shaped rhombs between its eight points. Between these and the beginnings of the repeat pattern, smaller five-pointed stars are created in the negative

spaces. In the larger, rectangular panel, half-motifs of the overall pattern occur at the two sides, while the smaller panel has only the first parts of the repeat design. The pattern was a favourite one in Islamic art and is ultimately derived from two interlocking squares (see El-Said and Parman 1976: 8-49, and especially figs. 36a-36d). Its appearance in relation to the door is probably significant, given the function of the *khalwa* defined in the *fatwa* as a cell 'for the invocation of Allah and for the study of religious science', and that the design was highly favoured in particular not only for the frontis- and finispieces of Qur'ans from the 14th century but also in relation to openings or the start of something. An example is the Qur'an produced by Ahmad ibn Kamal al-Mutatabbib ('the quack') in Cairo in 734/1334 (James 1988: 133 fig. 90, cat. 17). This point is discussed more fully in Auld, Chapter 24. Similar star-polygons decorate the roundels, described below, on the northern façade of the *khalwa*. SA]

The main dome of the *khalwa* is set directly on the four walls of the main chamber. Both dome and roof are covered with small flagstones. The dome culminates in a stone baluster finial carrying a crescent. This is made up of three parts; the lowest is the base, the middle contains a stone knop, and the uppermost part is made of a fully-closed crescent.

The western elevation is made up of two sections, and both are flanked by a buttress. The lower part of the façade has two huge pointed arches, once open but now completely blocked apart from two small rectangular openings in the tympanum of each. The upper part is also made up of two sections. That to the south is a plain wall, apart from a rectangular window measuring 80cm by 1.1m within the buttress. It is now fitted with an iron grille and covered on the outside by recent wire mesh. The buttress effect of this section of the building terminates five courses from the top with a chamfered course. The northern section of the upper part of the façade is highly decorated, with a tall recessed panel which terminates in a trefoil arch. This is constructed in *ablaq* of black and red while the tympanum, in striking contrast, is in dark yellow apart from two joggled stones in black that produce a negative cup-like or oil-lamp shape at their centre, and which are decorated with star-roundels. A rectangular window (75cm wide by 1.2m high) is set in the lower part of the recessed panel. It begins directly above the chamfered course of the recess and has a grey marble sill and slab lintel, with *ablaq* jambs. A joggled course surmounts the lintel in alternating red and yellow sandstone and grey marble; the central stone is red and repeats the cup-like shape above. Directly above this course, there is a decorative band of trilobate foliage alternating with trefoils, which acts as the base of the tympanum above. A string course of red cuts across the façade and continues across the northern elevation two courses below the roof of the building. At the top there is a narrow projected cornice of *cyma recta* moulding which also extends round the northern and eastern elevations of the *khalwa*. At the top of the south-western corner of this western elevation there is a stone waterspout, and the join where the frame of the antechamber meets the frame of the roof is cut and clumsily finished. A shallow dome covered with flagstones rests directly on the wall of the small ancillary room. It has no finial.

The northern elevation is both the largest and, after the southern, the most ornate. It also consists of two main sections. The lower part has two huge openings that give access to the lower storey. The first is to the east of the elevation and is a rectangular door measuring 1.62m wide and 2.1m high crowned by a lintel of white with a single black course. Above the lintel there is an arch composed of seven voussoirs of red and grey.

Some of the stonework of the jambs has been renovated recently, probably at the time when the two arches of the western elevation were blocked to house the generators. The second opening in the western section of the elevation measures 2.28m wide by 2.5m high. It also consists of a huge pointed arch. Both openings are fitted with a modern iron door.

The decorative scheme of the upper part of the elevation centres on three similar but not identical recessed panels. All three are rectangles set vertically. The first is situated in the western section and contains a rectangular window 77cm wide by 1.27m high. As usual, the window is fitted with an iron grille and is covered outside by modern iron shutters. The window opens directly above the chamfered slope of the frame; it has a grey marble sill, is surmounted by a lintel and has red stone jambs. The lintel is made up of a rose-pink section at the centre and from two sections of grey stone to either end, now weathered to black. Above the lintel is a skilfully constructed string course of seven joggled voussoirs of grey, yellow, black and red. Here the joggling seems to be a successful attempt to simulate the Mamluk stone carving tradition, but elsewhere in the *khalwa* the results are less impressive. Above this course there is a band of the same trilobate foliage and trefoils as on the western elevation; and one course over the decorative band, there is a plain cartouche. Three courses above the cartouche there are two bands of counterchange joggle of white and red, and, one course above the panel, the façade is closed by two decorative friezes which form a projecting cornice. The lower is a border of compressed counterchange floral motifs based on the trefoil. The upper frieze is made up of a series of lancet niches decorated with an incised palmette. An identical window appears in each of the other two panels in the eastern section of the elevation. Each window has a lintel of grey marble and a band of pale joggled voussoirs of grey and rose-pink above, centred on what appears to be an attempt to delineate a keystone in the shape of an oil-lamp or cup. Four courses above the joggling of the window, there is a panel of the same decorative floral frieze as to the north, but here it is framed by a band of incised hexagons that forms a type of twisted rope pattern. The hexagons are alternately filled with six-petalled floral rosettes and a smaller hexagon in an ABBABBA rhythm. Two courses above the panels a double row of simple *muqarnas* lancet niches marks the top of the elevation, below the narrow projection of the cornice that runs around three sides of the building, as noted above.

In its way, the eastern elevation is also impressive. It is a solid wall apart from a long vertical recessed panel which slices through the façade, and a rectangular window below the panel. The lower part of the elevation located below the recessed panel is plain, with the exception of the simple rectangular window mentioned above at the level of the sixth course. This measures 67cm by 75cm and is protected by modern iron shutters. Judging from the lintel and the jambs it is probable that it was opened recently, probably in the 1960s when the generator was installed. The lower part is made up of twelve stone courses which, owing to the slope of the steps connecting the two levels of the Haram esplanade, reach a height of 2.68m at the north-eastern corner and 1.25m at the south-eastern corner. The panel is set directly above the eleventh recessed chamfered course and stops below the projecting cornice frame which runs around the three elevations. A rectangular window is placed immediately above the chamfered course (81cm wide by 1.27m high), and is now fitted with an iron grille and recent iron shutters. The window has a grey marble slab lintel. One course above there is a rectangular marble

panel of light-red which is decorated by three six-pointed stars of dark-red marble set into the surface. Two small lozenge-shaped holes between the stars show that probably there were once inlaid turquoise-blue faience accents, now lost. The likelihood of turquoise-blue faience having been the inlaid substance is extrapolated from the detailing of the inside doorway to the main chamber described below and from a single surviving trace, also described below. One course higher there is another rectangular panel, now framed by a twisted rope border containing alternate small and large irregular hexagons. A lobed cartouche is placed in recess at the centre of the panel. In the middle of the cartouche there is an eight-pointed star, its points now a series of free-floating triangles. The inlay has clearly fallen out but a trace of one piece of turquoise faience still exists in the point top right of centre, adding credence to the assumption given above. Yet another panel appears one course above, reminiscent of the lowest example. But this time the three six-pointed stars are smaller, although also of red marble set into the surface; the central one has eroded now and the colour has darkened. And now two lozenges, instead of a single example, mark the space between the stars; but they too have now lost their inlay. Finally the panel is topped by a sophisticated stalactite *muqarnas* cornice of three tiers. It is adorned by concave lancets whose only decoration is a framing groove. Two large round-headed slit windows are opened to either side of the central panel, to give light and ventilation to the inner chamber. Their elegance is confirmed by splay-chamfered stone jambs. A stone waterspout is attached to the north of the northern window.

Interior

The interior of the lower storey of the *khalwa* consists of two sections. There is a single chamber to the east which is square in plan, each side measuring 4.25m. The floor of the chamber is on the same level as the Haram esplanade and is now of concrete. The chamber has a cross vault which rests on four huge identical pointed arches that spring from the four corners of the walls 45cm above ground level. There are two rectangular windows, the first in the eastern side, measuring 80cm wide by 75cm high, and the second in the western side, 80cm wide by 1m high, next to the eastern side of the western section of the lower storey. A rectangular recessed blind niche is placed at the centre of the southern wall; it is 78cm wide by 50cm deep and has a semicircular arch and hood.

The western part of the lower storey of the *khalwa* itself consists of two components. The first is a single bay to the north. The bay is nearly rectangular in plan (3.1m long by 2.58m wide) and is covered by a cross vault. Access to this bay was once from the north and the west through the two large arches. In this respect, the bay formerly resembled those of the northern and western porticoes of the Haram. However, as described above, the western arch has recently been blocked and now a doorway (1.16m wide) in the eastern corner of the south wall of the bay gives access to the second component of this section of the lower storey. This is a rectangular room once divided into two small cells. It measures 3.1m long by 1.8m wide. There is no fenestration in this section.

The upper floor of the North-Western Khalwa of Ahmad Pasha contains three rooms—the antechamber, the main chamber and the ancillary chamber. Two steps lead to the raised entrance of the door to the antechamber; the latter is small and rectangular in plan, measuring 1.5m wide by 2.6m long. It has been constructed to lead to the main chamber of the building.

The floor of the antechamber is separated from that of the main room by a low sill (12cm high), and it is paved with white traditional flagstones of medium size. At the centre of the floor there is an almost square (42cm by 40cm) white slab framed on all four sides by a band of red rectangular slabs 14cm in width. A similar panel, although it has a different design, is to be found set into the paving to the west of the *mihrab* of Qubbat al-Arwah (cat. no. 30). The aim was probably purely decorative, and is in keeping with the other elements of lavish ornamentation in the *khalwa*. If ever there is a case of conspicuous consumption in the architecture of Ottoman Jerusalem, it is to be found here. A rectangular window is located in the western wall of the antechamber, and opposite the window in the eastern wall there is a door measuring 80cm wide by 1.68m high, leading into the main chamber. The door is surmounted by a grey stone slab lintel which has been inscribed with a quotation from the Qur'an (15: 45) and the date 1203/1788-9. The position and choice of inscription doubtless relate to the present use of the chamber. The text (the Arabic wording is cited on Cat. Appendix 2, no. 22/2) of this quotation is interesting; in translation it reads: 'Enter you into it, in peace and security, enter you into it in peace [in] the year 1203' (*udkhuluha bi-salam aminin, udkhuluha bi-salam sanat 1203* [1788-9]). The first part of the text is the greeting of the righteous who will be admitted to the gardens and fountains of paradise. It would thus seem that it was the intention of the choice of this quotation to relate the entrance of this *khalwa* to the entrance to Paradise. It should be recalled that the northern gate of the Dome of the Rock, which is located opposite this cell, is called the Bab al-Janna (Paradise Gate).

There is a small central pointed masonry dome, supported on three small pointed arches on the west, south and east sides, and by the wall to the north. The arches to west and east are deep enough to form a shallow *ivan*. The transitional zone is provided by four pendentives at the corners with an intermediary low circular drum. The walls of the antechamber have recently been plastered.

The main chamber is square, each side measuring 4.5m, and it has a modern paved floor. In all, as already mentioned, there are five windows in this room—two in each of the southern and northern walls, and one in the eastern wall. These windows are surmounted by a stone slab which has been elegantly decorated with a recessed ogival frame moulding; directly above each slab is a relieving arch built of rubble. The masonry of the courses above the arches of the windows is marked by being quite differently chiselled from that of the courses below. It is therefore proposed that the walls above the level of the arches were formerly plastered, and that they were uncovered only recently when the chamber was redecorated. There are also five blind recesses in this main chamber—two identical niches open in the southern wall, one to the west close to the door, and the other to the east. Each measures 39cm wide by 71cm high by 32cm deep. Another pair of niches flank the window in the eastern wall; these are identical, each measuring 62cm wide by 1.03m high by 48cm deep. The fifth niche is in the western wall to the north of the door, and measures 76cm wide by 1.66m high by 50cm deep. This recess is surmounted by a horse-shoe arch. The dome is expressed inside as a shallow saucer of thirty-two whorled ribs. The centre contains a roundel with incised relief lines which appear to radiate from a central inner point. The transfer from square to circle is achieved by way of four pendentives in the corners and eight folded triangles, each of which represent one of the eight sides. This irregular vault is unique in Jerusalem as far as I am aware. The

dome and the transition area have recently been plastered.

A door in the west wall of the main chamber measuring 76cm wide by 1.73m high gives access to the ancillary chamber, which can be seen as the *khalwa* itself. The front face of the eastward-looking door is surmounted by a slab lintel decorated by a frame ogival moulding. The plan of the ancillary cell is square with an internal measurement of 2.67m, and it is paved throughout with modern flagstones. As described above, there are two windows placed in the centre of the western and northern walls which are similar, both being surmounted by a nearly-semicircular arch and scallop, and in both the opening begins 20cm above the floor of the chamber. In the southern wall, there are two blind niches, the western one measuring 60cm wide by 1.5m high by 40cm deep. It is, like the windows, set 20cm above the floor level. The second recess is a *mihrab* niche. It measures 76cm wide by 1.82m high by 50cm deep. Here too the apex is in the form of a semicircular arch and scalloped hood. As already stated, it is in the eastern wall that the door from the main chamber is located. It is quite exceptional in Ottoman Jerusalem in that its westward-facing surround is lavishly adorned with coloured masonry. The doorway itself is constructed with jambs of seven red and grey stones, and it is surmounted by a grey marble slab lintel. Directly above, there is a large, single white stone bracketted between two red ones. Into it three eight-pointed stars in red have been inlaid, and between them there are two lozenges in black, perhaps black marble or the black stone from Nabi Musa. There follows a single course in red and then a frame of engraved fretwork in the form of horizontal 'S' shapes, reminiscent of a debased Greek key-pattern. Within this frame there is a panel which consists of four white stones at the corners with red ones in between. In the centre there is a cartouche with ogival terminals and an eight-pointed star. The outer points of the star, which are again of black, float freely around eight further red points. The central point is marked by a turquoise circular disc. The scheme thus echoes that of the recessed panel of the eastern façade, but the turquoise faience inlay is still intact, whereas it was lost outside. Equally the colours of the stone in the protected environment have remained vibrant, and thus the impact of the doorway is considerable. The chamber is covered by a shallow dome which rests directly on the four walls. Small pendentives in each corner and eight folded triangles serve as a transitional zone. The walls and the dome have been recently plastered and whitewashed.

The architectural features and the architect

The *khalwa* under discussion is undoubtedly a masterpiece. It can be considered the jewel of Ottoman architecture in Jerusalem, or—to follow the analogy of Mujir al-Din (1973 2: 329) who considered the Ashrafiyya Madrasa the 'third jewel' after the Dome of the Rock and al-Aqsa Mosque—it is the fourth jewel of the Haram.

Before the work on the *siyills* began, the survey raised as many questions as it solved. These have already been described. The subsequent discovery of the relevant documents has now answered many more, but one central question remains—were the masons who built the two *khalwas* for Ahmad Pasha local Palestinians or they were imported from elsewhere, perhaps Syria or Egypt, or even Istanbul? The last hypothesis would have seemed the most likely by comparison with other monuments. For example, the masters and craftsmen involved in the construction of al-Ashrafiyya (Burgoyne 1987: 589-602), the projects relating to the city wall and other projects were brought

in from outside (see Chapter 36, Non-local Master Builders). Now, relying not only on the architecture itself but also on the invaluable *sijills*, it is possible to provide a different answer based more solidly on fact.

It is striking that Hujrat Islām Beg (cat. no. 21, dated 1002/1593-4), the North-Western Khalwa of Ahmad Pasha (cat. no. 22, dated 1009/1600), the North-Eastern Khalwa of Ahmad Pasha (cat. no. 23, dated 1009/1600), Khalwat Junbalatiyya (cat. no. 24, dated 1010/1601-2), Madrasat Ahmad Pasha (cat. no. 25, dated 1013/1604), and Khalwat Bairam Pasha (cat. no. 34, before 1038/1628) have many historical, architectural, and decorative aspects in common. These features have already been fully discussed in Chapter 36 under *Khalwas* and, more specifically there, under the fourth category of the *khalwas* and Table 36.7. From the information provided there it would seem that this group of *khalwas* must have been built under the influence of a single school of architecture or in a local style. It is quite possible that the man responsible for this was the Jerusalemite master builder, ‘Abd al-Muhsin ibn Mahmud ibn Nammar, a member of the family which contributed so richly to the architecture of

Ottoman Jerusalem over a period of three centuries.

Sijill 115: 721 states that ‘Abd al-Muhsin was contracted by Ahmad Pasha to build the Junbalatiyya *khalwa* (cat. no. 24). This *sijill* also contains an important piece of information about the *khalwa* of Bairam Pasha. It states that the building was erected by ‘Abd al-Muhsin ibn Mahmud, the chief of the master builders (*ra’is al-mi’ariyya*). Moreover, it includes the statement that the *khalwa* of Bairam Pasha was built according to the layout and the measurements of Khalwat Ahmad Pasha (Junbalatiyya).

It is also noticeable that four of the buildings in the group were constructed under the patronage of a single governor—Ahmad Pasha—and that they were built in a relatively short period of time, probably a single decade. This would support the suggestion that there was a single designer for them all. It is thus probably correct to infer that all the *khalwas* in this group, as well as the elegant North-Western Khalwa of Ahmad Pasha (cat. no. 22), were designed and constructed by the same local master mason/architect. For more details on ‘Abd al-Muhsin and his family business, see Chapter 36 above under the Family of Ibn Nammar.

23 THE NORTH-EASTERN KHALWA OF AHMAD PASHA

Name: The North-Eastern Khalwa of Ahmad Pasha

Date: Undated, probably Awakhir Muharram 1007/August-September 1598

Endowment: Ramadan 1009/March-April 1600-1

Variant of name: None known

Modern name: Maktab al-Tarjama (The Translation Office)

Location

At the north end of the Dome of the Rock terrace, abutting the eastern pillar of the north-eastern colonnade.

Site and brief description (fig. 23.1, pls. 23.1-23.6)

The North-Eastern Khalwa of Ahmad Pasha is situated 34m from the north-eastern corner of the upper terrace of the Dome of the Rock. Its lower western wall abuts the eastern side of the stairway at the southern end of the path leading from Bab Hitta to the upper esplanade. Its position is directly opposite the North-Western Khalwa of Ahmad Pasha (cat. no. 22), now known as the office of the director of al-Aqsa Mosque, lying to the west. The *khalwa*, like all those in the Haram, consists of an upper and a lower section. The lower part is a small cross-vaulted chamber, entered from the Haram esplanade. The building is constructed in principle, like several other cells, in order to bridge the gap in height between the two levels of the Haram, for the upper level—also a small single chamber covered by a hemispherical dome with a small antechamber in front—is built at, and entered from, the level of the upper terrace. The *khalwa* is thus a single-unit structure and it is built throughout with masonry of varying hues of yellow, red, and white that have weathered to either black or grey.

History

As far as was known when the research for this volume began, no information about this building had surfaced. However, as shown above (cat. no. 22) the North-Eastern Khalwa and the North-Western Khalwa of Ahmad Pasha share a similar history. The details so far unearthed of the life of its founder, the *waqf* documents, the site and the purpose for its construction are given under cat. no. 22.

Endowment

Although both the North-Eastern and North-Western Khalwas share the same *waqfiyya*, they differ as to the financial arrangements of the endowment and the stipulations imposed by Ahmad Pasha. Here again it was a document regarding an appointment that revealed the basic information about the endowment. The document is registered in Sijill 187: 127 in relation to the council of Qadi Sulaiman Efendi in the proceedings of the year 1096/1684-5. The document states that 'the late (*al-marhum*) Ahmad Pasha, the former governor of Gaza, has made *waqf* the whole chamber situated on the platform of the Noble Rock on the northern row (*bi-l-saf al-shamali*). It was dedicated by the said donor (Ahmad Pasha) for Shaikh al-Islam Radi al-Din al-Lutfi, and after him for his sons and his descendants. A sum of 1,000 *misriyya* pieces has been allotted every year for its benefit, 100 pieces for oil to illuminate the chamber, and the rest (900) for the reader (*qari*', that is, for Radi

al-Din) in recompense for his recitation from the Qur'an every day in the said chamber constructed by Ahmad Pasha.' The document states that after al-Shaikh Radi al-Din died, the post was occupied by his son Yusuf Efendi. Al-Shaikh Radi al-Din al-Lutfi must have been a man of some prominence, for the date of his death is recorded on the binding of the volume of Sijill 102. The record states that '(there) has passed away (*indaraja*) to the mercy of Allah al-Shaikh al-Imam Radi al-Din the son of Abu'l-Lutf ... after the afternoon prayer (*al-ʿasr*) on 13 Jumada II of the year 1028/28 May 1619.' When al-Shaikh Yusuf, the son of Radi al-Din, died, he left no sons, so the position was given to the son of his daughter, al-Shaikh 'Abd al-Qadir Zain al-'Arab. All this information, with the exception of the death of al-Shaikh Radi al-Din, is repeated in another entry in the *sijills* (187: 223). This second entry records the voluntary abdication (*tafarrugh*) from the position of reader by al-Shaikh 'Abd al-Qadir ibn Zain al-'Arab in favour of his brother al-Shaikh 'Abd al-Razzaq Zain al-'Arab.

Architecture

Exterior

A rectangular dais is built in front of the main, southern façade of the *khalwa*. It measures 2.05m wide by 4.2m long by 67cm high, and is built of the high-quality white stone traditionally used for paving and that has now weathered to grey. The flagstones are remarkably big, some measuring as much as 1.9m long by 90cm wide. The dais in all probability originally supported a now non-existent two-bay porch, for it still bears traces of column bases at its outer edge. There are other reasons for this assumption. For example, the stones of this façade appear to be homogeneous, and are still a relatively bright yellow in comparison to those of the rest of the *khalwa*—that is, the walls to the west and north—which show a degree of black discolouration due to a chemical reaction from exposure to rain. It seems likely therefore that the portico was dismantled only at a relatively late period. This portico would have rendered the building much more impressive than it now is.

The principal scheme of the south façade is made up of three parts. The first is a rectangular recessed panel enclosed in a slightly chamfered frame. Two identical windows are placed within the panel; each measures 75cm wide by 1.15m high, and each is fitted with an iron grille clad outside with a recent wire mesh. Each window is surmounted by a marble slab lintel, and directly above each there is a truncated relieving arch constructed of odd curving voussoirs that take a segmental shape around the central keystone, which is in the shape of a *qandil* or *mishka* (a pendant oil-lamp). The second part is formed from two blocked-up semicircular arches, flanking a two-tiered simple *muqarnas* bracket with an astragal moulding, the purpose of which was to act as a support for the arches of the porch of the *khalwa*. All these elements are incorporated into the upper part of the façade which is set directly above the two windows. A projecting stone cornice runs around the upper limit of the three walls. This too supports the assumption of an original two-bay porch mentioned above. The hemispherical dome sits directly on the roof of the building; it is covered with small flagstones to protect it from the elements, and has no finial. A simple undecorated door is set to the east of the southern façade and forms its third part. The roof level of this part is 70cm lower than that of first section. It is not easy to understand why this should be, although the same arrangement is seen in the Hujrat Muhammad Agha (cat. no. 20), the Khalwat Junbalatiyya (cat. no. 24) and the Odat Arslan Pasha (cat. no. 41). It seems likely that a cornice crowned this eastern extension and

this cornice therefore continued the line of the *cyma recta* moulding of the pier of the *mawazin* immediately to the west of this *khalwa*. The doorway (1.3m wide by 2.45m high) gives access to the interior of the upper chamber; it is approached by three steps, 69cm in height from the level of the terrace, and it is surmounted by a semicircular arch made of simple voussoirs.

The ground around the lower part of the North-Eastern Khalwa, especially in front of the northern elevation, is uneven. The masonry of most of the first course of this elevation is invisible. It is possible to see, however, that the first two courses of the northern elevation are built of large, coarse stones of varying dimensions, some measuring 1m long by 40cm wide, and that the joint lines become straight only at the level where a window is set into in the façade. The reason for this may be that the foundation of the building dates from an earlier period, or perhaps that larger stones were selected for greater stability. One must also reckon with plants growing at the base of the building, and this would disguise this lower-quality stone. The window is rectangular. It measures 70cm wide and 1.05m in height, and is surmounted by a stone lintel of three slabs, the middle one of which is both the biggest and the most clumsily cut. A relieving arch consisting of three voussoirs is set directly above the lintel; its keystone is red and is decorated by a double relief moulding consisting of lobed arcuated forms. The whole terminates at the centre with a trefoil. The window is fitted with an iron grille and with recent wire mesh similar to that of the south façade.

One course above the sloping chamfer that marks the end of the lower and the start of the upper part of the building there is a rectangular recessed panel. The panel is placed at the centre of the north elevation and is identical with the panel in the southern façade, though here it consists of two additional courses of masonry. The first of these is plain, but the second is decorated with three similar but not identical star roundels. The central example has a ten-pointed star, that to the east has twelve points and to the west there is a further example of one with ten points but with additional interlace. A beautiful effect is created by recessing the background and leaving the geometrical details of the roundels in reserve. Two courses above the recessed panel, the building finishes with a salient simple stone cornice which has a terracotta water spout at its centre.

The western elevation has the same layout and a similar decorative scheme as the north elevation, but owing to the slope of the path some of the stones are invisible. However they seem to be uniform in quality. Its recessed panel is smaller than that of the northern elevation, and it therefore has only one window, measuring 75cm wide by 1.15m high. The window has a red slab lintel, and directly above there is a relieving arch with another *qandil* or *mishka* (oil-lamp) motif, made up of five voussoirs. A star pattern flanks the arch to either side and a third example is placed above the keystone. The star motifs are identical to those of the western elevation, although somewhat smaller. The colour of the stones that now block the window appears to be consistent with the rest of the elevation, which means that the window must have been filled at an early period to allow two blind niches to be built for use as a cupboard.

The eastern elevation is the simplest. It too is constructed in two parts, the lower part of which houses a door that leads into the lower-level interior of the *khalwa*. The door measures 79cm wide by 1.57m high and it is raised 43cm above the level of the Haram esplanade. A red slab lintel surmounts the door and above it there is a flat arch made up of seven plain voussoirs set at an angle; the keystone is red. A simple

undecorated window is placed in the upper part of the eastern elevation, measuring 80cm wide by 1.27m high, and again with a red slab lintel. Above it, five masonry courses lead up to the cornice that runs around the three walls, although here a section to the south is damaged.

Interior

A small rectangular antechamber, measuring 1.3m wide by 1.75m long, leads into the main chamber of the *khalwa*. The floor of the antechamber is separated from that of the main chamber by a small sill 32cm high, and is paved with white traditional flagstones of medium size. Two blind recessed openings are placed on the north and east sides, the first measuring 30cm wide by 40cm deep by 70cm high and the second 40cm wide by 30cm deep by 70cm high. The roof consists of a cross vault and has been recently plastered.

A single step leads to the raised entrance door, measuring 75cm wide and 1.6m high. The main chamber is square in shape, and it has a modern pavement of black and grey 30cm squares set in a geometrical pattern of a type popular in Palestine during the Mandate period. This pavement is identical to the one existing in the Khalwa Parwiz (cat. no. 17), but is now concealed by a modern rug. The four walls of the room as well as the dome are plastered and were whitewashed in 1990. Two blind niches were opened in the west wall after the window was blocked; the one to the south measures 70cm wide by 90cm high by 35cm deep, and the one to the north measures 95cm wide by 1.4m long by 45cm deep. Another small niche is opened in the east wall next to the door, only 33cm wide by 54cm long and 36cm deep. As already described, there are five windows—two in the south wall, and one in each of the west, north, and east walls. These windows have similar outside dimensions and each has a lintel surmounted by a relieving arch, but on the inside each has a semicircular arch and scallop. The hemispherical dome is carried directly on the four walls of the room. The transition from square to circle is achieved by way of four squinches in the corners of the room. The north-western squinch has two lancet panels at the level of its springing, and traces of the same panel can still be seen in the south-western squinch.

The interior of the lower part of the *khalwa* is raised 43cm from the Haram level; it consists of a square room with a traditional pavement. A blind recess, 85cm wide by 50cm deep, forms a niche in the west wall. The room is covered by a simple cross vault with a very shallow saucer dome in the centre.

24 AL-KHALWA AL-JUNBALATIYYA

Name: Al-Khalwa al-Junbalatiyya

Date: 1010/1601-2

Endowment: None known

Variant of name: Khalwat Ahmad Pasha

Modern name: Khalwat al-Shurta al-Gharbiyya (the western cell of the police)

Location

The *khalwa* is located at the northern edge of the terrace of the Dome of the Rock, between Khalwat Qitas (cat. no. 16) and Odat (chamber) al-Hajj Arslan Pasha (cat. no. 41).

Site and brief description (figs. 24.1-24.4, pls. 24.1-24.4)

Al-Khalwa al-Junbalatiyya is narrowly separated from Khalwat Qitas with only 2.26m between them. Its eastern façade adjoins the western façade of the chamber of al-Hajj Arslan Pasha. The *khalwa* is similar to most of those on the northern side of the terrace in that it is made up of two floors, the lower one consisting of two rooms. The first of these is rectangular and the second is square in plan, and both are covered by a cross vault. This storey is built as a bridge between the lower and upper levels of the Haram esplanade. The upper floor consists of two integrated components, the first being a square domed chamber, and the second a rectangular area divided equally between two small square *khalwas*, of which the first serves as an antechamber to the second, main chamber. The *khalwa* is built throughout of white masonry which has now weathered to grey.

History

Identification

Al-Khalwa al-Junbalatiyya is one of the cells which are a truly Ottoman contribution to the platform of the Dome of the Rock. With the exception of the colonnades and the pulpit of Burhan al-Din, which are in the main Mamluk, and the Ayyubid Nahawiyya, no structure stood at the edge of the upper terrace of the Dome of the Rock before the Ottoman period.

There is no published information on the *khalwa*, but two relevant short documents were detected in the *sijills*. They give its name and location, as well as details of its founder, patronage and even the architect. The first document is dated 1010/1601-2 and is to be found in Sijill 83: 51. It is a declaration from the *mi'mar-bashi* (chief architect) of Jerusalem the Noble, 'Abd al-Muhsin ibn Mahmud ibn Nammār, that 'Ahmad Pasha had already contracted him to construct ('imara) the Junbalatiyya *khalwa* on the platform of the Noble Rock, in return for 50 *sultani* gold coins; a further 20 *sultani* gold coins were to be for its plaster, the doors and the doors of its cupboards and windows.' It is worth noting that the term 'imara is occasionally used to denote a restoration rather than a construction. However, it is safe to assume here that the word is used to imply 'construction', for the style of the *khalwa* bears all the hallmarks of the work of 'Abd al-Muhsin ibn Mahmud ibn Nammār (see Chapter 36 under *Khalwas*).

There are two elements which are not entirely clear in the first document relating to the *khalwa*—the location and details of the founder. It is therefore lucky that the second document written into Sijill 113: 112, dated 8 Muharram 1037/19 September 1627, includes information on both points. The relevant document is a permit issued by the *qadi* allowing

Muhammad Agha, *za'im* (holder of a fief) in the Noble City of Jerusalem, to reside in a chamber. The chamber is described 'as situated on the upper (*a'la*, in this case northern) platform of the Noble Rock on the western side (*bi-'l-janib al-gharbi*) whose *waqf* was set up by the son of Junbalat.' Since only two *khalwas* in the western section of the northern side of the Dome of the Rock terrace remain to be identified—those of Junbalatiyya and Arslan—and because these two *khalwas* are reported in the *waqfiyya* of Arslan Pasha (Sijill 198: 108; see below cat. no. 41) as abutting each other, this *khalwa* must be the Junbalatiyya. And indeed further support for the identification, if any were needed, is to be found in the architectural design.

The plan of the Junbalatiyya is almost identical to that of Khalwat Bairam Pasha. Their similarity is reported in Sijill 115: 721 (see also cat. no. 34) which says both that the Khalwat Bairam is built to the same plan as Khalwat Ahmad Pasha, and that they were constructed by the same architect, 'Abd al-Muhsin ibn Mahmud ibn Nammār. An inspection of the plans of the *khalwas* reveals that this is indeed the case.

Date

The date of the contract, as stated in Sijill 83: 51, was before 1010/1601-2. This in turn suggests that the *khalwa* was designed some time at the very end of the 16th century.

Founder

There is an interesting problem regarding the foundation of the *khalwa*. For while it is quite clear from the documents already described that the construction was carried out by Ahmad Pasha, the endowment in support of it was set up by Ibn Junbalat. This is a most unusual and contradictory situation, and is hard to unravel. If Ahmad Pasha built this *khalwa* for himself, why did he agree that it should be attributed to Ibn Junbalat and named 'the Junbalatiyya'? Even more fundamentally, why did he not arrange for the *waqf* himself, as he did for his three other prominent structures? Perhaps he was running out of money. Most probably Ahmad Pasha's role was as mediator on behalf of a relative or colleague, and he acted as supervisor of Ibn Junbalat's project. We are also faced with the problem of identifying Ibn Junbalat. Since his first name does not appear in the documents, it is impossible to pinpoint him, but the name is that of a prominent ruling family in Palestine in the Ottoman period. The donor of the *khalwa* was in all likelihood a member of the family. In any case, Ahmad Pasha's involvement meant that the *khalwa* became known by his name rather than that of Ibn Junbalat. The situation is entirely understandable, for Ahmad Pasha was closely associated with the Haram al-Sharif and was well known for the wealth of his *waqfs* and for his high-quality constructions.

Architecture

A rectangular stone dais is built in front of the main, southern façade of the *khalwa*. It measures 5.2m long by 2.3m wide and 80cm high. The fabric of the dais is similar to that of others on the terrace of the Dome of the Rock, for it is built of good-quality white stone that has now weathered to grey. The dais once sported a now non-existent two-bayed portico, for traces survive of the three bases of the columns at its outermost side, and the columns are marked on Powell's plan (1862).¹ In addition, three brackets

¹ E J Powell 'reduced' the plan of the Haram al-Sharif from Catherwood's original plan of 1833 at a scale of 10 feet to one inch. It includes 'corrections and additions from more recent authorities' and is dated 1st February 1862.

which once supported the inner arches can still be seen on the southern wall (see below). The fact that this stone has weathered relatively little suggests that the disappearance of the porch was comparatively recent, and is likely that to have been related to the earthquake which caused severe damage in Jerusalem in 1927.

The main scheme of the southern façade of the *khalwa* is in two parts, as it is in the North-Eastern Khalwa of Ahmad Pasha, although there is a significant difference between the decorative details of the two buildings. The main element of the decoration of the southern façade still extant is an oblong recessed panel surrounded by a gently chamfered frame. Two identical windows are set within the panel; each measures 85cm wide by 1.3m high, and each is fitted with an iron grille covered on the outside by wire mesh, and iron shutters for extra protection. Each window is surmounted by a white marble slab lintel, and directly above this there is a relieving arch made up of seven joggled voussoirs that appear to be an unsuccessful imitation of the Mamluk style. The joggled voussoirs have the appearance of a shallow veneer, but in fact the depth of pointing suggests that they are a true architectural feature rather than purely decorative. The voussoirs have recently been painted with whitewash, and it is thus difficult to determine the original colour of the stone; but a small break reveals it as grey.

A second element of the present façade is the traces of two pointed arches of different spans, the one to the west less pointed than the one to the east. The arches spring from three identical brackets made up of three tiers of elaborate *muqarnas* stalactites. Two rectangular recessed blind panels of different dimensions are placed in the centre of the tympana. The panel to the east measures 1.5m wide by 80cm high. It is surrounded by a solid stone frame decorated with an incised twisted triple-rope design. The panel to the west measures 85cm wide by 98cm high, and is also framed in solid stone, but here the incised design takes the form of a chevron border. The original purpose of these two panels was probably to house an inscription or a decorative plaque, for they are similar to the panels at the North-Western Khalwa of Ahmad Pasha (see cat. no. 22). The vestiges of a projecting cornice can be seen one course below the roof of the *khalwa* at both corners of the façade. This probably represents the remnants of a cornice that ran round the top of the three walls of the portico: it originally broke forward to enclose that projecting space. At the very top of all four façades, a narrow stone cornice now projects forward to run round the upper limit of the building. The main hemispherical dome sits directly on the roof of the building; it is a recent concrete construction and replaces the older dome. Neither dome nor roof are finished in stone, but the finial set on the apex of the dome is of stone.

A third element of the façade is a simple undecorated door, to the east of the main domed chamber. The level of the roof here reflects the lower height of the antechamber. The two levels appear to be original, for the joints of the courses run unbroken across the façades of both parts, and the eastern wall of the main chamber also shows no sign of any addition. This difference in height between the main chamber and the antechamber is a phenomenon that exists in other *khalwa* constructions in the Haram. Examples can be seen in the North-Eastern Khalwa (cat. no.23), and al-Madrassa al-Ahmadiyya (cat. no.25) among others. The doorway gives access to the interior of the *khalwa*, and is approached by two steps, 77cm above the level of the terrace. Although it looks superficially as if it might once have been a window, there is no evidence that the door was ever anything else. It is surmounted by a pointed arch constructed with simple

voussoirs of red stone.

The decorative scheme of the northern elevation of the *khalwa* is divided horizontally into two parts. The lower section is a solid masonry wall of regular courses with two doors; the one to the west was converted to a window (80cm by 80cm) by blocking its lower part. The west door, measuring 80cm wide by 1.24m high, is surmounted by a slab lintel with an uneven upper edge. One and a half courses (40cm) above the slab there is part of a relieving arch in the form of four voussoirs. The east door measures 78cm wide by 1.74m high. It too is surmounted by a slab lintel, and directly above it there is a relieving arch. The upper part is decorated with three windows, the first on the east side of the elevation. This is rectangular, measuring 70cm wide by 1.2m high, and is fitted with an iron grille. It is surmounted by a slab lintel and immediately above is an 'eye-brow' arch. The other two windows are within a recessed panel. They are identical, also covered by iron grilles and modern iron shutters on the outside, and each (80cm wide by 1.2m high) is surmounted by a white marble slab lintel. Directly above each lintel is a relieving arch made up of three voussoirs, in each case with a red keystone. A single band of simple lancet *muqarnas* niches projects forward, acting as a cornice and marking the summit of the rectangular recess of the panel six courses above the window arches.

A rectangular door (78cm wide by 1.61m high and 84cm deep) dominates the lower section of the western elevation (pl. 24/7). It too is surmounted by a slab lintel and above it there is an arch consisting of three voussoirs. There is a slit window to the south of the door, topped by a gently-curving, chamfered arch. The upper part of the western elevation has a recessed rectangular panel smaller than that of the northern elevation. It is provided with a single window, measuring 80cm wide by 1.3m high. Its lintel is a white slab, and directly above there is a single decorated stone, adorned with an inlaid marble slab with interlocking trefoils. The top of this recessed panel, too, like that of the northern elevation, is marked by a band of *muqarnas* lancet niches acting as a cornice. There is no evidence that a similar *muqarnas* cornice ever surrounded the portico.

Interior

A small rectangular antechamber, measuring 1.6m wide by 2.7m long, leads into the main chamber of the *khalwa*. It appears to be part of the original building. The floor of this antechamber is distinguished from that of the main chamber by a low sill 15cm high, and is paved with the traditional white flagstones of medium size. The room features a deep arch and, to the north of the arch, has a small saucer dome with seventeen ribs. The walls and the roof of the antechamber have been plastered recently. Originally there was a blind recessed niche in the east wall of the antechamber (Powell 1862). The blind niche was opened to serve as a connecting door between the Junbalatiyya and Odat Arslan. The conversion is a recent one, to allow easy access for the policemen who today occupy both *khalwas*. A doorway, 1.7m by 70cm, at the north of the antechamber gives access to a small square room, some 2m wide by 2m deep. Once ideally suited as a solitary retreat, today it serves as a kitchen. It is paved with flagstones and is covered by a cross vault with a saucer dome at its centre. The transition zone of the dome is decorated by a double incised chevron band which forms seven units, so that the dome has a seven-pointed star at its centre. The dome is plastered and coated with whitewash. A window is located in the north wall of the *khalwa*, and in the west wall there is a rectangular blind recessed niche measuring 90cm wide by 40cm deep by 1.5m high.

A doorway leads to the main chamber. This is square (4.1m by 4.1m) and has old paving stones on the floor. The walls of the room and the dome are plastered and have been frequently whitewashed over the last decade. As already described, there are five windows—two in each of the south and north walls, and one in the west wall. These windows have semicircular arches and scallops, apart from the windows of the south wall which have an ogival frame moulding resembling a small ogee arch. The hemispherical dome is carried directly on the four walls of the room. The transition from square to circle is achieved by way of four pendentives placed at the four corners of the room.

The interior of the lower part of the *khalwa* is on the

same level as the Haram esplanade. It consists of two rooms; the first to the west is square in plan and has a modern pavement. A door in the west wall leads to its interior. Two windows are located in the chamber; the first (originally a door) in the north wall, the second in the west wall, which appears on the outside as a slit window. A blind recess, 70cm wide by 70cm high by 70cm deep, forms a niche in the south wall. The room is covered by a simple cross vault and is used today by the Haram attendants. The second room to the east is rectangular in plan, measuring 2.1m by 4.2m, with no opening apart from the door. It is used today as storage space by the police and, like its neighbour, is covered by a folded cross vault.

25 MADRASAT AHMAD PASHA

Name: Madrasat Ahmad Pasha, or al-Madrassa al-Ahmadiyya

Date: Undated

Endowment: 15 Ramadan 1013/4 February 1604

Variant of name: Khalwat al-Ghazali

Modern name: It is now mistakenly known as the 'Khalwat al-Ghazali' by the Haram Guards. This name seems to be a corruption of the established tradition referred to by Mujir al-Din (1973 1: 299) that al-Ghazali (450-505/1058-1112) resided in al-Zawiya al-Nasiriyya above the Golden Gate (the Gate of Mercy) whilst in Jerusalem. Later the *zawiya* was renamed after al-Ghazali and became known as 'al-Zawiyya al-Ghazaliyya' but it has since disappeared.

Location

The *madrassa* is located to the east of the terrace of the Dome of the Rock, north of the eastern colonnade.

Function

Two buildings called *madrasas* were found in the course of research on the Ottoman buildings. The first is al-Madrassa al-Ahmadiyya (cat. no. 25). Its date, function and identification were all established by *sijill* evidence, but since it has a similar layout to the other *khalwas* in the Haram, it is here classified as one of them (see Chapter 36 under *Khalwas*). In support of this decision, to my knowledge there is no comparable building in Hebron, Nablus or Jerusalem which is not considered to be a *khalwa*. There are 15 *khalwas* on the Haram for non-residential students, and this small building fits into this category. Unlike the students, the *shaikh* was permitted to live in certain of the cells, for example in Hujrat Muhammad Agha (cat. no. 20), but there is no evidence that he did so in al-Madrassa al-Ahmadiyya. There is, at least, no mention in the *waqfiyya* of the *shaikh's* residence, although the lower chamber corresponds to similar rooms inhabited by the *shaikh* in Hujrat Muhammad Agha. It is possible that the use of the cells as a residence may explain why some *khalwas* came to be known by the name of the *shaikh*.

Site and brief description (figs. 25.1-25.6, pls. 25.1-25.7)

Al-Madrassa al-Ahmadiyya is the only building constructed to the east of the Dome of the Rock between the eastern colonnade and the north-eastern corner of the terrace. It is a free-standing structure on two levels, each consisting of two units. It is built in a variety of coloured stone—yellow, red, and white—that has unfortunately weathered to black or grey. It faces across the terrace to the north-eastern façade of the Dome of the Rock. The lower floor has a rectangular room with a high tunnel vault, and next to it there is another small chamber of similar shape. The upper storey also contains a larger room, but this is square in plan and covered by a hemispherical dome, and is preceded by a smaller antechamber. This upper storey is constructed on the level of the upper terrace.

History

Al-Madrassa al-Ahmadiyya is not dated by foundation inscription nor, as far as it has been possible to establish, does it appear in any contemporary travel account. It is ignored by modern scholars apart from al-'Asali (1981: 292), who thought that the structure had been obliterated. Here again the *waqfiyya*, recently discovered

in the *sijills*, plays a major role in providing the data hitherto lacking on the monument. The unpublished *waqf* instrument of al-Madrassa al-Ahmadiyya is to be found in Sijill 85 which includes the proceedings for the year 1013/1606. The *waqfiyya* is dated 15 Ramadan of that year, and is made up of two long pages with a total of 66 lines with an average of 25 words to each line. It is written in a beautiful, lucid Ottoman *naskhi* hand. As was the custom, the *waqfiyya* is divided into three main sections. The first is a foreword that takes up almost half of the *waqfiyya* (thirty-one lines out of sixty-six). It is floridly written, with rhetoric extolling religious teaching, encouraging in nature and concentrating on the rewards which await the patrons of charities in the afterlife. The second section provides vital information about the donor's identity, the endowments which he made together with details of their features and their physical borders, the financial arrangements and the stipulations of the *waqf*. The third section contains the donor's formal refutation of his *waqf* in the court before its final validation, and then a declaration that the endowment was charitable and valid. It ends with a long list of witnesses and certification as to the legality of the *waqf*. It is the second section that is most relevant to us here, and it is in consequence cited fully; the complete Arabic text of the *waqfiyya* is transcribed in Cat. Appendix 2, no. 25.

Identification

The *waqfiyya* is quite explicit with regard to the site and internal arrangement of the *madrassa*. The entry in Sijill 85: 41 states that 'Ahmad Pasha has declared in the council of the religious court that he has constructed the impressive and high-quality *madrassa* in the city of Jerusalem. It is located between the Mastabat al-Karak and the outer stairway to the east of the Sanctuary of the Noble Rock. The *madrassa* includes a small chamber; next to it there is a water cistern, and in front of the chamber there is a small garden. Above the said chamber, there is a big chamber (*bait kabir*) called *darskhana* (school-room); it is fronted by a portico (*suffa*) made up of three domes together with a vestibule covered by a dome. The *madrassa* is so famous that its borders do not need to be specified or (further) described.'

Date

The *madrassa* itself is undated, but the date of the *waqfiyya*, as stated above, is 15 Ramadan 1013/4 February 1604.

The founder

The founder of the *madrassa* was Ahmad Pasha ibn Ridwan Pasha ibn Mustafa Pasha. For his biography and details of his works in Jerusalem see cat. no. 22 above.

Endowment

According to the *waqfiyya* (Sijill 85: 42) Ahmad Pasha, the donor, made as *waqf* for the benefit of al-Madrassa al-Ahmadiyya the whole house which he had purchased from the ladies 'A'isha and Fatima, daughters of al-Hajj Hasan. The house was situated in the Bab Hitta district, and comprised three levels. The lower level included stables and three chambers with a courtyard, whereas the middle level consisted of five chambers, a courtyard, a water cistern near the staircase, and a latrine. The final, upper level was made up of three connected chambers with a courtyard and two latrines. In the corner of the courtyard there was another chamber. The house was bordered to the south by the Noble Haram, to the east by Madrasa Jauliyya, and to the north and west by the passable road (*al-tariq al-salk*).

Personnel and maintenance

The donor stipulated that the house should be leased according to the correct legal rent, which amounted to 1,000 silver *misriyya* per year. From the income mentioned, 'Ala' al-Din al-Niyazi — the caretaker — had to allocate the money needed for the following:

<i>Position-expenditure</i>	<i>Silver misriyya per year</i>
Salary for the teacher (<i>mudarris</i>)	500
Stipend for 4 students (50 per person)	200
Salary for someone to provide the illumination (<i>sha'al</i>)	20
Oil and mat	80
Any surplus to be kept for restoration and maintenance	200
Total	1000

The donor made it a condition that the teacher and the four students were to meet and study 'religious science' and the 'important arts' (*al-'ulum al-mu'tabara al-shar'iyya wa 'l-funun al-muhimma al-mar'iyya*) in the specified *madrasa* on certain days. They were to pray for him and for his ancestors. Ahmad Pasha stipulated that the position of teacher and inspector of the *waqf* should be given to the best and most pious scholar of the age. The donor assigned *maulana* (our master) *al-shaikh* Ishaq ibn Abu 'l-Lutf, the *mufti* of the Shafi'i sect in Jerusalem, for as long as he lived, to take the position, and after him the *qadi* of Jerusalem.

Architecture

Exterior

There are slight differences in the fenestration of the four external walls of the *madrasa* but otherwise they are similar. The jambs and arches of the windows are built with *ablaq* stone of red, black and white, and both lintels and sills are of white marble. The quality of the stone is high and it has been finely cut and dressed. The courses are carefully arranged with the larger stones set in the lower sections of the walls; some of these measure as much as 40cm in height and 1.92m in width. The joints are also very thin which is a sure indication of skilful craftsmanship. A chamfered string course marks the separation of the two storeys of the *madrasa* to north, south and east. The western façade is the exception, for it consists of a single storey only, being built at the level of the upper terrace.

This western façade, which is the main one, is marked by a vertical division between the wall of the main upper chamber, and the entrance to the antechamber. The building at this level was once preceded by a portico (as specified in the *waqfiyya*) with three domed bays, but this has since disappeared. Doubtless it was designed as the main decorative scheme of the façade. Now the façade consists of three pointed arches visible within the masonry, the spaces between them blocked by stones of a different colour. The central arch contains a large rectangular window (96cm wide by 1.63m high), fitted with an iron grille and a wire mesh grille. It is set within a 'frame' made up of a slightly recessed rectangular panel that reaches from the level of the dais to the beginning of the springing of the arch. Surrounding this panel on all sides there runs a narrow roll moulding. The window itself has a white marble sill and lintel cut from single blocks of stone, while its jambs are built in *ablaq* masonry of red and white. Above the lintel there is a shallow relieving arch of joggled voussoirs, the keystone being in the form of a debased 'cup', which is called elsewhere in this study (cat. no. 22) a *qandil* or *mishka*. This design was universally used in the Mamluk period to

denote the status of the founder and its use here seems to be another example of the fashion for a Mamluk revival. Three identical impostes are still *in situ* to mark where the arches once began; the bottom of each is decorated by two tiers of five lancet niches to form a minimal *muqarnas*. As already stated, the colour of the stones of the spandrels between the three arches is different from the rest of the façade, and here the building ends without the cornice that encircles it everywhere else. These details in addition to the still existing stone dais in front of the building at this point are the material witness to the portico described in the document. The dais measures 2.15m wide by 5.8m long. A hemispherical dome sits directly above the main chamber; it is covered in small flagstones and terminates in a very short stone finial which probably was once longer.

To the north, the entrance to the vestibule cuts into the final arch. It comprises a high arch with a horse-shoe profile. Directly above the apex of the arch is the projecting cornice.

The decorative scheme of the upper parts of the three other elevations of al-Madrasa al-Ahmadiyya to south, east and north are similar in that each has a rectangular window with identical dimensions, sills, jambs, and iron grilles. The only variation is that the window in the southern elevation is set into a recessed rectangular panel and it has a shallow relieving arch of joggled voussoirs over the lintel. The lower parts of the three elevations are similarly unbroken masonry, again with the exception of those to south and north which contain doors. The entrance to the south takes the form of a pointed arch. This is surmounted by a double tier of voussoirs and it gives access to the interior of the lower storey. To the north and east the lower walls of the vestibule are built with the same high-quality masonry as the upper level.

The northern elevation is partly obscured by the walls of the vestibule. Its doorway is rectangular, measuring 68cm wide by 1.5m high. It too is surmounted by a slab lintel and above there is an arch made up of three blocks. A stone staircase of 16 steps (each 1.13m wide by 21cm high) with a landing in the middle and at the end connects the two levels of the Haram esplanade. The staircase, which is protected by a stone parapet, is adjacent to the vestibule and is supported by a huge semicircular arch.

Interior

The entrance to the vestibule is raised 28cm above the level of the upper terrace. The antechamber itself is rectangular in plan, measuring 1.76m wide by 2.56m long, and the floor is paved in white stone slabs of different sizes, the largest one measuring 45cm wide by 90cm long. The walls of the vestibule display several types of chisel marks which would suggest different phases of repair or construction. Some of the stones in the eastern wall are crudely cut, probably indicating that it was once plastered. An off-centre blind niche (60cm wide by 1.07m high by 30cm deep) is situated in the centre of this wall, but its purpose is uncertain. A door in the north side of the vestibule, measuring 73cm wide by 1.46m high, and facing the door of the main chamber, acts as a connection between the two levels of the Haram esplanade. It is surmounted by a lintel, and directly above it there is a string course of joggled voussoirs. The vestibule is roofed by a cross vault with a small eight-ribbed saucer dome set in the centre. It is plastered, probably because it is constructed from rubble stone and it was the normal finish, both to give added strength and for the sake of appearance. A rectangular door (91cm by 1.6m high) giving onto the main chamber is set within a slightly recessed panel. The door itself is surmounted by a slab lintel, and directly

above this there is a shallow relieving arch of joggled *ablaq* voussoirs which echo the *ablaq* masonry of the jambs. Both this detail and the recessed panel recall the detailing of the windows in the eastern and southern façades and demonstrate the skill of the builder.

The interior of the main chamber is very simple, as in the majority of the *khalwas* on the Haram. It is square in plan, and retains the old flagstones of red and black. It is covered by a dome expressed on the exterior as a hemisphere. There is no intervening drum, the necessary circle being achieved by a transitional zone of pendentives in the four corners. There are four identical windows, one in each side of the chamber, each 96cm wide by 1.63m high by 64cm deep, and surmounted by a pointed arch. They begin just above floor level at a height of 13cm. Each window is flanked by two blind recessed niches except that to the north, which has a single niche to the west. The niches all share

the dimensions of 76cm wide by 1.15m high by 40cm deep, again with the exception of that to the north which is only 70cm wide, and the northern niche of the western wall which measures 45cm wide by 75cm high. The walls are very thick (approximately 85cm) and are plastered, as is the interior of the dome.

The interior of the lower part of the *madrasa* is on a level with the Haram esplanade. It is a rectangular chamber, recently paved and covered by a tunnel vault. Both the walls and the vault have been recently plastered. At the end of the chamber on the west there is a blind niche surmounted by a pointed arch which is 2m wide by 1.9m high by 1.23m deep, set 30cm above floor level. It houses the well-head of one of the Haram cisterns. In addition to the main room, the lower storey also has a small rectangular chamber below the vestibule. This too has a tunnel vault, and two small niches, one in the south-western corner and the second in the centre of the north wall.

26 MI'DHANAT AL-QAL'A

Name: Mi'dhanat al-Qal'a (The Minaret of the Citadel)

Date: The date of construction is unknown; it was restored in 1065/1655.

Endowment: None known

Variants of name: It is known as either 'Mi'dhanat' or 'Manarat al-Qal'a'. In the Auqaf file no. 3/17/30 the *mi'dhanat* was attributed to the mosque of the Citadel rather than to the Citadel itself.

Location:

The minaret is located inside the Citadel; it rises above the north-western corner of the south-western tower, near the south wall of the Citadel mosque.

Site and brief description (figs. 26.1-26.3, pls. 26.1-26.6)

The Citadel is situated in the south-western quarter of the Old City, next to the Jaffa Gate (Bab al-Khalil). A moat surrounds it on three sides, the fourth being defended by the city wall. The structure incorporates remnants from numerous periods of the occupation of the city, from the Roman period to modern times. One of the elements of the Citadel that dates to the Ottoman period is the minaret that rises close to the Citadel mosque. It has a cylindrical shaft, and consists of three distinct parts—the plinth, the shaft, and the lantern. Today the Citadel is known as the 'Tower of David' and houses the Museum of the History of Jerusalem; it is open to the public.

History

Identification

Although the minaret was already in existence (see below under Date) when Evliya Çelebi (Stephan 1980: 66, 68) visited Jerusalem in 1083/1672, he made no mention of it, despite other valuable information on the Citadel and its mosque contained in his account. However, the fact that he included a *mu'adhdhin* among those then living in the Citadel would seem to suggest the possibility of the existence of a minaret from which the call to prayer would be made. An inscription plaque which records its restoration in the 17th century, as well as the architectural design (see below) secures the identification of the minaret as belonging to the Ottoman period.

Date

The minaret has no construction date, but since Sultan Sulaiman I (927-74/1520-66) made remarkable contributions in the way of building projects in Jerusalem in general, and in the Citadel in particular, it is possible that the minaret was first constructed during his reign. So far this assumption lacks firm evidence, but there is a panel commemorating the restoration of the minaret and inscribed with the date 1065/1655. It is not easy to be specific as to the nature of the restoration work owing to the lack of written records; and it is not enough either to rely on purely architectural speculation, for many of the features that occur in the minaret are used throughout the Ottoman period. The restoration panel is on the north wall of the plinth, three courses below the transition zone from the square to the cylinder. It is of white marble measuring 50cm by 40cm, and it consists of four lines of Ottoman Turkish written in *ta'liq*. The script is slender

and is set in four cartouches; it is almost invisible from ground level. The inscription, in bastardised Turkish, is transcribed by van Berchem (1922-7: 165-66), who notes that it gives the information that 'the *silahdar* Muhammad ordered built (or restored) in 1065/1655 a minaret of fine construction in the oratory (*maqam*) of Lord (*hadra*) David (Da'ud).'

The inscription reads as follows:

'The possessor of wealth, piety and generosity,
The recipient of God's gifts and of His approval—
A man of noble qualities and doer of good works,
That is, Silahdar Muhammad Pasha,
on the site of the Prophet David
Has built an elegant gallery
[He wrote down the date of the minaret].
Silahdar Muhammad Pasha built [it]
[In the] year 1065.'

Founder

The founder of the Minaret of al-Qal'a is unknown, but taking into consideration circumstantial evidence it seems probable that the founder was Sultan Sulaiman al-Qanuni, for the Citadel was a main focus for Ottoman repairs and construction. These repairs started before the reign of Sultan Sulaiman al-Qanuni; they continued throughout it and intermittently thereafter, but the majority of the work—and certainly the most important part of it—was carried out under the patronage of Sulaiman himself in 938/1531-2. These parts include the repair of the wall and the moat, the construction of a summer mosque (cat. no. 27) and the rebuilding of the outer eastern entrance of the Citadel (for further details, see Ch. 36 under 'The Citadel'). If one recalls the overall works which have earned Sulaiman the reputation of a great restorer of the city (Meinecke 1988: 268-69), the prominent location of the Citadel, and the fact that it houses the only Friday mosque in the city other than the Aqsa Mosque, the most reasonable conclusion that presents itself is that the Minaret of al-Qal'a was constructed in the time of Sultan Sulaiman. Further support for this conclusion is to be found in its many architectural and decorative features which recur in the architecture of the 16th century. In particular, Turkish triangles are not found in any minaret in Jerusalem which dates to the Mamluk period, and can therefore be used as a dating control. This feature, along with cylindrical shafts and friezes of counterchange joggling, was evolved, it seems, in the Ottoman period—at least in Jerusalem. For more details, see Ch. 36 under 'Minarets' and especially Table 36.13 which details the architectural features of Ottoman minarets in Jerusalem.

Later period

As is clear from their location inside the Citadel, the mosque and minaret were intended for use by the soldiers stationed there rather than by the general public. Evliya Çelebi described the situation at the time of his visit to Jerusalem in 1083/1672 thus: '... In the citadel lives the commandant (*dizdar*), the governor's agent (*kekhyā*), an *imam*, a preacher, a *muezzin* and soldiers' (Stephan 1980: 66). Little is known about the later history of the minaret. It seems, however, that precautionary measures were taken, probably at some time during the 19th century, to strengthen the shaft by surrounding it with three iron bands. During the 20th century, its maintenance came under different

authorities, repair work being undertaken in 1940 and 1956.¹

Architecture

The minaret is entirely built of cut white stone of both square and rectangular blocks. These differ in size and chiselling technique from those used for the construction of the Citadel and for the tower on which the minaret stands, the masonry of the minaret being both smaller and finer than that of the rest of the Citadel. The Minaret of al-Qal'a has three main parts—a plinth that is square in plan, a cylindrical shaft subdivided into three by different ring mouldings, and a domed cylindrical *sham'a* (pinnacle) which is thinner and shorter than the shaft.

The four sides of the plinth measure some 3m by 3m and are 5m high. It is tucked into the north-western corner of the tower, and the south and west sides of the plinth merge into the corresponding walls of the tower. Access to the entrance is from the roof of the mosque by way of a staircase with sixteen steps. The only entrance to the minaret is on the south side of the plinth. The opening is rectangular and measures 64cm wide by 1.52m high, and it is surmounted by a slab lintel measuring 89cm wide by 45cm high. It gives immediately onto a spiral staircase of forty steps which rotates round a cylindrical stone core. The staircase finishes at the gallery for the *mu'adhdhin*, access to which is through a flat-topped doorway measuring 56cm wide by 1.45m high. A buttress spans the area between the east side of the plinth and the east side of the tower to give added support and to withstand the outward thrust of the minaret. The buttress is not integrated into the body of the plinth, which suggests that it is a later addition, as is the wall which abuts the entrance to the east. The tops of the four corners of the plinth are rounded to form four 'convex pendentive triangles', the architectural function of these triangles being to transform the cube of the base by way of an implied octagon into a circle from which the cylindrical shaft can rise. This transition zone closely resembles the one in the Minaret of Nabi Da'ud (cat. no. 1), and differs slightly from that of the minarets of al-Hamra' (cat. no. 3) and of al-Maulawiyya (cat. no. 19). The plinth is undecorated apart from the panel with the inscription which has already been discussed above.

A roll moulding with a double *cyma recta* profile separates the plinth from the main cylindrical shaft of the minaret. The shaft is divided into three storeys by two further mouldings—the first a billet and the second a roll moulding. A fourth moulding, of roll type, frames the top of the third story where the transition to the gallery and lantern occurs. The lowest division is the tallest. It has eleven courses measuring some 3m in height in total. At the level of the third course there is an iron band, which encircles the shaft to strengthen it, placed there during the 19th century (see above). Directly above this level on the north side, there is an circular stone window.

[Editorial note: Around this oculus, there is carved decoration in the form of six interlocking circles set within a

circular frame. Each strand of the design is marked by two grooves. The use of six interlocking circles is also found in two roundels of al-'Imara al-Amira, nos. 1 and 5, see cat. no. 15. At top and bottom the strands of the pattern surrounding the window twist to form a small circle which links the design to the outer frame. This use of small connecting circles is well known in Islamic art, and was particularly popular in the Mamluk period (see, for example, Atil 1982: 46-7, no. 9; 98, no. 31; 102-3, no. 35). In Jerusalem it is found on al-Almalikiyya (Burgoyne 1987: pl. 26.2) a site where, interestingly enough, the device of six interlocking circles is also found (Burgoyne 1987: fig. 26.7). SA]

A stone billet moulding runs around the shaft eight courses above the lower moulding, marking the visual centre of the shaft. The area is further distinguished by a course of relief-carved alternating knots and trefoils with extended stems (fig. 26/6; pl. 26/6).

[Editorial note: The minaret, which is otherwise plain, is distinguished by the three successive areas of paired mouldings and by this elegant band of decoration, which lifts the construction above the norm for Ottoman Jerusalem. The position of the ornamental band is emphasised by the protruding denticulation above it. The design consists of knots—which are reminiscent of the single example found above the door to the mosque of al-Zawiya al-Qadiriyya (cat. no. 35)—which are here topped by a trefoil. The bifurcated strands that make up each knot are carved with a central groove to heighten the visual impact. This is also true of the trefoil 'finials', which are gently concave. Between each knot there is a single trefoil on a long stem, which acts as a framing device for the knots. Each stem is carved with two deep vertical striations and, in addition to being concave, the central leaf of the trefoil has an inner 'pearl'. This detailing is very close indeed to that of the trefoil finials which decorate the inscription panels on the walls of the city. These inscriptions both name the patron as Sultan Sulaiman and date the restoration of the sections of wall (van Berchem 1923: 431-44) and the fact that the details of the ornamental band on the minaret of the Citadel and the inscription plaques on the walls are so close adds credence to the suggestion that the minaret was founded in the time of Sultain Sulaiman. SA].

Immediately below the carved decoration there is one of a number of slit window openings to allow light and ventilation into the interior. This one has an ogival apex with a slight return at the springing of the arch; the profile of this elegant top is marked by a groove running parallel to it. The middle and upper storeys of the minaret are featureless apart from a further roll moulding, this time faceted and decorated with incised triangles arranged as hexagons.

[Editorial note: Once again this detail points not only to a 16th-century date, but to a royal patron. Precisely the same treatment of an ornamental band is found used as a frame on the southern façade of al-'Imara al-'Amira (cat. no. 15). One way to read the design of the moulding is to see the surface as being carved with a succession of contiguous hexagons. These are subdivided by lines in relief which connect the points of the geometric figure. Each triangle thus created is cut away, leaving the bones of the design in relief. Interpreted in this way, the design links to the *khatam sulaiman* (Chapter 24). Another way of reading the design is to analyse it as a succession of diapers or lozenges, cut across the centre by a continuous line. On the hexagon and its use in Islamic design, see El-Said and Parman 1976: 50-81. SA]

This band acts as a break between the two upper levels,

¹ During the British Mandate, the Citadel was under the authority of the District Commission of Jerusalem (File DHA 80/1.61/40/13: 2). In 1359/1940 the Supreme Muslim Council (File DHA 90/1.61/40/13, 1, 2) approved 'necessary repairs' (which were not further specified) at a maximum cost of P£12. These repairs must therefore have been very minor. From 1948-67, the Citadel served as a military position for the Royal Jordanian Army (File 3/17/30/1). In 1375/1956 the walls were repointed, the stone parapet of the circular gallery renewed and six stones of the jamb of the door of the minaret leading to the gallery were replaced at a cost of DJ51 (File 3/17/30.5-7).

each of which is supported by an iron band. Each level also has a further slit opening. The shaft is topped with a simple roll moulding. There is no corbel *muqarnas* to support the gallery, as in the minarets of al-Hamra' (cat. no. 3) and al-Nabi Da'ud (cat. no. 1), or even a simple corbel as in the minaret of al-Maulawiyya (cat. no. 19). The gallery for the call to prayer is set immediately over the apex of the shaft; it has a new stone parapet (74cm high) and a simple iron fence added in 1375/1956 by the Supreme Muslim Council (Auqaf File 3/17/30, 5-7). The gallery is not sheltered in any way. The newness of the parapet and the absence of corbel or *muqarnas* might indicate a rebuilding, although there is no information as to this in the relevant Auqaf file.

The final part of the minaret is the *sham'a* (pinnacle), which is also cylindrical but shorter and thinner than the main part of the shaft. It rises directly from the gallery and is built of small blocks of masonry of the same quality as the main fabric of the minaret. The *sham'a* consists of two parts separated by a stone roll-moulding. The lower level (2.05m high) acts as a support for the upper level which is crowned by a small pointed turret. The unusual form of the pinnacle might also point to a rebuilding and there are blocks of black concrete scattered throughout the inside of the turret. The culminating accent is a metal finial with an open crescent which faces east-west.

27 MASJID AL-SAIF

Name: Masjid al-Saif (The Summer Mosque)

Date: (A) The construction is undated, but the *mihrab* bears the name of Sulaiman. It was probably built in 938/1531-2 when Sultan Sulaiman ordered a major restoration of the Citadel.

(B) Restored in 1151/1738-9.

Endowment: None known

Variant of name: Van Berchem (1922: 149, n. 2) identified the site as a possible *musalla*

Modern name: Masjid al-Saif

Location:

The mosque is situated to the south of the complex, between the moat and the main eastern entrance of the Citadel.

Site and brief description (fig. 27.1, pls. 27.1-27.5)

The *masjid* is an open-air praying area (*musalla*), situated between the outer and the inner wall of the Citadel. It is bordered to the north by the bridge which connects the two walls; to the west, to the south and to the east it is flanked by the moat that surrounds the Citadel on the east and the north. A simple rectangular door gives access to a narrow passage that leads to an almost rectangular open site now divided into two sections. A *mihrab* niche facing south is built in the centre of the southern wall, and is flanked on either side by a stone battlement.

History

Identification

The Masjid al-Saif is identified as dating to the Ottoman period by two inscription plaques. The first is a roundel bearing a blazon that records the name of Sultan Sulaiman I (926-74/1519-66/7). Although the roundel does not carry a date, it is most probably to be associated with the construction of the site. The second plaque is a restoration text dated 1151/1738-9.

Date

(A) The first inscription, which is in Arabic, is engraved on the keystone of the arch of the *mihrab* niche. It appears on a roundel measuring 20cm in diameter and it is made up of three lines of a fine, Ottoman *naskh* with some diacritical points. The roundel is divided into three horizontal sections in a style reminiscent of the typical Mamluk blazon.¹ Between each line, and surrounding the area of the inscription, a plain fillet border adds emphasis and dignity to the plaque. The word *'izza* (glory), which occurs in the first line, is written without an *alif*, as van Berchem (1922: 149) noted when he published the inscription. The translation runs thus:

The Sultan Sulaiman—may God render him a glorious victory.

Although the inscription is undated, it is probable that the summer mosque was built by Sulaiman in the year 938/1531-2, when the citadel underwent a large-scale restoration programme.

Part of the work included the construction of the outer gate and the bridge across the moat (see van Berchem 1922: 147, 149, 150-1).

The second inscription is a restoration text dated to 1151/1738-9, as stated above. The slab is of *malaki* stone, measuring 39cm wide and 58cm high, situated above the door of the entrance to the mosque. It is made up of six verses written in Ottoman Turkish. The verses are divided in half, each hemistich being set in a rectangular cartouche. From the fourth line onwards a fillet separates each hemistich. The script is a fine, compressed Ottoman *naskh* with diacritical and auxiliary points. A verse of the Qur'an (XI: 116) is at the head of the inscription, equivalent in depth to two of the lines of the verse below, for it is written in a much larger script and it stretches across the whole width of the slab. The date, which corresponds to the chronogram in the second hemistich of the sixth verse, is inscribed in numbers at the bottom of the sixth line. This inscription was not published by van Berchem, although Stephan (1933: 132-3) both translated and published it. The translation as given by Stephan is as follows:

1. Qur'an XI: 116. Good works drive away evils (Sale).²
2. Thank God this construction has been finished. Its ornamental 'title' is due to the kindness of the exalted personage (*hazret*) of the Agha of the Janissaries.
3. No more are the ornaments and embellishments threatened by ruin. For they have found again the previous balance in his time.
4. How many a prostration and earnest supplication the hearts perform here! He who repairs it from time to time is worthy to be the object of (benedictory) prayers.
5. He who prostrates himself in worship will praise him with a thousand blessings. How excellent a summer mosque! Its star shines bright.
6. The Agha of the Janissaries, the Khasseki 'Ali Agha, repaired (this beautiful mosque for the brethren?)
7. The heart's desire fixed its date with pleasant words: "This mosque has given beauty and splendour at (!) the Gate of the Citadel." Year 1151.'

Founder

As noted above, Sulaiman I (926-74/1519-66/7) is probably the founder of the summer mosque. The Khassaki 'Ali Agha is recorded as the person who undertook the restoration work in 1151/1738-9.

Architecture

A simple door measuring 90cm wide by 1.88m high provides access to the summer mosque. It is placed within a rectangular masonry wall measuring 7.2m long, 2.8m high and 45cm deep. The door is surmounted by a white slab lintel, 20cm by 1.16m, and the restoration plaque described above is placed directly above the lintel. The wall which houses the entrance to the mosque is built of clumsily-dressed small white stones and faces north. This wall is both built and finished in a rough way, and was

¹ The roundel is in principle similar in its design to those bearing Mamluk ranks; there is another roundel on the bridge of the Citadel with the name of Sulaiman that is also close to the blazon with the name of Sultan Qa'itbai (see van Berchem 1922: 149, no. 47).

² Stephan refers here to the George Sale translation of the Qur'an published in London in 1734.

probably rebuilt after 1893 when van Berchem copied the inscription on the *mihrab*. This would explain why van Berchem did not include the inscription over the entrance. The plaster that once covered the stonework has gone.

The entrance leads through a narrow passageway to a rectangular open space now divided into two sections. The first part lies to the east of the passageway. It has recently (1414/1993) undergone fundamental alterations with the aim of converting it into a small garden named after the sponsor of this work, Nessim S Dwek, and has a modern fountain in the centre.

The second part of the open space is the summer mosque itself (the *musalla*) which is located beyond the modern park to the south. The summer mosque has an almost rectangular floor which measures 8.9m wide and 7m long. It is paved with old flagstones and to the west it gives onto a stairway leading down to the lower level of the moat. A circular cistern mouth measuring 50cm in diameter is to be found at ground level to the west, and it is now adjoined by a modern rectangular construction to support a water tap. A masonry parapet topped by irregular battlements of various measurements (see below) runs around the southern and eastern sides of the mosque. The quality of the masonry, the different dressing technique of the stones and the size of the external walls of the southern and eastern walls of the mosque confirm that they were built at a different time from that of the walls of the moat, and in all probability later.

A *mihrab* niche, similar both in its layout and in the stone fabric to the *mihrab* to the rear of Sabil Bab al-‘Atm (cat. no. 8) is located in the centre of the south wall. The *mihrab* itself takes the form of an undecorated concave niche measuring 90cm in width, 62cm in depth and 2.1m in height; it is set into a rectangular stone block. This is constructed of ten dressed courses of white *malaki* stone of different sizes. The apex of the *mihrab* is in the form of a semi-dome and is surmounted by a pointed arch, the keystone of which carries the roundel described above with the name of the Sultan Sulaiman I. One course above the roundel, the masonry block is finished by a cornice which projects slightly. The upper sides of the block are flat and without a cornice, and thus give the whole upper level the impression of a rebuilding. One side only now terminates in a joggled merlon, although traces of the base of a similar merlon can still be identified on the opposite side. The west, south and the east sides of the *mihrab* block are simple solid walls with the exception of the masonry merlons decorating those to south and east. It is clear that these two are in secondary use and resemble in shape the merlons that crown the tomb chamber of Turbat al-Sitt Tunshuq (built before 800/1398) in the Old City of Jerusalem (see Burgoyne 1978 : 508, pl. 49.4). A rounded concrete summit has been added (probably in the 1950s) to the top of the *mihrab* block and above the battlements, serving not only to support the cresting of the *mihrab* but also as a form of protection.

The *mihrab* block is flanked on either side by masonry battlements, the eastern one measuring 1.8m wide by 90cm deep by 1.58m high, while the western battlements measure 1.36m wide by 1m deep by 1.58 high. The reason for the different measurements is not clear but may indicate a rebuilding.

Features

In the Haram several *mastabas* and *mihrabs* (cat. no. 55) serve as open prayer sites (*musallas*), but none of them is called a *masjid*, the identification given by the restoration inscription (see above) to the *musalla* at the Citadel under discussion here.³ The location of the many sites for prayer within the Haram al-Sharif would

seem to be the reason for not identifying them individually as a *masjid*, for the whole area of the sanctuary is considered by Muslims to be a Holy Mosque blessed by God (Qur'an, Sura XVII: 1). The 'Summer Mosque' in the Citadel is thus unique not only because of its designation—*masjid saifiyya*—but also because of its layout.

The site of the mosque has to be seen as a guardpost for the Citadel because of the presence of the parapet walls with their stone battlements, built above the walls of the moat that surrounds this part of the Citadel. The mosque was probably built on this site in order to allow the soldiers on guard to conduct their prayers while on duty. This hypothesis is supported by the fact that the mosque was later restored by 'the Agha of the Janissaries, the Khassaki 'Ali Agha' (see the inscription above). If this is indeed the case, the Summer Mosque was initially intended as a small private place of prayer (that is, not for the public at large) and this, as well as the fact that the mosque was repaired by 'Ali Agha only some forty years after Evliya Çelebi's visit to Jerusalem, may explain why it was not mentioned by him when otherwise he gave so full a description of the Citadel (Stephan 1980: 66-8).

³ Van Berchem (1922-3: 149, n.2) mentions that open prayer sites or *musallas* played an important role in Islam. He states that he hoped to publish the archaeological remains of the *musalla* at Konya together with the rest of the material he had collected on the subject; unfortunately he died before he was able to do so.

28 AL-MADRASA AL-MAWARDIYYA (RASASIYYA)

Name: al-Madrasa al-Mawardiyya

Date: Undated, believed to belong to the late Mamluk period

Endowment: See below

Variant of name: Al-‘Arif (1961: 307), Burgoyne (1971: 23), al-‘Asali (1981: 327), Najm *et al* (1983: 360), Bahat (1990: 26) and Bieberstein and Bloedhorn (1994 2: 359) all assumed first that the name of the building is al-Madrasa al-Rasasiyya, and second that it forms part of the Ribat Bairam Jawish. In the light of the *sijill* discovery (see cat. no. 11 and below), it has now emerged that both assumptions are incorrect. The name al-Rasasiyya came about because of the lead (*rasas*) plates which were used instead of the more normal mortar to join the courses of masonry. Burgoyne (1971: 24) thought the technique was ‘possibly the result of a scarcity of sand and lime for mortar’. ‘Ribat Bairam Jawish’ and ‘the *masjid* of the *ribat*’ are two other previous names used in the sources quoted above.

Modern names: Madrasa of Dar al-Itam al-Islamiyya al-Sina‘iyya.

Location

The building is located on the south side of ‘Aqabat al-Takiyya (formerly al-Sitt), between the Ribat Bairam Jawish (cat. no. 11) to the east and an anonymous building to the west.

Site and brief description (figs. 28.1–28.9, pls. 28.1–28.10)

The Madrasa al-Mawardiyya contains a very beautiful northern façade which combines two floors, the ground and first floor. The ground level is very simple, comprising an antechamber, two small inaccessible rooms, and a vestibule that leads to the first floor. The upper level is made up of the mosque hall of the *madrasa*, two open courtyards, two large halls, two chambers and two small rooms. There is a further level with two rooms built in the late Ottoman period; these are above the big chamber and the large *iwān* of the first floor and, with many other concrete buildings of a shanty-like character, they form the second floor of the Mawardiyya. The chambers of both levels constitute at present the principal area of the school of Dar al-Itam al-Islamiyya. The Mawardiyya architectural units are sandwiched between Ribat Bairam Jawish (cat. no. 11) and the east part of the complex of al-‘Imara al-‘Amira (Takiyya Khassaki Sultan, cat. no. 15).

History

Identification

According to the published references to it,¹ the Rasasiyya (al-Madrasa al-Mawardiyya) is identified as belonging to the Ottoman period. Although some records in the *sijills* (see below) provide important information about the building, its precise identification to the Ottoman period is still not certain. In our opinion, it is probably a late Mamluk structure. The only thing that would argue against its Mamluk provenance would be its location. It is in the heart of the 16th-century Ottoman section of the city, the only Mamluk examples in the area being the Dar and

Turbat al-Sitt Tunshuq—a lady, incidentally, who was probably of Turkish origin, according to Burgoyne (1987: 485); moreover the Dar is incorporated into al-‘Imara al-‘Amira complex. A detailed discussion on the date of the building concludes this catalogue entry.

Date

Unfortunately, al-Madrasa al-Mawardiyya (al-Rasasiyya) is dated neither by epigraphic inscription nor by literary evidence (see below).

The waqf documents

Though the references are very concise, the *sijills* locate the site of al-Madrasa al-Mawardiyya with precision. In *Sijill* 17: 127 (quoted by al-‘Asali 1989: 122) and *Sijill* 56: 649 it is stated that the Mawardiyya is adjacent to the Ribat Bairam (cat. no. 11). In another record (*Sijill* 7: 348), it mentions that the Mawardiyya is situated in the street of ‘Aqabat al-Sitt in Jerusalem.

Endowments

The few brief entries in the *sijills* make it obvious that a *waqf* had been made for the benefit of al-Madrasa al-Mawardiyya. Unfortunately, there are no details whatsoever about these endowments, but it is quite clear that they were insubstantial and insufficient for the purpose, because the funding for many necessary repairs had to be borrowed against future income from them. The *sijills* (7: 348, 435; 14: 151) show that al-Hajj Sinan al-Sughanji, who was in charge (*mutakallim*) of al-Mawardiyya, paid 2,000 ‘*uthmani* on 13 Jumada I 942/9 November 1535 for repairs. He paid the sum from his own money provided that he could recoup all of it from the future income of the *madrasa*. It seems, however, that even that money was not enough for all the necessary repairs because Bairam Jawish (see his biography, cat. no. 11), who became the *mutakallim* of the Mawardiyya in Shawwal 944/March 1538, asked the *qadi* for permission to renovate the dome and the vault of the Mawardiyya. Bairam paid 1,600 ‘*uthmani* in accordance with the estimate made by Muslih al-Din al-Mi‘mar (master builder), in addition to the 2,000 ‘*uthmani* already spent by al-Sughanji. The expenditure paid out by Bairam reached a total of 3,600 ‘*uthmani*, and the *qadi* allowed Bairam to recover part of the money from the future income of the endowments, and part by living in the Mawardiyya rent-free. Al-‘Asali (1989: 254) has published a long document (*Sijill* 68: 42) dating from between 995-7/1587-9 containing a schedule of the stipends of the officials and beneficiaries of the religious institutions in Jerusalem. The Mawardiyya is mentioned separately, and the names of Mahmud and his brother Ahmad appear, described as ‘*shaikh*, inspector and door keeper’ for 12 (coins—but no further definition of their value is specified) per day.

A new *waqf* instrument is to be found in *Sijill* 77: 537. It shows that the *madrasa* was already in a ruined state by the year 1005/1596-7. Mahmud Zain al-Wafa‘i (probably the same ‘Mahmud’ mentioned above), the *mutakallim* of the Mawardiyya, reported to the *qadi* that there were no funds to restore the Mawardiyya, and that the situation was so serious that if no urgent action was taken, the *madrasa* might collapse. He asked the *qadi* to grant a permit for a court inspection of the building in order to estimate the cost before repair work began, and to be allowed to pay the expenses from his own money against future income. This is of great interest because that visit of inspection and the subsequent estimated cost reveal not just the costs of the

	Doors and windows	8.30
	Total	186.60

repairs but also vital information about the architectural elements of the building. These correspond to a large extent with what is still standing today. As a result of this information, it is possible to locate the boundary between the complex of the Takiyyat Khassaki Sultan and Ribat Bairam and to place al-Madrassa al-Mawardiyya between the two. Above is the list of the architectural elements and expected cost of the repairs as registered in Sijill 77: 537.

From this it appears that the most urgent work involved water-proofing the roof and repairing the inner and outer walls. All this, however, accounts for less than a third of the total. Plastering and flooring accounts for the rest, but much of this would naturally follow from the water damage caused by a leaking roof.

Architecture

The north façade of al-Madrassa al-Mawardiyya provides a sharp contrast to the plain elevations of the neighbouring buildings, for it is lavishly decorated with multicoloured masonry. The façade, 5.75m long, is enclosed within a relief moulding and is flanked to the east by the archway house (*qantara*) of Ribat Bairam Jawish, and to the west by that of al-Zawiya al-Muhammadiyya (cat. no. 29). The façade is dominated by a recess enclosing the imposing portal entrance. It is built of red, black, and cream-coloured *ablaq*, and culminates in a scallop shell enclosed within a semicircular arch of chevron moulding. A door recessed by 60cm gives access to the interior; it is flanked by two stone benches (65cm by 60cm by 45cm) and is surmounted by a red slab lintel. Above the lintel there is an *ablaq* string course of black and white joggling, now weathered to grey. There are two identical shallow *muqarnas* impost panels arranged on either side of the string course. The scheme of the decoration is made up of three vertical *muqarnas* niches, each consisting of three tiers of small lancet panels. This feature is seen in the early Ottoman monuments in Jerusalem, such as the *sabils* of Sultan Sulaiman (cat. nos. 4-9). There are four rectangular windows; three are original and provide light for the interior of the mosque, and the fourth, of some unknown later date, serves to illuminate the staircase leading to the mosque. The fourth window (45cm by 55cm) is not

original, for it has no jambs or lintel. It was recently blocked at the same time as the entrance to al-Madrassa al-Mawardiyya was barred when access to the interior was transferred to the entrance of al-'Imara al-'Amira (cat. no. 15). The original windows are fitted with an elaborate iron grille, and surmounted by a slab lintel. Directly above the slab lintel there is another, constructed of joggled voussoirs of red, white and black stone. The first of these windows (75cm wide by 1m high) is one course above the entrance door. A ribbed semicircular hood, of what Meinecke (1988: 267) calls 'dove-tailed stones', which is framed by a chevron arch, is set five courses above the joggling. The other two original windows are built on either side of the recessed portal, and set into a tall, slightly depressed panel. They have similar measurements—90cm by 1.7m—but the joggled voussoirs are of different designs. A band of trefoil moulding occurs three courses above each window, surmounted by four rows of shallow carved *muqarnas*.

Interior

Access to the ground floor of al-Madrassa al-Mawardiyya is through the doorway which has been opened in the north façade. It measures 1.1m wide by 2m high, and it is fitted with a modern iron door with two leaves. The door leads to a square antechamber, 2.2m by 2.2m, which has been paved with antique stone slabs and which is covered by a cross vault of fine stone blocks. To the south and east of the antechamber, there are two small rectangular chambers which are locked at present. A stairway situated to the west of the antechamber gives access to the mosque and to the rooms of the *madrassa*. The stairway has four stone steps running west, followed by seven steps running south; it leads to a narrow passage. This, some 1m wide by 4m long, is open apart from its northern end which is covered by a cross vault. It is apparent that the passage used to extend a further 2m south to allow access to the remains of the *madrassa* buildings. A series of steps were built some time later to curtail the passage at its southern end, presumably when parts of the second floor of al-Madrassa al-Mawardiyya were added. These steps lead today to the second floor, and then down another stairway to the first floor of al-Madrassa al-Mawardiyya.

At the beginning of the passage, there is a trefoil-arched entrance door of *ablaq* masonry. It is the original entrance of the mosque chamber of al-Madrasa al-Mawardiyya but it is now blocked. Built of three colours of masonry—red, white and black—the door is both elaborate and beautiful. It measures 3.35m wide by 3.8m high and is surmounted by a slab lintel. Directly above the lintel is a relieving arch made up of seven joggled voussoirs of black and white *ablaq*. On either side of the entrance there is a single engaged cylindrical column. The shafts of these columns are supported on a square base, and they are crowned by a *muqarnas* capital. The trefoil arch is framed by a quirked ogee moulding, ending on either side with a volute, sometimes known in Arabic as a *mim* decoration. The location of this doorway is reminiscent of the entrance door of al-Zawiya al-Muhammadiyah, for both are in the west wall. It is probable that when they were constructed there were no structures there.

The interior of the mosque chamber is rectangular in plan, its ground paved with old stone slabs. The *waqf* document (Sijill 77: 537) refers to it as *al-majma' alladhi fihi al-mihrab*—‘the assembly room in which there is the *mihrab*’. It used to be approached from the entrance described above, but, now that this is blocked, access is through the door recently cut in the archway (*qantara*) of Ribat Bairam (see above cat. no. 11). Six windows illuminate the interior of the mosque. Three are in the north wall, two in the east wall and one in the south wall above the *mihrab* niche. The windows of the north wall are surmounted by a horseshoe arch and the others have a semicircular arch. All are fitted with different types of iron grille. The interior is divided into three principal parts. The main area is in the centre; it is square in plan with internal measurements of 3.2m by 3.2m, and is covered by a shallow dome. The dome is supported on four pointed arches. The arches are built of *ablaq* masonry of white and black and spring from the corners of the walls. Four *muqarnas* pendentives consisting of four rows of small lancets form the transition zone. The *muqarnas* is constructed of red and black stones and some are decorated with small ribbed shells. The dome is set on a twelve-sided drum, and its upper part is decorated with a quirked moulding.

The second part of the chamber is to the south. It is dominated by the *mihrab* niche built in the south wall. Both the *mihrab* and the *qibla* wall are beautifully constructed in *ablaq* masonry of red, black and white. The *mihrab* is flanked by two re-used marble columns which support a pointed arch. The bases of the shafts are largely hidden under the ground level, leaving only their torus moulding visible; the capitals are of a type of Corinthian with leaf-volutes. The *mihrab* niche is concave, inlaid with five marble lancet panels of red and black separated by white. It measures 80cm wide by 45cm deep by 2.4m high. The semi-dome of the *mihrab* niche is in the form of a pointed arch; it too is constructed of *ablaq* masonry but is otherwise undecorated. There is a big blind niche to the west of this area. Measuring 1.8m wide by 50cm deep by 2.1m high, it ends in a semicircular arch. It is this recess which is referred to as the *khizana* (‘cupboard’) in the *waqf* document (see above). The southern section of the mosque chamber is covered by a folded cross vault with a small saucer dome at the centre.

The northern part of the mosque is divided by an arch into two sections. That to the west is covered with a cross vault, and the eastern section has what Burgoyne (1971: 25) called ‘bowl-shaped and lozenge-shaped depressions in the plaster vault’. The north wall, which is the internal elevation of the north façade, is dominated by the three windows described above.

These windows are surmounted on the interior by white slab lintels. The windows located to the east and west of the central window have additional joggled lintels made up of *ablaq* masonry. The voussoirs of the lintels are not identical. Each of the three windows culminates with a horseshoe arch which is also built in *ablaq*. Three steps on the east of the north-east section lead to the door giving access from the *qantara* of Ribat Bairam. The mosque chamber is used today as a classroom, like most other parts of al-Madrasa al-Mawardiyya.

Access to what remains of the first floor of al-Madrasa al-Mawardiyya is by way of a staircase (A). Traces of earlier alterations, as already mentioned, suggest that staircase A used to continue southwards at the same ground-floor level as the mosque, to end in the courtyard (K) (see above cat. no. 11). Today the remnants of the first floor are reached from the main entrance of al-‘Imara al-‘Amira through a complicated network of passages at various levels. The description here will follow the original approach. On reaching courtyard K, there is an elaborate entrance to the south. It is dominated by a gadrooned and pointed arch enclosed within a rectangular masonry block, which is in turn framed by a stone billet moulding. Its uppermost stone course is chamfered. The diversity of colour and quality in the masonry shows that many alterations and additions have taken place at some time. There is a recessed (40cm) door in this entrance (1m wide by 1.9m high) with *ablaq* masonry to each side. The door has a slab lintel, and directly above there are two further masonry courses. A rectangular stone recess is in the centre of the tympanum of the gadrooned arch. It measures 70cm by 35cm, and it may once have held either a foundation inscription or a decorative plaque. The rear elevation of this entrance is expressed as a horseshoe arch constructed of undecorated voussoirs and framed with a slightly-projecting moulding. Two courses above the top of the arch, a further moulding marks the break between the buildings on the first floor and those on the second floor of al-Madrasa al-Mawardiyya. There is also a sophisticated joggled lintel above the slab instead of the two plain stone courses on the north façade of the entrance leading to the first courtyard (O) from courtyard K. The mouth of a well (40cm in diameter) is to be found to the west of this entrance. It is placed within a small niche (55cm wide by 55cm deep by 1.3m high), which has a small pointed arch. There is another blocked horseshoe arch adjacent to the entrance arch, leading to a rectangular chamber with no window. Perhaps it was used as a storehouse or was originally lit with lanterns.

Courtyard O is reached through the main entrance described above. It is mentioned in the *sijill* (77: 537) as one of the component parts of al-Madrasa al-Mawardiyya (see above). The reference says ‘... and for the pavements of the *saha* in front of the aforementioned (large) chamber—twelve gold pieces ...’ It is almost rectangular in plan, and is paved with large antique stone slabs of good quality, some of them probably dating back to the restoration detailed in the estimate mentioned in the *sijill*. Courtyard O is bordered to the west by what the *sijill* document called ‘the large chamber’ (*al-bait al-kabir*), to the east by the large *iwan*, to the south by *al-ma'zil al-juwani* (the inner sanctum or ‘place of isolation’), and to the north by the main entrance of the inner part of al-Madrasa al-Mawardiyya.

A huge pointed arch opposite the big *iwan* to the east gives access to a large chamber (P). The arch was blocked at some point apart from a doorway flanked by two windows to either side. This door measures 90cm wide by 1.7m high and is surmounted by a white slab lintel 1.1m wide by 40cm high. The

doorway has a modern iron door rather than the wooden one described in the estimate (see above). The windows are fitted with a simple iron grille, and surmounted by a semicircular arch of simple masonry blocks. The one to the south of the door measures 70cm wide by 1.4m high, the one to the north 90cm wide by 1.7m high. The interior of the 'big house' is a rectangle, paved with small coloured stone slabs, and the ground level is higher than that of the open courtyard O by 27cm. The interior is illuminated by a double window in the west wall. The window overlooks the northern courtyard of the Takiyyat Khassaki Sultan, where the water cistern of the *takiyya* is situated. Each window measures some 1m wide by 1.5m high, and they are placed within a recessed niche surmounted by a semicircular arch. The walls have been recently plastered and the roof is a tunnel vault.

The big *iwān* was located opposite the 'large chamber' according to the *sijill* document (77: 537) and thus must be the room marked Q on the plan. A large open pointed arch to the west, built with *ablaq* masonry of white and black, used to give onto to the chamber. It is now blocked with rough stones, and access therefore is by way of a doorway (90cm wide by 2m high) in the north wall. This is surmounted by a semicircle of undecorated voussoirs and is fitted with a modern iron door. Two identical windows once flanked the door to either side, but only the one to the east is now visible and continues to serve as window, for the second, to the west, has been transformed into a blind niche. It is hidden from the outside by a concealing wall adjoining the east end of the main entrance of al-Madrassa al-Mawardiyya. It was probably built to add strength and to consolidate the walls when a second chamber was added above the *iwān*. The east window measures 65cm wide by 1.1m high; it is fitted with an iron grille and surmounted by a semicircular arch. It looks over the staircase leading from courtyard F in Ribat Bairam Jawish to courtyard K, which gives access to the al-Madrassa al-Mawardiyya, and to the archway (*qantara*) of the *ribat*. The interior chamber of the *iwān* is square; it is paved with old coloured stone slabs (of red, yellow and grey, some of which measure between 27cm by 32cm and 21cm by 24cm) and is covered by a folded cross vault with a small undecorated saucer dome in the centre. A large blind niche, which measures 1.9m wide by 65cm deep and 1.7m high, is in the south wall, and is surmounted by a semicircular arch. There is another large niche in the east wall (1.75m wide by 65cm deep by 1.8m high) flanked on either side by an identical rectangular niche (50cm wide by 40cm deep by 75cm high); and it has a rectangular window 50cm by 90cm in its upper part. Despite the fact that the walls and the roof have been plastered recently, they are in a ruinous state.

Two pointed arches, each with a different span, separate the large courtyard O from courtyard R. The western arch forms a short tunnel-like passageway measuring 3m by 2.4m. The east arch is blocked apart from a doorway. The remnants of coloured jambs and joggled lintels, in addition to a chamfered frame, indicate that when the doorway was constructed it was of good quality and was of some significance within the original layout—perhaps it marked a boundary between spaces which discharged separate functions, or was the entrance to an area of special importance—but it too is now blocked.

It is difficult to know exactly what is meant by the term *ma'zīl juwani*. Literally it can be translated as the 'inner' or the 'internally isolated place' (from *ain za lam*—'*azala* to remove, to set aside, isolate, segregate; *ma'zīl*—'place of retirement, house of retreat; seclusion, segregation, isolation; isolation ward [in a hospital] ...' Wehr 1976: 610-11). To judge from the present plan

of al-Madrassa al-Mawardiyya and what was identified by the *sijill* as requiring restoration in this area (see above), it is possible that the term *ma'zīl* was applied to the western arch with its tunnel-like structure, and that its function was to act as a passage to separate the courtyard (O), the large chamber (P), and the big *iwān* (Q)—which formed a separate unit probably used for teaching—on the one hand, and the courtyard (R), the middle chamber (S), the small room (U), and the room (V)—probably the residential unit for the *shaikh* and his retinue—on the other. This suggestion means that al-Madrassa al-Mawardiyya was divided into three main parts. The first comprised the mosque (*al-majma'*); the second part consisted of courtyard O, the large chamber P, and the big *iwān* Q; and the third part, as described above, the courtyard R, the chamber S and the rooms U and V. While the *madrassa* still functioned, the teaching took place in the second unit O, P and Q as well as in the mosque. When the change to a residential house was made under Hajj Sinan al-Sughanji and Bairam Jawish (see under Endowments above), the teaching area was doubtless converted into a dwelling for the two people named as lessees and sponsors for the restoration work.

The ground level of courtyard R is higher than courtyard O by 40cm; its plan is nearly rectangular and it is paved with large stone slabs. Four chambers of various sizes surround courtyard R, and there is a staircase on the east side that leads from the first to the second floor of the *madrassa*. Two out of the four chambers can be identified by reference to the *sijills* as the 'middle chamber' (*al-bait al-wastani*) and the 'small chamber' (*al-bait al-saghir*). The 'middle chamber' (S) is located to the west of courtyard R. Its eastern elevation is the only visible façade. It is constructed of simple masonry, originally pierced by three windows and a simple doorway. These provided the only light and air for the chamber. Two identical windows, fitted with a plain iron grille and surmounted by a semicircular arch, are placed south of the door, each one measuring 75cm wide by 1.1m deep by 1.75m high. The door is 95cm wide by 2.1m high, and is surmounted by a semicircular arch. The third window—a rectangle 70cm wide by 1.05m high—is placed above the door. It has a slab lintel and is without a grille, presumably because one was not needed for security. The room is rectangular in plan, paved with coloured stone slabs of red and yellow, and has a tunnel vault divided by two cross vaults. There are two blind niches, the first a small one, situated to the south of the east wall, measuring 70cm wide by 50cm deep by 130 cm high; the other one is in the east corner of the north wall, and is 90cm wide by 40cm deep by 1.55m high. Both niches are surmounted by a semicircular arch.

The 'small chamber' T is situated at the south-east corner of courtyard R. It is approached through a simple doorway in its northern elevation. The door measures 80cm wide by 1.65m high; it has been fitted with a modern iron door and is surmounted by a white slab lintel. An arch of three simple voussoirs is built above the lintel. A window (55cm wide by 70cm high) is placed above the door; judging from its appearance, it was originally a slit window that was enlarged at some later date. To the west of the door, a window gives light to the interior; it measures 90cm wide by 1.5m high, and is surmounted by a semicircular arch composed of three simple stone blocks. The window is fitted with an iron grille with slender bars. The interior of the rectangular room is plain; it has old coloured stone slabs (also of red and yellow) of medium size on the floor and the roof is a cross vault. A blind niche (2.3m wide by 55cm deep) intended to serve as a cupboard is set in the west wall. Although the walls

have been recently plastered, they are in a dilapidated condition.

A small room (U) is located between the middle chamber S and the small chamber T. It is roughly square and is reached from courtyard R through a door (80cm wide by 1.65m high) in the north elevation; it is surmounted by a slab lintel and above the lintel there is an arch. A rectangular window (75cm wide by 1.5m high) is placed to the west of the door, surmounted by a slab lintel, and above the lintel there is a semicircular arch. The interior of the room is very plain; the floor is paved with coloured stone slabs of red and yellow, and it is covered by a tunnel vault. The walls and vault have recently been plastered. The small size of the room suggests that it might have been used as a kitchen or latrine. Room V is located to the east of courtyard R. It is somewhat similar but not identical to room U—it has the same windows, floor-paving and vault, and was probably used for a similar purpose. It is rectangular in shape and measures 2.6m by 3.2m. It is entered from the courtyard through a door in the east wall which has been fitted with a modern iron gate of a single leaf. The door measures 80cm wide by 1.65m high and it is surmounted by a simple slab lintel; the window is 50cm wide by 1m high. Room V is now used to store books. Its original function is not known, but it was conceivably used as a cell for a single student.

Apart from the chambers W and Y, the second floor of al-Madrasa al-Mawardiyya consists of numerous newly-constructed rooms built of concrete and blocks which are no concern of this study. Chamber W is built directly above the big *iwān* Q, and is reached—as is chamber Y—either from the staircase which leads from the main façade of the Mawardiyya to the mosque chamber or by way of the staircase in courtyard R which led to Ribat Bairam through courtyard K (see above). The exterior of chamber W is made up of four solid walls built with masonry courses with a rectangular shape. The west elevation has a double window (each opening is 85cm wide by 1.1m high) surmounted by a single slab lintel; above the lintel there is carved decoration.

[Editorial note: Two horn- or tusk-like projections flank a circular medallion that is suspended in the centre of a cusped frame. The motif is crisply cut and for emphasis is outlined by a narrow groove. The ‘medallion’ has a six-petalled floral motif. A similar motif is found at Nabi Da’ud and on the Sabil al-Khalidi, although in this second example the central medallion is missing. SA]

Five courses above the arch of the double window, the four exterior corners are set back to form a zone of transition to support a shallow dome, covered with small slabs. A buttress built at the southern end of the west elevation consolidates the chamber. There are two windows in the north wall of the chamber W, the first a single one to the west, measuring 70cm by 1.15m, and the second double (each part measuring 75cm by 1.15m); they are both surmounted by slab lintels and relieving arches above. A door to the south (85cm by 1.9 m high) gives onto the interior of chamber W; it is surmounted by a semicircular arch of re-used voussoirs. The floor is 7cm below the level of the passage that leads into the interior; it is covered with red and yellow paving slabs. As mentioned above, the interior is illuminated by two double windows and a single window. The double windows are set in a recessed niche. Two blind niches flank the western window. The southern niche measures 65cm by 45cm by 1.3m, and the northern one measures 70cm by 45cm by 1.2m. There is a further niche in the east wall, 1.05m by 50cm by 1.4m. It is surmounted by a recent window, 70cm by 45cm by 75cm. A big

cupboard recess (2.65m by 90cm by 2.2m and 30cm above the level of the floor) is set in the south wall. All the niches are surmounted by plastered semicircular arches, and are clumsily finished. The chamber is covered by a dome with a shallow profile which is carried by the walls of the chamber, and four triangular pendentives at the corners serve as a transition zone. The walls have been recently plastered. The original function was almost certainly residential; since 1968 it has been used as a classroom.

Chamber Y is opposite chamber W and is constructed above the *bait al-kabir* P. The three visible elevations to east, north and west of chamber Y have been constructed with small masonry blocks, both square and rectangular. Each is dominated by a double window surmounted by a slab lintel with the customary ‘eye-brow’ relieving arches above. Access to the interior of chamber Y is through a door in the south wall. In front of the door there is a small cell to the west which acts as an antechamber; there is a small blind niche to the east. The door measures 90cm by 1.95m and it gives onto the rectangular room. The floor, paved with red, black and white stone slabs, is 10cm lower than the level of the antechamber. As said above, three double windows light the interior while another, now blocked so that it forms a blind niche, was once in the north wall. The window openings are identical—each measures 80cm wide by 1.15m high, and each is surmounted on the interior by arches with a moulded frame. There is another large blind niche in the south wall 30cm above floor level, 2.1m wide by 50cm deep by 1.9m high. The chamber is covered with a cross vault, and both it and the walls have been recently plastered. A staircase in the west corner leads to the second level of chamber Y, built some time after the first level had been constructed, for their size, quality and colour of masonry are dissimilar. Again originally doubtless a residential unit, it has been used as a classroom since 1968—indeed, it is where this author completed his secondary education in late 1972.

Dating the building

Burgoyne (1971: 25) says that ‘this building [the Rasasiyya] ... really belongs to the Ottoman dynasty,’ but he had reservations, and suspected that it could have been designed either during the final years of, or immediately following, the Mamluk period. The building is not dated either by epigraphy or by literary evidence, as explained already, and there are those who have dated it to 947/1540 (see note no. 1 above), believing it to be part of Ribat Bairam Jawish.

To date, nothing has been found in the *sijills* that could provide a precise date of construction, but from *Sijill* 7: 348 it can be deduced that the building was standing in 942/1535, and is thus earlier than the earliest dated Ottoman structure in ‘Aqabat al-Sitt (cat. no. 7). Because of the absence of documentary evidence, it is possible to look for a dating control in the style and layout of the building, but this method has its problems since the building has both Mamluk and early Ottoman architectural features. Burgoyne (1971: 26) pointed to the chevron moulding as a typically Turkish influence. Meinecke (1988: 267) mentioned that the ornamental dove-tailed stones were current in Cairo on the Sabil Kuttāb of Khusrāu Pasha of 942/1535, and in Damascus on the Mausoleum of Ahmad Pasha, who died in 942/1535. He adds that the *muqarnas* dome and the pleated (chevron) arch were both part of the Mamluk architectural tradition in Cairo and Damascus. The interior too is rich with Mamluk architectural features such as the gadrooned arch, the horseshoe arch, the sophisticated *ablaq* joggled voussoirs and lintels, and *ablaq* jambs. Apart from the *ablaq* voussoirs, all these are features familiar in

Jerusalem before its conquest by the Ottomans. This raises the question of whether the *ablaq* voussoirs were not also part of the early Ottoman architectural repertoire in the city. Yet a survey of early and later 16th-century Ottoman projects in Jerusalem, such as the restoration of the citadel, the *sabils* project, Ribat Bairam Jawish, and the Khassaki Sultan complex—which, if rich ornamentation were to be found anywhere at this period, would surely be the prime site—reveals no sign of *ablaq* voussoirs in any of these buildings. This statement holds true for the minor Ottoman projects of the 16th century, although there is a single exception of a monument with coloured masonry—the Qubbat al-Nabi (cat. no. 10). But here it is not true *ablaq* that it used because, although the masonry is of different coloured stone, they are not placed alternately to give striped voussoirs. The *ablaq* was rather a feature of the restoration of the *qubba* by Muhammad Shakir in 1261/1845 (see cat. no. 10). Having said that, there is an apparent re-emergence in the prominent use of *ablaq* lintels and voussoirs at the end of the 16th century in Jerusalem. The use would seem to be part of a deliberate revival of architectural elements from the Mamluk period in the projects of Ahmad Pasha (cat. nos. 23; 24; and 25) and the Hujra of Islam Beg (cat. no. 21). It is worth pointing that these elements—that is, *ablaq* voussoirs and string course lintels—although they look like Mamluk design and seem to be constructed in a similar way, are not, however, identical, but have their own character. The foregoing argument makes it likely that al-Madrassa al-Mawardiyya should be dated to the late Mamluk period.

There is a gap of almost five decades between the last Mamluk building (al-Ashrafiyya, dated 885/1482) and the first Ottoman building (Sabil Qasim Pasha, cat. no. 2). Imperial projects, like the restoration of the Citadel (938/1531-2) and the construction of the *sabils* (see cat. nos. 4-9), had to wait another few years after that. Perhaps, then, it was some time between the year 900/1494-5 (when Mujir al-Din compiled his famous book, 1973 2) and the early years of the Ottoman reign that al-Madrassa al-Mawardiyya, al-Zawiya al-Muhammadiyya (see cat. no. 29), al-Zawiya al-Yunusiyya (now lost—see cat. no. 11) and al-Madrassa al-Qastumriyya (probably the anonymous building that appears in Burgoyne's list, 1976: cat. no. 46), and the tomb chamber located today within al-Imara al-Amira (see cat. no. 15) and others were built. This date would explain why these buildings are not mentioned in the work of Mujir al-Din (1973 2) while they appear frequently in the Jerusalem *sijills* for the first half of the 16th century, albeit without any detailed *waqfiyya* or a patron's name.

Although al-Madrassa al-Mawardiyya was lavishly decorated, especially on the northern façade and in the mosque chamber, it appears that its endowments were insufficient and that it suffered badly from want of repair. This situation meant that the *madrasa* was controlled by one inspector after another and finally transformed into a residence (see above). This would also explain various features; first, the blocking up of many parts of the *madrasa* to make it suitable for use as a residence; and second, the uniformity of the iron grilles, the sills, the lintels and the arches over the windows and doors of the *madrasa*. In particular, as has been shown, changes were made to the big chamber and the big *iwan*.

It is hard to know when the construction of the chambers W and Y on the second floor occurred. The architectural features—relieving arches set within the wall, double windows with 'eye-brow' arches, the size and dressing of masonry blocks and so on—are very similar to those of Ottoman private

buildings in Jerusalem, and they were in continual use until the introduction of the iron beam followed by the use of concrete—that is, just prior to modern architectural practice. These features have already been mentioned briefly in an attempt to date the second level of Dar Bairam Jawish (cat. no. 13).

29 AL-ZAWIYA AL- MUHAMMADIYYA

Name: Al-Zawiya al-Muhammadiyya

Date: Undated, most probably late Mamluk, possibly early Ottoman

Endowment: None known

Variant of name: None known

Modern name: Dar Abu Hadwan

Location

The *zawiya* is located to the north of the lower part of the street of 'Aqabat al-Takiyya (al-Sitt).

Site and brief description (figs. 29.1-29.3, pls. 29.1-29.6)

Al-Zawiya al-Muhammadiyya is situated on the other side of the road ('Aqabat al-Takiyya or al-Sitt) to al-Madrassa al-Mawardiyya (cat. no. 28) and almost opposite it. The eastern wall of the *zawiya* adjoins the west wall of the western hall of Maktab Bairam Jawish (cat. no. 12). Its southern façade is the only one visible, for the *zawiya* is bordered to the west and to the north by unrecorded buildings dating to the late Ottoman period. The main entrance to the *zawiya* was originally in the west front, which is now hidden. Originally the *zawiya* consisted of a single large hall divided into two sections on the ground floor. The upper second level was added later. This upper level is made up of an open courtyard and an archway spanning the street of 'Aqabat al-Takiyya (al-Sitt).

History

So far nothing is known or has been published about the building, and only one piece of information has been discovered in the *sijills*.¹ This is the brief record of a four-year contract to lease a building called '*al-Zawiya al-Muhammadiyya*'. The most interesting part of the record is the detail regarding the location. The document reports (Sijill 12: 397) that 'Taj al-Din Khalifa (the inspector) has leased to Mustafa ibn 'Abdullah of the Yeniçeri (Janissaries), the whole of al-Zawiya al-Muhammadiyya which is situated in Jerusalem the Noble at the lowest part (*suff*) of 'Aqabat al-Sitt near al-Madrassa al-Mawardiyya. It is so well-known in the neighbourhood that there is no need to give details either of its description or of its border.' Since the location of '*al-Zawiya al-Muhammadiyya*' given in the *sijills* (12: 697) corresponds to that of the building adjoining Maktab Bairam Jawish (cat. no. 12), and also because of its architectural form, it has been concluded here that the structure under discussion does not belong to the Maktab Bairam building but that it is most probably the '*Zawiya al-Muhammadiyya*' mentioned in the document.

The *sijill* entry shows that the building was not only in existence in Ramadan 947/December-January 1540-41 but in good enough condition at that time to be rented for 180 '*uthmaniyya*' per year. It is not known when it was built, and thus whether it is Mamluk or early Ottoman. With no dating control, it seems most practical to deal with the structure in a separate entry. It is hoped that it may be possible to date the building more precisely in the not too distant future.

Architecture

Exterior—the south façade

The south façade of al-Zawiya al-Muhammadiyya, its only visible one, merges with that of Maktab Bairam, although it is misleading to suggest that they form an integrated whole. Following the *sijill* reference quoted above and the discussion on the *maktab* (cat. no. 12), it is correct to see the two as separate entities. Although it adjoins the western end of Maktab Bairam, the *zawiya* is constructed of a different, good-quality masonry, which is now seriously dilapidated. The south façade of al-Zawiya al-Muhammadiyya lies 10cm behind the southern elevation of Maktab Bairam Jawish; moreover, the masonry courses of the two buildings are not engaged. This is not enough to decide whether the façade of al-Zawiya al-Muhammadiyya was built earlier or later than that of the *maktab*, but it suffices to indicate that it was probably constructed at a different time.

Two doors and one window dominate the lower section of the southern façade of the *zawiya*. The window is on the same level as the central door. Now blocked, the window is slightly recessed; it is a rectangular opening measuring 1.4m wide by 1.8m high, and is framed by a *cyma* moulding. The jambs of the window are built with coloured *ablaq* masonry and it is surmounted by a slab lintel. The window has suffered badly from later alterations; the stones with which it is blocked are both coarse and of a different quality to the masonry of the window itself, and it is probable that these stones replaced a high-quality iron grille. The same quality of coarse stone also appears in some of the courses to the east of the window. There is a rectangular window in the upper part of the southern façade which is still visible. It is flanked to the west by the archway and to the east by the south-western corner of Maktab Bairam Jawish. It measures 60cm by 1.15m, is surmounted by an elaborate marble slab lintel, and is also now blocked by stones. The Jerusalem Municipality has recently fixed heavy iron supports to the façade to help support the building, and as a precaution against it collapsing after an excavation to install a new sewage system (these supports do not appear in the drawing of the elevation). There is a rectangular door to the west of the window. It measures 80cm wide by 1.75m high; it is reached by three steps of 50cm from the level of the road of 'Aqabat al-Takiyya (al-Sitt). The door is simple, being fitted with two wooden leaves and surmounted by an equally simple single-slab lintel. This door was presumably built at the same time as the archway dwelling (*qantara*) and the rest of the first floor were added. The reasons for this belief are the simplicity of the design, particularly if it is compared to the doorway located directly to the east and to the window situated at the middle of the south façade. In addition, the first steps leading to the entrance are built over the sill of the original entrance. It follows that this original doorway has been partly blocked at a later date. There is another door to the west but it has nothing to do with al-Zawiya al-Muhammadiyya, for it gives onto one of the later separate adjoining buildings that have not so far been recorded. Three blocked pointed arches are to be found directly above the level of the lintels of the door and the window. These arches spring directly from the façade. The central arch has a greater span than the two to the sides; it is constructed of simple voussoirs, and its tympanum is occupied by a rectangular recessed panel that was probably originally open in order to give light to the interior. The curve of the eastern arch is clumsily finished.

The upper section of the southern façade, as noted above, is blocked by the later archway (*qantara*), which spans the road of 'Aqabat al-Takiyya. This archway forms the principal part of the first floor built at some point above the two main halls of

¹ I would like to express my deep gratitude to my colleague, Mr Khadr Salameh, the Librarian of al-Aqsa Mosque Library, for drawing my attention to this entry in the *sijills*.

the *zawiya*. In this respect, it is similar to the archway that spans the road to the east between the Ribat and Maktab Bairam (cat. no. 11). Once again, it is difficult to date with any precision either the archway or any part of the first floor, because of the lack of information. However, it would seem that the addition of the *qantara* stemmed from the need for residential space in the Old City of Jerusalem during the 17th and 18th centuries.

Interior—The Ground Level

The ground floor consists, as noted above, of one large hall divided by an arch into two rectangular chambers. Access is through an entrance situated directly west of the doorway in the south façade. The entrance is rectangular in shape, measuring 90cm wide by 1.85m in height. The jambs of the entrance are badly worn, but one can easily recognise that they were built in *ablaq* style using black and white stones of similar quality to those of the window on the south façade (described above); and it is surmounted by the same type of slab lintel. The door is now in a ruined state and is partially blocked. The floor level is lower than that of the first landing of the staircase that leads to the upper floor of the *zawiya*, and than the street level of Tariq 'Aqabat al-Takiyya. Three steps lead down to the room, which is now so full of earth and rubbish that the actual level of the floor is concealed. The rubbish is probably the accumulated debris from successive nearby restorations. The room is rectangular in plan with an internal measurement of 5.7m wide by 9.2m long, and a huge pointed arch at its centre divides the area into two similar rectangular spaces. The arch springs from two rectangular bases located on the west and east walls of the hall. The only means of illumination in the hall besides the door is the window to the south of the southern chamber (now blocked) described above. A gutter is cut in the southern wall just to the west of the window. It measures 40cm wide by 35cm deep and runs along the top of the wall to end at the mouth of a well. Its function was to collect rainwater.

One half of a gadrooned arch is to be seen at the north-eastern corner of the south chamber at the point where the eastern base of the pointed arch is located. It is surmounted by another half arch made up of voussoirs. The other half of each arch is obscured by the base of the pointed arch. On the one hand, this provides a clear indication that there was a sort of connection between Maktab Bairam and al-Zawiya al-Muhammadiyya, and that there were later alterations. On the other hand, it raises the possibility that al-Zawiya al-Muhammadiyya was built some time earlier than the Maktab Bairam Jawish (cat. no. 12).

There is a rectangular stone cenotaph, 1m by 1.85cm, in the north chamber of the hall. Only the upper two courses of the monument are visible, the rest being submerged under the present floor level. It is not known with certainty whom this cenotaph commemorates, for so far no funerary inscription has been found. However the local Jerusalemite community call the monument 'the tomb of al-Shaikh al-Matbuli'. Both chambers are roofed by a cross vault and there are traces of old plaster, a mix of lime and mortar. This hall is in a bad state of repair and is neglected today.

The first floor²

The approach to the first floor is through the doorway situated in

the south elevation. The doorway leads directly to a stairway made up of seventeen steps running north which gives access to an open courtyard (A). The courtyard connects the two parts of the first floor of al-Zawiya al-Muhammadiyya. The first lies to the north west and consists of a long chamber (C) divided into two separately cross-vaulted sections by an arch, an antechamber (*dirka*) (B), and a small room (D). The second part in the south west includes the *dirka* (E), the main chamber (F), and the two lateral chambers (G) and (H), each again separately cross-vaulted; these vaults follow a north-south axis. The archway (*qantara*) that spans Tariq 'Aqabat al-Takiyya is part of the northern section of this floor.

Courtyard A is a rectangle measuring 3.8m wide by 4.5m long. It has been paved recently with a modern pavement, replacing the old good-quality flagstones. It is bordered to the west by a simple wall built of stone and concrete blocks. A rectangular recess (50cm wide by 60cm long) with a slab lintel had previously been constructed in the south-eastern corner of the courtyard. This has recently been dismantled to give space for a modern bathhouse. The recess formerly housed the conduit-head leading to the gutter mentioned above, and thence to the cistern beneath the west part of the lower ground floor.

Antechamber B gives access to the long chamber C and the small room D to the north west of the complex. It was entered from courtyard A through the west wall, which was open and dominated by a pointed arch. The arch is built in *ablaq* technique with black, white, and red stones and it is surrounded by another arch of plain white stones. A new concrete kitchen has now been built directly in front of this antechamber. Antechamber (*dirka*) B is square in plan, measuring 2.7m by 2.7m, and it has a new pavement. The room is dominated by the arched entrance which acts as one wall and it is here called a *dirka*, for it gives access to the adjoining rooms. Two doors in the north and the south walls of the antechamber give onto chamber C and room D, and there is a rectangular recess in the east wall. This measures 1.85m wide by 35cm deep and 2.5m high, and is surmounted by a semicircular arch. The walls and the roof of the *dirka* have been recently plastered and its roof is covered by a cross-folded vault with a saucer dome in the centre.

Chamber C has only one elevation visible and that faces south over courtyard A. It is undecorated. Its single rectangular, window, which measures 1m wide by 1.7m high, has a slab lintel. Chamber C is reached through a simple door (80cm wide by 1.9m high) in the north wall of *dirka* B. The room is rectangular, with an internal measurement of 6.8m long by 2.7m wide. The floor is paved with the type of coloured tiles popular in Palestine during the first half of this century. The tiles are decorated with repeated geometrical patterns forming lozenges which enclose a floral motif. The interior is divided into two by a pointed arch which springs from two engaged piers on the north and south walls of the chamber. The first part to the east is windowless, and is smaller than the area to the west. In this second part of the chamber, there is a rectangular blind recess (90cm by 45cm by 1.6m high), which was originally a window in the north wall; this is surmounted by a relieving arch. The room is now lit by a double window in the west wall set within a rectangular niche measuring 1.8m wide by 1.5m high. Each window opening measures 70cm wide by 1.1m high, has a slab lintel on the outside and is fitted with iron grille. Each part of chamber C has its own cross vault, and the walls have recently been plastered.

Access to room D now is through a new opening in its

² This floor has recently undergone a major renovation with additions by the residents; there are therefore serious discrepancies between the survey plan and the more up-to-date description of the architecture as it now exists.

south wall; originally it was approached through a door in the south wall of *dirka* B, that is from the north. The door is 75cm wide by 2.35m high, and it leads into a square room which measures 2.5m wide by 2.5m long internally. The floor was once paved with white flagstones that have now been replaced by a modern pavement. Two windows illuminate the room, the first in the west wall overlooking the courtyard (A); the second is smaller. It is in the south wall, opening towards Tariq 'Aqabat al-Takiyya. It is now blocked, as explained already, its lower part being on the same level as the ground. There is a modern artificial wood ceiling concealing the original cross vault.

The other part of the upper level of the complex is approached by way of *dirka* E which gives access to the main chamber F, as well as to chambers G and H. In principle, the two *dirkas* (B) and (E) resemble each other in that they are both entered by way of an arch which effectively forms one side of the room. Like B, the external northern face of E is dominated by a slightly pointed arch. But E is rectangular in plan with an internal measurement of 2.6m wide by 3.4m long. It was once raised 20cm above the level of courtyard A. The floor has recently been given a new pavement in place of the old one, and the room is covered by a domical vault. Its lowest part is carried on four small pointed arches which spring from the corners of the room. Four corner triangular pendentives mark the transition zone from the square to the octagonal drum. The drum is made up of eight blind panels surmounted by semicircular arches which support a series of faceted triangles with a small saucer dome above them. The exterior is expressed as a shallow dome covered with small flagstones.

A simple entrance in the south wall of *dirka* E used to lead to the principal chamber F. It is now blocked but was fitted with a wooden door made up of two leaves. Chamber F is flanked by the southern parts of the halls G and H to west and east. It is square in plan, measuring 3.7m by 3.7m, and has a modern pavement. A rectangular double window in the south wall provides light and air. Each section of the window measures 40cm wide by 1.85cm high and is surmounted by a semicircular arch on the inside and a slab lintel on the outside; it is fitted with an iron grille. Chamber F is covered by a dome expressed internally as a shallow saucer and externally as a hemisphere. The twelve-sided drum rests on a faceted twelve-sided base of two masonry courses. Each side of the drum was once pierced by a small window under a semicircular arch. All but one of the windows are now blocked. The drum and the transitional masonry courses are supported on four pointed arches, which extend almost the full width of each side of the chamber and are supported in turn by the walls from which they spring. A pendentive in each of the four corners serves to form the duodecagonal transitional zone between the square base and circular drum. The dome and the transition area have recently been coated with plaster. The exterior of the dome once again is covered with small flagstones.

A simple entrance in the western wall of *dirka* E, now dismantled, once gave access to the adjoining hall G. It was fitted with a wooden door with two leaves. The interior of room G, running north-south, is rectangular, measuring 2.4m wide by 6.9m long. It is divided into two by a pointed arch in the middle of the chamber. The arch springs from a small pier on the west and from the eastern wall of the hall. The interior is lit by two windows; the first, on the west side, is a rectangle measuring 60cm wide by 1m high and surmounted by a semicircular arch. The second window is to the north and is smaller than the first one. The floor is covered by a modern pavement, and the walls

have recently been plastered. The roof is made up of two cross vaults.

Chamber H corresponds to chamber G on the other side of F. Although similar, the two halls are not identical, for they differ in measurement, in the scheme of fenestration and in their doors. Chamber H opens directly off *dirka* E with no intervening door, for the division between the two spaces is dominated by a pointed arch. The interior of H is rectangular in plan, measuring an average of 2m wide by 5.7m long. A single window in the east at floor level provides light. The window is rectangular, measuring 75cm wide by 1m high, and is fitted with wooden shutters and an iron grille. The window opens onto the Tariq 'Aqabat al-Takiyya directly over the western archway. Another small slit window is placed in the south side over the door that leads to the back courtyard (I). It measures 20cm wide by 60cm high. The floor of chamber H is covered with flagstones, the walls have been recently plastered and the roof is covered by two cross vaults. The once-open courtyard I, now roofed in concrete, is entered through a door in the south wall of chamber H. The courtyard is rectangular in plan and paved with flagstones. It is bordered to the east and south by a rusticated stone wall reaching a height of 3m, and to the north by the south wall of chamber G. The double window in chamber F is in the north wall of courtyard I and here too there are traces of an arch that has been partly dismantled and later blocked. A small room with a pointed-arched entrance once occupied the west end of the courtyard but has now been dismantled to allow the area to be transformed into a kitchen.

30 QUBBAT AL-ARWAH

Name: Qubbat al-Arwah (The Dome of the Spirits)

Date: Before 1037/1627-8

Endowment: 1037/1627-8

Variant of name: None known

Modern name: Qubbat al-Arwah

Location

Qubbat al-Arwah is located to the north west of the terrace of the Dome of the Rock, about 10m to the south east of the north-western colonnade.

Site and brief description (figs. 30.1-30.3, pls. 30.1-30.8, col pl. XXXVI)

The building is octagonal in plan. It is a free-standing, single-unit structure. Eight columns carry eight arches with a slightly pointed profile; these are left open. A single course of masonry above the arches supports a heavy projecting cornice; the hemispherical dome rises immediately above this level, supported by the arches below. A single course of masonry encloses the base of the columns and thus delineates the octagonal floor space; below the arch to the south (the *qibla*), the enclosure breaks outwards to form a semicircular niche which serves as a *mihrab*. Most of the octagonal flooring of the interior is made of a single slab of natural white rock of irregular shape, part of which continues below and beyond the enclosure to the north east, to merge with the paving of the terrace.

History

Identification

As early as 1037/1627-8 the Qubbat al-Arwah was mentioned in the *waqfiyya* of Muhammad Agha in Sijill 113: 639. The donor specified funds to cover the cost of oil and to pay a man to be in charge of lighting the lamp that was to hang in Qubbat al-Arwah, which was stated to be located in the north-western section of the platform of the Noble Rock. In 1083/1672 Evliya Çelebi (Stephan 1980: 93) included a description of Qubbat al-Arwah in his survey of the shrines on the north side of the Haram. He wrote that: 'Bab Hutta (*sic*) is the shrine of the prophet Qaffah b. ... Nearby is the Dome of the Spirits (Qubbat al-Arwah), with its small dome rising over eight slender columns'. In 1105/1693, al-Nabulsi (1986: 116, 118) visited Qubbat al-Arwah on two successive days (4-5 Rabi' I), but beyond noting the fact he gave no details.

Date

Qubbat al-Arwah is not dated either by epigraphic foundation text or *waqf* document. Burgoyne (1976: no. 115) suggested the 16th century as a tentative date for the building. Najm *et al.* (1983: 320) and Taha (1990: 21) both go one step further and state that the Qubbat al-Arwah dates to the 16th century but without giving their grounds for that dating. The founder of the building is equally anonymous (see below).

Endowment

Sijill 113: 639-40 contains a long *waqfiyya* bearing the name of Muhammad Agha the Administrator (*mutawalli*) of the *waqfs* of Khassaki Sultan (cat. no. 15). He was known as the brother of *maulana* (our master) Istaqamati Efendi, the son of the deceased Ahmad Pasha. Muhammad Agha had made a *waqf* in the sum of

300 *ghirsh asadi* (gold coins). He stipulated that the *mutawalli* was to administer (*yurabbihu*) the money in a lawful way and that he was to raise an annual interest of 48 *ghirsh asadi* on the capital. The expenditure of the income was specified, and among the amounts listed were two items concerning Qubbat al-Arwah. The *waqfiyya* reports that '... he (the administrator) is to allocate 3 *ghirsh asadi* in each year for the cost of oil to light the lamp that hangs each night in the Qubbat al-Arwah, which is located on the platform of the Noble Rock on the north-western side. The lamp is to be lit every day throughout the year from sunset to daybreak. Another 2 *ghirsh asadi* are to be allocated annually for a man to light the lamp and to serve it. Muhammad Agha has appointed Shaikh 'Ali al-Khafaji for the duration of his life and after him the appointment is to be according to the *qadi* of Jerusalem.' For the full Arabic text of the *waqf* of Qubbat al-Arwah, see Cat. Appendix 1, no. 30.

Architecture

Exterior

The dome is hemispherical and rests on eight slender columns spanned by arches constructed of small grey-white stones, which are framed by a thin ogival moulding. The eight arches are similar in height and their span is between 1m and 1.06m, the arch to the south having the widest span. The *qibla* is further marked by a roundel which decorates the keystone of the arch to the south. The roundel has a six-pointed star, the arms of which stand a little proud of the surface and are marked by a central groove. In the centre of the star-polygon there is a projecting floral boss, its centre marked by a six-petalled rosette. A metal tie-beam now runs between the openings at the level of the springing of each arch. The shafts of the slender columns are cylindrical and are made of grey-white marble; they share a radius of 62cm. The capitals are of various types, which would suggest that they are in secondary use.

[Editorial note: 1. Capital nos. 1 and 8 are similar but not identical. They are of a basket type, and their ornamentation is made up of two series of counterchange triangles. The first series of triangles are small, carved in relief, and appear to be conceived with a straight base, while the second group are larger, are recessed and their bases are formed from a concave semicircle. The effect is organic; the upward-pointing triangles resemble bracts surrounding a fruit. The carving of capital no. 1 is of a higher quality than that of capital no. 8, which has a lozenge decoration at the bottom of the recessed triangles, giving the effect of a secondary leaf. The abaci are plain with the exception of two engraved grooves running parallel to the edge, and a slanting chamfered corner.

2. Capital no. 2 is a *muqarnas* type, made in two sections. The upper part of each face consists of three ogival arches slant-cut into the surface; within this outer delineation, a crisp fillet frame outlines the cut-away *muqarnas* panel, which takes the form of an almond; each almond is divided into four facets, with the four faces meeting at the springing of the enclosing ogee. The lower part of this upper level is cut by triangular facets framed by deeply cut grooves that meet at the centre, directly below the apex of the upper arches. The groove continues into the lower level to form part of the frame of the four splay-faced, irregular lancet panels. It is possible to read this lower section either as two subdivided panels, or as four irregular lancets. Either reading is marked by the emphasis at the apex of the panels, for a deep triangular recess is carried above a groove and carries the supporting 'pilasters' for the ogival arches above. These 'pilasters'

take the form of crisp fillet projections with the same profile as the ogival frames. The corners of the capitals are conceived with the same grammar—that is, they are formed of chamfered panels whose curved profile is cut by a central groove that rises to a deeply recessed triangle carrying the ‘pilasters’ to each side of the angle. A narrow astragal moulding runs round the base of the capital, which has no abacus.

3. Capitals nos. 4 and 5 are identical. They too are a type of *muqarnas*, but one markedly different from the design described above. The decoration is made up of three tiers of triangular splay-faced *muqarnas* panels, three at the base rising to a single panel at the apex. Together they create a chamfered corner. The panels are undecorated apart from a narrow groove outlining each. Between each of them there is a deep recess. The triangular shape of this recess, allied to the groove surrounding each lancet panel, allows a play of light and shade over the surface. Indeed, the contrast between the *muqarnas* lancet elements and the recesses between them creates a sort of counterchange motif. The centre of each face of the capital is marked by a single niche. It is conceived as being in two sections; the lower part is a recessed triangle cut with triangular facets to each side of it, and the upper part is a chamfered niche with a pointed profile. The astragal of this shaft is in the shape of a roll moulding.

4. Capitals nos. 5 and 7 are similar. The decorative scheme derives its form from the upper section of a standard Corinthian capital which has been greatly simplified (see, for example, Wilkinson 1987: figs. 24–5). The projecting corner volutes have lost all semblance of a leaf apart from a central rib on capital no. 7; it is seen more clearly on capital no. 5. At the centre of each face a vestigial palmette, again reduced to the utmost simplicity of form and identifiable only by the slender triangular rib and projecting tip, rises to carry the square abacus above. This is divided into two sections by a central groove. The astragal is a roll moulding.

5. The last example, capital no. 6, is odd, and the origins of its design are obscure. Each face is made up of three stilted semicircular niches; the first and the third niche each have at the centre a tall tapering triangle which gives the effect of a leaf with a central rib; this interpretation is given credence by the detailing of the middle niche which is worn but is clearly foliate. Beneath the capital there is a plain thin slab apparently of a different composition to the capital itself. The function of the slab is presumably to raise the capital above it to the requisite height, almost as if it were a misplaced abacus. It is undecorated apart from a slight step before it is cut in a curved chamfer to meet the circle of the column beneath. SA]

Although the capitals are so diverse in form, which must point to a re-use, the columns themselves are cut from the same stone and rest on identical bases. Each base consists of a square plinth measuring 32cm by 32cm, is set across the angles of the octagon, and has a torus moulding and an apophyge. The bases of columns nos. 1, 4, and 8 are constructed from veined stone. The upper joints of all the columns are strengthened by a metal band; similar bands encircle the bottom of all columns except no. 3, which has a band two-thirds of the way up its shaft.

Above the apex of the southern arch, a square blind recess runs between the frame of the arch and the cornice above; once it probably housed either a decorative panel or one with an inscription. The projecting cornice is composed of three elements—a concave section supporting a *cyma reversa*—and it runs around the top of the building. This marks the beginning of

the dome, which is constructed of an uncovered mortar mixture. The apex is crowned by an elaborate knopped marble finial in the form of a full moon. It is conceived in four sections. The lowest section is a plain baluster knop, its base wider than the top. Two grooves mark the beginning of the middle section, which is itself made up of two parts. The upper section is square in plan and rests on the lower part which is in a form of a short baluster knop. The uppermost part is a seamless ring from which a short protuberance rises towards the sky.

Interior

Qubbat al-Arwah, octagonal in form, is centrally planned and is surrounded on all eight sides by open arches. Thus it has no one face that could be called ‘the main façade’, and can be viewed from any angle. Equally, access to the *qubba* can be from any side. The building is surrounded at the level of the floor on seven sides by slabs of white marble, each measuring 1.4m long, 17cm wide, and 17cm high. They are arranged in octagonal form, to enclose, as mentioned above, the rock forming the floor of the little building. There is a difference in the south side of the octagon, where the slab wall has been replaced by five stones forming a semicircular niche to serve as a *mihrab*. The slabs of the low barrier are fixed together by means of joint holes filled with lead.

The niche that serves as *mihrab* is unusual; it is probable that it was once higher than its present level, for it seems inconceivable that the unsightly joins which are now uncovered were so planned from its inception. It is 40cm deep and is preceded by a rectangular panel of black marble set into the floor.¹ This measures 29cm by 43cm. A geometrical marble panel is to be found set into the paving to the west of the *mihrab* niche. It is made up of a white octagonal slab in the centre, with four triangles of red marble set at the corners; the whole design is framed by white flagstones. This decoration may indicate that the site was once occupied by a construction to which no reference is found in the medieval sources.

The interior of the domed building has no decoration whatsoever, and it has been recently replastered. The zone of transition leading to the dome is achieved by means of a short circular drum.

Features

The founder of the Qubbat al-Arwah is not known. This was perhaps deliberate, for some religious teaching encouraged benefactors to make their charitable donations anonymous. Another possibility, since this is best regarded as a commemorative building, is that its foundation was due to local initiative rather than to the sponsorship of a member of the ruling élite. Whatever the circumstances of the commission, the founder can be presumed to have been motivated by two factors: (1) the floor, which is formed of a single piece of bedrock;² and (2) the tradition in Islam which regards Jerusalem as the site of the Day of Judgment. The dome as a gathering place to which the souls of

¹ Although the idea is intriguing, it is difficult to suggest any connection between this panel and the Black Stone (*al-balata al-sauda*) located within the Dome of the Rock—one of the Holy Places in Jerusalem from the early Muslim period right up to the middle of the 16th century. On its significance and history, see Elad 1995: 78–81.

² It is worth mentioning that the floor of Qubbat al-Arwah today resembles the floor of Qubbat Jibril according to the description of Nasir-i Khusrau (1945: 43).

the believers could be summoned is implicit in the name al-Arwah. Because of this function, the site deserved *ziyara*, and in turn the assembled souls needed Qur'anic recitation.

To date the dome with any precision presents a problem due to the lack of any secure dating control. Those who propose a foundation date in the 16th century (see above) are doubtless influenced by the date of Qubbat al-Nabi. Yet, as already demonstrated in the catalogue entry devoted to the Qubbat al-

Nabi (cat. no. 10), a date in the 16th century is correct only for the second *mihrab* rather than for the Qubbat al-Nabi as a whole. At present, then, there is no conclusive proof either to support or to deny that the Qubbat al-Arwah was founded in the 16th century. It is, however, safe to say that it was extant in the 17th century because of the existence of the *waqf* dedicated to the lighting of the dome as mentioned above, and it is, of course, possible that the 17th century is also the period of its foundation.

31 QUBBAT AL-KHADR

Name: Qubbat al-Khadr¹

Date: (A) Qubbat al-Khadr. Undated, perhaps 1249-82/1833-67
(B) 'Reserved' *mihrab* and the *maqam* al-Khadr. Undated, but with a reference before 900/1494-5

Endowment: None known

Variants of name: Mujir al-Din (1973 2: 21) refers to the 'reserved' *mihrab* as *mihrab magharat al-arwah* (the niche of the cave of the spirits), and the site beneath the *mihrab* as *maqam al-khadr* (the place of al-Khadr)

Modern name: Qubbat al-Khadr. The area below Qubbat al-Khadr was referred to by al-'Arif (1947: 79) as 'Zawiyat al-Khadr'.

Location

The Qubbat al-Khadr is located at the north-western corner of the terrace of the Dome of the Rock.

Site and brief description (figs. 31.1-31.3, pls. 31.1-31.10)

Qubbat al-Khadr stands isolated from any close neighbour. It is flanked to the west and to the north by the corner formed by the upper parts of the western and northern walls of the terrace, and is hexagonal in plan. The dome, which has a pointed profile, rests on six arches carried on columns. The space directly under the dome houses a 'reserved' *mihrab* and is raised 48cm above the level of the terrace. The building is commemorative, constructed in honour of al-Khadr who was himself associated with al-Haram al-Sharif. Beneath the domed structure, there is a rectangular hall covered by a barrel vault at the level of the Haram esplanade. The hall is known as 'Zawiyat al-Khadr' and is used today as a store for old tiles from the Dome of the Rock.

¹ Al-Khadr, who is identified with the Christian St George, has a prominent position in Muslim tradition. He is mentioned in the Qur'an as a companion of the Prophet Moses (Qur'an XVIII: 59-81). Traditionally he is believed to appear in different human guises, one of them as a protector of ships, but he is also a protector in a more general sense—a figure to whom prayers are directed in times of crisis. He is frequently described as 'the man in green'. According to tradition, al-Khadr used to live in Jerusalem, and therefore had a close association with al-Haram al-Sharif where he was frequently seen at prayer. This is the reason for the many sites on the Haram which bear his name. For further references to al-Khadr within the Islamic tradition, see Wensinck in *IEP* 1978 4: 902-5 and *Palestinian Encyclopaedia* 2 1984: 7. Al-Khadr has been associated with different sites at different periods. Ibn al-Faqih (1885: 100-1), writing in 291-2/903, after describing the Dome of the Chain, mentions that 'in front of it (the dome) is the prayer place of al-Khadr (*wa amamuha musallat al-Khadr*)'. Eighty years later al-Muqaddasi (1873: 170) writes of 'Mihrab al-Khadr'. Al-Wasiti (1979: 91), who compiled his book some time around the year 410/1019, reported on the residence (*maskan*) of al-Khadr in Jerusalem. Ibn al-Murajja (1995: 140), al-Suyuti (Le Strange 1887: 266) and Mujir al-Din (1973 2: 20-1, 28, 29) cite the tradition of al-Wasiti, though Mujir al-Din adds information on 'Maqam al-Khadr'. Throughout the Ottoman period, the association of al-Khadr with the Haram seems to grow in popularity. Evliya Çelebi (Stephan 1980: 71-2, 83) mentions 'Khalwat al-Khadr' in addition to the *maqam* and also notes that one of the Haram Gates is named after him. Al-Nabulsi (al-'Asali 1992: 262, 258) refers to a gate, *mihrab* and a Maqam al-Khadr. See also Elad (1995: 117).

History

Identification

Al-Suyuti (Le Strange 1965: 156) wrote in 875/1470 '... The Dome named the Dome of the Prophet is, as I understand it, the one which lies to the east of the Sakhra, being also called the Dome of the Chain. It was built by the Khalif 'Abd al-Malik. For I would point out that in the Haram area, beside the Dome of the Ascension, there are two other Domes. One, a small Dome, stands at the edge of the Sakhra Platform, on the right hand side of the northernmost of the steps leading up to the Platform from the west. I believe at the present day this is in the hands of certain of the servants of the Noble Sanctuary, and is put to some use on their part; certainly no one in the Holy City considers this to be the Dome of the Prophet.' See also van Berchem (1925: 45) for the Arabic text. Le Strange (1965: 156) commented on the reference by al-Suyuti, the only earlier reference known to us, by saying that 'At present (the dome is) known as Kubbat al-Khadr, the Dome of St George.'

There are problems regarding this identification. The first difficulty is al-Suyuti's identification of the Dome of the Prophet with the Dome of the Chain, which was not adopted by subsequent authorities, as Le Strange also noted (1965: 155). Mujir al-Din (1973 2: 20-1) recounted the tradition of the 'lined' *mihrab* (*makhtut fi 'l-ard*) of Qubbat al-Nabi, following al-Suyuti. The term 'reserved *mihrab*' seems preferable to 'lined *mihrab*' and is the one used here. Mujir al-Din dismissed the identification of the Dome of the Chain as the Dome of the Prophet, but did not mention Qubbat al-Khadr at all, although he described the reserved *mihrab* and the *zawiya*. The inference is, therefore, that the dome itself did not exist at the time when Mujir al-Din was writing. The second problem is that al-Suyuti did not make the connection between his dome and al-Khadr. And the third problem is that it is difficult to see how the building could have been used by 'certain of the servants of the Noble Sanctuary', if we are to accept its present form as original. Perhaps it has been radically changed (see below). The conclusion has to be that, if there was a domed structure on the site at the time of al-Suyuti, it can have had little in common with the present Qubbat al-Khadr.

Qubbat al-Khadr is identified only by modern commentators as belonging to the Ottoman period. These references are Burgoyne (1976: no. 116), Najm *et al.* (1983: 321), Meinecke (1988: 261-2), Bieberstein and Burgoyne (1990: no. 187), Taha (1990: 21), and Bieberstein and Bloedhorn (1994 2: 89-90). Buschhausen (1978: 233), unlike these authors, thinks the dome belongs to the late Mamluk period.

The marble *mihrab* (*mihrab min rukham makhtut fi 'l-ard*) reserved within the floor level is recorded by Mujir al-Din (1973 2: 21) who added that 'people go to visit it.' Mujir al-Din (1973 2: 20-1) also identifies the place known as 'Maqam al-Khadr', today known as 'Zawiyat al-Khadr'. The text states '... beneath the west *maqam*, next to the Dome of the Rock, there is a rock called '*Bakh Bakh*';² this is the place (*muda*) of al-Khadr—peace be upon him. He (al-Khadr) was overheard while he was

² '*Bakh Bakh*' literally means 'excellent, well done or bravo.' It is inscribed on 'Abbasid coins from Ramla (Natsheh, unpublished MA thesis, cat. nos. 63-65). The term is used by the Prophet in the Hadith Abu Talha (al-Sahihan, Muslim n.d. [Dar al-Fikr] 2: 693, and al-Bukhari n.d. [Dar al-Ihya' al-Turath al-'Arabi] vol. 7: 142). In this context it denotes praise in relation to an act of charitable value that will be rewarded.

praying and calling (to God) there. This place has been abandoned in our time (900/1494) and has become a storage place (*hasl*) for the mosque. It is located beneath the court of the Sakhra opposite Bab al-Hadid adjoining the staircase that leads to the Sakhra court. It is frequented by the people (*ma'nus*).'

Date

The dates of the domed building, the 'reserved' *mihrab* and what is today known as al-Zawiyat al-Khadr are all unknown; so far no relevant inscription or *waqf* document has been found. The account by Mujir al-Din implies, however, that both the *mihrab* and the site of the *zawiya* date to the pre-Ottoman period, that is to some period before Mujir al-Din compiled his book in 900/1494-5. Buschhausen (1978: 233) reflects that 'judging from the style of the dome, it is dated (*sic*) to the decline of the Mamluk period'; he adds that it possibly dates to the 15th century, but gives no supporting argument for his opinion by way of comparison. If his view were to be accepted, it would be difficult to understand how Mujir al-Din could have overlooked the dome while describing the *mihrab* and the *maqam* beneath. The conclusion must be that it is not a Mamluk structure and thus must belong to the Ottoman period. A more precise date is attempted in the discussion below.

Founder

It is not known who founded the *mihrab*, the *maqam* (*zawiya*) and the Qubbat al-Khadr. Qubbat al-Khadr is in this respect the same as Qubbat al-Nabi (cat. no. 10) and Qubbat al-Arwah (cat. no. 30). A possible explanation for this anonymity is offered in the closing paragraphs of the catalogue entry on Qubbat al-Arwah.

Architecture

The shallow dome terminates in a slight point. It rests on six slender, elegant columns which carry arches that also come to a point and are constructed of seven small stones acting as voussoirs, originally white but now weathered to grey. The arches are similar in height (2.42m) and span (70cm). The extrados of each arch is framed by a carved billet decoration. An unadorned iron tie-beam once ran between the arches above the capitals at the level of the springing of the arch. Four struts are still extant; two have been lost.

The shafts of the six columns are of grey-white marble. Five are cylindrical. The sixth, to the north (no. 4), is octagonal. Four of the cylindrical columns and the single octagonal shafts are matched in height, measuring 2m. The exception is no. 1 to the south which is shorter than the other five, being only 1.63m; the extra height needed to match its companions is achieved by a short cylinder of red and black granite, which is 42cm high and is now badly cracked. The radius of the granite cylinder is 87cm. This is wider than the radius of the shaft it carries, which measures only 54cm at the head and 59cm at the base. A metal band reinforces the join between the two elements of this column, and a further metal band has been placed recently around the top of the shaft at the point where it meets the capital, again in order to strengthen the joint. These bands replaced copper ones, and were the work of the Aqsa Restoration Committee in the 1970s.

The capitals are of various types. The most simple type is represented by the capitals of shafts nos. 1 (in the south with a granite base), 3 and 5 which closely resemble each other.

[Editorial note: The capitals are numbered 1-6 in a clockwise direction. Numbers 1, 3 and 5 are similar; each has a marble abacus. They are by far the simplest in design. The upper

part of the square abacus, the sides of which each measure 24cm, projects beyond the lower, smaller section. The capital proper, which is cut from a different stone, is constructed in two sections, both of which are plain except for their corners, which have been chamfered. The corners of the upper sections have an oval or almond-shaped boss left in reserve in the middle of a squat lancet-shaped niche, marked by a crisp central division that corresponds to the corner. The lower square section of the capital, although echoing the upper in the lancet-shaped chamfer at the corner, has no central boss, leaving the chamfer as a plain, splay-faced concave cut that converts the square into an irregular octagon to achieve the necessary transition to the cylindrical shaft below.

Capital no. 2 is the only example of its kind. It too has a heavy abacus with a complex moulding. Below it, the capital is cut from a single, separate stone. The design incorporates a kind of false abacus within it; this forms the uppermost part and is unadorned. Below this square, the stone is cut away in two levels. The upper level has a lancet-shaped chamfer at the corners. Each is decorated with a five-rayed, foliate motif which is perhaps a vestigial acanthus. Another lancet-shaped niche is cut in the centre of each side. In each case, this is decorated with a series of grooves that follow the profile of the niche, to give a striated effect. The areas between the lancet elements are cut away sharply, presumably in order to accentuate the design. The lower level of the capital, where it meets the column beneath, is converted into a circle by a series of eight splay-faced, plain elements. These are the familiar lancet shape and their tips meet the level above at the point where the frames of the upper lancet-niches converge. This arrangement leaves a deep triangular cut underneath each corner and the central motifs. The deep shadow produced by this cut, which is framed by the sides of the plain niches, completes the upper design in a satisfying way.

Capitals nos. 4 and 6 are similar in that they both employ re-used Crusader capitals as part of their design, using them as a kind of abacus extension. Although not identical, this upper element in each case consists of a series of circular concave saucers delineated by a carved undulating stem. Foliage hangs from this stem, with the deeply drilled detailing typical of the Crusader period. The interesting point about this re-use is that it has necessitated a reworking on two sides to cut an over-large capital to fit the smaller Ottoman site. The reworked faces are towards the interior of Qubbat al-Khadr and are not, therefore, immediately obvious to a visitor to the upper terrace of the Dome of the Rock. The reworking appears unfinished, or at any rate with no attention to detail. In each case it consists of a central circular boss flanked by an elongated oval set at a slant to either side. It is just possible to make out a narrow fillet which joins the top of the circular boss, encircles it and then extends to join the bottom of the neighbouring oval. It is probably a clumsy attempt to emulate the Crusader design and is clearly intended to represent a stem, for four leaves can also be made out. This makes it likely that the central disc in each case is intended to represent a fruit. Probably the two ovals are also meant to represent fruits or buds; perhaps they all echo the mosaic fruits in the Dome of the Rock and were originally intended to recall the fruits and flowers promised to the faithful in Paradise.

The lower sections—that is the capital proper—of nos. 4 and 6 are Ottoman. At first sight they appear to be similar, but a closer examination reveals differences. They are both typical of Ottoman capitals found elsewhere on the Haram (for example, Qubbat al-Nabi, cat. no. 10, or the North-Western Khalwa of Ahmad Pasha, cat. no. 23, although the carving on both of these

is finer and crisper than it is here), and basically take the form of two simple *muqarnas* tiers. No. 4 is cut from a single stone, but no. 6 is made up of two separate stones, the joint occurring above the lowest tier. Both nos. 4 and 6 have a total of ten motifs in the upper level, each made up of a central almond-shaped device marked by a central division. These are set into a squat lancet-shaped niche, which is flanked on each side by an acute-angled triangle placed as a wedge beneath the main element. These niches are arranged so that there are two on each face with another across the corners, creating a chamfered reduction in the overall size of the upper level. Cut flat across the base, the segmental element created by each niche with its wedge-shaped additions is given definition by the play of light across the surface. Where the points of the wedges meet, three grooves run vertically down into the lower section of the capital. The effect is curiously organic, as if the grooves represent stems of an abstracted flower motif in the segmental niches above. The corners of this lower level are each chamfered with a splay-faced lancet niche.

Further differences between nos. 4 and 6 lie in the carving. No. 6 is cut more crisply and the uppermost level of the Ottoman capital proper is finished by a narrow border of teardrop-shaped depressions. There are eleven to each side. Each alternate drop has a small circular boss and they are so arranged that a boss appears at each end of each face. However, the lowest level of the lower tier of capital no. 6 is very roughly finished. It is larger in circumference than the column beneath, and the clumsy reworking may have been executed at the time the capital was adapted for use on Qubbat al-Khadr. Clearly, because of the different designs and the haphazard arrangement, the capitals were gleaned from elsewhere. Although the overall carving of no. 4 is less crisp now, it may be that the softened effect is due in part to wear and tear, for the lowest level is well finished in a crisp cut to accommodate the size of the column beneath. It is fitted with a metal band, and the sharpness of the cut might indicate that it was deliberately designed for just such a support at the time when the present Qubbat al-Khadr was erected. SA]

Buschhausen (1978: 233, pls. 333-7; 338-40) says that the capitals take the form of the 'late Mamluk stalactite' but neither cites his authority nor gives parallels. It is obvious that the almond-shaped device is on the contrary used in Jerusalem solely in buildings from the Ottoman period (for example, on Qubbat al-Nabi, cat. no. 10; Qubbat al-Arwah, cat. no. 30; the North-Western Khalwa of Ahmad Pasha, cat. no. 22 and Sabil Mustafa Agha, cat. no. 48). No comparison can be found in Mamluk architecture in the city. It is clear that the upper levels of capitals no. 2 and 4 date to the Crusader period, and Buschhausen (1987: 233), who suggests that the decoration shows traces of animal figures, compares these with the capitals of the *sabil* of Sulaiman at Bab al-Nazir (cat. no. 7) and is inclined to believe that they might come from the same source. There is no confirmation of the reason behind the variety of capitals used in this small building. Its suggested late date, however, added to the inconsistencies in the way it has been built, might suggest that the capitals were collected from various different sites and are here in re-use.

The bases of the columns are partly hidden. This appears to be the result of the floor of the reserved *mihrab* having been raised at some time, which has had the effect of concealing the column bases. The shaft of no. 1 rests on a short cylindrical granite base, as shown above; and in the case of no. 4, which is an octagonal column, this moulded base is further raised above the platform by an additional square cushion 8cm high.

One and a half courses above the billet moulding over the arches a projecting cornice runs round all six sides of the building. The salient face is decorated by a series of pointed, leaf-shaped divisions, each containing an abstracted plant with seven leaves, reminiscent of those found on capitals nos 1, 3 and 5. This cornice marks the start of the dome, which is constructed with stone and mortar, and was covered in 1998 in lead sheeting by the Aqsa Restoration Committee. The apex of the dome is crowned by a modern metal finial in the form of a crescent.

Interior

The plan of the building is hexagonal, surrounded on all six sides by open arches. This is the only domed structure on the Haram al-Sharif which has a hexagonal plan. Usually the commemorative domed structures in Ottoman Jerusalem have an octagonal plan, like the Dome of the Prophet (cat. no. 10) and Qubbat al-Arwah (cat. no. 30), or are four-sided, like Qubbat Yusuf (cat. no. 38), Qubbat Yusuf Agha (cat. no. 39) and the dome of the summer pulpit—although this last dome is a Mamluk building which was restored in the Ottoman period (Burgoyne 1987: 319-20). There is no obvious reason for the choice of six sides, for there is no clear iconographic association with the number six as far as this author knows, although the hexagon is widely used in Islamic geometric design.

Access is possible from the south and east only, for the sides to west and north are bordered by the walls of the north-western corner of the terrace of the Dome of the Rock. As the building is raised 48cm above the level of the terrace, access is not easy. The dais measures 1.9m wide by 1.81m long and it includes a *mihrab* similar to that found in Qubbat al-Nabi. It is clear that an addition to the east has enlarged the original area of the site.

The *mihrab* is shown as a reserved area within the floor level. It is simple in design and is made up of three slabs. Two are rectangular in shape and are of black stone, while the third is of white marble. This last slab has a rectangular base but terminates towards the south (the *qibla*) in the form of a pointed arch. A frame of red paving marble runs round these three slabs and this in turn is framed by white marble. For more details about this type of *mihrab* see Ch. 36 under the heading 'The floor or "reserved" *mihrab*'.

The Zawiya of al-Khadr (Maqam al-Khadr)

The *zawiya* is to be found at the level of the Haram esplanade. To the north and west its sides are formed by the north-western corner of the terrace of the Dome of the Rock. The *zawiya* is separated from the north-western colonnade by a passage which leads to its entrance. The entrance is preceded by a square porch of three pointed arches topped by three courses of masonry. The arches are carried by two columns to the north and by imposts to the south. The short, massive columns are of red granite and are in secondary use. The eastern column is 2.1m high and its radius is 1.7m, while the western one is 2.2m high and its radius is 1.7m. Both columns have cushion capitals and moulded *abaci* of restrained elegance, and the imposts have a similar rounded profile and moulding.

The door to the *zawiya* is simple and measures 97cm wide by 2.12m high. It has a narrow stone lintel which is surmounted by an arch. The only other aperture in the building is a window between the lintel and the arch. The interior is currently used to house old tiles from the Dome of the Rock, removed after the restorations of the 1960s. It consists of a single rectangular hall with a barrel vault rising directly from floor level. A simple

mihrab niche with a semicircular head is cut into the south wall of the vault. The *mihrab*, walls and vault are all lime-plastered.

Date

Qubbat al-Khadr is a commemorative building, as already stated, which seems to have been erected on a site for a long time associated with al-Khadr, as discussed above. A likely sequence of events seems to be as follows:

(1) The lower part of the north-western corner of the Dome of the Rock terrace came to be identified as the Rock of Bakh Bakh (see note 2) in Islamic tradition, according to Mujir al-Din (see above). It is believed to be the place (*muda'*) where al-Khadr used to pray, and according to a mid-16th century guide³ was known as Magharat al-Arwah. At some later date the place became known as Maqam al-Khadr.

(2) A 'reserved' *mihrab* (*makhtut fi 'l-ard*) was built some time before 900/1494-5 over Maqam al-Khadr, and during the Mamluk period developed into a site to be visited for religious purposes.

(3) By the end of the Mamluk period and in early Ottoman times, Maqam al-Khadr was no longer used for religious purposes, and was employed instead as a storage place for materials belonging to the Aqsa Mosque.

(4) At first, al-Khadr was believed to have prayed at Maqam al-Khadr, also called the Rock of Bakh Bakh. Subsequently, in the late 11th/17th to early 12th/18th century, this tradition became associated with another site, known today as al-Zawiya al-Muhammadiyya, Masjid al-Nabi or Qubbat Bakh Bakh (cat. no. 43).

(5) A dome at some still later period was built over the 'reserved' *mihrab*, perhaps deliberately in order to revive the traditional link with al-Khadr, and to encourage the *ziyara* (visitation) of the Haram and Jerusalem generally.

If the above sequence is correct, it is possible that the dome dates to the end of the 12th/18th or perhaps to early in the 13th/19th century. Apart from Meinecke, all those who date the Qubbat al-Khadr to the 10th/16th century are influenced by the date of the second *mihrab* of Qubbat al-Nabi, but unfortunately they do not support that date with any documentary proof (see above). Two dating controls may be helpful in an attempt to solve the puzzle. The first is the billet stone moulding which frames the arches, and the second is the decoration of the cornice which runs around the building below the springing of the dome. Both these decorative elements are found in 10th/16th-century Ottoman architecture in Jerusalem.

Meinecke (1988: 261), basing his view on the billet moulding ('denticulate frieze'), presumed that Qubbat al-Khadr was erected at the same time as the restoration of the neighbouring colonnades, that is the north-western colonnade, for this has the same billet moulding as Qubbat al-Khadr. These colonnades were restored between 926-74/1519-67 (van Berchem 1925: 184-86) by order of Sultan Sulaiman during the comprehensive restorations of the Haram. Meinecke (1988: 261-

2) comments that 'This decorative element [denticulation] which was adopted from Mamluk architecture goes back to the early architectural activities of Sultan Sulaiman in al-Quds/Jerusalem ... [It] goes back to the Aleppo school of architecture, [and thereafter] can no longer be traced in al-Quds/Jerusalem.' Meinecke supported his argument with examples of the architecture of Sultan Sulaiman in Jerusalem which have this decorative billet moulding. He mentions Maqam al-Nabi Da'ud (930/1524), the minaret of the Citadel (restored in 939/1524), and Sabil Bab al-Silsila and Sabil Bab al-Nazir, both of which are dated to 943/1537. Meinecke concluded his discussion by saying that this decorative detail cannot be traced in Jerusalem after 943/1537, pointing out that the billet moulding is no longer employed in the *mihrab* of Muhammad Beg, which dates to 945/1538-9.

There is more than one obstacle to accepting Meinecke's hypothesis. First, there are three places where the billet moulding occurs in the complex of Maqam al-Nabi Da'ud. These are: (a) above the triple arch of the double window in the upper eastern side of the main entrance to the Maqam; (b) on the north elevation of al-Zawiya al-Ibrahimiyya; and (c) above the arch of the eastern entrance to the Maqam. None of these three sites can be dated to the 16th century—they are all later. Al-Zawiya al-Ibrahimiyya is attributed to Ibrahim Pasha, son of Muhammad 'Ali, and was built in 1834, and both the eastern and northern entrances have foundation inscriptions which date them to restorations carried out in the 19th century.

Secondly, there is no reliable evidence that the minaret of the Citadel was either built or restored by Sulaiman—it is only an assumption (based on the major work being carried out by him at the time) that the sultan patronised the restoration of the minaret. Even if one believes that the minaret was restored under Sulaiman, it is not clear if the billet moulding dates to the work undertaken by him or whether it rather dates to the other period of restoration by Muhammad Pasha in 1065/1655, which is documented by a marble panel (van Berchem 1922: 165). If the billet moulding on the minaret of the citadel is from the time of Sulaiman, it might also be expected to occur on the minaret of Nabi Da'ud, but in point of fact it is not to be found there. Meinecke (1988: 27, 6 n. 39) himself recognised that the Khassaki Sultan, completed in 959/1552, has sporadic billet mouldings, but explained their presence there by saying that 'these could be earlier constructions which were inserted into the pilgrim hospice (the Takiyya of Khassaki Sultan) at a later date'. He observed (1988: 262) that this decorative moulding is preserved in several places on the surrounding walls of the Haram and in particular over the entrances, but he considers them an indication of the comprehensive restoration work undertaken by Sultan Sulaiman. If these are part of the restorations of Sulaiman, it is surprising that there is no foundation panel to testify to the fact, for it is clear that Sulaiman was keen to document almost every work he undertook in the Holy City.

Finally, this type of moulding is found in many other dated and undated monuments. For example, it occurs above the entrance of the house of Bairam Jawish (959/1551-2), on the North-Western Khalwa of Ahmad Pasha (1009/1600) no. 22, and on the façade of the outer entrance of the 'Umar ibn al-Khattab mosque which was built in 1255-77/1839-61, as well as on an undated *sabil* near Bab Hitta and an unidentified domestic building in Tariq al-Wad located a few metres south of Sabil al-Shurbaji (cat. no. 40). It would thus seem that the billet moulding was a popular decorative element adopted from Mamluk buildings and employed widely in Ottoman architecture. It is not

³ Nasir al-Din Muhammad al-Rumi (mid-16th century) wrote of the same place in his 'Guide for the Muslim Pilgrim to Jerusalem', but in more concise form, under the name of Magharat al-Arwah. He describes the site (Elad 1995: 166) as that '... from which one can descend to the Gate of the Inspector (Bab al-Nazir) towards the place called Magharat al-Arwah (The Cave of the Spirits) which is located at a distance of 10 cubits or more (about 5 to 6 m) from the edge of the staircase.'

used exclusively in the building work of Sultan Sulaiman, as Meinecke thought, and thus unfortunately cannot be used as a proof for dating Qubbat al-Khadr, for it is of course possible to copy such decorative elements in later periods.

A second element which might be used as a dating control is the cornice which runs round all six sides of the building. The salient face is formed of a small lancet niche resembling a single *muqarnas* niche, decorated with a series of pointed, leaf-shaped divisions, each containing an abstracted plant with seven leaves. The design is reminiscent of those found on the extrados of the huge pointed arch of the Damascus Gate (944/1537-8). But this cannot be taken as evidence, for not only are the motifs not identical, but such decoration can be copied at any time. Moreover, this type of decoration is not to be found in the majority of 16th-century buildings.

The problem is compounded by the fact that 'Ali al-'Abbassi mentions the existence of Qubbat al-Khadr in 1807 but none of the diaries of travellers in the 10th-11th/16th-17th centuries do so. Above all it does not appear on three maps drawn

before 1867. The evidence is contradictory, but it is possible that the dome was built at the end of 12th/18th century or at the beginning of the 19th century. The maps are in the collection of the Palestine Exploration Fund in London. The first map was drawn by Catherwood in 1833, the second is a reduced copy of that map with a few corrections and additions, and the third is a sketch map drawn by Conrad Schick (Schick 239/7) of the north-western area of the Haram. If it is accepted that these early survey maps are accurate, then we are left with a problem. If 'Ali al-'Abbassi was talking about the same dome, then it must have been built some time before 1807. But if it was in existence then, why is it not shown on the three 19th-century maps? Up to now there is no obvious solution to the problem of date. Perhaps 'Ali al-'Abbassi was referring to a different *qubba* by the name of Qubbat al-Khadr. Whatever the solution, one fact remains unchallenged—our Qubbat al-Khadr certainly existed in the later 19th century, for the Ordnance Survey map of Palestine dated 1867 shows it quite clearly.

32 MASJID AL-QAIMARI

Name: Masjid al-Qaimari

Endowment: None known

Date: Undated

Variants of name: Masjid al-Qaimariyya; Jami' al-Qaimari

Modern name: Masjid al-Qaimari

Location:

The mosque is to be found in the north-west area of the Ottoman walls of Jerusalem.

Site and brief description (figs. 32.1-32.3, pls. 32.1-32.4)

The building is situated to the west side of the New Gate¹ (al-Bab al-Jadid). It is flanked to the north, west and east by the Ottoman walls, and by medieval, possibly Crusader, structures to the south and east. The site includes a small, undecorated entrance-way which ends in a T-junction or passage that in turn gives onto a rectangular courtyard, and a simple domed chamber now used as a mosque. To the south of the courtyard there is a group of modern buildings which now serves as a kindergarten, and shops to the east enclose a small tomb chamber. The complex does not have a minaret.

In principle the Masjid al-Qaimari, with its domed prayer chamber as the main feature, can be compared to other Ottoman mosques in Palestine, although it has no parallel in the public buildings of Ottoman Jerusalem. These comparanda are the prayer hall of al-Jazzar mosque at Akka (Acre), and the mosque dated 1743 of Zahir al-'Umar at Tabariyya (Tiberias). These two mosques have typical Ottoman features and relate to certain examples in Istanbul, for example the mosque of Firuz Agha (Bernie *et al.* 1992: 115). The features include: a square or nearly square domed chamber, a porch of two or more bays surmounted by small, shallow domes, and a 'pencil' minaret. The Masjid al-Qaimari has, however, only one of these typical features, namely the domed chamber. This diminutive scale can be explained in part by its location in a nook of the city wall.

History

Identification

Although the building has no inscription plaque and has suffered from extensive restoration, the mosque in its present form resembles a typical Ottoman single-unit structure, for it consists of a square prayer chamber surmounted by a dome. Moreover, the use of poor quality, roughly dressed stone for the exterior walls, the fact that the structure is not mentioned by Mujir al-Din, who in 900/1494-5 listed all the extant Islamic monuments of the city, as well as the fact that the Ottoman city walls (finished in 945/1538-9) are integral to the structure on the northern and western sides, all point without doubt to a date in the post-Mamluk period. Despite the fact that this pared-down type is common among early Ottoman mosques elsewhere from the 8th/14th century (see Kuran 1968: *passim*), it is the only example from the Ottoman period still standing in Jerusalem.

Date

Burgoyne (1976: no. 114), al-Husaini (1977: 20), Najm *et al.*

(1983: 51), Bieberstein and Burgoyne (1992: no. 185), and Bieberstein and Bloedhorn (1994 2: 62) have all dated the mosque to the 16th century, but without giving any supporting evidence. In the absence of any foundation inscription and because so far neither a *waqfiyya* for the building nor any reference to it in the historical sources has been found, it is almost impossible to date this monument accurately.

Founder

Unfortunately, no information² has yet emerged regarding the founder. However, the name of the mosque—al-Qaimari³—seems to be derived from the name of Sitt Qamra bint Ahmad al-Qaimari, who is buried in the tomb chamber.⁴ Given the simplicity of the building and the indifferent quality of its stonework, it seems likely that the founder was an ordinary member of the public rather than from the higher ranks of society.

Other periods

Any visitor to this site will immediately recognise that the building has undergone many modifications and alterations. The windows, for example, which are oddly placed, are covered by modern shutters, and the exterior masonry is of many different types, both as to size and technique, with many stones re-used from elsewhere. The squinches, especially from the exterior, are ugly and ill-constructed. Above all, the *mihrab* is off-centre, with a clumsy scallop, and appears on the exterior as a masonry fill. A fuller description is given below. The visual impression is backed by the evidence contained in the *waqf* file (Auqaf file no. 54: 6) of the mosque. There can be no doubt that the location of the monument has always given it a strategic importance, especially when the cease-fire lines were determined during and after the 1386/1948 war. No doubt the position of the mosque has been a contributory factor to the manifold alterations which it has undergone.⁵ During the last four decades alone, many repairs have been carried out within the mosque.⁶

² This despite the recent publication in Jerusalem of an anonymous book entitled *al-Qaimariyyun*. Most of the information in the book relates to al-Qubba al-Qaimariyya, which is located outside the walls of the Old City. That site appears to date to the Ayyubid period and has certain Crusader architectural features.

³ Al-'Asali (1989: 110) published a fragment of Sijill 143: 56 dated 1060/1650-1 concerning the appointment of al-Shaikh Ibrahim ibn Bashir al-Khalili as a servant (*khadim*) in the tomb (*maqam*) of al-Shaikh Qaimar. Unfortunately for our purpose, the record is clear that the tomb was located outside the Old City of Jerusalem and can therefore have no bearing on the mosque under discussion. The Maqam al-Shaikh Qaimar was originally an Ayyubid structure and is still extant.

⁴ According to Mr Muhammad al-Qaimari (1992: 77), there was once a plaque on the tomb of Qamra, but it was defaced by paint and plastered with concrete. The name Qamra is inscribed on the cloth pall covering the tomb.

⁵ There were originally two rooms in the mosque courtyard, which were demolished during the 1386/1948 war. Subsequently, the area was used by the Jordanian Army for fortifications, which were later demolished some time before 1376/1956 (Auqaf file 54: 6, 20).

⁶ All the details of the restorations are preserved in the Auqaf file 54 which dates back to 20 Shawwal 1368/14 August 1949. A total sum of 24.79 Palestinian pounds was first requested, but because of the critical circumstances at that time, only P£ 10.79 was approved. At this time the major repair work undertaken consisted of replacing glass in the windows; repairs to the wood of the doors and the windows; and the removal of rubble (File 54: 1). The second record of expenditure on repairs is dated 29 Dhu 'l-Hijja 1377/16 June 1958 when a total of JD

¹ Yenişehirlioglu (1989: 50, 53) in error dated the New Gate to 944/1537. The city wall was breached at this point only in 1308/1889-90 when a new gate was built in order to provide easy access to the Christian Quarter (Ben-Arieh 1984: 1).

Architecture

The entrance to the mosque is through a narrow vestibule, which is raised above street level by means of six steps. It is bounded to the north by the Ottoman walls, and to the south by a modern building, erected in the early 1950s according to the Auqaf file (54: 6). The vestibule leads to a T-shaped passage from which the mosque is entered.

The Mosque

The eastern façade is the main one. It has at its centre the door which gives access to the interior of the monument. The door is flanked by two rectangular windows. One course beneath the level of these windows, the lower part of the wall projects forward about 15cm to form a narrow ledge on both sides of the doorway. This ledge measures 2.6m by 70cm on the north side and 1.9m by 90cm on the south side, and its purpose is obscure, for the walls are so thick that they need no reinforcing. A new sheet of corrugated iron shelters the door, and replaces an earlier one. Apart from the door and the two windows, the façade is plain; it is built of rubble masonry. The varied tooling of these stones could either be the result of re-use or it may represent different stages of restoration.

The dome, which is almost hemispherical and is built of a mixture of stone, lime and mortar, sits on an octagonal drum. It has recently (1410/1990) been faced with small blocks of stone similar to those used for paving (Auqaf file 54: 79).

Apart from a small vertical window in the centre of the upper part of the façade, the south elevation consists of a solid wall, constructed mostly of rubble masonry in the same way as the east façade. However, its first two courses are different, for they are made up of much larger stones. These two courses appear to be the remains of an earlier structure on the site. Could it have been a Crusader structure?

Interior

The interior space consists of a single, square prayer chamber which is raised above the open courtyard by means of a step 15cm high. The modern floor replaces the previous flooring that probably resembled the paving still extant in the courtyard. The prayer chamber has a hemispherical dome which, as already

stated, rests on an octagonal drum. The drum is supported on four huge pointed arches, extending almost the full width of each side of the chamber and measuring 4.5m in height. They spring from just above floor level and they dominate the whole elevation, their strong salience adding force to this impression. At the south-western corner, however, the arch running south-north parallel to the city wall begins at a height of only 50 cm from floor level, which supports the proposition of re-use of original, pre-Ottoman, masonry at that corner. Four squinches act as the zone of transition between the square base and circular drum. The bottom centre of the squinch is marked by a stepped cavity. Below the collar of the dome, some corners of the hexadecagon are marked by projecting corbels or lintels. The squinches are expressed on the exterior as small, plastered stone projections.

The *mihrab* is off-centre, has a skewed round-arched profile found nowhere else in the building, and is unusually low and narrow. All this suggests that it was not originally conceived as a *mihrab* but served as a niche or window in the earlier building. This hypothesis is borne out by the masonry fill visible on the exterior. If this hypothesis is correct, the original building on this site was not a mosque.

There are six windows, all of different sizes: one on each of the east, south, and west sides of the drum; two rectangular windows flank the door; and a final one is found well above the *mihrab*, just below the apex of the southern arch. There is no window on the north wall, but an original entrance in the city wall has been closed and now serves as a niche, slightly off-centre to the west of the northern arch.

The tomb chamber is situated to the south of the vestibule, and is preceded by a small antechamber which today serves as a place of ablution. A small passage formerly led from the antechamber to the tomb, but it was blocked off during the last phase of work. The tomb chamber is now remarkably small.⁷ It has no window opening, and the tomb rests against the south wall.

Features

Although the design of the mosque is typically Ottoman and it cannot have been built in that form before the Ottoman period (see above), nonetheless the structure has architectural features that mark it as different from other Ottoman buildings. First, if the structure was indeed built to serve as a mosque, the absence of any trace of a minaret would be surprising, particularly in view of the Ottoman preference for furnishing small, domed, square mosques with minarets, and the fact there was ample available space for one. Moreover, the mosque is sited in the highest part of the city, in a place easily accessible to and patrolled by the Muslim authorities, and in the traditional Christian quarter. A minaret on this site would therefore recommend itself on several grounds. Secondly, the quality of stonework suggests the hand of

²² was needed for the following—to whitewash the whole mosque and the tomb chamber; to paint the window adjacent to the gates; to restore sections of the wall of the mosque and of the tomb chamber; and to repair the pavement at the entrance to the mosque. This work was completed at the end of September in the same year (File 54: 26-31). After 1387/1967 the following events are recorded with regard to the site: on 14 Sha'ban 1388/5 November 1968 a manservant (*khadim*) was appointed to the mosque at a monthly wage of JD 6 (File 54: 34). The mosque was supplied with electricity in 1393/1973 (File 54: 34); a new iron gate was installed at the outer entrance of the mosque in order to protect it from misuse at night and to prevent the accumulation of dirt (File 54:42); and in 1410/1989 a dispute arose between the Auqaf Department and Mr H. Seniora over the ownership of land adjoining the site. The dispute was later settled in favour of the Auqaf Authority. Finally, large-scale renovations were undertaken on the site on 15 Dhu'l-Hijja 1410/7 July 1990. Indeed, these works would be better described as an 'adaptation' or 'modification'. The intention was to restore the site and, excluding the mosque itself, to make it suitable to meet a modern requirement in the form of a small kindergarten. The cost of the work reached a total of JD 32,498.76 which was met from a special fund raised in Kuwait through the efforts of a local committee (Auqaf file 54: 67-79).

⁷ It appears that this room was once larger. According to the letter of Mr Mahmud Khalil al-Qaimari dated 3 May 1950 (Auqaf file 54: 6), sent to the President of the Supreme Muslim Legislative Council, it was reduced at least twice in the early 1950s. In that letter Mr al-Qaimari voiced his astonishment that part of the tomb chamber had been converted into two shops, the first used as a glass factory, the second as a coffee shop. The letter went on to question how the Auqaf Authority had allowed (3 May 1950) Mr Ghatas to erect a new building which, according to the writer, violated the mosque and the tomb. Mr al-Qaimari ended his letter with a request to stop the building work and to restore the mosque to its previous state.

local unskilled craftsmen, representative of the village vernacular tradition rather than the Ottoman urban style. Such features as the breadth and width of the joints between stones and courses, the rough masonry, and the off-centre location of the upper window, suggesting a lack of pre-planning, all provide tell-tale evidence. In addition, the grossly unnecessary thickness of the walls, the variation in ground-levels, the widespread re-use of materials, and above all the evidence of the adjacent continuous wall to the south, indicate that the site was in all probability occupied by a previous structure.

To sum up, Masjid al-Qaimari seems to represent a meeting point between early Ottoman architectural features and local domestic building traditions. It is therefore difficult to date, although our hunch—unsatisfactory from an academic viewpoint—is that it dates from the late Ottoman period and was built by local initiative.

This theory is based on the fact that single-unit mosques predominate in the early period of Ottoman architecture, and surviving examples are to be found in small *masjids* and provincial buildings. Bernie (Bernie *et al.* 1992: 114-115), in trying to explain the reasons for the single-unit type of mosque exemplified in the Mosque of Zahir al-'Umar in Tiberias, argues that 'the 1740s marked the development of what has become known as Ottoman Baroque.' She further argues that it is to be expected that local Palestinian mosques would not exhibit such stylistic features and it is therefore preferable to look for relevant parallels among earlier buildings. If this argument by Bernie is valid, and it probably is, it is likely that the Masjid al-Qaimari, too, was built some time in the 18th century.

Whether or not this date for Masjid al-Qaimari is proven in the future, certain possibilities concerning the site of the building remain relevant. These include: (1) a connection with the tomb of Sitt Qamra, which might have resulted in the mosque's original establishment as a *zawiya* or *maqam*; (2) the height of the building, which provides a clear view in multiple directions and therefore a possible connection with the Citadel; (3) a possible connection with the Crusader site of Tancred's Tower, which was later developed as a defensive tower or a guard post occupied by Sufis.

33 AL-ZAWIYA AL-NAQSHBANDIYYA

Name: al-Zawiya al-Naqshbandiyya

Date: Undated

Endowment: Final endowments 10 Muharram 1033/3 November 1623

Variants of name: Three names are given to this building. The first is 'al-Zawiya al-Bukhariyya', for most of its caretakers in the later period were from Bukhara. According to al-'Arif (1961: 499) the *zawiya* was built by al-Shaikh Muhammad Baha' al-Din Naqshband al-Bukhari. Al-'Arif does not give the source of his information, but this at least explains how this name came to prevail. The second name is 'al-Zawiya al-Uzbekiyya', apparently after a famous caretaker, the *shaikh* Muhammad al-Salih al-Uzbeki and his son al-Shaikh Hasan, who were, as their name indicates, both from Uzbekistan. The third and most widely-used name is 'al-Zawiya al-Naqshbandiyya' as the *zawiya* served the Naqshbandiyya order of *sufis* (see below). More recently it has frequently been called 'al-Takiyya al-Naqshbandiyya' instead of *zawiya* (Auqaf file 3/17/12, 44 and below).

Modern name: al-Zawiya or al-Takiyya al-Naqshbandiyya.

Location

The *zawiya* is situated a few metres to the northwest of the Haram entrance of Bab al-Ghawanima.

Site and brief description (pls. 33.1-33.9)

The northern boundary of the site is determined by the western end of Tariq al-Mujahidin, more commonly known as the Via Dolorosa; to its east lies the street of Bab al-Ghawanima which leads to the Haram. There are a number of houses to its west and it is flanked to the south by al-Zawiya al-Afghaniyya (cat. no. 35).

The *waqf* document of al-Zawiya al-Naqshbandiyya (see below) provides no details of the original architectural make-up of the *zawiya* apart from a brief reference to a mosque and four chambers for its Sufi members. The land register certificate issued in 1938 does not give any information either about the components of the *zawiya*, although it states that the whole area of the complex was 1,335 square metres (Auqaf file 3/17/12, 73). The *zawiya* has not yet been surveyed.¹ From 1857 until the present the *zawiya* has unfortunately suffered a number of serious changes and additions, including the rebuilding of the northern façade, the addition of a second floor built in stages (see below), and the construction of many new houses placed haphazardly within its courtyards. However, the most dangerous alteration, incurring a massive destruction, took place in October 1983 under the current lessee of the *zawiya*. As a result, four chambers for the Sufi residents to the east of the vestibule, the long rectangular vestibule, and cells and halls opposite the four Sufi chambers were demolished. This means that we have lost forever one of the original (and unsurveyed) parts of the *zawiya*, for it is impossible today to make out any of the features of the building dating to before 1857 with the exception of the dome over the tomb of al-Shaikh al-Salih Muhammad al-Uzbeki (see below), and the mosque. It has been a great disappointment not to find a proper and detailed photographic record of the complex before

the changes of 1983. The Department of Islamic Archaeology has a written text describing the *zawiya* dated 28 March 1983. According to this, the convent included: an eastern elevation (which has since largely been altered); a northern façade built in various phases since 1857 (still extant); a long rectangular vestibule (of which only a small part has been preserved); four *sufi* chambers in addition to a large hall and a few cells on both sides of the vestibule (now completely destroyed); the mosque chamber; and an open courtyard with the Qubbat al-Shaikh Muhammad al-Salih al-Uzbeki (both of which still exist). The first level of the *zawiya* is now taken up with a large souvenir store, three smaller shops and a mosque chamber still in use. The second level is used as residences for three families with parts of it belonging to the store.

History

Identification²

Al-Zawiya al-Naqshbandiyya is identified by many *waqf* documents in the Shari'a Court in Jerusalem (Sijills 103: 416-17; 107: 117-19; 220: 29, 131). In addition, a number of different inscription panels, some of which are probably re-used (see below), support the identification of the *zawiya* to the Ottoman period.

Date

If we are to believe al-'Arif (1961: 499) and, following him, al-'Asali (1981: 353), al-Zawiya al-Naqshbandiyya was built between the years 717-92/1317-1389-90 by the founder of the Naqshbandiyya Sufi order, al-Shaikh Muhammad Baha' al-Din Naqshband al-Bukhari. Since neither author supports his account with a contemporary source or document, and as there is no hint of a reference in any of the contemporary historical sources such as Mujir al-Din (1973 2) to such a *zawiya*, it is difficult (if not impossible) to consider a 14th-century date for the convent as established. It was most probably built in different stages and at various times (see the endowments below). The first stage was when 'Uthman Beg, who was well-known to the Sufi community, came to Jerusalem and erected a mosque and four cells for four Sufi members. This was assuredly before 1033/1623-4, as evidenced by a *waqfiyya* described below. Al-'Arif (1961: 499) and al-'Asali (1981: 353) fix the date of this work as 1025/1616, but again without giving supporting evidence.

The second step to be established was the drawing up of the *waqf* document to secure the income for the *zawiya*, and to register it at the Shari'a court. Even this registration was made in two main stages with slight differences (see below). Later, in 1144/1731, a dome was built over the tomb of al-shaikh Muhammad al-Salih al-Uzbeki, whose post at the *zawiya* had been as caretaker and principal *shaikh*. The dome was constructed by the then governor of Jerusalem, Mustafa Agha Parwana (1144-1165/1731-51). A panel with a foundation inscription records the construction. De Jong (1984: 39; 54 n. 104) drew attention to this panel and photographed it. He presented al-'Asali with a copy of this photograph, and it was published in 1981 (al-'Asali 1981: 352). The panel is to be found on the north wall of the *qubba*

¹ During the last decade, the *zawiya* has been the subject of dispute between the Auqaf Administration, the caretaker and the lessee. The situation is so sensitive that it has proved impossible to make a survey or to take measurements.

² It is surprising that this monument with its many inscription panels escaped the meticulous work of van Berchem (1922, 1923). It is also odd that more recently Burgoyne (1976), Walls and Abu'l-Hajj (1980), and Bieberstein and Bloedhorn (1994) have all missed it. It may be an example of the influence exerted on modern European scholarship by the work of van Berchem.

rather than the façade of the *zawiya* as al-‘Asali suggested. The marble panel is made up of five lines of Arabic written in Ottoman *naskhi* script. The work is of high quality and the script is robust, the lines divided by a fillet into five cartouches. The translation is as follows:

1. [There] has ordered the construction of this elegant dome, he who is distinguished among
2. the greatest notables, his Excellency (lit. ‘presence’) al-Hajj Mustafa
3. Agha Parwana Zadah, Governor of Jerusalem the Noble, over the tomb of the pious *shaikh*
4. Muhammad al-Uzbeki, the *shaikh* of al-Zawiya al-Naqshbandiyya
5. —may his exalted mystery be hallowed and may the mercy of Allah be upon [him], the year 1144 (1731-2).

It is likely that some rooms were added to the *zawiya* while Shaikh Hasan, the son of Muhammad al-Salih al-Uzbeki, was in post, as al-‘Arif (1961: 499) has suggested.

A rectangular plaque records that a major restoration—and it might have been an enlargement project—was carried out on the *zawiya* in 1209/1794. A panel survives in the north façade, probably placed there when it was completely rebuilt soon after 1857. It is probably not in its original location but is a re-use. The panel is of marble, measuring 40cm wide by 25cm high, and consists of six verses of Arabic in Ottoman *naskhi* script. The text is rhyming and the calligraphy is elegant and highly compressed. The translation runs as follows:

1. Move quickly to the splendid and wise *zawiya*, and seek the blessing of reading the valuable books.
2. Be in good spirits for the sake of your happiness, for this *zawiya* has abundant gifts.
3. It is the right path for hearts, and guidance is within its auspices.
4. And pray to Allah (*al-muhaimin*, superintendent) in it for his answers can obviously be achieved there.
5. He who initiated its construction is undoubtedly one of the purest hearts.
6. He has gained remembrance during his lifetime and will be given a comfortable place in the second life. The year 1209 (1794).

Founder

The founder of the mosque and the four chambers for the *sufis* was—as stated above—‘Uthman Beg. His full name, as it appears in an early *waqfiyya* in Istanbul (Sijill 98: 563), was ‘Sufi ‘Uthman Agha ibn ‘Abd al-Mu‘in’. He was head of the door-keepers (*ra‘is al-bawwabin*) for the grand vizier (*al-sadr al-‘azam*) Ibrahim Pasha before Shawwal 1024/24 October–November 1615 (Sijill 98: 563). It seems from the *sijill* records that ‘Uthman Beg stayed in Jerusalem for a certain length of time. It is difficult to fix the precise period owing to lack of information, but it is safe to say that he was in Jerusalem as early as 17 Sha‘ban 1024/11 September 1615 when he married (Sijill 98: 19) the daughter of the governor of Jerusalem, Muhammad Beg.³ ‘Uthman Beg apparently continued to live in Jerusalem for the rest of his life,

because later he changed the stipulations of his *waqf* in the interests of his family (see below). It is unknown when he died and the only other information available relates to certain of his financial transactions. The *sijills* reveal that ‘Uthman Beg leased a soap-factory (Sijill 107: 309), and rented a stable (Sijill 98: 3) near the Ghawanima district. From the *waqf* endowments (see below) and the amount of his bridal money, which was 1,000 *sultani* in gold, it is clear that ‘Uthman Beg was one of the rich élite who came from Istanbul to reside in Jerusalem. No clue has yet come to light as to whether or not he was buried in his *zawiya*.

Hajj Mustafa Agha Parwana Zadah, the founder of the dome chamber that was built over the tomb of al-Shaikh Muhammad al-Uzbeki, was the governor of Jerusalem from 1144-65/1731-51. Mustafa Agha was also the patron of a *sabil* on the Haram which was named after him—Sabil Mustafa Agha (see cat. no.48). Other additions to the *zawiya* were built anonymously, in all likelihood by some of the caretakers of the convent such as al-Shaikh Hasan, son of al-Shaikh Muhammad al-Uzbeki, as al-‘Arif states (1961: 499), or al-Shaikh Rashid al-Bukhari, as Mr Walid al-Bukhari, the grandson of Ya‘qub al-Bukhari, believed. But, once again, it is not possible to be positive about attributing the restorations to these individuals.

The Waqf Documents

Four unpublished documents have been traced in the Jerusalem *sijills* relating to the *waqf* made by ‘Uthman Sufi for the Naqshbandiyya *sufi* order. The first is probably the replica of a *waqfiyya* (Sijill 98: 563-5) drawn up by ‘Uthman Sufi. It is made up of three large pages and is dated the beginning of Shawwal 1024/20 October 1615. It states that ‘Uthman Sufi donated 1,000 *sultani* gold coins in addition to a big house at Istanbul as a *waqf* for the chief *shaikh* and the members of the Naqshbandiyya Sufi order and in the interests of al-Shaikh Muhammad al-Qastamuni. Then, in late Ramadan 1029/July–August 1620, ‘Uthman Sufi relinquished this document and established another new *waqfiyya* (Sijill 103: 417-19). A major amendment and new terms transferred the income of the former *waqf* to the benefit of four Sufi members of the Naqshbandiyya order. The document had the proviso that these four had to live in Jerusalem in the four rooms which had been built by ‘Uthman Sufi. Finally, a new *waqfiyya* (Sijill 107: 117-19) was drawn up by ‘Uthman Sufi on 10 Muharram 1033/3 November 1623 and this divided the *waqf* income equally between the four Sufis and his own descendants. This is a standard format *waqfiyya* of about 1,750 words and it can be divided into three parts.

The first section is a foreword. It begins with the usual prayers for Allah and the Prophet Muhammad, and emphasises the rewards that await the charitable both in this world and in the afterlife. In this section the name of the donor and the chief judge who has registered the *waqfiyya* are given as ‘Uthman Beg, ‘well-known to Sufis’, and Burhan al-Din, son of Muhammad, respectively. The second part contains the main text, which gives a detailed description of the endowments, terms, facts concerning the personnel and their duties, purpose of the construction, and expenses. Finally, the *waqfiyya* ends with an epilogue confirming the legality of the endowment and the inability of the donor to reclaim it after the caretaker has taken over the *waqf*. Because this last document was ‘final and legal’, and because only the donor had the right to change or to add to his *waqf*, it will be considered here as the authoritative *waqfiyya* from which to draw information on the buildings.

³ For the biography and architectural work in Jerusalem of Muhammad Beg, see cat. no. 19.

Endowments

Various estates are specified in the *waqfiyya* (Sijill 107: 117) of 'Uthman Beg as an endowment to provide income equally for the donor's family and for the maintenance of the *zawiya* (see below). The estates were scattered in different parts of Jerusalem, both inside and outside the walls, and although all the estates have been carefully demarcated, it is pointless today to specify these borders, for much has been changed since the time of the *waqfiyya*. The list specifies income from the following:

- the whole harvest of grapes, figs, almonds etc., from land at al-Baq'a;
- the whole harvest of grapes, figs, quinces, olives etc., from the aforementioned land at al-Baq'a situated beside the *qasr* (villa or summer residence) built on it of stone and lime;
- the house situated in al-Ghawanima quarter known formerly as the 'House of Saifi Jawish';
- a house in al-Ghawanima quarter named the 'House of Jihan Agha', opposite the house of Saifi Jawish;
- a vegetable garden in al-Ghawanima quarter;
- one third of the soap factory and all that belongs to it of old brass (utensils), table-cloth and cisterns, located in the Damascus Gate quarter; and all the new brass pots and the new table-cloth which the donor provided for the soap factory.

The *sijill* entry (103: 419) adds that the donor had made a legal *waqf* for the benefit of the poor of two copper casseroles with their lids, a copper basin, a copper jug, four copper plates, a rug, and a Turkish (Rumi) carpet. According to the Auqaf file (3/17/12) the current income of al-Zawiya al-Naqshbandiyya is limited to the properties located inside the *zawiya* itself. This means that all the estates listed in the *waqf* of 1033/1623-4 no longer provide any income and were lost to the *waqf* some time ago.

Expenses, terms and duties

There is no estimate in the *waqfiyya* of the income from these estates, but it is clearly stated that the income, which apparently reached 162 *ghirsh* a year (see below), should be divided in half. The first half should be for the benefit of Ibrahim, the oldest son of the donor 'Uthman Beg, and for the sons of his sons, the males taking double the share of the females. In the event that the line of Ibrahim's descendants should die out, the *waqf* should serve the poor, to whom the second half of the income was dedicated. This second half of the income should be for the benefit of four poor Sufis living in Jerusalem in the four chambers built by the donor close to his mosque; the Sufis were to belong to the Naqshbandiyya Sufi order. These four persons were to be identified as people of religion, piety, virtue, and success. None of them should be careless or beardless, nor should he smoke or take any intoxicating drink or drug. In the event that there were no *sufis* of the Naqshbandiyya order in Jerusalem, the income should benefit four poor Sufis from the *arwam* (perhaps Rumi—in other words, they were to be Ottoman Turks) who possessed the same qualities. And if there were no Sufis from *al-arwam* in Jerusalem, then half of the *waqf* should go to four persons from the *affāq* (wandering) Sufi order, and, if that were impossible, the income should benefit four Sufis from any order. If there were no Sufis at all in Jerusalem, the income should go to members of the poor from *al-arwam* who were resident in Jerusalem, and in case that it

was impossible to do even this, the income should benefit the Muslim poor anywhere.

The donor reserved for himself throughout his life the position of caretaker, and after him it should go to his son, Ibrahim, and to the sons of his sons, provided that they were resident in Jerusalem. In the case that none of his descendants lived in Jerusalem, the position should be given to the son of his (the donor's) *shaikh*, Muhammad al-Naqshbandi, if he were in Jerusalem, and if not the position should go to the most deserving of the four Sufis. The donor assigned the sum of 6 *ghirsh* per year as a salary for the caretaker, and the rest of the income should be divided equally between the descendants of the donor and the four Sufis. The caretaker was to give each of the four Sufis at the beginning of every month 1 *ghirsh* for food and half a *ghirsh* for accommodation. Another 6 *ghirsh* per year should be spent to cover the cost of pottery jugs and mats for the mosque that had been constructed in the *zawiya* by the donor ('Uthman Beg), and for oil to light the mosque between dawn and the morning prayer, and between sunset and the evening prayer. The four Sufis were to assemble in the mosque to perform the five daily prayers, to recite certain chapters from the Qur'an after every prayer, and to call on and praise the Prophet Muhammad. The merit of the Sufis' prayers should be presented as a gift to the souls of the Prophet Muhammad, and of all of his companions, the friends of his companions, the donor himself and his descendants whether dead or alive, the donor's *shaikh*, Shaikh Muhammad al-Naqshbandi, and thence all Muslims.

Description of the building

Unfortunately, there are almost no details in the document about the architectural appearance of the *zawiya* except a brief reference to the mosque and the four chambers for the Sufis. The *waqfiyya* (Sijill 103: 418) mentions that the mosque 'has a niche and two windows with iron grilles, the first opening to the south and the second opening to the north'.

Purpose of construction

It is obvious from the *waqfiyya* (107: 118) that there was a dual purpose in the establishment of the *waqf*—the first to secure income for the donor's family, and the second to provide accommodation for four members of the Naqshbandiyya order in Jerusalem. Following the general weakening of the Sufi orders in the second half of the 19th century, it appears that the *zawiya* served the poor by providing free food and accommodation. This service thus concurred with the terms of the *waqf* document, although it was admittedly low on its list of priorities. Apparently al-'Arif (1961: 499) had been influenced in the 1950s by this practice when he wrote that 'the Zawiya Naqshbandiyya was constructed in order to accommodate and feed poor Muslims from Bukhara, Java, and Turkistan'.

Subsequent History

According to Sijill 220: 29, in the year 1137/1724-5 a noble sultan order was issued to inspect the *zawiya* and to register all the costs necessary for its restoration in a special document (*daftar*) to be sent to Istanbul. Muhibb al-Din, *naqib al-Ashraf* (head of the 'Alid 'descendants of the prophet'), therefore, accompanied by two architects as well as a group of people and a few of the Naqshbandiyya poor, visited the *zawiya*. This group reported that 'the *zawiya* is made up of two parts, the upper of which comprises a mosque, a chamber with a door opening to the south and its northern wall destroyed, a demolished chamber to

the east and below it a wrecked chamber, another dilapidated chamber, and an *iwan*. The lower part is composed of five chambers, an *iwan* with a cistern, a latrine (*adabkhana*), a small cistern and utilities (*marafiq*). All of these need to be reconstructed, for they are in a ruined state. The two architects estimated that the repairs would cost 734 *asadi ghirsh*.⁷ It took almost six months to carry out the restoration work and the actual cost reached a total of 965 *ghirsh asadi* (Sijill 220: 131). When the restoration work was finished the *qadi*, Muhibb al-Din (*naqib al-Ashraf*), and many dignitaries toured the building and inspected the restoration.

Architecture

Exterior—the North Façade

The north façade is the main one of al-Zawiya al-Naqshbandiyya. It faces, across the Via Dolorosa, the Lithostratos Convent of the Sisters of Zion. The springing of the Ecce Homo arch is in the middle of the façade, and the recent attic constructed above it belongs to the *zawiya*. The façade is made up of two sections, built at different times and each with types of masonry that differ in quality and chiselling technique. The present architectural features of the lower section were built some time after 1880, for a photograph taken in that year and published by Schiller (1980: 78) shows a completely different elevation from the one that exists today. This lower part consists of sixteen courses of stonework. Its eastern corner forms the angle where the road of Bab al-Ghawanima meets the main road of al-Mujahidin (Via Dolorosa). The main entrance to the *zawiya* is raised above street level by means of two steps measuring 40cm high, and it is flanked by a stone bench on either side, each measuring 45cm wide by 45cm deep by 65cm high. The door is 1.15m wide by 2.3m high, and it is surmounted by a slab lintel of white masonry. A narrow grooved moulding is the only form of decoration, and this runs round the whole structure. The lintel is supported by two brackets decorated with a frame moulding. Directly above the lintel there is a semicircular oculus window which provides light for the area behind the door. It is fitted with a modern iron grille and surmounted by a semicircular arch of 11 voussoirs. The keystone of the arch projects slightly and is decorated with a roundel (15cm in diameter) with a six-pointed star at the centre from which radiate lines carved in relief. A semicircular arch of chevron voussoirs frames the whole upper part of the entrance niche; the stonework of the entrance is finely cut and highly dressed, quite different in quality to the rest of the façade. Directly above the chevron arch a string course like a cornice cuts across the north face, separating the lower from the upper section. A door is situated to the east of the *zawiya* entrance, surmounted by a primitive semicircular arch. This leads into a rectangular area currently used as a souvenir shop. To judge by the shape, the size of the arch and the lack of lintel, it is probably of recent date.

A blind recessed niche is located to the west of the entrance, 60cm wide by 65cm high. The recess is surmounted by a small semicircular arch and is now fitted with a wire-mesh grille. Its lower part is deep enough to form a small basin to hold the water that used to be distributed to passers-by. Today the small water-trough (*misqa*) no longer functions, for it is blocked by the modern iron grille. Immediately above the niche there is the inscription panel described above, giving the date of one phase of restoration as 1209/1794.

A rectangular door is placed to the west of the *misqa* niche and this leads to a small shop. Originally this door was a window, for it is mentioned in the *waqfiyya* (Sijill 103: 418) as the

north window of the mosque chamber. Recently the window has been enlarged and widened, for the stone courses of the shop are roughly cut with no jambs, lintel or voussoirs to accommodate the space for the door. In late 1997 the shop was amalgamated into the mosque as a gesture of goodwill by the landlord. A rectangular restoration inscription is fixed almost one and a half courses above the top of the door. The panel is of marble, measuring 50cm wide by 50cm high, and consists of seven verses of Ottoman Turkish poetry. Each verse is divided into two hemistichs, and each hemistich is set into a simple rectangular cartouche. A fairly wide vertical groove and six thinner horizontal ones, which act as fillet borders, separate each hemistich, making a total of 14 cartouches. Three small, incised roundels decorate the lower part of the vertical cut. The script is a fine, thin, but compressed late Ottoman *naskh*, with many diacritical and auxiliary points. The date of the restoration is given as 1236/1820–21. Since the masonry courses surrounding the late 18th-century plaque are new and have a distinctive chiselling technique, it may be that the plaque is in secondary use. The string course that separates the two storeys of the façade is two courses above the panel and the southern springing of the Ecce Homo arch is at the same level to the west. It is believed that the Ecce Homo arch is the only surviving remnant of the Triumphal Gate in Hadrian's Aelia Capitolina (of the 2nd century AD), the span of which continues into the Ecce Homo Basilica.⁴

The second storey of the north façade of al-Zawiya al-Naqshbandiyya consists of two parts. The first, to the west, abuts the Ecce Homo arch, and dates to 1352/1933 according to an inscription; this is rectangular and contains merely the word *sanat* (year) and the numbers of the year in the Hijra calendar in Arabic. It is part of a long slab lintel set two courses above the course that divides the two storeys of the façade. The masonry in this section is distinct from the rest of the façade, for it is built of finely cut stones of white and red. The main focus is a double window of identical rectangles. Each window is surmounted by a horse-shoe arch and fitted with modern iron bars. Each arch springs from the wall on one hand and from the central cylindrical column on the other. The shaft of the column is of white stone; it has a bell-shaped base and a simple *muqarnas* capital. A rectangular moulded frame encloses the double window. The building terminates nine courses above the string course.

The second and eastern part of the upper storey is undecorated, its only relieving feature being three identical rectangular windows. Each window is fitted with modern iron bars on the outside with wooden shutters inside. The windows are surmounted by a low segmental arch of five voussoirs. The sills, the jambs, and the arches of the windows are smoothly dressed and project slightly. They are typical of buildings produced in Jerusalem during the period of the British Mandate. A rectangular restoration inscription is fixed to this part of the façade at the west corner above the level of the entrance. The panel is of grey stone and is made up of a *tughra* in relief which bears the name of the Sultan 'Abd al-Hamid II, the son of 'Abd al-Majid (1293–1327/1876–1908), contained inside a circular medallion. Five lines of Turkish *nasta'liq* script, each separated by a fillet frame, are set below the roundel. Unfortunately, the script is so badly eroded that it is almost impossible to read. It is possible to make out one word—*ta'miri* (restoration). This is located on the first

⁴ The basilica is the traditional spot where Pilate produced the tortured Jesus to the people, saying 'Behold the Man' (John 19: 5). See Murphy O'Connor 1986 (2nd Edition) 32–3; and Prag 1989: 158–9.

line and is legible enough to determine that the plaque is written in Turkish and that it is a restoration inscription. Unfortunately it is not possible to make out the date or further details of the work. Since it seems that the other inscriptions in al-Zawiya al-Naqshbandiyya are no longer in their original positions, it is an open question whether this panel too is in secondary use or *in situ*. Because of its illegibility, it even raises the more fundamental question of whether the plaque belongs to al-Zawiya al-Naqshbandiyya at all. If the inscription is indeed original and pertains to the building, then it provides a dating band of 1293-1327/1876-1908, which thus makes the eastern part predate the western section.

The eastern elevation

The eastern elevation runs from north to south through the short street to Bab al-Ghawanim. This elevation constitutes the eastern border of the *zawiya*, as well as the east wall of the four chambers and cells built for the Sufis. The masonry is very simple—medium square stones roughly chiselled and mostly weathered to black due to the elements; some are eroded. The pointing between the courses is thick and black. The upper three courses are slightly recessed, suggesting that they were added later or that they serve as a parapet. Before 1983 there was a small shop in the centre of the elevation and also five windows, two to the north of the shop and three to the south. The three small rectangular windows located to the south have been demolished and replaced by three large entrance-ways, which have been fitted with an iron door made up of two folded leaves. The entrances lead to the interior of the *zawiya*, now a very large, roomy gallery. The entrance to the shop leads to a rectangular area measuring some 4m long by 3m wide. There are no jambs, lintels or vousoirs at the top of the semicircular arch over the entrance. The shop is therefore not original but most probably of recent date. The floor of the shop is covered with small paving stones and it has a wooden roof. The two identical windows located to the north are still extant; very simple in form, they appear to be old although it is possible they have been widened at some point and therefore that the protective grille is modern. Each window is surmounted by a white slab lintel. A recent concrete construction was added above the eastern elevation, probably after 1983.

The Mosque

Access to the mosque of al-Zawiya al-Naqshbandiyya was until 1997 (see above) through the main—and the only—entrance in the north façade. A rectangular door measuring 1.4m wide by 2.4m high is situated to the west of the vestibule that once led to the interior of the mosque itself. The door is surmounted by a semicircular arch, contained in a recessed niche. It is flanked by stone benches on both sides. A damaged funerary inscription was attached in 1967⁵ to the eastern side of the northern bench. It measures 30cm wide and its present height is also 30cm. The first and last lines of the inscription are missing, and the beginning of the second and the third line are also lost. The script is written in Arabic in *naskhi* script with diacritical points. The bad condition of the text through loss and erosion allows only a partial reading, which may be translated as:

... [has passed ?] from the abode ([*intaqala*] *min dar*) of annihilation (life) to the eternal abode

(second life) ... (*al-fana' ila dar al-baqa' ...*). This is the tomb of the deceased Shaikh Muhammad al-Uzbeki ... [who belonged] to the Naqshbandiyya order, may Allah forgive him.

It is probable that the missing last line contained the date, which, as we discovered from the *sijills*, was 1144/1731 (see above). The position of this inscription is very curious. It is only 30cm above ground level and, in order to be able to read it, or even to look at it properly, it is necessary to kneel. Its true position should be either on the tomb of al-Shaikh Muhammad or, at the very least, somewhere within the tomb chamber.

The interior of the mosque comprises a single rectangular chamber, some 40cm lower than the floor level of the vestibule, which is reached by means of three steps. The room runs east-west and measures 9.2m long by 4.3m wide. The floor has a modern pavement, and from the ground to a height of 1.5m modern stone slabs have been fixed on the walls of the mosque chamber to try to eliminate damp. A trace of the old window which was blocked before 1997 by the new shop can be detected in the north wall of the chamber, and a simple *mihrab* niche is in the centre of the south side. The *mihrab* niche seems to be a later addition; it is 80cm wide by 50cm deep by 1.8m high and is surmounted by a simple semicircular arch. The area around and above this has been faced with modern pottery tiles decorated with geometric and floral motifs. The mosque chamber is roofed by a simple barrel vault and is covered with plaster. The simplicity of the *mihrab* and the prayer-chamber as a whole, as well as the disappearance of the south window mentioned in the *waqfiyya* (see above) suggest that the mosque has undergone some alteration. But the location of the mosque is doubtless original. If the position of the mosques in al-Zawiya al-Afghaniyya (cat. no. 35), al-Khanqah al-Maulawiyya (cat. no. 19), and al-Khanqah al-Salahiyya (*waqf* 585/1189) are taken into account, it will be seen that the prayer-chamber of each of these monuments is located close to the main entrance to enable easy access for any outsider coming to pray. In this respect the location of the mosque in al-Zawiya al-Naqshbandiyya conforms to that of the others.

Interior

The interior of al-Zawiya al-Naqshbandiyya at present is made up of three main sections. The first is the large store recently formed as a result of demolishing the constructions built on both sides of the old vestibule. This shop is entered through five large doors, three on the eastern elevation and two on the northern façade. The architecture of the space is very complicated and misleading, for it is not merely the result of the demolition of the main parts of the *zawiya* and adding new constructions in their place, but also the result of excavations in the lower parts of the *zawiya* to provide more space. The shop is thus a mish-mash and there is little point in attempting a logical description. The second section of the *zawiya* is a rectangular plot of land planted with various kinds of trees. This garden is located to the southwest of the *zawiya* complex, and adjoins the northern border of al-Zawiya al-Qadiriyya (cat. no. 35). There is a rectangular tomb in the north-western corner of the plot of land, constructed of two courses of stonework with a rectangular base above with an uncovered top. The western end has a tomb marker in the form of a cylindrical head covering of the type still used in Jerusalem today by Muslim divines. A small dome has been built over the tomb. The dome, which has a shallow profile, is carried on four identical pointed arches springing from four piers. The space between the arches is open, with the exception of the northern side which appears to

⁵ This is according to Mr Walid Bukhari, the son of Shaikh Ya'qub al-Bukhari, the last caretaker of the *zawiya*.

have been blocked recently, to judge by the use of modern concrete blocks. The small dome rests directly on the four supports, the transition zone being realised by means of four corner pendentives without an intermediary drum. The interior is undecorated, but on the northern side there is a collection of recent pottery tiles with five lines of fine *naskhi* script. The translation runs as follows:

1. The *Fatiha*
2. This is the tomb of the departed
3. al-Shaikh Musa [son of] Ya'qub al-Bukhari
4. who died on 5 Ramadan 1393.
5. 1 October 1973. May Allah grant him mercy.

A funerary inscription on a stone plaque occupies the northern corner of the east side. The plaque is of modern marble and

contains six lines of Arabic. The script is a slender, modern *naskh*, well-cut and very clear with diacritical points. The translation of this runs:

1. He Who is the Living, the Eternal [One]
2. [This is the] tomb of the deceased al-Shaikh Ya'qub al-Bukhari
3. The shaikh of al-Takiyya al-Naqshbandiyya in Jerusalem the Noble
4. He died on Monday 22 Jumada I 1376
5. 24 December 1956.
6. Say the *Fatiha* for his soul.

34 KHALWAT BAIRAM PASHA

Name: Khalwat Bairam Pasha

Date: 1038/1628-9

Endowment: 1042/1632-3

Variant of name: In the *sijills* (151: 181; 245; 567) it appears as 'al-Khalwa al-Bairamiyya'

Modern name: None is known. The lower part of the building is now used as an office for the draughtsmen of the Aqsa Restoration Committee; the upper section is a centre for the Haram Fire Brigade.

Location

The *khalwa* is located at the western edge of the terrace of the Dome of the Rock, between the Hujrat Islam Beg (cat. no. 21) and the Khalwat al-Sadanat al-Haram (cat. no. 51).

Site and brief description (figs. 34.1-34.4, pls. 34.1-34.2)

Khalwat Bairam Pasha is situated on the western divide between the two levels of the Haram esplanade. It is similar to the others found in the Haram in that it consists of two storeys. The lower section is a relatively large rectangular hall covered by two cross vaults. A *mihrab* niche is set in the south wall of the hall. The upper level of the building is made up of two units—the first is a square chamber covered by a hemispherical dome, and the second is a rectangular area divided equally between two small square cells. Both parts of the *khalwa* are built of good quality stone, which has weathered to shades of black or white.

History

All the historical information on this monument has been provided by the relevant Jerusalem *sijills*, for nothing else has so far been discovered or published. Sijill 115, which includes the proceedings for the year 1038/1628-9, contains on page 721 the copy of a document of sale registered originally at the religious court in Damascus. Although the transaction was carried out in Damascus, it relates to one of the *khalwas* on the terrace of the Dome of the Rock. The document gives the name of the vendor and the purchaser, details of the sale and specifications of the site, including the price, terms and—above all—the name of the architect. For the whole Arabic text, see Cat. Appendix 1, no. 34.

Identification

The *khalwa* of Bairam Pasha is clearly identified in Sijill 115: 721 as an Ottoman construction. The document states that 'Mustafa Agha has sold to Muhammad Agha the son of Husain, the legal agent of Bairam Pasha, that *hujra* (cell) which he possesses and which he has constructed out of his own money in the way of equipment and *mu'na* (material), which includes stones, fill, *qusurmil* and the like. The cell is located on the western edge of the platform of the Noble Rock facing the Dome of the Ascension on the upper roof of the cell of our master al-Shaikh Nusrat al-Islam which is located opposite Bab al-Qattanin, one of the gates of the Haram of Jerusalem the Noble.' The *sijill* goes on to give further information, saying that the cell 'is built in an identical style to the cell of Ahmad Pasha; it comprises a fine *makhda'* (chamber) below its two chambers together with *manafi' shari'iyya* (legal facility—this is discussed below). The length and width of the cell is the same as the cell of the aforementioned Ahmad Pasha.'

Date

The cell has no foundation inscription, but it is clear from the *sijill*

document that it was constructed shortly before 1038/1628-9, and it must therefore be correct to date it to that year at the latest.

Founder

The founder of the cell was Mustafa Agha ibn Muhammad, who was a member of *al-mutafarriqa* of the Sublime Porte (al-Bab al-'Ali—the central office of the imperial government of the Ottoman sultan in Istanbul). The cell was built by the then chief architect in Jerusalem—'Abd al-Muhsin ibn Nammar (see also cat. no. 22). The cell was then purchased by the Vizier of Egypt, Bairam Pasha, through his legal representative, and was named after him.

It emerges from the Jerusalem *sijills* that Bairam Pasha had a long association with a number of architectural projects in Jerusalem and Hebron. Besides this cell and its endowment (see below), he was responsible for other restorations and repairs in the Haram al-Sharif. Sijill 113: 248 includes a document relating to a donation of 1,700 *ghirsh* (gold coins) sent to Jerusalem by Bairam Pasha, then Vizier of Egypt. Dated 1 Rabi' I 1037/10 November 1627, it states that '... since Bairam intended to do charitable deeds for the mosque of the first *qibla* and the third Haram (the Dome of the Rock and Masjid al-Aqsa)—which has a virtue beyond counting—and for the *maqam* of the fathers of the Prophet al-Khalil (Ibrahim, Abraham), Bairam has sent 1,700 *ghirsh* to our master (*maulana*) Ahmad Efendi, the *qadi* of the city of Jerusalem the Holy and the governor (the administrator) of the *waqf* of the Holy Haram' (for the complete Arabic text, see Cat. Appendix 1, no. 34).

This document includes the information that Bairam Pasha allocated 1,000 *ghirsh* of the 1,700 to those areas of al-Aqsa mosque (presumably not just the mosque but the entire Haram) deemed by the *qadi* to be in need of repair—such as the cisterns—and to the maintenance of the 'two domes', their medallions (*jamat*), fixing the lead and wood, and other things. The rest of the money—that is, 700 *ghirsh*—was to be used for the restoration of the Great Mosque of Hebron.

The money was delivered to the *qadi* by a merchant named as al-Khwaja (gentleman) Taha ibn al-Shaikh Musa al-'Asali, in the presence of Muhammad Pasha (the governor of Jerusalem), Husain Efendi (the *shaikh* of the Haram al-Sharif), and Ahmad Agha, who had been appointed by Bairam Pasha. A deficit was discovered when the money was counted and, according to a legal certificate, was put down to the difference in the exchange rates of Egypt and Jerusalem. Soon after the arrival of the donation from Bairam in Jerusalem, it is reported in Sijill 113: 439 that the *qadi* Ahmad Efendi decided to restore the three porticoes at the main door of Masjid al-Aqsa. It seems that the lead over the porticoes had many large holes that were allowing water to leak through. The porticoes were impossible to restore until the sheets of lead had been melted down and recast. This repair was undertaken on 22 Rabi' II 1037/31 December 1627 at a cost of 600 *ghirsh asadi*. Another entry in the same *sijill* (113: 448) shows that the second choice for the use of the money by the *qadi* was rebuilding seven derelict porticoes located close to Bab al-Nazir, at a cost of a further 600 *ghirsh asadi*. It seems that a third option was restoring Sabil Sha'lan (for details, see cat. no. 36). According to Sijill 113: 1, Bairam Pasha also donated 1,000 *qit'a misriyya* (silver coins) to the tomb of al-Nabi Da'ud (David), as well as textiles of various sorts and colours to cover the tomb and niches.

From these documents it emerges that Bairam Pasha must be considered one of the major patrons of Ottoman

Jerusalem, and should take his place alongside Bairam Jawish, Ahmad Pasha, Khudawirdi Abu Saifain, and Muhammad Pasha.

Endowment

Sijill 122: 456 includes a relatively long and interesting record dated 9 Shawwal 1043/8 April 1633. It reveals that the Vizier Bairam Pasha sent 230 *ghirsh asadi* (gold coins) to Qasim Agha, and that Qasim transmitted the money together with his commissioner, Ridwan 'the Janissary of Damascus', to Jerusalem. The money was to be delivered to the readers who had been appointed in the Khalwat Bairam, located on the platform of the Noble Rock. The document concerns the allocation for the year 1042/1632-3; there was also an additional 10 *ghirsh asadi* for the *mu'adhdhin* of the Haram. Shaikh 'Abd al-Qadir al-'Alami, the inspector of the readers (of whom there were thirty-two; their names are given), had received the money. He had paid each reader 6.5 *ghirsh asadi* (making a total of 208 *ghirsh asadi*), and he had taken for himself 19.5 *ghirsh asadi* in recompense for the position of inspector. Another document in Sijill 151: 567, dating from the last third of Ramadan 1066/12-22 July 1656, is a list (*sijill*) which includes the allocations of the salaries of the daily readers in Khalwat Bairam.

From the records, then, it can be inferred that Bairam had arranged a *waqf* for his *khalwa* in Jerusalem in the form of ready money to be sent yearly to Jerusalem. It is, however, not clear from this document what the position was to be after the donor's death. It is fortunate that Sijill 151: 245, dated 4 Rajab 1066/28 April 1655, includes the appointment of a reader to the *khalwa* at 6 *sultani* gold coins annually. The salary was to be paid from the gold coins coming each year from Istanbul, which arrived with *al-surra al-rumiyya* (the yearly money from Istanbul). This proves that, before he died, Bairam had set up a *waqf*, the income from which was to be sent to Jerusalem for the readers of his *khalwa*. It should be noted that Bairam employed a large number of readers; in terms of comparison, their number comes second only to those of the royal *waqf* of Khassaki Sultan.

Architecture

Exterior

The eastern façade of the cell faces the Dome of the Rock and is built on the same level. It is constructed with dressed masonry although it has the occasional rough stone in the upper part of the façade. The façade is dominated by three openings. One is a rectangular door measuring 69cm wide by 1.8m high, surmounted by a simple stone lintel. The jambs of the door and the stone above the lintel are different from the rest of the masonry, which would suggest a later phase of restoration or modification to the façade fenestration, such as the conversion of a window to a door. The door openings start one course above ground level and a rectangular window, measuring 90cm by 1.4m, placed to the south of the door, begins at a height of two courses from the ground. This is the second and central opening. It is surmounted by a lintel and above it is a pseudo 'eye-brow' arch. The third opening, still further to the south, is a simple pointed arch. There is a slight return at the level of the springing but otherwise it is undecorated. A trace of moulding can be seen in the upper course of the façade but it has almost completely disappeared. Two water-spouts are fixed at the top of both ends of the façade. The one to the north is small and made of terracotta, while the one to the south is of stone and has a big, flat opening.

The hemispherical dome sits directly on the roof above the four walls of the large chamber, and as usual there is no drum.

The dome is crowned with a stone finial made in three sections. The upper part of the finial is in the form of an open circle, facing north-south. The middle section is square in shape, and is slightly bigger than the upper and lower parts. The lower part constitutes the base of the finial, and is plain like the middle section.

The main scheme of decoration on the western elevation too depends on the system of openings—in this case, the fenestration. In all there are six similar windows—three to each part, but irregularly disposed. They are all surmounted by lintels and fitted with iron grilles. The windows differ both in their dimensions and in the type of arch that surmounts them. Both windows to the north of the upper part of the building measure 93cm by 1.4m, and are surmounted by an 'eye-brow' arch. The third window at this level measures 84cm by 1.22m and there is no arch above the lintel. The lower three windows share the same dimensions of 75cm by 1.32m. Only the central opening is marked out, and this is done by a lightly recessed and pointed blind arch.

The southern elevation is a solid wall with the exception of four windows, which are fitted with iron grilles and surmounted by lintels. Two of these respectively appear in the upper and lower storeys. The lower window to the east measures 80cm by 1.25m, while the one to the west measures 74cm by 1.24m. A door measuring 90cm wide by 1.6m long is set in the lower part of the northern elevation. It is surmounted by an arch made up of five voussoirs. To the west of the door there is a rectangular window measuring 73cm wide by 1.2m long, fitted with an iron grille and wire mesh. The eastern window of the upper section measures 80cm wide by 64cm high, while the western one measures 90cm by 1.2m; both are fitted with an iron grille of the same quality as the rest of the windows. The upper section of the northern elevation is pierced by two identical windows, which are surmounted by a white slab lintel and an 'eye-brow' arch.

Interior

The lower storey of the *khalwa* consists—at present—of a rectangular prayer chamber measuring 4.3m wide by 8.5m long. It has recently been paved and is covered by a double cross vault, but this is not centred as might have been expected. The reason for this must be the fact, mentioned in the *sijill* (see above), that this chamber originally consisted of two rooms. It seems that the wall which separated them was later dismantled, thereby creating a single rectangular hall. There are five windows in all, three in the west wall and two in the south wall, all of which are surmounted by a semicircular arch. In addition there are two extensions set back on the east side of the chamber. These could be the *manafi' shari'iyya* (literally 'legal facility') mentioned in the *sijill* document described above. They were adjuncts to the two chambers and were probably used for storage space by the *shaikh* who occupied the building. A simple concave *mihrab* measuring 58cm wide by 1.66m high by 33cm deep is placed in the middle of the southern wall between two windows. It is constructed of stone and has a semicircular arch and scallop. The *mihrab* is not described in the *waqf* documents; because of its shallow depth, it may have been added when the two rooms were adapted to create a single chamber. The walls of the prayer chamber are plastered and whitewashed.

The interior of the upper section of Khalwat Bairam Pasha consists of a rectangular hall divided unequally into two units. The first unit consists of two components: a small antechamber and a small ancillary square room. The second unit

consists of a large main chamber, also square. The antechamber once gave access to the whole interior of the upper section, but today the door is locked. The room measures 2.1m by 2.5m and is covered by a small folded vault with a small saucer dome at the centre. As noted above in the description of the south elevation, there are two windows in the south wall, the window in the antechamber forming the eastern one. It is surmounted by a semicircular arch and scallop. A narrow passage to the west leads into the ancillary room, which is to the west of the antechamber, and is square in plan, measuring 2.1m by 2.1m. The ancillary room has recently been paved and is covered by an eight-part cross vault. There are two windows, one to the west and another to the south, both already described under the relevant elevations. A blind recessed niche in the north-eastern corner measures 52cm deep by 60cm wide by 1.15m high.

A rectangular opening connects the ancillary room and the main chamber; it measures 81cm wide by 1.53m high by 94cm deep. The lintel of the opening seems to have undergone a recent unskilled repair, but the opening is original, for there are

fine jambs on either side of the opening looking north. It is worth noting that at some time this aperture was blocked, which means that the two units are quite separate. This explains the conversion of the northern window of the eastern façade to a door. Recently, when the Haram Fire Brigade took over the *khawwa*, it was reopened to allow easy access between the two units.

The main chamber of Khalwat Bairam is reached today through the rectangular door (originally a window) in the eastern façade. It is a square chamber with a modern pavement of tiles, 20cm by 20cm, and is covered by a shallow dome. There is no intervening drum, the necessary circle being achieved by a transitional zone of pendentives at the corners. There are five windows in all, four in the west and north, and one in the east wall to the south of the door. Each window is surmounted by a pointed arch. A blind recessed niche is placed in the south wall; it measures 70cm deep by 80cm wide. The walls are thick (approximately 97cm) and plastered.

35 AL-ZAWIYA AL-QADIRIYYA

Name: al-Zawiya al-Qadiriyya

Date: 1043/1633

Endowment: 15 Muharram 1043/22 July 1633

Variant of name: al-Zawiya al-Afghaniyya

Modern name: al-Zawiya al-Afghaniyya

Location

The *zawiya* is situated to the north of Tariq Barquq, which leads from the Haram gate, Bab al-Ghawanima, to Tariq al-Wad.

Site and brief description (figs. 35.1-35.3, pls. 35.1-35.12)

The southern boundary of the site is determined by Tariq Barquq; this street also lies to its west, as do a number of as yet unrecorded dwellings. To the north the complex is bordered by the complex of buildings that make up al-Zawiya al-Naqshbandiyya (cat. no. 33). The *zawiya*, as already described, fronts onto two sections of Tariq Barquq, one part of which is a thoroughfare and the other a side street, although they share the same name. The entrance to the *zawiya* leads to an open courtyard, generously planted with trees, vines and flowers. The courtyard is surrounded by eleven small cells, a large chamber, a mosque, a house of two floors (the lower of which is original, while the upper is a later addition), latrines, and an area for ablutions. In addition to the courtyard, the complex has a plot of land measuring 600 square metres.

History

Identification

Al-Zawiya al-Qadiriyya is identified by a foundation inscription as well as by a *waqf* lodged in the Shari'a Court in Jerusalem (Sijill 122: 233). The *waqfiyya* states that '... Muhammad Pasha has made *waqf* the whole beautiful *zawiya* constructed by him, located in the Ghawanima neighbourhood of Jerusalem the Noble.'

Date

The date of al-Zawiya al-Qadiriyya, as it appears on the foundation inscription, is 1043/1633. Both Burgoyne (1976: no. 124) and al-Husaini (1977: 21) recorded the date as 1040/1630 but it was in fact correctly read earlier by al-'Arif (1966: 500). The inscription is on a stone panel in a prominent position in the middle of the tympanum over the entrance. The panel is rectangular in form and measures 30cm by 20cm; the inscription consists of three lines of high quality Ottoman *naskh*, set out in six cartouches. The cartouches are undecorated rectangles of two columns, and are outlined by plain fillet borders. It is worth pointing out that, apart from the inscriptions in the name of Sultan Sulaiman on the walls of the city, the *sabils* and the Haram—which display a standard of high-quality calligraphy comparable to Mamluk inscriptions within Jerusalem—the majority of Ottoman inscriptions in the city are modest in size and quality, and notably so in relation to context and execution. They must be seen as local Jerusalemite rather than the courtly panels represented by Mamluk examples and by those of Sultan Sulaiman al-Qanuni.

The translation of the panel reads as follows:

1. In the name of Allah the Compassionate, the Merciful, this is the *zawiya* of

2. our master and lord, the leading savant, the sultan of all saints,
3. 'Abd al-Qadir al-Jilani—may Allah hallow his mighty secret, (in the) year 1043 (1633).

The penultimate phrase, 'may Allah hallow his mighty secret', is a eulogy used in reference to the name of a deceased Muslim saint. It apparently refers to the belief that an eminent Sufi was in possession of a secret which enabled him to perform miracles (*karamat*). The most auspicious *du'a* for any Sufi, therefore, whenever his name is cited—in particular by his followers—is to ask Allah to hallow his 'secret'.

The reading of the date is confirmed by a *waqfiyya* in Sijill 122: 236 which carries the date 15 Muharram 1043/22 July 1633.

Founder

The *waqfiyya* refers to the donor, Muhammad Pasha, as 'our master, the governor of Jerusalem the Noble'. The document also refers to him by other long titles affiliated to his position, such as *amir al-umara' al-kiram*, *kabir al-kubara' al-fikham*, *mu'taman al-daula al-bahira*, and so on.¹ Muhammad Pasha, as explained elsewhere (cat. no. 19 under Founder), was a renowned patron of architecture in Jerusalem. He also played a leading administrative role in the city. Other catalogue entries have shown him contracting through his legal agent (*wakil*), the Administrator, to collect the *waqf* revenue of al-Zawiya al-Hamra' (cat. no. 3). He endowed a plot of land for the Khanqah al-Maulawiyya (cat. no. 19), and it is recorded in the foundation inscription that it was during his period of office that Bairam sent donations to rebuild the Sabil Sha'lan (cat. no. 36). On 17 Sha'ban 1024/11 September 1615 the daughter of Muhammad Pasha married 'Uthman Sufi, the founder of al-Zawiya al-Naqshbandiyya (cat. no. 33).

There are many other items in the *sijills* (volumes 98-122) which record proceedings from the years 1024-43/1615-1634 that bear the name of Muhammad Pasha. Most of these records document his financial transactions, but a few point to other activities. From the records it is clear that Muhammad Pasha was deeply involved with the city of Jerusalem. He spent a long time there both as governor (1036-43/1626-33), and as a retired person. For example Sijill 100: 282 dated 1028/1618-19 states that the inspector of the *waqf* of al-Masjid al-Aqsa had contracted Muhammad Pasha, 'retired in Jerusalem', to help him to collect the revenues of Masjid al-Aqsa from certain villages, for the inspector was having difficulty in obtaining their income. On the binding of Sijill 112: 1, dated 23 Rajab 1036/9 April 1627, one of Muhammad Pasha's many arrivals in Jerusalem is recorded. It states that 'our master Muhammad Pasha, the governor of Jerusalem, has arrived at the place of his seat and at the centre of his government and rule (*ila mahal wilayatihi wa mautin hukumatihi wa himayatihi*).'

Muhammad Pasha acted as Supervisor of the *waqf* of Qanat al-Sabil² according to Sijill 113: 848 dated 20 Dhu 'l-Hijja 1037/21 August 1628. It states that the *qadi*, on the basis of an

¹ For other titles of Muhammad Pasha, see the text of the *waqfiyya* in Appendix I, no. 35. His titles appear frequently elsewhere in the Jerusalem records, for example in Sijills nos. 98: 18, 19; 105: 418, 451, 474, 645, 718, 726.

² On Qanat al-Sabil, see Ch. 36, under the Water Supply, n. 16.

official letter (*kitab*), had assigned Muhammad Pasha, *amir al-umara'* (all of his titles are provided), the governor of the city of Jerusalem, to the position of supervisor of al-Qanat al-Sabil—the water supply for Jerusalem—and its endowments for the sake of Allah (without salary).

Among the endowments of Muhammad Pasha, there is a short *waqfiyya* of one page with twenty-two lines in Sijill 102: 273. It is dated the beginning of Dhu 'l-Qa'da 1028/10 October 1619, and it records that Muhammad Pasha, then governor of Jerusalem, had devoted a plot of land located on al-Tur mountain (Mount of Olives) for the benefit of the retreat (itself) and the poor (Sufis) who came to al-Shaikh Abu 'Abdallah Muhammad Shams al-Din surnamed al-'Alami. The plot was described as planted with olives and, as was normal, its boundaries were specified. The donor stipulated that the supervision of the land was to be in the hands of al-Shaikh al-'Alami, and after him his sons; and after his sons, one of the poor who observed the order of al-Shaikh al-'Alami. Whenever Muhammad Pasha is mentioned in the *sijills*, his name is accompanied with the complete string of his titles, which was the common practice for governors of Jerusalem in the Ottoman period.

There can be no doubt that Muhammad Pasha was one of the greatest patrons of charitable architectural projects in Jerusalem. Indeed he was the last Ottoman governor to enrich the city with a major architectural undertaking. Thereafter, the monuments in Jerusalem are either very small or represent restorations rather than new projects.

It is noteworthy too that all of Muhammad Pasha's projects in Jerusalem were associated with Sufi orders.

In addition to al-Zawiya al-Qadiriyya, under discussion here, which Muhammad Pasha built and to which he gave a generous donation, as already mentioned, he made *waqf* two plots of land, one for the Maulawiyya order, and the second for the Sufis of al-Zawiya al-As'adiyya at the mount of Olives. He appears as *wakil* (agent) for the great *mufti* of Istanbul, al-Shaikh Abu Sa'id As'ad Efendi, *shaikh mashaikh al-islam*, with the responsibility of supervising the building of Abu Sa'id's *zawiya* (al-As'adiyya) on the mount of Olives on 20 Muharram 1033/13 November 1623 (Sijill 107:128). This explains the similarity between the plan of al-Qadiriyya and al-As'adiyya mosques. Together with the western part of Kursi Sulaiman (cat. no. 40), they represent the work of a single architect or planner.

There is no clue in the information provided by the *sijills* as to Muhammad Pasha's affiliation with the Sufi orders. If one compares the interests of three major patrons of the architecture of Ottoman Jerusalem (other than Sultan Sulaiman and his wife)—namely, Bairam Jawish, Ahmad Pasha and Muhammad Pasha—it will be seen that these men concentrated in different areas. Bairam's interest lay in differing types of architecture, although he did not neglect the needy poor. Ahmad Pasha's activity focused on the *'ulama* (people of knowledge). Muhammad Pasha, for his part, concentrated on Sufi institutions. It seems probable that the interest shown by Muhammad Pasha to the Sufi community reflects the good position achieved by this community within Jerusalem society in the second half of the 17th century. In other words, connections between the Sufi order and the governor served their mutual interests—while the governor gained public support, the Sufi community benefitted from financial aid in the form of *waqfs*.

The waqfiyya

The unpublished *waqfiyya* is to be found in Sijill 122: 232-6 dated

15 Muharram 1043/22 July 1633. It is a comparatively lengthy document of five pages with thirty-seven lines to the page, each line averaging sixteen words. The *waqfiyya* states that Muhammad Pasha, being sound in body and mind, had attested in the presence of the *qadi* and other witnesses (who were to sign below) that he had endowed the whole of his 'elegant and beautiful *zawiya*'. The *zawiya* had been constructed out of his own money in the Ghawanima neighbourhood of Jerusalem the Noble. In addition to the *zawiya*, the donor had made *waqf* 1,000 silver *ghirsh asadi*, each *ghirsh* being equal to 30 *nisf misriyya*. Although it is difficult to ascertain the precise value of coinage in circulation in Ottoman Jerusalem over the centuries, it seems that the scale of the financial endowment of al-Zawiya al-Qadiriyya by Muhammad Pasha is in keeping with the normal standard of the time³ when compared with the endowments of al-Khanqah al-Maulawiyya (cat. no. 19) and Hujrat Islam Beg (cat. no. 21).

Description of the zawiya

According to the *waqfiyya* (Sijill 122: 233), the *zawiya* comprised the following architectural elements:

- 1. A large rectangular mosque with 'many windows' in its four walls (the number of window are not specified).
- 2. A large square kitchen located opposite the mosque to the north.
- 3. A large house situated to the north of the *zawiya*, which included a big room with two windows opening onto the open courtyard of the *zawiya*. A cooking range (*aujaq*) was to be found in this room. The house had been prepared by the donor to act as the residence for the *shaikh* of the *zawiya*. A handsome platform adjoined the house.
- 4. The *zawiya* also included a small *iwvan*, whose door opened towards the east. It had a cooking range (*aujaq*) and a large basin (*qas'a*) of stone for the laundering of the clothes of the poor who were resident in the *zawiya*.
- 5. The donor had arranged eleven cells located to the west and south of the *zawiya* for the poor of the Qadiriyya, who were on retreat in the *zawiya*.
- 6. A large irregular rectangular garden (*haud*) for cultivation. This is described in the *waqfiyya* as square: *wa bidmin al-zawiya al-mazbura haud kabir murabb' bi-rasm al-zira'a*. The land measured 12m to the west, 14.8m to the north, 12m to the east, and 18.85m to the south.

³ This statement is based on the amount and percentage of the annual profit and on the equivalent in *nisf misriyya*.

Name	Amount of endowment	Percentage and profit	Equivalent in nisf misriyya
Al-Khanqah al-Maulawiyya	500 <i>ghirsh asadi</i>	15% = 75	3,000
Khalwat Islam Beg	500 <i>ghirsh asadi</i>	15% = 75	3,000
Al-Zawiya al-Qadiriyya	1,000 <i>ghirsh asadi</i>	20% = 200	6,000

Although the sum for al-Zawiya al-Qadiriyya is double that of Khanqah al-Maulawiyya, it should be remembered that the number of Sufis residing in the Qadiriyya was double that of those in the Maulawiyya. It is worth noting also that between the *waqf* of Islam Beg (1002/1593-4) and the *waqf* of the Qadiriyya (1043/1633) the *sultani* had, it seems, been devalued by 10 *nisf misriyya*.

7. Three cisterns to contain rainwater.

8. A fair orchard (*hakura*; 16m wide by 20.5m) situated to the east of the *zawiya*, approached from the complex and planted with figs, almonds, and grapevines. It also included a cistern to collect rainwater, two latrines, and two platforms (*suffa*).

The boundaries of the *zawiya*

The whole property specified in the document had been made *waqf* by the donor, through a legal document dated 1042/1632. The *zawiya* was bordered to the south by the thoroughfare within which the entrance to the *zawiya* was found, to the east by houses known as 'the houses of 'Uthman Beg al-Sufi al-Masri' (for his biography see cat. no.33 under Founder), to the north by al-Zawiya al-Naqshbandiyya (cat. no. 33)—which had been endowed by the same 'Uthman Beg—and to the west by an open courtyard and stables which were owned by 'our master the donor'.

The document concluded that the detailed property which had been recorded was a true and legal *waqf* and that the donor, Muhammad Pasha, dedicated it for certain charitable deeds, namely:

1. The *zawiya* was endowed for the benefit of the Qadiriyya *sayyids* who followed the order of 'al-Shaikh Muhyi al-Din 'Abd al-Qadir al-Jilani, may Allah hallow his secret'. In case of there being no Qadiriyya members in Jerusalem the Noble, the *waqf* was to be for the benefit of the Muslim poor in Jerusalem the Noble, and if that was impossible, then it was to be dedicated to the Muslim poor anywhere.

2. Money in the form of cash had been endowed for the benefit of the *zawiya*, and the Administrator of the *waqf* was to deal with it legally, twelve *ghirsh* for each ten *ghirsh*, and he was to avoid *riba* (illegal interest). The income annually would amount to 200 *ghirsh asadi*. This was a large amount on 1,000 *ghirsh asadi*, corresponding to 20 percent interest. Other sums of money (see note 1) had, however, a lower rate of interest at 12 percent (each 10 *ghirsh asadi* for 11.5 *ghirsh asadi*) as in the *waqf* of the Maulawiyya (cat. no. 19) and the Khalwat Islam Beg (cat. no. 21). Whether this arrangement (*mu'amala*) represented illegal *riba* or legal *ribh* is still in dispute between the *muftis* today.

Personnel and expenses

The administrator of the *waqf* was to pay the following expenses:

Position	Ghirsh asadi annually
The <i>shaikh</i> and <i>imam</i> of the <i>zawiya</i>	20
Eleven Sufis (6 <i>ghirsh</i> each)	66
Door-keeper (<i>bawwab</i>) for the <i>zawiya</i> (one of the eleven Sufis)	3
<i>Sha'al</i> (in charge of lighting the oil-lamps) and attendant	3
Oil for the illumination of the mosque of the <i>zawiya</i>	6
Mats for the <i>zawiya</i>	2
Buckets, jugs, and ropes	3
Food to be cooked in the <i>zawiya</i> kitchen every Friday night for the Sufis (one and a half <i>ghirsh</i> each Friday night)	72
Cook (to be one of the eleven Sufis)	2
The <i>qadi</i> of Jerusalem, for signing the account books	3
The administrator	6
The surplus was first to be used to maintain the <i>zawiya</i> , should there be need, otherwise it was to be added to the capital	14
Total expenses annually	200

Stipulations

The donor, Muhammad Pasha, made the following stipulations:

1. The donor stipulated that the supervision of his *waqf* was to be his during his lifetime (may Allah grant him a long life), and after him it was to be under the control of his sons and the sons of his sons in order of maturity and competence (*al-arshad fa-l-arshad*) for the sake of Allah and without salary. The donor had the right to add or to deduct (from the *waqf*), to change or exchange it, to grant or to withhold, to assign or dismiss and to do whatever else he chose during his lifetime. After his death no one had the right to make any change to the *waqf*.

2. He (the donor) stipulated that the administrator of his *waqf* should be al-Khwaja Muhammad ibn al-Khwaja Nur al-Din al-Sahib during his lifetime, and after him the position was to be filled according to the [decision of the] Inspector and the *shaikh* of the *zawiya*.

3. The *shaikh* of the *zawiya* was to be the *imam* of the mosque; he was to perform the five daily prayers, and he was to be pious and (rightly) guided in both his deeds and words. If the *shaikh* left Jerusalem the Noble for more than three successive days without legal excuse and thus suspended his duties as *imam* and *shaikh*, the administrator was to replace him with another *shaikh*, always provided that he had the same qualifications.

4. It was to be a condition that none of the eleven Sufis was allowed to transfer (*tafarrugh*) his right to reside in his cell to anyone else, and if he did, then the *shaikh*, together with the administrator, was to appoint a replacement with the necessary qualifications to reside in the *zawiya*. In the case of a poor Sufi travelling out of Jerusalem the Noble for more than three successive days without legal excuse, once again the *shaikh* together with the administrator was to replace him with another indigent to occupy the cell.

5. The donor stipulated that the Sufis together with their *shaikh* were to gather after every prayer, unless they had legal excuse not to do so. They were to recite passages from the Noble Qur'an, to praise the Prophet Muhammad, and to make invocation to Allah in accordance with the practice of their named *shaikh* ('Abd al-Qadir al-Jilani). The merit of this action was to be for the benefit of the soul of the Prophet, for all the messengers and prophets of Allah, for the companions of the Prophet, for 'Abd al-Qadir al-Jilani, for the donor and his family, and for all Muslims.

6. Furthermore, the donor stipulated that the cell which abutted the entrance of the *zawiya* was to be allocated to the Sufi who was to act as door-keeper of the *zawiya*, whoever that might be.

7. The administrator of the *waqf* was to give the endowed money only to a capable man, who was prepared to pay the income of the *waqf* on time. The administrator was to hand over the money only providing he held either a strong mortgage or other suitable guarantee. He was to avoid anyone who was unjust, powerful or from whom it was difficult to disengage.

8. Finally, the donor stipulated that, if it proved impossible to pay out the sums assigned above, the *waqf* was to be for the Muslim poor anywhere.

Later periods

The relevant file in the Auqaf Administration is no. 3/17/35 and it is important in that it contains information on the history of the *zawiya* in the last four decades and in particular provides evidence on its function, income and any necessary repairs, services, and so on. The documents in the file show that the *zawiya* in recent times had no other source of income than the JD2.605 a month donated by the Auqaf Authority, and even that has stopped since

17 February 1986. Despite the lack of income, the *zawiya* still functions independently. Shaikh 'Abd al-Karim al-Afghani is the current *mutawalli*, and he comes under the direct supervision of the *qadi* of Jerusalem rather than the Director of the Auqaf (as the file 3/17/35 31-2, 37-8 shows). From 1372/1952 until 1387/1967 the *zawiya* provided accommodation for Afghan visitors and pilgrims while they were in Jerusalem (File 3/17/35 1, 5, 20, 39) and thus continued to function according to tradition rather than the specifications of the *waqf* document. As well as providing temporary accommodation for visitors, the *zawiya* also served as a permanent residence for some of the Afghan community in Jerusalem. Later, during 1983, part of the western wall of the façade collapsed as a result of penetration by water, which placed it under too much strain. The collapse of the masonry revealed a large barrel vault.⁴

Architecture

Exterior

Al-Zawiya al-Qadiriyya has two façades that overlook the street called Tariq Barquq, as already explained—one facing west, and the other facing south. At the south-western point, where the two façades meet at the corner, there is a chamfered re-used stone. It takes the form of a simple *muqarnas* with two small niches, each cut across by a horizontal divide, set under a single niche of the same design centred above. In the spandrels to either side of the upper niche, there is an incised stem, and the niches are each outlined by a fillet frame with a central groove.

[Editorial note: The chamfer of the corner masonry is to allow laden animals to make the tight turn. The decoration is a charming—and rare—example of street ornamentation in the Ottoman period. The profile of the three *muqarnas* niches is segmental, the break in outline corresponding to the horizontal change in the depth of carving in each. The foliage details that decorate the spaces on either side of the upper niche recall the somewhat similar organic interlace on the façade of Khalwat Qitas, cat. no. 16. SA]

The masonry of the western façade consists of regular courses of square, roughly dressed stones. It is high and long, measuring 26.8m by 5.4m. It is divided into two parts, both of which are unbroken apart from a small window in the northern section, which was rebuilt relatively recently after its collapse in 1983; it remains slightly recessed in relation to the alignment of the other part of the wall.

The southern façade

The wall forming the southern façade has four component parts: a western face, a recessed entrance-way, the southern elevation of the mosque, and a plain wall that runs east of the mosque's southern elevation. The western face, measuring 34.6m by 9.1m, extends from the south-western corner of the *zawiya* until it reaches the recessed entrance.

The entrance door is off-centre and set in a recess with a pointed arch. It is raised above the level of the street by two steps measuring 65cm in height. The entrance is flanked on either side by stone benches, and the door is surmounted by a lintel. The imposts of the pointed arch incline inwards as if for a horse-shoe arch. The tympanum of the arch contains three inscriptions. The lower one is modern, and is written on metal. It bears the message 'Mosque of al-Zawiya al-Afghaniyya, built in 1043. There is no God but Allah, Muhammad is the Messenger of Allah.' This notice was probably put in place when the mosque of the *zawiya* was re-opened in 1981. It was joined in 1996 by another metal inscription. It is made up of three lines written in a modern hand. The translation is as follows:

1. *Waqf* of al-Zawiya al-Afghaniyya
2. the 'Alawiyya Sufi order
3. Masjid al-Zawiya al-Afghaniyya 1043.

The second inscription, relating to the foundation of the *zawiya*, has been described above. The third and uppermost panel is also modern, but of marble, and probably dates to post-1967; it says '*Waqf* of al-Zawiya al-Afghaniyya, 1043'.

The third component part of this façade is the southern elevation of the mosque, which rises to twice the height of the entrance. The two lower courses of stonework are rusticated and of a larger scale than the other masonry in this part of the building. The façade is undecorated apart from two rectangular windows, each measuring 1m by 1.5m. Each window has a lintel surmounted by a small relieving arch, and is fitted with an old iron grille. This part of the façade is crowned by a projecting stone course which serves as a frame and extends around all four sides of the mosque.

The last part of this façade is a plain wall which constitutes the southern border of the plot of land situated to the south east of the *zawiya*. It is built of masonry that is identical with the fabric of the façade except for the upper three courses which are rusticated, and this suggests that they have been added later, after the main construction had been completed.

Interior

The entrance leads into a vaulted doorway measuring 1.9m by 1.5m. It is flanked by a remarkably thick wall to the east (1m) and west (1.4m). The doorway, which opens into a courtyard, has a flagstone pavement identical to that of the rest of the courtyard. This would seem to be the original pavement. Some of the flagstones measure 46cm by 1m and have the same colour, quality and size as examples in the floors of other Ottoman buildings such as al-Khanqah al-Maulawiyya.

The courtyard is spacious, its total area being in the region of 400sq. m. The central part is planted with a variety of trees and flowers. The rectangular planted area (some 12m wide by 18.5m long) is enclosed by a wall reaching a height of 68cm. In the *waqfiyya* described above, this area was called the *haud*, and described as square. It is not possible to be sure whether the details in the *waqfiyya* are in error or whether the garden has undergone some change which has altered it to the present shape.

Cells

The eleven cells (A-K) are almost identical in their shape, area, design, and façades. They differ slightly, however, in size. The only exception is cell H which has no window with an opening onto the courtyard, but instead there is a small one set in the west

⁴ The vault (M) is situated at the north-west corner. It was discovered on 6 March 1983 as a result of the disintegration of part of the western wall of the *zawiya*. The section that then came to light seems to have been part of the vault only, since a modern wall of masonry blocks divides it in two. The main entrance to the vault was probably at one time from the north, but it was closed some time ago. Access now is through al-Zawiya al-Qadiriyya itself by way of a recently constructed lower level. The profile of the vault, which runs from north to south, is pointed. It is built of good quality stone, and measures 25m long, 4.5m wide and about 3m high.

façade. The doors and the windows (each measuring 50cm by 76cm) of the rest of the cells open onto the courtyard. The door to each cell measures 76 cm by 1.5m, and is surmounted by a lintel with a relieving arch of the 'eye-brow' style above. To the east of each door there is a rectangular window, which has been provided with a simple iron grille for protection; the windows are similarly surmounted by a stone lintel and arch to conform to the style of the doors. The interior dimensions of the cells A to K are as follows: A, 3.7m by 2.1m; B, 4m by 2.2m; C, 3.7m by 2.1m; D, 3.6m by 2.1m; E, 3.6m by 2.15m; F, 3.6m by 2.1m; G, 3.6m by 2.7m; H, 3.2m by 2.8m; I, 3.1m by 2.8m (irregular shape); J, 2m by 3.1m; and K, 2.2m by 3.1m. Each is paved in stone, with a barrel-vaulted roof and blind niches in the walls. These range from one to three in number and vary in location. The walls of the cells are plastered. These cells, as the *waqfiyya* states (see above), used to provide accommodation for indigent Sufi residents.

The north-west chamber L

Chamber L is located next to cell K, at the north-western corner of the *zawiya*. It is rectangular in shape and measures 3.2m by 5.5m. The *waqfiyya* defines it as a small *ivan* with a cooking range and stone basin for the laundry (see above). It has two entrances in its eastern wall; the first is large and consists of an arch with a pointed profile, while the second is located to the north and consists of a rectangular door surmounted by a lintel. It is interesting that the *waqfiyya* denotes cell L as an *ivan*, and suggests that at the Jerusalem court at least some of the scribes were not conversant with the niceties of architectural terminology. Anyone who examines the plan of this so-called *ivan* will see immediately that there has been a mistake. An *ivan* should be open on one side and its floor level must be higher than the surrounding floor (Amin and Ibrahim 1990: 17).⁵

The interior of chamber L has recently been divided into two parts by a pointed arch, each part being covered by a shallow cross vault. The floor is paved with flagstones. In the southern part of the chamber, and close to the entrance, there is a well-head which seems to have been blocked recently. At a height of 35cm to the north of the west wall there is a window measuring 55cm by 70cm. It is the only opening in the west façade, as mentioned above. The north wall has two openings. One, to the west, seems to have been designed to contain the *aujaq* (cooking range), while the second to the east is a blind niche capped by a lintel and was probably intended to serve as a wall-cupboard. This chamber is now used once a week as a location for the Sufi *dhikr*.

The building O and P

This building is located in the north-eastern corner of the *zawiya*, and has two floors. The lower level (O) is original. In the *waqfiyya*, as mentioned above, it is defined as a house for the *shaikh* of the *zawiya*. Access to the hall is through the southern façade, where there are two doors; the one to the west is bigger than that to the east, and both are surmounted by a lintel. The interior of the house (the hall) is square in plan. It is divided into four square bays by four pointed arches. The arches are supported by a central pier, measuring 1.1m by 1.1m, and by the walls from which they spring. Each bay is cross-vaulted. Two rectangular windows are set in the western wall of the house; they have been recently

widened, and now have neither jamb nor lintel. In the north wall, and close to the level of the vault, there are two openings which were, it seems, originally chimney flues. They were apparently blocked at the time the second floor was added.

The masonry of the hall is different from that of the cells and the mosque and also from that of the second level, being more heavily rusticated than elsewhere in the *zawiya*. The inference of this difference in masonry might be that hall O was built at some time other than 1043/1633, but, since the lower part of the hall is mentioned in the *waqfiyya*, the hall must have been constructed at the same time as the rest of the *zawiya*. The difference in masonry could indicate a change in the availability of stone. Today the house is used for prayers and a meeting place for the people who frequent the *zawiya*.

The second level (P) was added at a later period and now serves as a house for the present *shaikh* of the *zawiya*. The upper storey is reached through a passageway that extends from the staircase leading to the mosque. This floor consists of two parts—an open courtyard, and a rectangular hall divided into two rooms. The first of these is larger than the second and both are covered by a modified form of the local cross vault. A door in the eastern elevation leads to the interior, and there is a window next to it. Four other window openings provide light—one in the south wall, and the other three in the west wall. The windows and the door are each surmounted by a semicircular arch. It is not possible to give a precise date for this upper level.

The mosque—exterior

The mosque is situated to the east of the main entrance of the *zawiya* and is raised 2.4m above ground level. Ten level steps, surrounded by a modern metal fence, lead to its entrance. The mosque is built of stone similar in quality to that of the main part of the *zawiya*. Of its four faces, the southern one is integrated into the wall façade that gives onto the street, as described above.

The main façade, with the entrance to the mosque, looks north. The doorway is simple, measuring 1.1m by 2m; immediately over it there is a lintel, and above that an 'eye-brow' relieving arch decorated with an interlaced geometrical device.

[Editorial note. This takes the form of a knot. The motif is based on the idea of a single strand of rope, which bifurcates into two thongs. These are interwoven to produce a rectangular interlace in the form of a guilloche or duplex knot. The two strands then re-unite before splitting again to terminate in a leaf. The pattern is also called 'Solomon's knot', 'the endless knot', 'single knot' and 'lover's knot' (Rainey 1973: 177). While its appearance over a door may be simply ornamental, it is possible that it carries a more complex message, for similar knots were used to adorn the upright strokes of letters in inscriptions. In particular, knots traditionally decorated the letters *lam* and *alif*, two letters of the name of God. Other words frequently decorated in a similar way were blessings or good wishes, such as the word *baraka* ('blessing'; Baer 1998: 62-7). It has been argued (Auld, unpublished PhD thesis) that the presence of a knot may have had a cosmic significance because the term for 'knot' in Arabic (*'uqda*) also has the subsidiary meaning—as in the Latin *nodus*—of 'planetary node'. Another possibility is that an alternative term in Arabic for 'knot' or 'plait', *saraja*, has an additional meaning of 'to light' (the lamp) or 'to beautify'. This term is used in the Qur'an (25: 62; 33: 45; 71: 15, and 78: 13) to describe God, the Prophet and the sun. The popularity of the use of knots in inscriptions, which first made its appearance in architecture in Persia and Central Asia in the 10th century and diffused westwards to

⁵ In the *waqfiyya* under discussion, there are two obvious mistakes. The first is the use of the term *ivan*, as just discussed, and the second is the use of *haud*—which usually means 'pond'—to denote the garden (see above).

become widespread in such minor arts as ceramics and metalwork by the later 12th or early 13th century, had waned by the 15th century. The appearance of a knot over the door of a mosque in Jerusalem in the 17th century is therefore interesting and indicative, if nothing else, of the long-lasting nature of decorative motifs in Islamic art. SA]

To either side of the door there is a rectangular window equipped with a grille; both also have a lintel and relieving 'eye-brow'-shaped arch. Round the top of all four façades runs a projecting stone cornice that acts as a frame for the whole building. Two hemispherical domes using a lime and mortar cement rest directly on the roof of the mosque. The roof itself is covered by small flat stones. In the usual way, each dome is topped by a stone finial facing east-west. The finials are identical, each comprising three parts. The lower and central sections are made up of a short cylindrical shaft divided by roll mouldings. The third, upper, section takes the form of an open circle.

The western elevation is divided into two halves by a central buttress. Two windows of identical design are placed in each half-section. At ground level a stone bench, 80cm wide and 70cm high, runs across the façade. Two elaborate stone spouts to the north of the western elevation direct water collected on the roof for storage.

Only about half of the eastern elevation is visible, for there is a difference in the ground level between the site of the *zawiya* and the land that borders the mosque to the east. What can be seen shows that the elevation is a twin of the one to the west except for the absence of relieving arches above the lintels of the windows, which are now blocked, and there are neither bench nor water-spouts.

The interior of the mosque consists of a rectangular prayer chamber divided into two by a pointed arch. Each half of the space is square in plan and is covered by a shallow dome. There is no intervening drum, the necessary circle being achieved by a transitional zone of pendentives at the corners of each square bay. There are twelve windows in all, six to each bay, surmounted by a pointed arch. They begin just above floor level at a height of 30cm. The walls are so thick (approximately 1.2m) that the window openings form wall niches large enough to accommodate a Qur'an stand and stool. In addition there are two blind niches, one to the east and one to the west, which serve as storage spaces. A simple concave *mihrab* is found at the centre of the southern wall between the two windows. It is constructed of stone and has a semicircular arch and fluted half-dome. The walls of the prayer chamber are plastered except for the area around the *mihrab*, where the stone courses remain visible.

36 SABIL WA MIHRAB WA MASTABAT SHA'LAN

Name: Sabil Sha'lan

Date: (A) *The sabil*

1. Construction 613/1216-7

2. First restoration 832/1429.

Second restoration 1037/1628. Third restoration undated

(B) *The mihrab and mastabat*

1. Construction 795/1392-32

First restoration 832/1429

Second restoration 1061/1651

Endowment: 1037/1628

Variants of name: It is known as 'Sahrij (cistern) al-Malik Mu'azzam 'Isa', 'Mihrab wa mastabat Yusuf Pasha', and 'Sabil Bairam Pasha', but the most widely used name is 'Sabil Sha'lan'.

Modern name: Sabil, Mihrab wa Mastabat Sha'lan. Evidence for this name first appears in the second half of the 17th century (see below under Founders).

Location

Sabil Sha'lan is located in the north-western section of the Haram esplanade, at the end of the path which leads from Bab al-Nazir to the upper terrace of the Dome of the Rock.

Site and brief description (figs. 36.1-36.4, pls. 36.1-36.9)

The *sabil* now consists of two units. The first is a small, rectangular room, with the mouth of the cistern at its centre. It is covered by a shallow dome. The second unit is a rectangular bay of stone with four pointed arches on heavy piers. Between the two sections there is a large stone basin. A rectangular *mastaba* abuts the *sabil* to the north, known as the 'Mastabat Sabil Sha'lan'. To the south of the *mastaba*, at the north-eastern corner of the chamber containing the cistern-head, there is a *mihrab* commonly known as 'Mihrab mastabat sabil Sha'lan' but it should more properly be called 'Mihrab Yusuf Pasha'. These structures are surrounded by open space, but Khalwa Parwiz (cat. no. 17) is only a few metres to the east, and to the west is Mastabat Jarkas. The *sabil* is no longer in operation.

History

Identification

Four commemorative inscriptions give a clear picture of the major development of the *sabil* over a long period; all have been published by van Berchem (1925: 99-102). Two of the inscriptions are pre-Ottoman but two are from the Ottoman period. The *sijill* entry specifies the location and the name of the *sabil*, recording that the '... *sabil al-wazir* ... is located in the Aqsa mosque below the stairs (the north-western colonnade) of the Dome of the Rock to the west.'

Although the cistern itself dates from the Ayyubid period, it is included here because its major architectural features are Ottoman (see below).

Date

The *sabil* was first built in 613/1216-7, according to the foundation plaque (A). This is marble and is to be found to the north of the western arch. It measures 55cm wide by 57cm high and consists of ten lines of Arabic written in simple, slender Ayyubid *naskhi* script with diacritical points. The script is incised

and is arranged in cartouches. The translation is as follows:

1. In the name of the Allah, the Compassionate, the Merciful—
2. (There) has volunteered to make this cistern
3. And this blessed *masna'* for the love of Allah
4. The poor slave (who hopes) for the mercy of Allah
5. Muhammad ibn 'Urwa ibn Sayyar al-Mausili—may Allah forgive him
6. And His blessing be upon him. (There has built them) by the grace of our master the Sultan
7. al-Malik al-Mu'azzam Sharaf al-Dunya wa'l-Din Abu
8. 'l-'Aza'im 'Isa ibn al-Malik al-'Adil Abu Bakr ibn
9. Ayyub—may Allah pardon them both. And this in the months of the
10. Year six hundred and thirteen (1216-7)—and the blessing of Allah be upon Muhammad and his followers.

The meaning of the word *masna'* is a structure to contain water, such as a pool, a basin or a cistern (see Amin and Ibrahim 1990: 108). Its meaning here is a cistern.

The second inscription (B) is Mamluk. It states that the *sabil*, *mastaba* (here called *musalla*) and *mihrab* were restored in 832/1429. The inscribed panel of marble (44cm by 54cm) is slightly recessed and is located to the south of the arch. It consists of five lines of Arabic, each set in a rectangular cartouche surrounded by a fillet border. The script is Mamluk *naskh* with diacritical and auxiliary points. The translation runs as follows:

1. (There) has renewed this *sabil*, *musalla* and *mihrab*, the poor
2. Slave of Allah Shahin, the Superintendent of the two sacred
3. Harams, in the reign of our master the Sultan al-Malik
4. al-Ashraf Barsbai—may God perpetuate his royalty—At the time of
5. The month of Ramadan the venerated, (in the) year eight hundred and thirty-two (June 1429).

The question remains when and by whom the *musalla* and the *mihrab* were constructed. The inference from the discrepancy between the two inscriptions is that it was some time between 613-832/1216-1429, and Mujir al-Din (1973 2: 273) does indeed give both a precise date and the name of the governor then ruling Jerusalem and Hebron. He writes that 'the Amir Balwi al-Zahiri, the inspector of the two Noble Sanctuaries (*al-haramain al-sharifain*) and the deputy of the Sultanate, who has constructed the *mihrab* and the *mastaba* located under the big fenced tree facing Bab al-Nazir, one of the gates to al-Aqsa mosque, in the month of Dhu 'l-Hijja 795/October-November 1393 ...' Al-'Arif (1947: 81) reiterated this information, whereas Taha (1988: 57) wrongly locates it close to Bab al-Ghawanim (see also cat. no. 55).

The third inscription (C) is Ottoman, and it too marks a restoration. The plaque is marble, measuring 60cm by 60cm. It has a chamfered edge, and is set into the wall above the arch between the two inscriptions described above. It contains four lines written in Ottoman *naskh*. The script is medium-sized, fine and attenuated; it is highly condensed with diacritical and auxiliary points. The translation reads:

1. (There) has ordered the restoration of this blessed *sabil* after it had fallen into ruin and disfunction
- 2.—the charitable, the dignified Wazir, the venerated Chancellor, His Excellency Bairam
3. Pasha, the Governor of Egypt the protected. It has been repaired under the direction of the Prince of the Noble Emirs, His Excellency
4. Muhammad Pasha, the Governor of al-Quds al-Sharif, in Dhu 'l-Hijja in the year 1037 (August 1628).

The fourth panel (D) commemorates yet another restoration. It is of stone and is to be found above the *mihrab* niche. Its octagonal shape is without parallel in Jerusalem. It is recessed, and set within a rectangular frame measuring 58cm wide by 42cm high, with chamfered edges to east and west. The plaque is damaged and is set at an angle and is therefore either not in its original position or is very inferior work. A fillet divides the octagon into two cartouches, each of which has a single line of Arabic text written in Ottoman *nashk*. The script is fine and slender, with diacritical marks and a few auxiliary points. The translation is as follows:

1. In His Name, Allah who is high above all, [this] gracious *mihrab* which is saved from any deficit
2. I have dated (the chronogram) '(He) has constructed a building by order of Yusuf Pasha' in the year (blank).

Van Berchem (1925: 102) tentatively read the last word of the first line as *muhasi*, but realised that it had no meaning. The preferred reading here is accordingly *muhasha* ('free of any deficit'). Van Berchem correctly gave the chronogram as 1061/1651.

Founder and restorers

The founder of the cistern was al-Malik al-Mu'azzam 'Isa, the son of al-Malik al-'Adil who was himself the brother of Salah al-Din al-Ayyubi. Al-Mu'azzam 'Isa contributed so much to the architecture of Jerusalem and to the Haram in particular that Mujir al-Din (1973 2: 100) concluded that 'of all the former rulers, the two who did the most charitable acts in the Aqsa Mosque and in the Maqam al-Khalil (the Great Mosque of Hebron) are al-Mu'azzam 'Isa and after him al-Nasir Muhammad ibn Qala'un'. Al-Mu'azzam 'Isa began his architectural work while he was Governor, continuing his projects after he had become Sultan (615-624/1218-27). Mujir al-Din (1973 1: 158, 402-3, 2: 19, 22, 28, 30, 34, 42, 104) listed most of the relevant monuments although some were omitted. Wiet (1949: 36), in the general index of the van Berchem corpus of Jerusalem Arabic inscriptions, gave the numbers of the inscriptions attributed to al-Mu'azzam 'Isa. (For further reading, see among others Burgoyne 1976; Walls and Abu'l Hajj 1980; Rosen-Ayalon 1985: 65-72; Rosen-Ayalon 1990: 306-14).

It is possible to identify the personalities connected with the construction and continuing care of the *sabil*. Muhammad ibn 'Urwa al-Mausili was one of the *khawass* (leaders) of the period of al-Mu'azzam 'Isa. He lived first in Jerusalem and then, after the walls of Jerusalem had been breached, moved to Damascus where, again according to Mujir al-Din (1973 2: 146), he died and was buried. In addition to Muhammad ibn 'Urwa al-Mausili,

four other rulers contributed to the restorations of the *sabil*, *mihrab* and *mastaba*. The first of these was al-Sultan al-Ashraf Barsbai (825-41/1422-37), who (according to Mujir al-Din 1973 2: 96) donated a huge Qur'an to the mosque of al-Aqsa. He set up a *waqf* to provide for the reciter and a servant in which he stipulated that the *shaikh* of al-Madrasa al-Salahiyya should be the reciter, and appointed al-Shaikh Shams al-Din Muhammad ibn Qutlubugha as a reader. Van Berchem (1925: 139) published the inscription concerning the renovation of a cistern in Jerusalem by Barsba'i. Burgoyne (1987: 542) studied the cistern under the name of 'the well of Ibrahim al-Rumi' (see also cat. no. 26). Mujir al-Din (1973 2: 274) mentions three men bearing the name 'Shahin' who acted as Superintendent of the two Harams in the time of Sultan al-Ashraf Barsbai (825-841/1422-37). But given the year of the *sabil*'s restoratio, it is clear that the relevant man was Shahin al-Shuja'i.

Bairam Pasha was the vizier of Egypt and the patron of the *khalwa* named after him on the terrace of the Dome of the Rock. For his work in Jerusalem, see cat. no. 34. For the biography of Muhammad Pasha, who was governor of Jerusalem in 1037/1628, see cat. no. 35. Finally, Yusuf Pasha, who was responsible for the restoration of the *mihrab*—according to his *waqf* document registered in Jerusalem Sijill 145: 324 dated 14 Jumada I 1061/5 May 1651—was at one stage governor of Aleppo and then governor of Jerusalem in 1061/1651. The *waqfiyya* states that Yusuf Pasha donated 95 *ghirsh asadi* (gold coins). The yearly interest on that sum, which amounted to 14 and one-third *ghirsh*, was to be allocated to:

2 reciters in the Dome of the Rock (each at 4 <i>ghirsh</i>)	8
Oil to illuminate the cave of the Dome of the Rock	2
For the persons in charge of lighting the lamp	1
The surplus (for the Administrator of the <i>waqf</i>)	3.33
Total	14.33

Endowment

The record in Sijill 13: 248, discussed under cat. no. 34, suggests that an unspecified portion of the money donated by Bairam Pasha and sent to Jerusalem was allocated to the restoration of Sabil Sha'lan. This accords with the stipulation made by Bairam that the money he had made *waqf* should be spent on repairing any Haram cistern in need of renovation. The information contained in the *sijill* further suggests that following its restoration, Sabil Sha'lan was included among the institutions of the Haram which were to be financed and maintained from Haram income. This can be deduced from Sijill 168: 5 dated 8 Jumada II 1098/21 April 1687, which informs the reader that the *qadi* assigned to Shaikh Muhammad ibn Mustafa al-Ghudiyya the office of *al-siqayya* (water supplier) for Sabil Bairam Pasha. Shaikh Muhammad replaced Shaikh Ibrahim, the son of the deceased Shaikh Sulaiman ibn Sha'lan. He was to be allocated one *'uthmani* for the ropes and buckets, and one *'uthmani* for himself per day, which were to be paid out of the income of the 'Noble *waqf*'. It is interesting to note that at this date, in the later 17th century, the *sabil* bore the name of Shaikh Ibrahim. The father of Shaikh Ibrahim, Shaikh Sulaiman ibn Sha'lan, features in another record in Sijill 123: 397 where we learn that he had been appointed as a daily reciter of the Qur'an in the porticoes of Bab al-Nazir at a rate of five *ghirsh* annually.

Architecture

A rectangular bay, measuring 1.7m wide by 2m long and 2.17m in height, dominates the western façade of the *sabil*. It consists of four pointed arches whose span to west and east is 2m, while to south and north it is 1.04m. The arches are carried on four piers. The two outer supports are square (70cm by 70cm), and those towards the interior have been integrated and concealed from the outside by the northern and southern walls of the *sabil* chamber, probably when it was restored. The masonry of the bay is finely dressed and has thin joints, contrary to that of the *sabil* chamber. This would indicate that the two types of masonry probably belong to different phases of construction, with the bay belonging to the earlier building phase. The main western arch of the bay is decorated with the three inscriptions described above (A-C). The central plaque (C) is placed directly above the arch, and the other two are to the north and south of the arch respectively. A stone cornice projects to act as a frame marking the summit of the bay. The ground level in front of the arches is that of the most recent level of the Haram esplanade; it has at some point been raised, for the height of the piers is only 1.1m from ground to the springing of the arch. Most of the area of the two esplanades of the Haram was paved during the Mamluk period (see Qubbat al-Nabi, cat. no. 10). The rise in level could thus be taken to imply that the bay is pre-Mamluk, or, in other words, Ayyubid—presumably dating from the year 614/1216-7. But the implicit purpose of the bay and the layout of the three inscriptions tend to weaken this surmise. The locations of the inscriptions on the Haram have been chosen with considerable care, and most, if not all, are at a focal point. If it is right to see the bay as Ayyubid, it is odd that the Ayyubid plaque is not in the central position which is now occupied by the Ottoman inscription. It seems more likely, therefore, that this bay forms a second phase in the building of the *sabil* and that it was thus presumably built (or rebuilt) during the Mamluk period, with the two inscriptions—the Mamluk to the south of the arch and the Ayyubid to the north—set so as to balance each other. The Ottoman slab has been added in the centre. The function of the bay even as a secondary phase of construction is still not entirely clear. The ceiling below the roof of the bay has been recently lowered by 31cm in order to accommodate a modern electrical refrigerator for water. The bay, expressed on the exterior as flat-roofed, has a cross vault in the interior.

At the back of the bay, where it abuts the *sabil* chamber, there is a recessed niche surmounted by a pointed arch. The upper part of the niche, the arched apex, is now hidden, for it is blocked by the bay described above. The central area of the niche consists of a blocked-up window measuring 64cm by 90cm, and below it there are two thick stone slabs with a hole 6cm in diameter pierced through each. The lower part of the niche consists of a rectangular stone dais measuring 2m long by 90cm wide and 1.41m in height from the floor. The upper part of this dais was designed for use as a basin to hold water, and there are two circular apertures 21cm in diameter in the stone cover, one in the centre and one to the south. It was the original intention that a third aperture would be cut to the north. It seems most likely that water was first drawn from the cistern and then poured into the upper basin; from here it would run through the two small holes into another trough which would serve as the dispenser. If this hypothesis is correct, the recessed niche with its three parts (the arch, and the upper and lower troughs) is the oldest part of the structure of the *sabil*. This would mean that it could date from the Ayyubid period.

The three external walls of Sabil Sha'lan to the north,

the south, and the east are similar. They are constructed of various sizes of square and rectangular stones that are roughly dressed. The masonry joints are so inaccurate that they are occasionally filled with rubble (*daqshum*), which is a sign of both low quality and shortage of funds. The building in this respect would resemble domestic architecture more than a public monument with a long history. The ground around the walls is uneven, with a considerable degree of change in level. As usual, the masonry of the lower courses is larger than that of those above. There are two windows in the northern and southern sides with an identical measurement of 78cm wide by 1.4m high. The lintels, jambs and sills of the windows have been finely cut and project slightly from the wall. The windows are now fitted with modern iron bars. The northern wall shows the various phases of the building both through the alignment of the courses and through the fabric itself. The four stages of development are clearly differentiated—the earlier phases have already been mentioned above, namely the recessed arch, and the bay. The chamber of the *sabil* is the third phase, and the fourth and final stage is represented by the *mihrab*. Three stone steps 70cm in height lead up to the door of the chamber, which measures 76cm wide by 1.67m in height. Simple in form, the door has projecting jambs and a lintel made up of three jogged blocks. A heavy ovolo and fillet moulding in stone creates a cornice which runs around the top of the four sides of the building, marking the change to dome level. A single-course stone parapet is raised above the cornice on the east and west sides in order to divert the rainwater.

The shallow ribbed saucer dome, which resembles an umbrella in form, is set on a circular drum one course high surmounted by a roll moulding. The dome is carved in stone and, instead of the usual finial, a stone ball is set at its apex. The style of the dome is unusual. It is the only incidence of its type in the Haram or in the Old City of Jerusalem as a whole. It is western in style and was built probably in the second half of the 19th century, when western styles of architecture were followed in Jerusalem instead of traditional ones. It is hoped that there may be photographic evidence yet to be discovered which would support this tentative date.

The interior of the *sabil* chamber is rectangular in plan, made up in the main of a square area covered by the dome and a rectangular recess which is surmounted by a pointed arch. This area resembles a small *iwān* of 1m in depth. The mouth of the cistern is in the middle of the room at floor level. The room is paved in white dressed flagstones, and both the cistern-mouth and the floor are now covered by a modern rug. The sills of the windows to south and north contain basins to hold water, and there is a third one (now blocked) to the west. The later basin once provided the outer trough to the west with water. These three basins—or at least the two that still exist to the south and north—were most probably added during the last restoration of the *sabil* in 1037/1628. At this time it would seem that Sabil Sha'lan was converted from a 'one-window' or trough type to a 'three-window' type of fountain, like Sabil Mustafa Agha (cat. no. 48), and Sabil Bab al-Maghariba (cat. no. 18). The interior four walls and the saucer dome have all recently been plastered and whitewashed. Inside, the dome rises directly above the walls without any apparent drum, despite its exterior expression, for here it is carried on four pendentives.

The *mihrab* abuts the north-eastern corner of the *sabil* chamber to the south of the *mastaba*. It is built of the same dressed masonry as the majority of the external *mihrabs* on the Haram and takes the form of a rectangular block measuring

1.36m wide by 2.1m high by 87cm deep. The concave niche measures 68cm wide by 1.3m high by 45cm deep, and is undecorated. The apex is in a form of a shell niche and it is surmounted by a pointed arch. The second stone of the arch on the east is poorly finished. The inscription plaque (described above), which records the restoration of the *mihrab* by Yusuf Pasha, is set directly above the arch. A projecting frame with a chamfered moulding marks the apex. The upper part of the southern side of the *mihrab* has a sloping roof to prevent any retention of water.

The *mastaba* of Sabil Sha'lan lies to the north of the fountain itself, and is reached either by way of two stone steps to the east, or by a stairway of eight steps to the west, the difference being an indication of the degree of change in ground level. The *mastaba* is bordered by eight concrete blocks linked by two levels of simple iron piping, which were probably laid in place by the Supreme Muslim Council in the first half of this century, and it is paved by a recent stone pavement except on the east, north and

west, where a strip about 1m wide has been left unpaved. A large tree grows in the western section of the *mastaba*, and this accords with descriptions by various travellers of the prayer platforms on the Haram (see cat. no. 55, under Identification). Only Sabil Sha'lan and Sabil Bab al-'Atm (cat. no. 8) have both a *mihrab* and a *mastaba* attached to them. Although it is not a general rule, many of the *sabils* on the Haram were constructed near a *mastaba* with a *mihrab* attached to them. Examples of this practice are: Sabil Qasim Pasha (cat. no. 2); Sabil Bab al-Maghariba (cat. no. 18); Sabil Mustafa Agha (cat. no. 48); and Sabil Qa'itbai (887/1482). Although there is no record of why this should be, it is reasonable to suppose that a group of people gathered for a lengthy period of recitation, contemplation or instruction would benefit from being close to a source of drinking water.

37 MIHRAB 'ALI PASHA

Name: Mihrab¹ 'Ali Pasha**Endowment:** None known**Date:** 1047/1637-8**Variant of name:** None known²**Modern name:** Mihrab 'Ali Pasha**Location**

The *mihrab* is to be found to the west of the Haram platform, about 10m north east of Bab al-Qattanin, between the west wall of the Haram and the Dome of the Rock esplanade.

Function: There can be no doubt that the *mihrab* was constructed with a dual purpose in mind. The first, as the inscription states, was to commemorate the founder, 'Ali Pasha. The second was to adorn the Haram with another monument, which would also serve a religious purpose. The *mihrab* itself is not sacred in Islam, but it fulfils an important function in acting as a guide for the faithful, pointing towards the direction of Mecca.

Site and brief description (fig. 37.1, pls. 37.1-37.3, col. pl. LV)

The *mihrab* is a single-unit, stone-built structure, situated on the southern side of a rectangular stone eponymous *mastaba*, known as the 'Mastabat Mihrab 'Ali Pasha'. The *mastaba* is surrounded on all four sides by open ground.

History**Identification**

The *mihrab* is securely dated to the Ottoman period by virtue of an inscription panel which contains the name of the founder and the date of construction.

Date

The date of the *mihrab* is repeated, and is given in two different ways. It appears numerically at the end of the inscription as 1047/1636-7, and it appears again by means of computation of the numerical value of the letters of the last phrase.³ The plaque is rectangular in shape, and is made of marble, set in a slightly recessed, chamfered panel; it measures 80cm by 25cm. The inscription is in two lines of Ottoman *naskhi* script, written in the form of Arabic poetry. The script is set in two rectangular cartouches divided by a perpendicular fillet moulding into four equal parts. At the beginning and end of both horizontal and

vertical fillets, there is a small quarter-rosette of two 'petals'. Thus, at the top and bottom of the vertical, central fillet, where two sections meet, a half-rosette is formed. The full rosette, which has eight 'petals', is created at the centre of the plaque, where the various fillets cross. The script is elegant, crisply carved, and well-proportioned with diacritical and auxiliary points, with unfilled spaces between the letters. It must have been designed by a master calligrapher.

The inscription has been studied and published by van Berchem (1925: 191). The Arabic version is to be found in Cat. Appendix 2 (no. 37). The translation reads as follows:

[The *mihrab*] was built by 'Ali Pasha, who is acknowledged in good deeds—an excellent *mihrab*—They dated [it] (the chronogram). Through it, 'Ali is commemorated (in the year) 1047 (1637-8).

Founder

Nothing is revealed in the inscription about the founder. However, his title 'Pasha' implies that he was the governor of Jerusalem in 1047(1637-8).

Endowment

None is known. It would not be surprising if no *waqfiyya* existed for the upkeep of the *mihrab*, since its function is straightforward. The fact that it is located within the Haram precinct reduces the likelihood of any *waqfiyya* having been established because funds from the *waqf* of the Haram al-Sharif would be used to finance its upkeep or any necessary restoration. The question arises, however, as to how easy it was to obtain permission to erect a structure on the Haram? The records of the *sijills* suggest that there was no hard and fast rule that covered all structures. In one case (Sijill 77: 243), when 'Abd al-Muhsin ibn Nammar, the master builder of the Haram al-Sharif and the city of Jerusalem, sought to build a cell in which to keep his building tools, he had first to convince the *qadi* of Jerusalem of its importance for his work before he was granted permission. (See also Chapter 36 'Abd al-Muhsin ibn Mahmud, under the Ibn Nammar family). For more complicated structures, such as the two *khalwas* of Ahmad Pasha (cat. nos. 22, 23), a legal authorisation (*fatwa*) was needed from a prominent scholar living outside Jerusalem before permission could be granted to build them (for more details see cat. no. 22, under Identification and Sijill 79: 312). In another case (Sijill 79: 574), permission to open two windows in the Dome of the Rock was granted following official approval gained from the authority at Istanbul. (For further details, see Chapter 36 under the heading 'Ottoman repairs on the Haram in the 16th Century').

Architecture

The *mihrab* is reached by means of steps in the middle of the eastern, northern, and western sides of the level *mastaba* platform. There are three stone steps at each side, rising 70cm from the ground to the level of the *mihrab*. The elevation of the *mastaba* dais is made up of three courses of stonework, and it is paved in fine white stone slabs, the largest of which measures 66cm by 80cm. The slabs resemble those of the rest of the pavement of the Haram precinct, which have now weathered to grey. The paving scheme of the *mastaba* is divided into two sections by an axial line of flagstones which leads from the steps at the northern end of the *mastaba* to a point in front of the *mihrab*. The *mastaba* platform is

¹ For an overview of the *mihrabs* of Jerusalem in the Ottoman period with regard to number, type, location and significance, see Chapter 36 under the heading 'Mihrabs'.

² As far as I know, there is no other name currently in circulation for the monument. However, most of the local populace refer to it with reference to its site rather than by a specific name. For example, it is described as 'the *mihrab* opposite Bab al-Qattanin'. When the Department of Islamic Archaeology and the British School of Archaeology began their survey of the Mamluk and Ottoman sites, this was found to be the case for most of the monuments of Jerusalem. Most were known by the names of the families who currently occupied them rather than by their historical or founder's name.

³ The phrase is *bihi 'Ali yudkhir*, which by *abjad* can be computed to equal 1047.

not protected by a stone barrier and measures 7m by 11.6m.

The *mihrab* is a concave (*mujawwaf*) niche cut into a rectangular wall, which is built of high-quality stone.⁴ The niche, which measures 1.04cm wide by 49cm deep by 2.3m high, is surmounted by a pointed arch built of alternating *ablaq* stonework. The use of coloured stone and the form of the arch are the most distinctive features of the *mihrab*. The stones vary in colour from white to grey, red and black. The *mihrab* is expressed externally by a simple three-faceted façade surrounding the convex niche, which projects beyond the south edge of the *mastaba*. Evidence of recent repair can be seen in the repointing of the coursing of the *mihrab*.

Features

As already stated, undoubtedly the *mihrab* was intended to fulfil a dual function. The first, as the inscription states, was to

⁴ See Chapter 36, n. 64.

Fig. 37.1 Mihrab 'Ali Pasha, plan and elevation.

Pl. 37.1 Mihrab 'Ali Pasha, general view.

commemorate the founder, 'Ali Pasha. The second was to adorn the Haram with another monument, which could also serve a religious purpose. The *mihrab* itself is not sacred to Muslims but the direction of Mecca is of paramount importance in prayer and the *mihrab* has been developed to the extent that it can be either an integral or a separate element in Islamic architecture. In Jerusalem this development began in the early period although the earliest extant example dates only to the Mamluk period.⁵ The practice continued to flourish in the Ottoman period when *mihrabs*, although normally found integrated with other architectural elements,⁶ are on occasion found in free-standing form, like the one under discussion.

⁵ Mujir al-Din 1973; Burgoyne 1987. Examples of these are Mihrab Da'ud and Mihrab Jarkas.

⁶ Examples of this type include Iwan al-Sultan Mahmud II (cat. no. 50), Qubbat al-Nabi (cat. no. 10) and Qubbat Yusuf Agha (cat. no. 39).

38 QUBBAT YUSUF

Name: Qubbat Yusuf (Dome of Yusuf)

Date: Muharram 1092/January-February 1681

Endowment: None known, see below

Variants of name: Qubbat Yusuf ibn Ayyub (Salah al-Din), Qubbat Yusuf Agha

Modern name: Qubbat Yusuf

Location

Qubbat Yusuf is to be found on the terrace of the Dome of the Rock, in the western sector of the middle of the southern area.

Site and brief description (figs. 38.1-38.5, pls. 38.1-38.7, col. pls. LVII, LXIII)

Qubbat Yusuf is a single-unit, free-standing structure. It is to be found between the *minbar* (pulpit) of Burhan al-Din (740/1388) and al-Qubba al-Nahawiyya (604/1210-11) at the western edge of the upper terrace of the Dome of the Rock, facing the south-western façade of the Dome of the Rock.

The building, which is commemorative, is rectangular in plan, and its dome is supported on three pointed, open arches and a solid back wall. This southern wall is embellished with elaborate carved masonry ornament.

History

Identification

Two foundation inscriptions securely place the dome within the Ottoman period. The first is written in Arabic and the second in Ottoman Turkish. A third monumental inscription dates from the Ayyubid period, and is located in secondary use on the interior (that is the north-facing) elevation of the southern wall. The latter inscription has misled some scholars into identifying the building with Salah al-Din Yusuf al-Ayyubi (see below).

Date

Shafi'i *et al.* (1971 2: 34), Rogers (1973: 268-9), Drory (1980 10: 57), Gauthier-Van Berchem and Ory (1982: 67) and Najm *et al.* (1983: 99) believed that the dome was constructed at the time of Salah al-Din in 587/1191, and renovated in 1092/1681 by the Ottoman Yusuf Agha. Rogers is the only one who raised the possibility that it might have been built by Yusuf Agha. The reason for these scholars' belief was probably the Ayyubid foundation inscription. All three inscription panels were published by van Berchem (1925: nos. 150, 151: 23-36). The earliest Ayyubid plaque is dated 587/1191, and it records the rebuilding of a wall and the bridging of a ditch (*hafr al-khandaq*) by Salah al-Din. It is clear that this cannot refer to the construction of the domed building and must be in secondary use, as van Berchem himself recognised, followed by Rosen-Ayalon (1990: 305). There is thus no reason to believe that the dome was constructed in the Ayyubid period; the confusion seems to have been caused by the fact that the panel was in secondary use and had been listed (correctly) under the Ayyubid section by van Berchem, and this fact was then taken to refer to the building as a whole rather than to the plaque alone.

The other two panels are Ottoman; they give the date of Qubbat Yusuf as Muharram 1092/January-February 1681. The two later marble panels are placed in the spandrels of the pointed arch facing north. The first, to the west of the arch, is square, 50cm by 50cm, and is written in Ottoman Turkish. The inscription is arranged in five lines of Ottoman *naskh* in relief. The script is slender with diacritical points. The translation runs as follows:

The Superintendent 'Ali Agha has built this (edifice)—that the reward should all fall on Yusuf Agha! On seeing it, the oracle pronounced its date: 'It was finished in one thousand and ninety-two' (Muharram of the year 1092/January-February 1681 is specified in the second plaque).

Van Berchem (1925: 32, n. 1) indicated that the fourth line is not a chronogram as first seems to be the case, because the sum of the numerical values of the letters is only 835. Perhaps the strangest part of the inscription is that it gives 'Ali the epithet 'Agha', which should have been applied only to governors or other high-ranking officials. 'Ali, on the other hand, to judge by the inscription, was only 'the superintendent (*nazir*)' acting on behalf of Yusuf Agha. 'Ali was thought by van Berchem to have been the Superintendent of the Haram, which might have warranted him being called *agha*, but further information has been uncovered which indicates that he was probably *mi'mar al-masjid al-sharif* (builder of the Noble Mosque) and that his full name was 'Ali ibn Nammar (see below).

The second plaque is to the east of the arch; it measures 50cm wide by 40cm high. It is also of marble, and shares the same layout and style as the Turkish panel although it is written in Arabic. The translation is as follows:

1. (There) has built this (dome) out of godliness (piety) on behalf of Yusuf,
2. the Agha of the Abode of Supreme Felicity (Istanbul), through his perfect godliness (piety).
3. We are presented with it in the phrasing (chronogram) 'Regarding its construction
4. 'Ali has built it (the dome) but the reward for it returns to Yusuf'.
5. Muharram of the year 1092.¹

It is clear from the text of these two plaques that the dome was built in the Ottoman period, for the repeated use of the word *bina* (construction) in both the Arabic and Turkish inscriptions with no mention of a restoration or repair, unlike in many other buildings in the Ottoman period, underlines that point. Rosen-Ayalon (1990: 307) knew of only one inscription in addition to the Ayyubid text; she had difficulties in dating the dome because she recognised several post-Crusader features, which she did not specify, but still believed that the building could be either late or immediately post-Ayyubid. It is true that a first inspection gives the impression that many elements are Crusader, but a more careful analysis shows that there is in fact only one area which is original, unadulterated Crusader work, and this is the two columns and capitals located on either side of the blind central niche of the south wall. The other 'Crusader' elements, as van Berchem already pointed out (1925: 34), are merely pastiches. The presence of Crusader elements in Islamic architecture in Jerusalem in general, and more particularly in Ayyubid and Ottoman architecture, is an undisputed fact but it alone is not enough to date the monuments in which they occur as being Crusader, especially if they have foundation inscriptions which give a different date. If one adds to the presence of the inscription further information regarding the founder and the master builder,

¹ Dr Christine Woodhead translates this panel as:
Superintendent 'Ali Ağa
When[Hâtîf?] saw it he gave the chronogram
It was completed in 1092.
Muharrem 1092.

as is the case for Qubbat Yusuf, there can be no doubt about its Ottoman date. Indeed, in my opinion Qubbat Yusuf must be seen as a commemorative monument. The presence of so many reused elements can easily be explained not only by the fact that recycling material saves both time and money, but also because the beauty of the stonework was appreciated by successive patrons and builders. In the Ottoman period there seems to have been an additional reason for re-using material in newly constructed buildings—a lack of quarrying. Hundreds of pages in the Jerusalem *sijills* were perused that record various proceedings in the city, but not one of them contains a mention of stone being quarried or newly cut. There are on the contrary, many references in the *sijills* (see Chapter 36 under the heading Stones) to dismantling older structures or to selling the masonry from a ruined building.

Founder

Information on the founder has been published to only a limited extent. Everything that has appeared is derived from the two foundation inscriptions described above, supplemented by material found in a further two inscriptions concerning a second domed building (cat. no. 39) constructed by the same patron. The only information, then, that can be gleaned from these is the name of the patron—Yusuf—and that he was Agha of Istanbul, identified by van Berchem (1925: 32) as a eunuch of the imperial palace. But his relationship to Jerusalem is not made clear. However, while searching in the *sijills* for an endowment document for the two domes in or around the year of the construction, a record (Sijill 183: 225) was discovered which gives information about the founder² and the builder. It reports that Yusuf Agha had made over two plots of land outside (*bi zahir*) Jerusalem as *waqf*. The plots were bought by his legal agent, al-Hajj 'Ali. Yusuf Agha dedicated these plots as a cemetery for the burial of Muslims. The *waqfiyya* is dated Dhu 'l-Hijja 1091/December 1680–January 1681—that is, just a few months before the construction of the two domes. In the *waqfiyya* a series of epithets for Yusuf Agha are mentioned, from which it is possible to infer that he was Governor of Jerusalem, although this is never directly stated, for his titles are identical to those used for the city's governors, such as *mu'tamad al-muluk wa 'l-salatin*, and *mu'taman al-daula al-'aliyya al-'uthmaniyya*. From the same document it appears that al-Hajj 'Ali was the recent caretaker of the *waqf* of the Dome of the Rock and al-Aqsa mosque, as well as the *waqf* of the Great Mosque at Hebron. In addition, we learn from a separate record (Sijill 183: 226) that al-Hajj 'Ali was the master builder of the Noble Mosque (*mi'mar al-masjid al-sharif*) and that his full name was 'Ali ibn Nammar. This is a fascinating piece of information, for we know that 'Ali was the brother of 'Abd al-Muhsin ibn Mahmud ibn Nammar, the master builder of Jerusalem and the Haram in the late 16th century and the early years of the 17th century (see cat. no. 22). He thus belonged to the most famous family of builders in Jerusalem in the

Ottoman period. This would explain the relationship between al-Hajj 'Ali and Yusuf Agha.

Purpose of the Building

Neither the foundation inscription nor the *sijill*, nor indeed any other historical source, reveal anything about the function of the building. Since the structure is relatively small and similar in principle to many commemorative domes scattered over the upper terrace of the Dome of the Rock, it is probably correct to see it too as commemorative. The question remains as to what event or personality was to be commemorated. Most probably Yusuf Agha wanted to be remembered for his good deeds in the Haram al-Sharif—this at least is the impression given by the emphasis in the inscription that any reward should go to the founder. Van Berchem (1925: 34–6) commented that the re-use by Yusuf Agha of the Ayyubid inscription slab was intended to add prestige to the new building by making a connection with Yusuf Salah al-Din, the great sultan who liberated Jerusalem from the infidel Frank, and thus gaining additional divine blessing on both it and—by extension—on himself. Van Berchem further hypothesised that he would not be surprised if Qubbat Yusuf became in due course known as 'the dome of the patriarch Joseph' in the same way that, a little to the north, the dome of a *wazir* called Sulaiman had become known as the Dome of Solomon (van Berchem 1925: 35).

Architecture

The dome, which has a shallow profile, is carried on three pointed arches that face towards the west, north and east respectively, and on a solid wall to the south. The arches are similar in height and span, and the spaces between them have been left open. The voussoirs of the northern arch are a type of chevron, while those to the west and east are undecorated and form a simple arch, springing from a corbel block to the south. The corbel is decorated with a large trefoil motif similar to a *fleur de lys*. A tie-beam connects the arches at the level of their springing. The arches are supported by columns, one at the north-western and one at the north-eastern corner, and by the solid rear wall to the south. The shafts of the white marble columns are cylindrical, each measuring 1.93m in height, and with a radius of 55cm. The capitals are fairly simple—over a concave collar, they swell to form a shallow cushion which supports a square abacus. The bases are square, with a torus moulding and apophyge. In order to strengthen the joints, a metal band has been placed around the junction at the top and bottom of each column. These were added in the early 1970s by the Aqsa Restoration Committee, at the same time as similar bands were placed round the shafts of Qubbat al-Nabi (cat. no. 10), Qubbat al-Arwah (cat. no. 30) and Qubbat al-Khadr (cat. no. 31). These replaced copper bands, which were probably added as a precaution against collapse or after damage by one of the many local earthquakes. The spandrels of the arch to the north contain the two inscription panels described above. Those to the west and east are without decoration. The dome sits directly on the upper part of the structure with no intervening drum; it is ribbed and covered with lead sheeting to protect it from the elements. It culminates in an elaborate stone finial, now sadly broken, made up of two sections separated by a roll moulding. The lower part is pyramidal in shape while the upper section, part of which is missing, consists of an oval held within four bands that surround it to form the base of a stem that must once have held the finial. The finial, like the majority on the Haram, faced south-north—that is, in the direction of Mecca. The lead sheeting and the finial were renewed as recently as 1997 by the Aqsa Restoration Committee.

² There is another record (Sijill 145: 243) which concerns the appointment of al-Shaikh 'Abd al-Haqq ibn Jama'a to the *waqf* of Yusuf Agha in return for the payment of one *ghirsh* (gold coin) per year. Unfortunately this was the only detail given, and it is dated 1061/1650–1. This makes it unlikely that it belongs to our Yusuf Agha as patron of the two domes—but may refer rather to another Yusuf Agha altogether. Another possibility is that Yusuf Agha associated with the date Muharram 1092/January–February 1681 was in fact renovating the two domed structures rather than building them from scratch. It remains puzzling that Yusuf should have instructed 'Ali to build or repair two domes in the Haram in the same year.

The building is rectangular; it measures 2.38m wide by 3.24m long and is raised 11cm above the level of the terrace by means of a square stone platform which measures 2.36m by 2.36m. The platform is paved with rectangular coloured marble and stone slabs of various size, the biggest being 70cm by 120cm whereas the smallest measures 18cm by 21cm. Access is equally possible from the west, north or east. The southern wall is solid and measures 88cm wide, 2.38m long and 3.2m high; the exterior is constructed of dressed masonry. The interior façade of the south wall is divided into two main horizontal sections. The lower part is probably built of a number of stone courses, but it is not possible to see them, for they are obscured by the large Ayyubid inscription panel which measures 1.87m wide by 97cm high. It is this that bears the name of Salah al-Din, and commemorates the construction of a wall and bridge over the ditch in 587/1191 (van Berchem 1925: 23-31). A recessed frame moulding separates the inscription plaque and the upper part of the wall, which consists of a rectangular recessed blind niche surmounted by two pointed arches with different profiles, designed probably for contrast. The niche is backed by a single slab of white marble framed by red marble blocks. In all it measures 95cm by 69cm. The voussoirs of the inner arch are gadrooned and are supported by two identical slender columns which are partly integrated into the masonry of the southern wall. The shafts of the columns are also of white marble; they are 49cm in height, and their capitals are formed of two levels of broad one-lobed leaves below ram's horn volutes. A small part of the base is visible in addition to the roll moulding separating it from the shaft.

The tympanum of the arch is filled with a carved concave scallop-shell with fourteen gently curving ribs radiating from a central five-petalled rosette which is flanked by volutes. The motif still has traces of green and blue paint, which may have been added at the time of the visit of Kaiser Wilhelm in 1898.² The gadrooned inner arch is flanked by the outer chevron arch supported by two columns. The extrados of the chevron arch is framed by a narrow moulding decorated with a repeat leaf-motif, probably based on the Classical egg-and-dart moulding. At the intrados of the arch it is possible to make out a trace of blue-painted decoration in the form of a floral motif of arabesque design, though it too appears to be late.

The shaft of the eastern column which supports the outer chevron arch is constructed of three segments of stone of different height; it is broken and part of it has been lost. A roll moulding separates the shaft, capital and base of the column to the west. This west column is similar in layout although it is made up of only two segments. Directly below the roll moulding on the upper fragment of the shafts there is a narrow concave band with an intermittent circular pattern. The bases are square and undecorated but their tops have been reduced to match the shafts. The capitals are decorated with volutes flanked by alternating foliate and geometrical leaf motifs. A rectangular panel is set into the wall to either side of the niche to east and west. These are flanked by the outer columns which support the outer chevron arch, and by attached columns to each side of the inner recess to the rear. The attached columns are identical to those supporting the outer chevron arch. The panel is made up of two sections; the lower part is red and undecorated, whereas the decoration of the upper part is made up of two motifs arranged in a way reminiscent of *muqarnas* panels. Below there are two tiers of a series of five lancet panels,

while above there is a reversed scallop-shell composed of three broad concave ribs to each side of a central, closely fluted section.

The small dome rests directly on the four façades, the transition zone being realised by means of four corner pendentives without an intermediary drum. The inner saucer of the dome is decorated with a series of thirty-eight radiating ribs which curve away from the central depression in a whorl pattern. Round this central device runs a concentric, incised band of thirteen zig-zags which is surrounded in turn by intersecting concave-sided stars of irregular form, with thirteen points in all reaching to the edges of the dome. The dome is plastered and coated with a yellow wash.

Features

The description of the architectural features of Qubbat Yusuf underlines the fact that its construction uses different types of decorative and architectural elements. These can be divided into three categories—the first includes purely Islamic features, such as the small *muqarnas* niches, the inscription panels, the decoration of the dome and the arabesque floral ornamentation. The second category is represented by the chevron arches and the gadrooned arch and these, although originally Crusader, were adopted and used throughout the Ayyubid, Mamluk, and Ottoman periods to such a degree that they became integral parts of the architecture of these dynasties. The third category consists of the true Crusader elements, represented by the two small columns with their capitals situated on either side of the blind panel. The decorative scheme of the south wall is indeed reminiscent of a jigsaw puzzle. It brings to mind the computing 'cut and paste' command, for it contains elements of all three categories. The Crusader elements are no more dominant than any of the others, however, and this may explain why Buschhausen (1978) made no mention of these features in his book, although he studied the Crusader elements in the *minbar* of Burhan al-Din, which is just a few metres from Qubbat Yusuf. Van Berchem (1925: 34 and n. 3) was the first scholar to draw attention to the differences in this hotch-potch of material and he noticed the much more carefully matched re-used Crusader material in Sulaiman's *sabils* (cat. nos. 4-9).

39 QUBBAT YUSUF AGHA

Name: Qubbat Yusuf Agha

Date: 1092/1681

Endowment: None known

Variant of name: None known

Modern name: Qubbat Yusuf Agha, and Maktab al-Tadhakir (the Ticket Office)

Location

The *qubba* is located within the Haram al-Sharif to the southwest of the precinct, and lies between al-Aqsa mosque and the Islamic Museum, about 30m southeast of the Bab al-Maghariba (the Moroccan Gate).

Site and brief description (figs. 39.1-39.4, pls. 39.1-39.4)

Qubbat Yusuf stands alone and as isolated as any similar structure within the Haram, in the middle of the western enclosure of al-Aqsa mosque. To the north, the *qubba* faces the Mastaba and Mihrab al-Sanaubar (the Niche of the Pine), to the west the entrance of the Islamic Museum, to the south Jami' al-Nisa (The Women's Mosque) and to the east, the western wall of al-Aqsa mosque. It is a single-unit structure, square in plan and built of high-grade stone. The sides to north, west and east were originally open but have now been enclosed; the southern wall, which contains a *mihrab*, was always enclosed. The dome has a shallow, almost flat profile, and rests directly on the four walls. The monument has undergone many changes and additions, the latest being its conversion for use as a ticket office for the visitors to the Haram.

History

Identification

The *qubba* is identified by two foundation inscriptions, which provide both the date and the names of the patron and the builder. There is another inscription but unfortunately this has so far proved impossible to decipher.

Date

The date is given as 1092/1681 in the two foundation inscriptions, which were published by van Berchem (1925: 192). The first panel is of marble; it is rectangular in shape and measures 24cm by 50cm. The panel was originally located on the west side of the northern arch, but it has since been moved to the eastern elevation and is now set into the north side of the eastern arch. It consists of two lines of Arabic, arranged in two cartouches separated by a fillet. The text is written in Ottoman *naskhi* script, which is here left in relief; it is slender with diacritical points. The translation reads as follows:

This construction of Yusuf has enjoyed the reward
(of Allah) which fulfils your needs.
'Ali is he who built it for him (Yusuf) that its date
might satisfy you.

The second panel, which was also originally set into the northern façade, was also moved in the same way as the first panel described above. It is now on the south side of the east arch, and consists of four lines of Arabic written in the same style as the first plaque, though with no frame or cartouches. It is again of marble and is square, measuring 50cm by 50cm. The translation runs as follows:

The reward of its construction belongs to Yusuf Agha (of the) *dar al-sa'd* (Constantinople), who has the highest rank.

O you respectful one, date it ... it is (the dome) founded for Yusuf by al-Hajj 'Ali (in the) year 1092 (1681).

Van Berchem read the second line as *dhat al-ma'ali*, explaining that it was difficult to reach. To get a clear view he would have had to climb a ladder, and he added '*ce petit texte m'a paru trop insignifiant pour en valoir la peine*' (1925: 193). The plaque is now more accessible and it is clear that it should be read as *dhi'l-qadr al-'Ali* and therefore this adjective should not be attached to Constantinople, as van Berchem considered to be the case, but rather to Yusuf Agha himself.

Founder

For details see cat. no. 38.

Later periods

During the last two decades the monument has undergone many changes, the most important of which was the addition of a heavy stone arch in front of the northern façade, supported on two piers. This stone portico, which is in the form of an *ivan*, has been constructed with a pointed arch. Its function is unclear, but as a consequence, the two inscriptions have been relocated to the eastern elevation. In addition to the new portico, the other three arches, which were originally open, have been enclosed by sheets of aluminium and glass; a small hinged opening forms a window in the northern façade, and there is a door opening in the east side. The majority of these changes were made in the early 1970s when the monument was adapted by the Restoration Committee of al-Aqsa Mosque at the request of the Auqaf Authority to serve as a ticket office.

Architecture

The northern façade is the main one. Although in detail it closely resembles the western and eastern elevations, it is marked out as the most important by the two inscription panels discussed above, although these have recently been relocated. It takes the form, as do the other façades, of a pointed arch and is constructed of high-grade white stone. The arch is carried on a corbelled springing from two supporting piers that are square in plan. Unfortunately the original arch is now concealed by the new arch of the portico. The four façades of the building are crowned by a dome. This is shallow in profile and rests directly on the four walls. It is covered by small stone slabs in the customary Jerusalem fashion of the period. The western, eastern and southern elevations have the same appearance as the original northern wall, with the exception that the elevation to the south is completely closed by masonry of the same quality as the rest of the building. There are three simple terracotta spouts at the top of the building, two to the south and one to the east of the northern elevation. Recent iron tie-beams with a circular head strengthen the walls of the building.

Access to the interior is now from the east instead of the original northern entrance since this wall is now completely closed except for the small hinged opening through which tickets can be sold. The interior, raised by 20cm from the esplanade ground level, is very simple. It is a square area (3.4m by 3.5m), paved with new flagstones. The arches of the exterior are also expressed in the interior. Three of them were originally open, as explained above, but all four walls are now blocked. The arches

rest on two piers attached to both the northern and southern walls. There are four triangular pendentives which spring from the inner corners, and which form the inner zone of transition in order to convert the square plan to an octagon on which to rest the dome. The interior of the dome is coated in plaster.

The *mihrab* is placed in the centre of the south wall. It measures 70cm wide by 40cm deep by 180cm high and is constructed from a block of almost rectangular white stone. The simple *mihrab* niche, which has a slightly pointed arch, has no form of decoration either in the way of column or decorative motif. One course above the apex of the *mihrab* there is a square panel measuring 70cm by 85cm with an inscription. Unfortunately the condition of this plaque is so bad that so far it has proved impossible to decipher.

Features

The study of the two domes of Yusuf Agha raises many questions, for some of which it is impossible to provide a complete answer. The first point is that the two domes have as many similarities as they have differences. They share the same patron, builder, date, and also the same reason for their construction, for both are commemorative monuments. In addition, they both have two new, purpose-cut foundation inscriptions as well as incorporating an older, re-used one. The first question, then, is why there should have been a *pair* of foundation inscriptions in each case, when the information contained in them is fundamentally the same. Perhaps the plaques were duplicated primarily for decorative reasons. To my knowledge, these two small domed buildings are the only monuments in Jerusalem which have two inscriptions with the same date and contents.

Despite these similarities, however, the two monuments are remarkably different with regard to size and decoration. Qubbat Yusuf Agha, discussed here (cat. no. 39) and located within the Haram esplanade, is bigger and heavier than Qubbat Yusuf (cat. no. 38) on the upper terrace of the Dome of the Rock. The decorative scheme of Qubbat Yusuf (cat. no. 38) is extraordinarily lavish in comparison to that of Qubbat Yusuf Agha (cat. no. 39), which is essentially plain with no cladding or any decorative features. The result is that we have two contradictory approaches—one is over-simple and the other over-complicated—both for the same patron and by the same builder. It is reasonable to ask why, and to speculate on which dome was the earlier in date. Qubbat Yusuf (cat. no. 38) was built in Muharram 1092/January-February 1681; the month in which Qubbat Yusuf Agha (cat. no. 39) was erected is not included in the inscription. If Qubbat Yusuf is the earlier of the two, which is possible, it is perhaps surprising that the same quality of decoration was not at least maintained for Qubbat Yusuf Agha, if not surpassed. The answer most probably lies in two factors—the availability of building material, and the skill of the craftsmen. Both from the *sijills* and the material evidence of some Ottoman monuments, it would appear that many of the building materials (stone, capitals, shafts, and even the marble itself) are in secondary use. The *sijills* (see Chapter 37 under Stones) contain many records concerning the sale and purchase of secondary material. It is probable that a certain amount of old material was available for the first monument, Qubbat Yusuf (cat. no. 38), which allowed it to be richly decorated; while for the second there were no comparable fragments available and therefore it was built in a more simple style, representative of local building technique. It is also possible that the location has something to do with the difference. The added aura of sanctity of the upper level, which is closer in

proximity to the Sakhra, could also account for more money being spent on this small building, which was dedicated in the sacred month of Muharram. Van Berchem followed a similar argument in his suggestion already mentioned that the inclusion of the Ayyubid plaque added prestige to the commission.

40 SABIL AL-SHURBAJI

Name: Sabil 'Abd al-Karim al-Shurbaji

Date: 1097/1686

Endowment: 1097/1686

Variant of name: Masjid al-Shurbaji

Modern name: Masjid al-Shurbaji

Location

The *sabil* is to be found at the junction of the two main streets that run north-south, at the southern end of the inner square of the Damascus Gate (Bab al-'Amud). Its situation can be seen as deliberately high-profile since it is on the main thoroughfare for travellers within the walled city of Jerusalem, as they went about their business.

Site and brief description (figs. 40.1-40.4, pls. 40.1-40.3)

The *sabil* is situated at the north-west corner of Tariq al-Wad. The site is flanked to the east by the street, to the north by the square which leads to the Damascus Gate, and to the west and south by shops.

The *sabil* is a simple structure, consisting of a single room, almost square in plan and covered by a shallow dome. A door in the eastern wall gives access to the interior. Two windows with grilles were opened in the north wall to allow water to be distributed to thirsty passers-by.

At some unknown point in time, the building stopped functioning as a public fountain and was no longer used. Then in 1389/1969, converted into a mosque (*masjid*), according to al-Shaikh 'Ali Najm, the first *khadim* and recent *imam* of the mosque, and to Auqaf file no. 52. At present, the daily prayers are recited in the building, once at noon and once in the afternoon (*al-zuhr* and *al-'asr*).

History

Identification

By the virtue of the *waqfiyya* (Sijill 187: 515-17) and the unpublished foundation inscription, it is possible to say with certainty that the monument dates to the Ottoman period.

Date

A foundation inscription has been preserved; it is to be found above the two windows on the northern façade. It is written in a simple *naskhi* script cut into the marble plaque. Despite its present poor condition, it is possible to read the date and the original function of the structure. The inscription has three lines, written in an Arabic poetic style. It reads as follows:

'Abd al-Karim al-Shurbaji built the *sabil* so that thirsty people might drink, hoping through this deed for reward, blessing and charity from Allah the Glorious. Beloved respectful one, set out to date it, and say (it is) a drink from Paradise or a spring.

The date of construction is written underneath the third line of the inscription in numerals as 1097/1685-6. In addition, if the alphabetical letters of the second half of the last line of the inscription (the chronogram *wa qul sharaban min salsabilan au mu'in*) are computed according to their numerical value, the same date will be found. The date of the *waqfiyya* also corresponds to the date mentioned above.

The Waqf Document

The original *waqfiyya* is found in the Jerusalem *sijills*; its date is given as the beginning of Dhu 'l-Hijja 1097/19-28 September 1686. The *waqfiyya* is of considerable importance in view of the fact that it is the sole available source discovered so far relating to the building. It is a standard document and is made up of a foreword, the main text (which gives a description of the building), the terms of the endowment, facts concerning the personnel, the purpose of the construction, and so on, and finally a relatively long epilogue. The reason for the construction of the building is of particular interest.

Purpose of Construction

The founder made the *sabil*¹ a *waqf*, in his wish for the blessings of almighty Allah, for the good of all the people of Allah, with no conditions attached, for the benefit of anyone—whether departing or arriving, from the city or from the semi-desert, old or young, strong or weak, man or woman—all of these people were permitted to drink from his *sabil*.

Description of the Building

The structure, described as a complete, stone-built shop, is stated as being situated in the protectorate (*mahmiyya*) of Jerusalem the Noble, in the area of the Damascus Gate (Bab al-'Amud). In order to ensure that the *sabil* was built to a suitable standard, the donor specified that the building should be erected, that the floor should be paved with stone and flagstones, and that it should be plastered with lime; and he also ordered a new wooden door with a new iron lock. He also arranged for the supply of a fine basin for water, made of new marble and coloured stone. The basin faced the high street (*al-shari' al-a'zam*) to the north and this façade was provided with two new windows with grilles separated by a jamb. In addition, a brass bowl with an iron chain was attached to the basin by order of the donor so that people could obtain water from the basin through the grilles of the two windows.

Endowment

The *waqf* document specifies three and a half shops as properties to provide income for the *sabil*. They are listed as follows:

Item	ghirsh annually
(1) The whole shop built of stone and abutting the <i>sabil</i> ; its door to the east, facing the public road.	12
(2) The whole stone shop situated in the Bab al-'Amud district, bounded to the south by a passable road, to the east by another road, to the north by an open space, and to the west by the shop belonging to the donor.	8
(3) The whole <i>hasil</i> (storehouse) located opposite the blessed <i>sabil</i> , which contains a cistern to collect water.	4
(4) A half-share (12 <i>qirat</i> out of 24) of the stone shop located in the same district, shared equally by the <i>waqf</i> of the Dome of the Rock. The shop is flanked to the south by the coffee-shop owned by the donor, to the east by the basin of the soap factory (<i>haud al-masbana</i>), to the north by the same soap factory and to the west by the public road.	1.5
Total income annually	25.5

¹ Al-'Asali (1989: 112) suggests in error that 'Abd al-Karim al-Shurbaji founded both a *sabil* and a mosque at the same time. The *waqfiyya* makes it clear that only a *sabil* was in question.

Personnel and Maintenance

Two persons were appointed to maintain the *sabil*, each with specific duties; these were:

Item	ghirsh annually
(1) Shaikh ‘Ali ibn Shu‘ib, as care-taker of the <i>waqf</i> of the <i>sabil</i> ; in addition he was entrusted with the following duties: he was to clean out the basin and to sweep the floor of the <i>sabil</i> , to open and to close the building, and to illuminate the <i>sabil</i> during the months of Ramadan and Sha‘ban. ²	6
(2) Al-Hajj Ibrahim ibn al-Hajj Husain, as a water carrier, to bring water to the <i>sabil</i> in summer and winter.	18
(3) The donor allocated one <i>ghirsh</i> annually to buy oil for the lighting, and one half- <i>ghirsh</i> for repairs.	1.5
Total expenses annually	25.5

Sijill 271: 59 published by al-‘Asali (1989: 114) states that at the beginning of Dhu ‘l-Qa‘da 1204/13-22 July 1790, the *qadi* appointed Mustafa Beg ibn Murad Agha and Ahmad Beg ibn ‘Abd al-Karim Beg to the supervision of the *sabil* of ‘Abd al-Karim al-Shurbaji. Both men were appointed to replace their fathers, who were mentioned in Sijill 271: 59 in accordance with a legal document dated 1172/1758-9. It is interesting to notice that the two and half shops specified in the *waqfiyya* were by that time used as dwelling houses, and that three *uqiyya* (weight) of wheat were assigned to the *waqf* from the Takiyya Khassaki Sultan.

Recent Period

When the post of caretaker was vacant in 1373/1953,³ the *qadi* of Jerusalem decided on 19 Muharram/28 September to allocate the management of the *sabil* endowment (Auqaf File 52: 54) to the Director of the Auqaf Administration. Early in 1374/1954, the following year, the *qadi* dismissed a case presented by Ibrahim ibn Darwish al-Bannan, the last caretaker, against the Director of the Jerusalem Auqaf Administration. Darwish al-Bannan had claimed his right to the half-position of *al-tauliyya* (caretaker).

Although the *sabil* and its property have been the responsibility of the Auqaf Administration since 1373/1953, it appears that the *sabil* continued to be unused and neglected until early in 1380/1960. Attempts to use the *sabil* and its façade to exhibit merchandise were rejected in response to serious objections from neighbours, despite the fact that the Auqaf Department was in favour of leasing it out (Auqaf File 52: 172, 173). However, as a result of these attempts, the mayor (Arabic *muhafiz*) of Jerusalem issued strict instructions to the Chief Qadi, the President of the Supreme Muslim Council, that on the one

hand the *status quo* of the *sabil* should be maintained, and on the other that necessary repairs should be undertaken in order to enhance its condition. In consequence, the old door, which had three windows, was replaced by a new one of wood. The *sabil* was, in addition, provided with electricity in 1386/1966. Additional fencing to prevent dirt from accumulating inside the recess was provided by the Auqaf Authority in 1406/1985.

Founder

Although three *waqfiyyas* mentioning the donor have now been discovered in the *sijills* in addition to Sijill 187: 515-17, mentioned above, information on the career and life of ‘Abd al-Karim al-Shurbaji is still relatively limited. The first of these, in Sijill 187: 136-7, dated Ramadan 1096/August 1685, records that ‘Abd al-Karim al-Shurbaji, the son of Mustafa, had endowed two shops located in the Jewish quarter for the benefit of the *mu’adhdhins* in the Noble Dome of the Rock. The second, in Sijill 187: 191-2 is dated Dhu ‘l-Hijja 1096/October-November 1685, and states that ‘Abd al-Karim al-Shurbaji, the son of Mustafa, had freed his white slave named Hasan, and that he had made as *waqf* for Hasan’s benefit during his lifetime the whole house located in Bab al-Hitta neighbourhood, and, after him, for the benefit of his children, both male and female. In the event that the descendants of Hasan died out, the *waqf* was to be for the benefit of the mosques of the Dome of the Rock and al-Aqsa, and if this was impossible then it should go to the Muslim poor. The final *waqf* (Sijill 187: 464), dated the beginning of Shawwal 1097/21 August 1686, comprises the complete oil press which produced *siraj* (sesame oil) in Jerusalem the Noble at Bab al-‘Amud (Damascus Gate), and the arcade in which to tether the animals (*dawabb*). The benefit of these properties was to be devoted to the poor who were resident in the *riwaq* of Shaikh Mansur.⁴ The *riwaq* is described as being located in al-Masjid al-Aqsa near the western staircase (the north-western colonnade) which leads to the platform of the Noble Rock. To judge from the information in the *waqfiyyas*, the donor must have been a very wealthy man to be able to donate the endowments. However, his titles would indicate that he did not occupy an official position in the city.

Architecture

The north façade faces the end of the inner square of Bab al-‘Amud. It is the main façade and is made up of a simple recess with a pointed arch, which is decorated with a splay moulding around the extrados constructed of red and cream-coloured *ablaq* voussoirs. At the rear of the recess, two windows, also constructed of *ablaq* masonry and provided with grilles, are surmounted by a rectangular marble plaque in the middle of the tympanum of the arch which contains the foundation inscription. A diaper-work moulding extends across the façade one course above the pointed arch, and terminates at the end of the eastern façade. There the stone-faced dome rises directly from the roof. It is finished by a new brass crescent finial. The main façade retains its original 1097/1686 form except for the recently-added signs to guide visitors to historic sites in the city. The signs are placed on either side of the springing of the arch, to the right (west) of the

² The *waqfiyya* does not explain where the lanterns were to be hung, but most probably they were to be located outside the building in the niche of the arch as at Sabil al-Khalidi (cat. no. 44). The reason for the specific instruction was in order to provide light for the *sabil* so that worshippers had access to water before and after prayers at night and at dawn.

³ The post of caretaker was shared, at that time, equally between Darwish al-Bannan, who died in 1370/1950, and Yahya al-Shihabi, who fled to Egypt in 1368/1948 (Auqaf file 52: 1, 10).

⁴ The *riwaq* no longer exists but its location can be deduced from Sijill 166: 224 and from traces of the piers which used to support it to the east and which are still visible in the western wall of the esplanade of the Dome of the Rock in the area between Qubbat al-Khadr (cat. no. 31) and the Hujrat Islam Beg (cat. no. 21).

spandrel, and above the dome.

The east façade is plain, facing onto the street called Tariq al-Wad. A simple entrance opens in the centre to give access to the interior. Above the lintel of the door, a small rectangular window provides light. In contrast to the north façade, this eastern side is composed of simple, high-quality masonry which consists in the main of approximately square stones laid in regular courses. Recently, these courses have been painted with a yellow lustre paint, and the joints of the stones have been picked out in thick black, which has given the whole façade a new and rather peculiar appearance.

Fig. 40.1 Sabil Shurbaji, plan of location (Courtesy Department of Islamic Archaeology).

Fig. 40.3 Sabil Shurbaji, section (Courtesy Department of Islamic Archaeology).

Interior

A single step leads to a low entrance door. The single chamber is square in shape, and its paved floor is concealed under a modern rug. A new *mihrab* has been set in the southern wall, presumably when the *sabil* was converted into a mosque in 1389/1969. The four walls of the room, including the *mihrab* niche, are covered with red flagstones to a height of 2.06m, the rest of the walls and the dome being plastered with mortar. The dome rises directly from the western and eastern walls; from the south and north, it is raised on two small pointed arches. The shallow dome is carried on four pendentives.

41 ODAT ARSLAN PASHA

Name: Odat (chamber) Arslan Pasha

Date: 1109/1697 (restored)

Endowment: 1109/1697

Variant of name: None known

Modern name: Markaz Shurtat al-Haram (Haram Police Station)

Location

Odat Arslan is located in the western section of the north side of the Dome of the Rock terrace, between Hujra Muhammad Agha to the east (cat. no. 20) and al-Khalwa al-Junbalatiyya (cat. no. 24) to the west.

Site and brief description (figs. 41.1–41.2, pls. 41.1–41.6)

Odat Arslan consists of two parts. The lower storey contains two square chambers, the same as the current arrangement of the upper level. The room to the east is covered by a hemispherical dome while that to the west is covered by a cross vault built some time after 1279/1862. A portico with two domed bays stands in front of the domed chamber. The *oda* is used today as an office for the Haram police.

History

Odat Arslan, like most of the other cells on the Haram, lacks any particular published historical account. A fair amount of its early history is contained within the *waqfiyya* lodged in the Jerusalem *sijills* and confirms its Ottoman date. A good, small plan of the upper storey is to be found in the map drawn by Powell in 1862. The plan is important because it shows the layout of the western chamber at a time before renovations were completed. As the general architectural design of the *oda* is similar to that of Hujrat Muhammad Agha (dating to 996/1588—cat. no. 20), it is tempting to date this *oda* also to the early decades of the 17th century. But the discovery of the *waqfiyya* makes it more reasonable to put the date of this *oda* forward to the last decade of the century.

Identification

The *waqfiyya* (Sijill 198: 109) reports that ‘the above-mentioned *waqf* (discussed below) was established by the donor for the benefit of the chamber (*oda*) whose construction has been renewed by the founder on the northern section of the Masjid al-Aqsa the Noble, abutting the chamber made *waqf* by Ahmad Pasha’. Since all the other *khalwas* (see cat. nos. 14, 16, 17, 20, 21, 22, and 24) on the northern side of the terrace have been convincingly identified, and since this *oda* abuts the Junbalatiyya (cat. no. 24)—also specified by the *sijill* as being constructed and named by Ahmad Pasha—the identification seems to be secure.

Date

The renovation of the *oda* is not dated, but on the basis of the *waqfiyya* one may assume that it was carried out shortly before 1109/1697.

Founder

The original founder of the cell is not known, but the person responsible for its rebuilding—as stated in Sijill 198: 109—was al-Hajj Arslan Pasha. He was one of the rulers of Jerusalem and Palestine in the late 17th century. He was governor of Jerusalem,

Nablus, and Gaza and is named in the *sijill* as also being the *amir* of the Syrian pilgrimage (*amir al-hajj al-Shami*).

Endowments

The *waqfiyya* states that ‘at the council of the religious court, al-Hajj Arslan Pasha, being fully competent, has certified that he has made as *waqf* the whole house built in Jerusalem the Noble that is situated in the Jewish quarter. It is known widely by the name *dar al-balat*. The house contains chambers, latrines, and utilities (*marafiq*). It is bordered to the south by the passable road, to the east by the public road, to the north by the house of Ibrahim al-Nasrani, and to the west by the house of Ibn al-Nabulsi.’

Arslan had stipulated that the inspector of the *waqf* should lease this house, and from the income of the rent, the amount of which was unspecified, he was to maintain the building whenever the need arose, and the surplus was to be allocated to the reader (*shaikh*) of the lesson (*al-dars*) in the *oda* (chamber) that had been built by the donor. The reader (*qari*) had to recite the Qur’an, the normal petitions, the prayers to the Prophet, and to invoke Allah. The merit of all this was to be dedicated to the donor.

For the duration of his lifetime, Arslan had appointed al-Shaikh ‘Isa al-Kurdi to be the reader in the chamber and he made it a condition that after ‘Isa the position was to be given to whoever was qualified and deserved it.

Architecture

Exterior

The exterior of the southern façade resembles the southern façade of the Hujrat Muhammad Agha (996/1588, cat. no. 20). Both the layout and the architectural elements of the two-bayed portico are similar although there are minor differences, such as the finish of the interior of the small domes of the portico, which (unlike those of Hujrat Muhammad Agha) are without ribs, and the span of the arches, which is larger by 15cm. The dais supporting the portico also has different dimensions, being 6.06m long by 2.14m deep by 83cm high. Alterations to the structure, which took place some time after 1862, can be identified, based partly on the Haram map drawn by Powell and partly on the evidence visible in the building as it is today.

First, the western window in the southern façade has been enlarged and converted into a door which measures 80cm wide by 1.7m high and now gives access to the interior, as the original door has been blocked (see below). Second, the open arch in the entrance of the vestibule has been blocked with stones, leaving space for a door that gives onto the interior of the western part of the upper section. A projecting denticulated cornice finishes off the top of the building; immediately below it is a shallower frame which encloses the upper part of the façade.

The north elevation remains unchanged. It is a solid wall built of regular courses of masonry apart from five window openings and a door. Three of the five windows are identical. These are in the upper part of the elevation and are fitted with iron grilles. Each is surmounted by a slab lintel and above there is an ‘eye-brow’ arch. A door is placed at the west end of the elevation, to give access to interior of the lower part of the *oda*; it measures 78cm wide by 1.69m high. It too is surmounted by a slab lintel and above it there is a relieving arch. Next to the door to the east are two rectangular windows, each measuring 80cm wide by 1.2m high. As usual, they are protected by an iron grille and wire mesh.

The eastern elevation is constructed of undecorated

masonry. It has a door (78cm wide by 1.67m high) which is surmounted by a slab lintel with an 'eye-brow' arch of three voussoirs above. The arch has recently been reinforced with iron and concrete. At the level of the seventh course below the summit of the building, there is a small slit window. A plain stone course serves as a frame for the eastern and western elevations, projecting forward slightly, in place of the more customary stone cornice. The western elevation is obscured by al-Khalwa al-Junbalatiyya, which it abuts.

Interior

The interior of the upper storey of the cell consists at present of two chambers. The principal one is to the east. It is square in plan, and is paved with good quality, large marble slabs of grey and red of different sizes, some of which measure 1m by 56cm. The chamber has four windows, two in the north wall and two in the south wall. Each window measures 76cm wide by 1.2m high by 90cm deep and the openings begin only 29cm above the level of the floor. Each is surmounted by a semicircular arch and scallop. However, as already stated, the western window in the south wall has been enlarged and converted into a door to give access to the interior, after the original door in the west wall was blocked. A shallow concave *mihrab* niche is located in the centre of the south wall (shown on the plan as M), flanked by the door and the eastern window. The niche measures 70cm wide by 1.86m high by 29cm deep and does not appear on Powell's map of 1862.¹ The

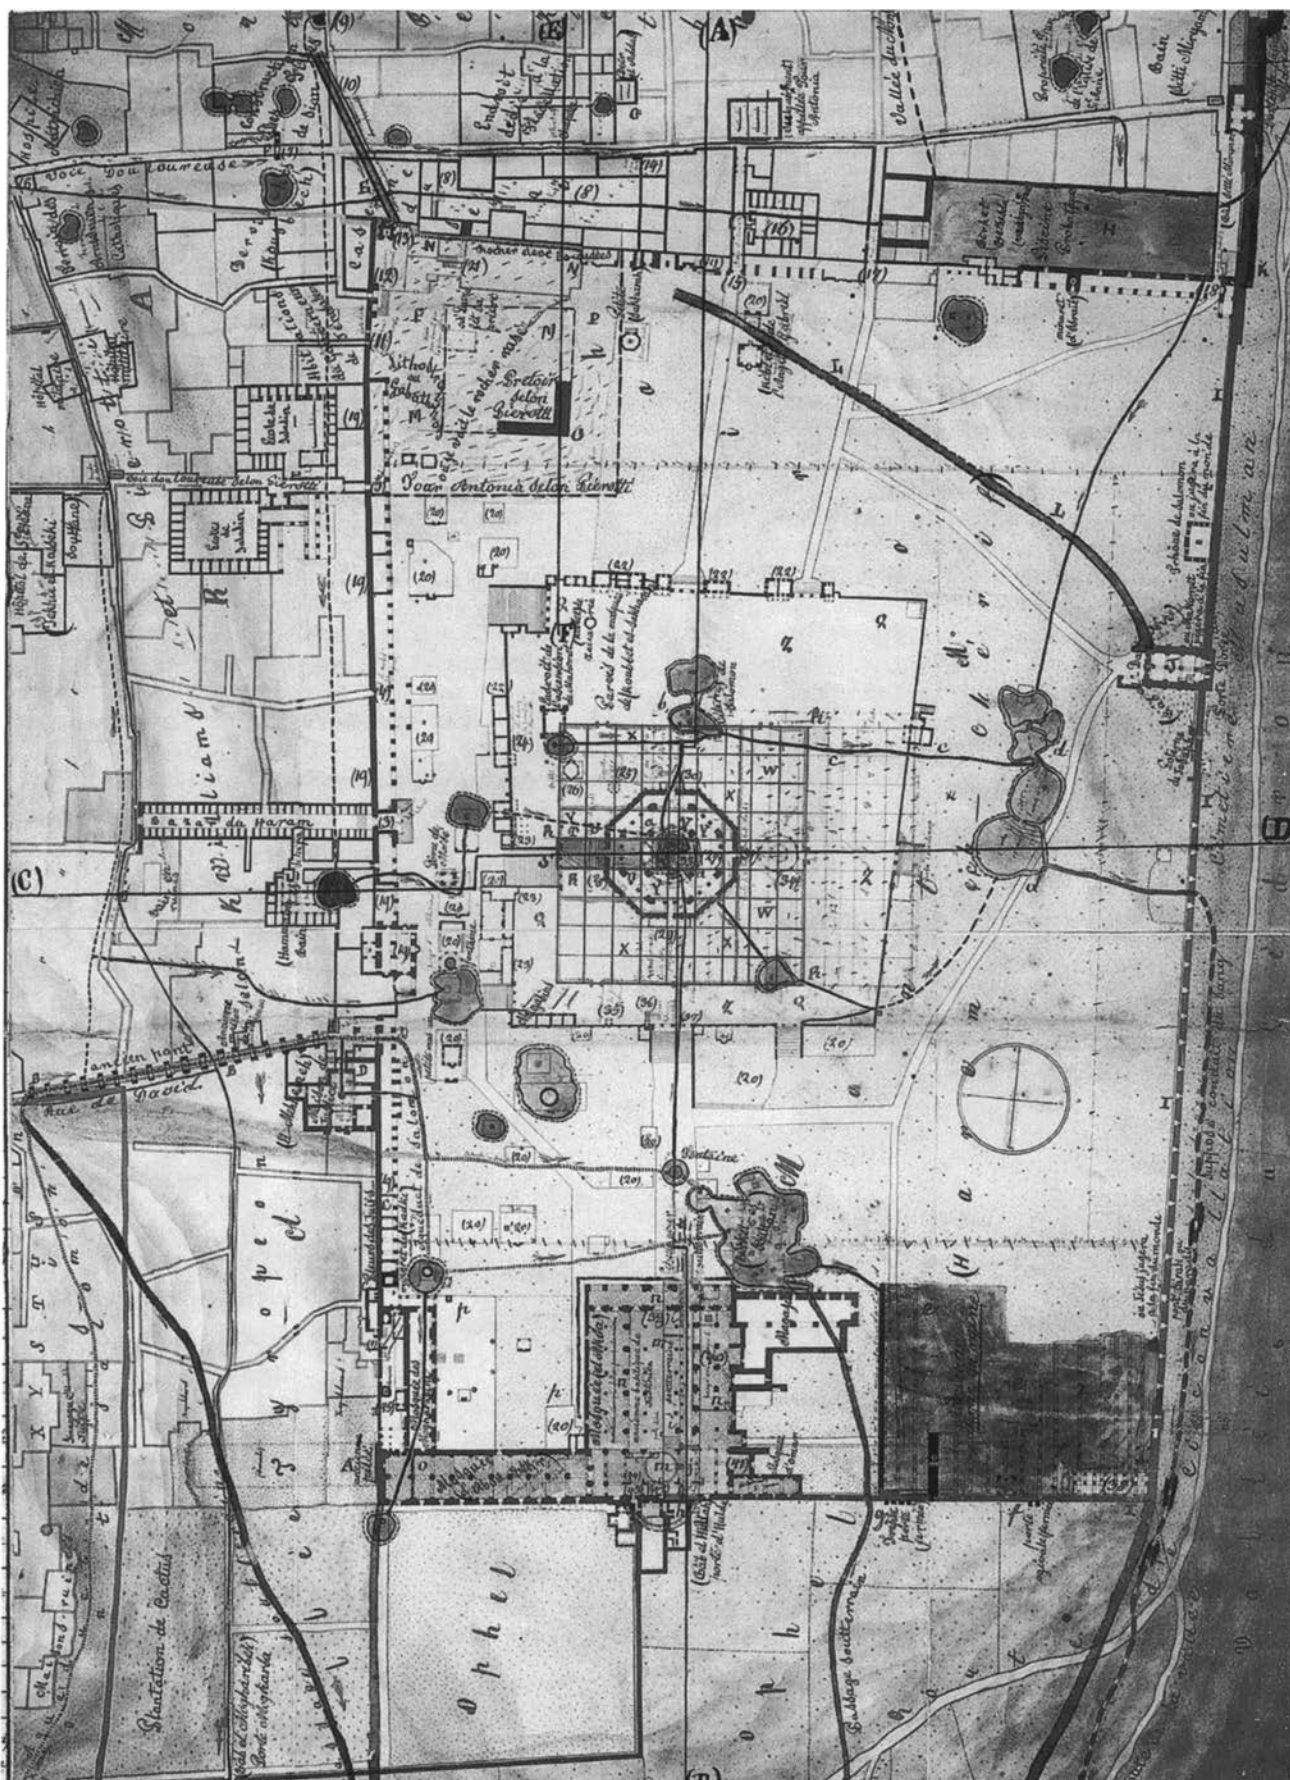

scallop at the apex of the *mihrab* is pointed and clumsily finished, so it was probably inserted some time after 1862 when modifications took place in both chambers, but in particular in the one to the east. The eastern wall is constructed in the form of a blind pointed arch which is pierced by two blind niches. The first of these measures 1.4m wide by 1.64m high by 38cm deep and has a further recess at its centre in the form of another, smaller niche measuring 29cm wide by 54cm high by 30cm deep. The second niche is located to the north of the first and measures 32cm wide by 37cm high by 33cm deep. From the interior, the dome has the appearance of being shallow and rests directly on the four walls and on four pendentives at the corners of the chamber. Both dome and walls have been plastered recently.

The second chamber of the upper storey of the cell is now also square in plan. It has a modern paved floor and is covered by a folded cross vault with a small saucer dome at the centre. Only one rectangular window (88cm wide by 1.5m high by 73cm deep) illuminates the chamber and access is by the newly opened door in the south wall. Before 1862, according to Powell's plan of the Haram, the layout of the chamber was completely different. It was made up of two rectangular parts divided and separated by a wall running from east to west, and the northern part was closed completely apart from a door opening to the north of the western wall of the main chamber. The second of the two areas was an open vestibule, leading to the interior of the main chamber. The interior of the lower part of Odat Arslan Pasha is very simple. It consists of two identical square chambers; each is covered by a cross vault and has a single window and door which have been described above.

42 KURSI SULAIMAN

Name: Kursi Sulaiman (The Chair or Throne of Solomon).

This is an odd name for a building. The word *kursi* in Arabic means 'seat' or 'throne' and it is possible that the name relates to the spur of rock against which the building is erected. In any event, the concept of *kursi* in the context of the name Sulaiman reflects the status of the biblical King Solomon (Sulaiman), son of King David (al-Nabi Da'ud) within the history of Jerusalem. Detailed information on this status as contained in Muslim literature is to be found in Mujir al-Din (1973 1: 117-45).

The building is made up of two parts. The western section is a typical Ottoman mosque; the section to the east contains a large stone cenotaph, which could be considered as a *maqam*. The name may relate to its function; see below.

Date: Undated. Probably after 1017/1608-9

Endowment: See below

Variant of name: Evliya Çelebi (Stephan 1980: 93) called it the 'Maqam (place of) Sulaiman', in addition to 'Kursi Sulaiman'

Modern name: Kursi Sulaiman, Dar al-Hadith

Location

The building is situated at the eastern border of the Haram between Bab al-Asbat and Bab al-Rahma wa 'l-Tauba (The Golden Gate).

Function

The Kursi Sulaiman building can be interpreted as a commemorative monument built to honour the Prophet Sulaiman, son of Da'ud (see below under purpose of the building). Since 1403/1982-3 the building has been used as a *Dar al-Hadith* (Centre for the Traditions of the Prophet Muhammad).

Site and brief description (figs. 42.1-42.6, pls. 42.1-42.7)

The building is in a relatively remote area to the northeast of the Haram esplanade. The eastern wall of the building is shared with the eastern wall of the Haram, and this part of the wall, which extends from the north-eastern to the south-eastern corners of the Haram, also serves as part of the eastern wall of the Old City of Jerusalem. The other three sides of the building are surrounded by open ground partially planted with trees. It is a single unit-structure of rectangular shape divided on the interior into two sections. The first of these is made up of two square bays. Each is surmounted by a hemispherical dome. The southern bay houses a *mihrab* niche. The second part is a rectangular hall which accommodates a remarkably large cenotaph.

History

Identification¹

In Sijill 89: 84, which includes the proceedings for the year

¹ It should be emphasised that the identification relates to the standing structure which is located in the eastern part of the Haram, which has been identified as Kursi Sulaiman since the early 17th century. There are references to Kursi Sulaiman as a place (*maudi*) rather than as a separate building in some Islamic sources before the Crusaders as well as in later periods up to the end of the 16th century. Elad (1995: 82-7, 89, 90, 92-3) gathered the available information and discussed in detail the possible association of the location of Kursi Sulaiman with the still-existing Qubbat Sulaiman. He refutes van Berchem's proposed location for the Kursi Sulaiman in the eastern section of the Haram during the early period, that is before the 17th century.

1017/1608-9, it is reported that 'Musa ibn Abi 'l-Nasr al-Barq' had been appointed to the 'half-post of service to the tomb of our lord Sulaiman, the prayers of Allah be upon him, which is located inside the wall of al-Masjid al-Aqsa the Noble.' He was to receive 'one-half 'uthmani every day in addition to what is assigned (to this position) from the money coming yearly from Istanbul.' No further details are given with respect to the location, but since the appointment refers specifically to a tomb (*qabr*) and not to a *maqam*, this would probably imply that at that time there was no edifice over the tomb itself.

Al-'Ayyashi (al-'Asali 1992: 212) refers to Kursi Sulaiman under the name 'the Dome of Sulaiman's Throne' (*Qubbat 'Arsh Sulaiman*) in the record of his visit to Jerusalem in 1074/1663-4. He reported that 'near the gate of the mosque which lies next to the valley, there is a place said to be the Dome of Sulaiman's Throne. It is one of the shrines. One of the scholars said that requests (made there) are answered (by God). It is close to Bab Hitta.' The report of al-'Ayyashi is puzzling, for it contains both positive and negative information. On the negative side, it is noticeable that al-'Ayyashi writes in indirect speech, which means he did not see the place personally, but rather repeated what he heard. Secondly, it is not clear from his account if he is indicating a structure or a site. And finally the information that the monument is 'close to Bab Hitta' recalls the earlier traditions which locate it and identify it with the Qubbat Sulaiman described by Mujir al-Din (1971 1: 123). It is worth underlining, however, that al-'Ayyashi explicitly places the site at the east wall of the Haram in the location of the structure now under discussion. Evliya Çelebi (Stephan 1980: 93)² gives a little more information on the structure itself. He writes 'In the line of buildings falls also the Shrine of Solomon and his Throne, which are connected with the wall of the fortress, having two high domes and seven windows.'³ Here is the Throne of Solomon. I have listed these shrines after the shrine of Maryam's cave. These are located on the eastern sides of the Haram esplanade.' Kursi Sulaiman is also mentioned by al-Nabulsi who visited it in 1101-5/1690-4 (al-'Asali 1992: 263); he said 'Hence we went to the place which is called Kursi Sulaiman—peace be upon him—at the rear (*mu'khar*) of the mosque from the east; we entered it and there we prayed and we appealed to the exalted God. In the building there is a well-planned dome. Inside (it) a large solid rock that looks like a tomb adjoins the wall ... someone mentioned to us that Solomon the Prophet of God—peace be upon him—was buried there.' Elad (1995: 92) apparently did not know of the accounts of either al-'Ayyashi or Evliya Çelebi because he thought al-Nabulsi was the first Muslim writer to mention Kursi Sulaiman as being located at the eastern Haram wall. He commented (1992: 93) on the description by al-Nabulsi, saying that it required closer study, for the traveller had 'copied entire fragments (without so much as mentioning it) from the description given by the 15th-century Mujir al-Din of Qubbat Sulayman in the north-west Haram.' Elad went further, asserting that there is no original information in al-Nabulsi's description. It seems, however, that al-Nabulsi's description is authentic for, according to his statement, he visited the site and although his description is very concise

² Evliya Çelebi (Stephan 1980: 71) also mentions the 'Kursi of Solomon' inside the Aqsa Mosque but here he refers to a seat. He said 'There is also the Seat of Solomon and the chair for the preacher.' However, as Stephan (1980: 71) noted, no existing dais, platform or seat in Masjid al-Aqsa carries the name of Solomon.

³ There are today nine windows (see above).

from the architectural point of view, it is correct and corresponds to today's structure—apart from one element. Al-Nabulsi mentions one 'well-planned' dome and today the monument is roofed by two hemispherical domes. It is impossible to know whether al-Nabulsi was being imprecise or whether the monument was changed after al-Nabulsi's visit. The layout of the building gives no clue, but the similarity to the layout of al-Zawiya al-Qadiriyya (cat. no. 35) and Zawiya As'adiyya (whose *waqf* is dated 20 Muharram 1033/13 November 1623) on the Mount of Olives might suggest that the former option is the most likely. At the time of al-Qayati, who visited the Haram in 1302/1884-5 (al-'Asali 1992: 325), Kursi Sulaiman was still considered to be one of the places of *ziyara*.⁴

Date

The building of Kursi Sulaiman is undated. There is an inscription panel inside the monument to the west of the tomb but this implies the purpose of the building rather than giving its date. The slab is rectangular and of marble. The inscription, which is unpublished, is made up of four lines of Arabic and is written in *naskhi* script, set in rectangular cartouches. The script is relatively thick and has diacritical and a few auxiliary points. The first two lines of the script have been recently painted with black paint. The text is a citation from the Qur'an, Sura XXVII: 30-3. The translation according to 'Ali (1946: 985) runs as follows:

1. It is from Solomon, and is (as follows): In the name of God, Most Gracious, Most Merciful. Be you not arrogant against me
2. But come to me in submission (to the true religion). She said: You chiefs advise me in my affair,
3. No affair have I decided except in your presence. They said we are endued with
4. Strength and given to vehement war. But the command is with you, so consider what you will command.

Purpose of the building

The layout of Kursi Sulaiman gives the impression that it was built initially to serve as a *masjid* (cf. the *masjid* of al-Zawiya al-Qadiriyya, cat. no. 35). It is however better to consider the building as a commemorative shrine, for it has a huge stone tomb, and is built close to two important sites which were included among the places to be visited by Muslim pilgrims—the Place of al-Sirat and Bab al-Tauba and Bab al-Rahma (The Gate of Repentance and the Gate of Mercy, or Golden Gate). The Qur'anic verses which are inscribed on the panel mentioned above can be interpreted as a reference to the function of the building. The verses narrate part of the communication that took place between the Prophet Sulaiman (Solomon) and Queen Bilqis (the Queen of Sheba). In these lines Solomon invites Bilqis and her people—who were pagans—to embrace the true and universal religion of Unity, of which Muslims consider themselves the true inheritors. Muslims thus feel that they have the right to honour the Prophets of God who are mentioned in the Qur'an and who were associated with Islamic traditions. As the Prophet Solomon,⁵ to whom God granted among other valuable gifts both knowledge

and judgment, is mentioned seventeen times in the Qur'an, and because Solomon is associated with building projects in the Haram (Temple) area, it is understandable that a commemorative shrine named after Solomon the Prophet should be found within the Haram precinct, more especially since it was probably erected during a period which saw a growing interest in Jerusalem as a place for *ziyara*. In fact the building of this monument is a revival, for an earlier monument bore the same name but was located by and associated with the Dome of Sulaiman.

Architecture

Exterior

The Façades

There are three façades to the building, the fourth being subsumed within the Haram wall, which is also the city wall, and all are built of regular courses of masonry. The stones, which are identical in height but vary in width from 20cm to 50cm and are either square or rectangular, are carefully dressed in white and black. The lintels and the arches of the façades are built at a uniform height, and they are consistently cut, dressed and arranged, giving the exterior of the building a coherent appearance as if it belongs to a single phase of construction, with the exception of the south-east corner (see below).

The north façade is the main one, for here the entrance door is to be found; it is preceded by a square paved courtyard measuring 10m wide by 10.5m long. The pavement is constructed of fine white stone slabs which have weathered, like most of those used in the area of the Haram, to grey. The paving scheme is divided into four sections by four axial lines which run from south to north, each line measuring between 40-44cm in width.

The doorway is off-centre. It measures 1.1m wide and 2m high, and is surmounted by a slab lintel formed by a single stone of considerable size—1.75m wide and 28cm high. A relieving arch made up of three plain stones has been placed over the door lintel. The entrance is fitted on the outside by an iron grille made in two halves, each with four vertical and eleven horizontal bars. The grille is original, but it was not custom-made for the building because its individual bars are both taller and broader than the entrance; the result is that the bars are fixed to the surface of the lintel and the jambs, rather than set into the framework as is more normally the case. There is another iron door fitted to the jambs on the inside. The door is flanked to either side by a rectangular window. East of the eastern window there is a further, third window. These all share the same measurement, namely 1.1m wide and 1.8m high, and they have the same kind of lintel as the door. However, here the shallow relieving arches leave a small aperture above each lintel, giving the impression that each window or 'eye' is surmounted by an 'eyebrow'. The bottom of the windows is raised 20cm above the level of the paved ground. All three windows of the north façade are fitted with a simple iron grille and have iron shutters; while the shutters are recent, the grilles seem to be traditional.

Four courses up, and set directly above the lintel of the door, there is a rectangular recessed panel. The panel has a chamfered frame, and measures 75cm wide and 50cm high. A recently inscribed slab with Qur'an XVII:1 is now fitted into this panel, although ten years ago it was vacant. It is not known if there was once an original inscription which was subsequently

⁴ Any follower of the Bahara Shi'a sect of India visiting the holy places on the Haram is still keen to include Kursi Sulaiman in the itinerary.

⁵ For further details regarding the position held by Solomon within Islam see Hirschberg (1978: 108).

lost, or if it had been the original intention to have one and this was never achieved. A rectangular slit window measuring 25cm wide and 90cm high opens above the recessed panel. The slit window is topped by a small ogival arch surmounted in turn by a carved trefoil device. A slightly projecting cornice extends around the top of all three façades acting as a frame to the whole building and marking its upper limits. Two hemispherical domes rest directly over the west part of the building; they are covered by a skin of small flat stones. The eastern part of the roof is flat and is covered with stone slabs similar to those on the domes; both have been recently repointed. A wall of large rusticated stones of varying size and quality has been built recently over part of the join of the north wall of Kursi Sulaiman. It is not recorded when this was built, but it is possible that it is the work of the Supreme Muslim Council after the earthquake of 1927.

The western façade is the longest one, measuring 13.25m in length but sharing the same height (5.6m) as the other façades. It is divided into two halves by a central buttress measuring 1.12m wide and 5.4m in height. Two windows of identical design, similar to those of the north façade, are placed in each half-section. The relieving arches above the lintels of the southern window in each half-section are however different, for they are made up of two stones only, the first being longer than the second. Two identical slit windows resembling the one found in the north façade are set in the centre of each half-section. Part of the cornice which runs around the top of the building is missing in the southern part of the western façade, which resembles the western façade of al-Zawiya al-Qadiriyya (cat. no. 35).

The south elevation is a solid undecorated wall with the exception of three rectangular windows and one in the form of a single slit. The western and central windows are identical in form to those flanking the door in the north façade. The eastern window differs from them in that it has a stone lintel (*'atab sinaf*) probably rebuilt recently at the same time as the south-eastern corner of this elevation. The reason for this assumption is the presence of a crack, the recent shape of the lintel, and the fact that the stones of the corner do not match the rest of the building.

The eastern elevation is a solid wall and constitutes a small section of the eastern wall of the Old City of Jerusalem as well as the wall of the Hararm (see above: "Site and brief description").

Interior

The interior of the building is rectangular in plan. It is divided into two sections by two pointed arches. The arches, which run from north to south, are supported by a central rectangular pier 1.2m by 80cm, and by the walls from which they spring.

The first section consists of a rectangular prayer chamber divided into two square bays by a pointed arch whose opening runs from east to west. The arch is supported by the central pier and by the western wall. Each square bay is covered by a shallow dome and lacks any intermediary drum. The domes rest directly on a circle achieved by a transitional zone of four large pendentives at the corners of each square bay. In all there are twelve windows in this section. Four of the windows, two in each bay, are opened in the upper part of the walls; they are identical, undecorated and rectangular and on the exterior are expressed as slits. The remaining eight windows—four to each bay—are also identical. They begin at a height of only 20cm above the floor level and are surmounted by arches with a slightly pointed profile. Some of the stones in these arches are clumsily finished, and this

may indicate that these arches as well as the interior walls were originally plastered and probably only recently stripped. There are thick black lines of repointing between the courses of the walls, and the two domes have been recently replastered.

A concave *mihrab*, 1m wide and 50cm deep, occupies the middle of the south *qibla* wall in the southern bay, and is flanked by a window to each side. The *mihrab* niche is surrounded by a rectangular block measuring 1.4m wide and 2.6m long, which is built of finely dressed stones. A stucco cornice made up of small, simple painted *muqarnas* niches, which are partly dilapidated, crowns the rectangular block. These niches are decorated by a curved foliage motif. The *mihrab* niche is surmounted by a pointed arch. The hood of the *mihrab* is decorated by four scalloped ribs decorated with carved stucco. Three of the original seven ribs are missing.

[Editorial note: The stucco carving is similar but not identical in the four ribs, and they vary with regard to their state of preservation. The technical expertise demonstrated by their design is high—the designer had to work to take account of the curvature of the hood. The only other example known in Jerusalem is the dome of the Sabil Qa'itbai, where the swell of the dome is matched to the forms of the motif and is 'quintessentially Egyptian in style' (see Burgoyne 1987: 609). The decoration of the ribs of the *mihrab* is, however, not Egyptian in style but ultimately derived from Timurid design. They are filled with an interlocking chain of split palmettes reminiscent of, for example, an illuminated page from a *Diwan* of Qasim, dated 863/145-60, or a double-page painting from the *Horoscope* of Iskandar-Sultan ibn 'Umar Shaikh, dated 22 Dhu 'l-Hijja 813/18 April 1411, ff. 18b-19a, illustrated in Lentz and Lowry 1989: 248, cat. no. 139; 145-7, cat. no. 36. The motif was also widely used in textiles (Lentz and Lowry 1989: 218). SA]

The second section of the interior of Kursi Sulaiman is rectangular in plan, as already mentioned, and is situated to the east of the first section. Two identical windows are set in this part, the first to the north and the second to the south. This area is covered by a barrel vault which rests on the two arches on the west on one hand, and on the wall on the east on the other. The vault is plastered and accommodates an extraordinary stone cenotaph which measures 9.5m long by 7m wide and 2m high. Originally the cenotaph was probably a huge single stone; its facing of stones on the north, west and south probably dates to when the building was first erected. The inscription plaque (mentioned above) is fixed to the western side of the cenotaph. There are two cylindrical stone finials (50cm in diameter) on the top of the southern and the northern ends of the cenotaph, and it is all covered by a green pall in the customary way.

Summary

The founder of the building of Kursi Sulaiman is unknown, as are the founders of other commemorative buildings erected in Jerusalem during the Ottoman period. The size and the design of the structure involved a complicated building process. It is unlikely therefore that the building was built by a group of local workmen or ordinary citizens. Whoever initiated the construction must have been either an influential administrator or a man of some financial standing. The question of who built it must thus remain open owing to lack of information. None has yet emerged from the Jerusalem *sijills* but it is always possible something may yet surface either in the Holy City or in Istanbul. There is certainly the hint, quoted from the *sijills* and discussed above, which indicates that it was included in the *waqf* of al-Aqsa as

being one of the institutions which benefitted from the annual sum (*al-surra*) sent to Jerusalem from the Ottoman capital. As to the date of construction, the only suggestion so far has been made by Bieberstein and Burgoyne (1990: no. 195), who thought that the building was erected in the 11th/17th century but gave no supporting evidence for such a date. There are indeed three indications that point to this being the correct date. The first is the similarity of the layout of the prayer chamber with the layout of al-Zawiya al-Qadiriyya which is securely dated to 1043/1633-4 (cat. no. 35) and to al-Zawiya al-As'adiyya which was made *waqf* on 20 Muharram 1033/13 November 1623; the second is that the

building of Kursi Sulaiman, located on the eastern wall of the Haram, is mentioned first in the records of 11th/17th-century Muslim travellers; and finally, it is not mentioned in the itinerary of the mid-16th century guide book for the Muslim pilgrim to Jerusalem compiled by Nasir al-Din Muhammad ibn Khadr al-Rumi. Nasir al-Din says (Elad 1995: 165) that '... the Muslim continues to Qubbat Sulaiman, called "The Chair of Solomon" (Kursi Sulaiman). There, after the prayers and the reading of al-Fatih, the Muslim must put his hand on the Rock that is within the building with the dome.'

43 AL-ZAWIYA AL-MUHAMMADIYYA (MASJID AL-NABI)

Name: Al-Zawiya al-Muhammadiyya

Date: 1112/1700-1

Endowment: 1139/1726-7

Variants of name: Various names have been given to this monument. 'Qubbat al-Hadi al-Amin'¹ is the first, appearing in the foundation inscription dated 1112/1700-1. The name is a reference to the Prophet and may have led to some confusion, since there are two other individuals who both had a close association with the monument, both of whom were also named Muhammad. The first was Muhammad, governor of Jerusalem in 1122/1700. The information is contained in the foundation inscription where he is named as the founder of the monument (see below). The second Muhammad is al-Shaikh Muhammad al-Khalili, who used the *qubba* for meditation and instruction and endowed it with a *waqf* (see below). Despite the later association of these two men with the *qubba*, the fact that the reference in the title is both to *al-Hadi* and *al-Amin* (a combination of epithets commonly given to the Prophet Muhammad) points to an initial intention to make a link with the Prophet himself rather than with his two namesakes. The real confusion seems to lie with the identification of the *qubba* rather than with the attribution 'Muhammadiyya'² ('of Muhammad'), since there is another well-known monument which has borne a similar name for a long time—the Qubbat al-Nabi (the Dome of the Prophet Muhammad, cat. no.10). The name Qubbat al-Hadi al-Amin seems to have been in limited circulation. It was mentioned only in passing by van Berchem (1925: 194) and Taha (1990: 21). It has been replaced (probably to avoid confusion) by the second name given to the *qubba*, 'al-Zawiya al-Muhammadiyya'.³ This variant of the name is mentioned four times in the *waqfiyya* of al-Shaikh Muhammad al-Khalili. The *waqfiyya* is dated 1139/1726-7 (Sijill 188: 244ff) and has been published by al-Husaini and Abu 'l-Lail (1979: 23, 33, 36, 43). The name 'al-Zawiya al-Muhammadiyya' is the preferred one here, for it reflects the function of the monument at the time of al-Shaikh Muhammad al-Khalili (see below). 'Qubbat Bakh Bakh' is yet another name given to this monument by 'Abd al-Latif al-Husaini, who died in 1224/1809 (1985 2: 152), and by al-Husaini and Abu 'l-Lail (1979: 11). This name is used again in some contemporary references, but without any explanation being given: al-'Asali (1982: 41); Najm *et al.* (1983: 379); and Taha (1990: 21). According to Ibn al-Murajja (1995: 144), followed by al-Suyuti (1982 1: 200) and Mujir al-Din (1973 2: 20), 'Bakh Bakh' is a name given to the rock once identified with the place (*maudi*) of

al-Khadr. However, according to Mujir al-Din (1973 2: 21) the location of the rock is not related to the site of the monument under discussion, but rather to the place known today as 'Zawiyat al-Khadr' located below Qubbat al-Khadr. At the time of Mujir al-Din (900/1494) the place was called 'al-Maqam al-Khadr' (see Qubbat al-Khadr cat. no. 31). The question which is therefore raised is whether it was a mistake on the part of 'Abd al-Latif al-Husaini when he associated the name 'Bakh Bakh' with al-Zawiya al-Muhammadiyya. Most probably he was merely passing on the current tradition. To be more specific, it seems that the tradition at the time of al-Husaini had already shifted the site of the rock 'Bakh Bakh' from the Maqam (Zawiyat) al-Khadr to the site of al-Zawiya al-Muhammadiyya. This would explain why Shafi'i *et al.* (1971: 32); Najm *et al.* (1978: 379) and Taha (1990: 21) identify the site with the *musalla* (place of prayer) of al-Khadr; the *maqam* (place) of al-Khadr, and the *qubbat* or *sakhrat* (dome or rock) Bakh Bakh. The length of time between Mujir al-Din and al-Husaini (almost three centuries) may add credence to this proposition, for the time span is enough for such a change in tradition to take place and, indeed, it is one to which the Haram area is accustomed. A second reason is to be found in the biography of al-Shaikh Muhammad al-Khalili written by al-Husaini (1985 2: 146-8). Here it is possible to detect the strong effect al-Khadr had on the life and character of al-Shaikh Muhammad—it is clear that al-Shaikh Muhammad himself attributed his authority and knowledge to the support and influence of al-Khadr.

The name 'Masjid al-Nabi' (the Mosque of the Prophet) is more recent; the term *Moschee des Propheten* was first used by Schick (1887: 25) in the late 19th century, and later mentioned again by van Berchem (1925: 194-5); it has been taken up by such contemporary writers as Burgoyne (1976: no. 145), al-Husaini (1977: 21), Walls and Abu 'l-Hajj (1980: 18), Najm *et al.* (1983: 379), Taha (1990: 21), Bieberstein and Burgoyne (1992: no. 96) and Bieberstein and Bloedhorn (1994 3: 89). Although this name is thus the one most widely used in contemporary references, it has no historical basis and it seems to be the result of a misunderstanding. It is clear that it was the intention first of van Berchem (1925: 193) and then of Walls and Abu 'l-Hajj (1980: 18) to be more specific by calling the building the 'Aedicule of the Magistrate Muhammad'. Van Berchem (1925: 195) mentioned 'Kursi Muhammad' (the Throne of Muhammad) as yet another name used by Wilson (1866: 36) with a reference to Catherwood. Finally, al-'Arif (1947: 78) and Taha (1990: 21) both called the building 'Qubbat al-Shaikh al-Khalili' (the Dome of the Shaikh al-Khalili).

Modern name: Masjid al-Nabi (The Mosque of the Prophet); Qubbat al-Shaikh Muhammad al-Khalili (The Dome of the Shaikh Muhammad al-Khalili).

Location

Al-Zawiya al-Muhammadiyya is located in the north-west section of the terrace of the Dome of the Rock.

Site and brief description (figs. 43.1-43.4, pls. 43.1-43.5)

Al-Zawiya al-Muhammadiyya is a free-standing monument situated between Qubbat al-Mi'raj (the Dome of the Ascension) and the north-west colonnade. Its western elevation lies 12m from the western border of the terrace. The *zawiya* is constructed in two parts: a rectangular underground vault encloses a natural irregular rock, and over it a square-domed chamber is supported by four huge pointed arches. The site is used today as an office for

¹ *Al-Hadi* means 'the guiding' and *al-Amin* means 'the honest'; both are epithets of the Prophet Muhammad. However, used singly, the titles *al-Hadi* and *al-Amin* were also used by the 'Abbasid caliphs.

² In the Islamic Museum of al-Haram al-Sharif there is a Qur'an manuscript (no.169) dated 1116/1704 which is dedicated to Qubbat al-Muhammadiyya. The manuscript was one of the seven copies of the Holy Qur'an in the collection of al-Shaikh Muhammad al-Khalili and is mentioned in his *waqfiyya*; see al-Husaini and Abu 'l-Lail (1979: 22).

³ Mujir al-Din (1973 2: 44) mentions another *zawiya* bearing the same name, located outside the Haram. It was a *waqf* of Muhammad ibn Zakariya al-Nasiri of 751/1350. Al-'Asali (1982: 353) reports that it is 'dilapidated' but in fact it no longer exists. See also Cat. no. 29.

al-Aqsa Restoration Committee. Some ten years ago, in 1983, it used to house the Dar al-Hadith (The House of the Traditions of the Prophet).

History

Identification

The present structure of al-Zawiya al-Muhammadiyya is identified by a foundation inscription (see below), and the identification to the Ottoman period is frequently and explicitly mentioned in the *waqf* document of al-Shaikh Muhammad al-Khalili as stated above.

Date

The fifth line of the foundation inscription takes the form of a chronogram. Its numerical value is 1112/1700-1. The panel on which the inscription appears is of marble and is to be found above the lintel of the entrance. It is 50cm wide and 60cm high, and it is set back about 5cm. The script is composed of five lines of Arabic, each within a rectangular cartouche. The script is a slender, rounded *naskh*. There are ample diacritical points, with a few auxiliary signs. Van Berchem (1925: 194) published the text; for its full Arabic wording see no. 43 in Cat. Appendix 2. The translation, which was not attempted by van Berchem, runs as follows:

1. Fortunate was the Dome of al-Hadi al-Amin when it was restored after its disappearance
2. by [Muhammad], the governor of Jerusalem who constructed in it [Jerusalem] cisterns for the Muslims.
3. His countless charities in al-Aqsa Mosque were also noteworthy to those who saw [them].
4. Muhammad [the governor] has the wish (for paradise). Its chronogram [is]:
5. We said: 'Enter into it, in peace and security' (*qulna: udkhuluha bi-salamin aminin*).

The first line makes little sense, unless it can be interpreted as the intention of the writer to say that there had once been a dome named after the Prophet Muhammad (al-Hadi al-Amin) on the site, and that the dome had since disappeared. The construction or restoration (see below) of the dome by the Muhammad, Governor of Jerusalem was 'fortunate' (*tal' sa'd*). Van Berchem (1925: 194), who published but could make only partial sense of the inscription, considered it to be a text commemorating a restoration. The question that arises, however, is how it could have been a question of restoration when the original monument had disappeared (*ba'd al-khifa*). It is moreover clear from the style and type of the present structure's masonry that if it was indeed a matter of 'restoration' then it was a major work rather than just a consolidation or minor repair. The building must be seen as a new structure even though it is not identified specifically as such in the inscription, as was customary. Because of this, the text and date are here considered as references to a primary construction rather than as referring to the restoration of an extant edifice. The verb in the second line ('*ammara*') is also problematic for it has two meanings in Arabic; the first is 'to restore or repair', the second 'to build or construct'. The chronogram after the word 'we said' (*qulna*) is a quotation from Qur'an XV: 46.

Founder

According to the inscription, the founder of the present structure was Muhammad, who was governor of the city of Jerusalem in the year 1112/1700-1.

Endowment

The *waqfiyya* of al-Shaikh Muhammad al-Khalili is found in Sijill 188: 244ff, dated the beginning of Sha'ban 1139/24 March 1727. It is a long document of about seven thousand and two hundred words. As it has been published by al-Husaini and Abu 'l-Lail (1979: 15-46), it is enough for our purposes if comments here are confined to the information related directly to al-Zawiya al-Muhammadiyya. First the *waqfiyya* states that al-Shaikh Muhammad al-Khalili donated all the books of his well-stocked library to the foundation. The names and the authors of these are listed in the *waqfiyya*. Al-'Arif estimated that the books must have numbered some seven thousand items (Husaini and Abu 'l-Lail 1979: 22-33). In addition to his library, al-Shaikh Muhammad donated the following estate as a *waqf*—a soap-factory at Bab al-'Amud, Jerusalem; the ground floor of the weaving factory adjacent to the soap-factory; the vineyard opposite Herod's Gate, Jerusalem; the vegetable garden (*hakura*) close to Herod's Gate; the vineyard of al-Maghazin, Jerusalem; the income from the olive trees located at the site at al-Yusuifiyya, Bab al-Maghariba, Jerusalem; two vegetable gardens (*hakura*) at Bab al-Maghariba (no specific names are mentioned); the vineyard at the site of al-Baq'a, Jerusalem; the vacant space (*khulu*) over al-Madrasa al-Baladiyya, Jerusalem; the vacant space (*khulu*) over Suq al-Qattanin, Jerusalem; the vacant space (*khulu*) of al-Jib village, *waqf* of Sultan Inal, outside Jerusalem; the garden at Jaffa seaport (*iskila*); the large shop (*hasil*)⁴ close to the property of the inheritance of Murad Agha, Jaffa; the large shop (*hasil*) and the house built by the donor (al-Shaikh al-Khalili) at Jaffa close to the site where there was once a coffee-shop; the two floors with a wooden (*khashb*) and cane (*qasab*) ceiling at Nabi Musa, Jericho; and the two-storeyed house as well as the kitchen, *haush*, *iwan* and dependencies which were constructed by the donor at Hebron.

Shaikh Muhammad al-Khalili stipulated that the beneficiaries of this *waqf* were to be himself while he was alive, and after his death his sons and the sons of his sons. In the event that the line of his descendants died out, the *waqf* should serve al-Zawiya al-Muhammadiyya. The *waqfiyya* states that '... if they (the descendants of al-Shaikh Muhammad) became extinct, the *waqf* shall be for (the benefit of) al-Zawiya al-Muhammadiyya, well-known on the platform of the Sacred Rock, and for the pious Shafi'i theologians.' The *waqfiyya* further states '... if they (the family of the Shaikh) become extinct, the *waqf* shall be for al-Zawiya al-Muhammadiyya situated in al-Aqsa Mosque on the platform of the Rock, in order to serve its interests and requirements, and for the poor and for those close by (*mujawirin*).' In the event of the descendants of the Shaikh Muhammad being alive and administering the *waqf* according to the terms specified in the document, it was a condition that the caretaker (*mutawalli*) of the *waqf* should repair the *zawiya* whenever it was in need of restoration. From the income of the *waqf*, the caretaker had in addition to spend the sum of 20 *piastres* (*sic*—the total in fact should be twenty-one—see below) per year on the *zawiya*. That sum was to be allotted as follows:

⁴ The word *hasil* has two meanings: either a large shop, or a storeroom. Here the meaning is of a large shop (Amin and Ibrahim 1990: 31).

1. Salary for al-Hajj Muhammad the son of Jum'a, and for his son after him, for servicing al-Zawiya al-Muhammadiyya	7
2. Mats for the floor of the <i>zawiya</i>	4
3. <i>Sawadid</i> (posts) for the trellis of the grapevine which covered the main entrance and the south wall of the <i>zawiya</i>	2
4. Oil for illumination in the month of Ramadan and other months	6
5. Oil lamps (<i>qanadil</i>)	2
Total	21

The purpose of the building

It is difficult to infer from the inscription what was the initial impulse behind the construction of the building. It is, however, obvious from both the *waqfiyya* and the biography of al-Shaikh Muhammad al-Khalili that the edifice was used so exclusively by al-Shaikh al-Khalili some time after its construction that it was attributed to him. Al-Shaikh Muhammad used the building as a place for retreat and *dhikr*. This justified the reference to it as a *zawiya* in the *waqfiyya*. In accordance with the practice of serving *sufis*, the building also provided accommodation for various religious classes which were led mainly by al-Shaikh Muhammad al-Khalili. The subjects studied were the Traditions of the Prophet (*hadith*), preaching (*wa'iz*) and Qur'anic commentary (*tafsir*).

Architecture

The eastern façade is the main one. Its width is 9.9m and its height is 4m; it is built of fine, white, rectangular dressed stones of different sizes, some of which measure up to 30cm by 20cm. To the north of this façade is the door which gives access to the interior of the *zawiya*. The door measures 94cm in width and 1.83m in height and is surmounted by a slab lintel. It is raised above the ground level of the terrace of the Dome of the Rock by means of a simple sill, 5cm in height. The recessed inscription plaque (see above) is set one course directly above the lintel of the door. A further four courses of masonry continue beyond the plaque to the top of the façade. Two rectangular openings which form a double window are found to the south of the door, each measuring 82cm in width and 1.41m in height. They are today fitted with simple iron grilles which are not of recent date and are most probably original. The windows are surmounted by lintels of the same quality and at the same level as the lintel above the door, but they begin 45cm from ground level. The masonry of the façade appears to be homogeneous except at the top of the south-eastern corner which shows a change in the size of stones, and as a result the lines of the pointing are also broken. It seems also that there was a window between the door and the north corner of the building, for the line of the masonry courses is again broken and the stones are of a different size. It is unusual that the upper part of all four faces was not finished with the customary projecting stone cornice, whose purpose was to protect them from rainwater. There are, however, two simple terracotta spouts which project slightly and direct the water collected on the roof away from the building. The first is at the top of the south part of the eastern façade, and the second is on the western corner of the south elevation. It appears that a third spout was once to be found to the north of this façade, for the masonry shows the black discolouration which is the result of chemical reaction. The other three elevations to the north, the west and the south are built in the same way and with the same features as the eastern façade. The only exception is the fenestration which is here centred and

consists of two separate windows instead of the double window found in the eastern façade. All the windows in the building share a similar design and measurement. The shallow hemispherical dome rests directly on the roof of the *zawiya*. Both the roof and the dome are covered by small flagstones. The dome is finished by an unusual short stone finial resembling the one on Sabil Mustafa Agha (cat. no. 48); both were presumably once taller before being damaged.

Interior

The interior of al-Zawiya al-Muhammadiyya consists of a single-domed chamber which is rectangular in plan with internal measurements of 6.9m wide by 8.1m long; the wall is 90cm thick. The ground of the chamber is at the same level as the terrace of the Dome of the Rock. It is mostly paved with large slabs (the biggest being 44cm by 140cm, while the smallest measures 26cm by 45cm) of dressed flagstones, which show a crisp sawcut edge and thus probably belong to a recent restoration. The chamber is covered by a hemispherical dome which sits on four huge, pointed arches. The arches spring from four square bases a mere 75-80 cm above the floor level. The massiveness of the arches allied to the low springing-points and the thickness of the walls combine to make the interior appear heavy and relatively small, especially if it is compared to the exterior. Why the masonry is so massive is hard to suggest, for the dome is comparatively shallow and modest in size. The recess of the northern arch is deeper than that of the other three, and it gives the impression of a small, narrow *ivan*. It is further marked out by having a low skewed recess cut at the point of the springing. Four pendentives at the four corners serve as a transitional zone for the dome. The lowest level of these pendentives is built of stone, the rest being constructed of a mixture of lime and mortar in the same way as the interior of the dome and the intrados of the four arches. As already described, there are eight windows in all—one double window in the east side, and two windows in each of the other three. The windows in the south side flank a simple undecorated concave *mihrab* situated at the centre of the wall. It is built of stone and has a semicircular arch and fluted semi-dome. The *mihrab* measures 73cm in width, 38cm in depth and 1.88m in height. In the walls to the west and north, a blind recess is flanked to either side by the two windows, and each is surmounted by an arch.

The Underground Vault

The underground vault is located directly beneath the domed chamber. Al-'Arif (1947: 79) referred to this place as a 'cavern' (*kahf*). The area is not mentioned in the *waqfiyya* of al-Shaikh Muhammad al-Khalili nor is there any hint in his biography that it was used as a place of retreat. It is here described as an 'underground vault' because of its architectural features and for lack of a precise definition.

The underground vault is reached through a rectangular opening measuring 94cm wide by 3m long found in the floor of the chamber at the south-eastern end. This opening leads to a staircase built in two sections. The first part is made up of eight steps and runs southwards; the second part consists of fourteen steps and runs westwards. The interior of the vault is rectangular in shape and measures 6.8m in width, c. 8m in length and 4m in height. It is covered by a cross vault supported on four piers springing directly from the corners of the area. The floor is uneven because part of it is still made up of the natural rock, which reaches a height of some 1.5m by 3m long. The rest of the floor is covered with flagstones. The walls of the vault and the roof

are plastered. It is interesting to note that even the rock has received a coating of plaster and this must have occurred some time ago, for the consistency of the plaster is thick, smooth and composed mainly of lime. More recent plaster usually contains a high percentage of concrete and sand. The walls of the vault are solid except to the south, where there are two slit recesses. The south one was probably used as a gutter to guide the rainwater from the roof of the chamber and the platform of the Dome of the Rock to this vault when it was used as a cistern. The western recess is blind. There is a *mihrab* in the vaulted chamber, with a decorated panel placed next to it against the wall that supports the second part of the lower level. The *mihrab* is slightly concave, and its apex is surmounted by a small, white marble arch, whose span is shorter than its radii. The arch, which was certainly once part of a larger decorative scheme, is in secondary use. It is carried on relatively massive marble cylindrical columns that lack either capital or base. To the east of the arch, a carved panel has been joined to it haphazardly; it is supported by the column of the arch to one side and by another similar column to the other side. Its main decoration is a carved shell surrounded by a band of reel volutes. The fragments are in the Crusader style, in particular the arch which to some extent resembles the one still *in situ* over the entrance of the cave below the Dome of the Rock, and another one found in the small *mihrab* located to the west of the main

mihrab of al-Masjid al-Aqsa.

Conclusion

It seems probable that some sort of structure occupied the site some time before the building of the present al-Zawiya al-Muhammadiyya. Unfortunately, the sources are silent as to its nature and the inscription panel reveals nothing about its inception (*ansha*). Since the inscription panel clearly states that Muhammad the Governor constructed cisterns in the Haram, and because the form of the underground vault fits such a function, it is tempting to speculate that the vault (at the beginning at least) acted as one of these cisterns. Later, the cistern would have fallen into disuse, and the tradition connecting al-Khadr and al-Shaikh Muhammad al-Khalili, who used to live in the building, probably gained wide acceptance. Later still the traditional place of al-Khadr seems to have lost its importance, doubtless at first through neglect; it was then put to use as a storage place for the mosque from the time of Mujir al-Din (900/1494). It is perhaps as a result of these circumstances that tradition has moved the place of al-Khadr from a position near the north-west colonnade to this site. The addition of the *mihrab*, the elaborate lower level and the iron balustrade would have served to enhance the site, and to make it suitable for *ziyara* (visitation, pilgrimage).

44 SABIL AL-KHALIDI

Name: Sabil Muhammad San'allah al-Khalidi

Date: 1125/1713

Endowment: Beginning of Rajab 1125/24 July 1713

Variants of name: Sabil Daraj al-'Ain, Sabil Khatt (Street) Da'ud

Modern name: Sabil Daraj al-'Ain

Location

The *sabil* is located to the north of Tariq Bab al-Silsila immediately east of its junction with the stepped street (Daraj al-'Ain) leading up from Tariq al-Wad.

Site and brief description (figs. 44.1–44.2, pls. 44.1–44.4)

Sabil al-Khalidi is situated in an area which, by long tradition, has been associated with a number of architectural projects. A series of archaeological excavations undertaken from 1967 onwards below the present level of the street of Bab al-Silsila and below the western wall of the Haram have revealed traces of structures dating from the Roman to the late Mamluk periods. In the Ottoman period a series of dwelling houses were built on both sides of the street, and apparently in particular above Mamluk monuments. The site is still flanked to the west by the street called Daraj al-'Ain, and to the south by the main thoroughfare of Bab al-Silsila; when it was constructed in 1125/1713, it was bordered to the north by an unrecorded building then used as a stable, and to the east by a shop and by the house of the donor. The door to the *sabil* is in the western façade, opposite the eastern elevation of al-Turba al-Jaliqiyya which dates to 707/1307. The *sabil* is a simple structure. It consists of a single room that is almost square in plan and is covered by a barrel vault. A door in the western wall gives access to the interior. Two window openings with simple grilles in the south wall once allowed water to be distributed to thirsty passers-by. Some time ago the *sabil* ceased to operate, and it now does not function as a public fountain but is used as a storage place by the Khalidi family. A plan to reconstitute it as a working fountain is under consideration.

History

Identification

The *sabil* can be identified with certainty as dating to the Ottoman period by virtue of an unpublished *waqfiyya*¹ (Sijill 208:105), first identified as such by Natsheh (1980: 20). Al-'Asali (1982: 283) followed Natsheh in listing the *sabil* as Ottoman.

Date

No foundation inscription for the *sabil* survives, but a recessed panel measuring 30cm wide and 30cm high still exists in the south wall of the fountain and can be presumed to have once contained a plaque with a commemorative inscription. The *waqfiyya* implies that shortly before its date—which is at the beginning of Rajab 1125/24 July 1713—a shop owned by one Muhammad San'allah al-Khalidi had been converted into a public fountain and furnished with a marble trough. The tentative 16th-century date given to the fountain ten years ago (Natsheh

1980: 20) has thus since proved to be incorrect.

Founder

The *waqf* document (Sijill 208: 105) gives the name of the founder as *mafkar al-'ulama' wa'l-mudarris al-'Azam* Muhammad San'allah al-Khalidi, son of the deceased Khalil Efendi al-Khalidi. Both the family name and the laudatory titles of the founder and his father make it obvious that Muhammad San'allah was one of the prominent citizens of Jerusalem in his era. The founder belonged to a leading Palestinian family whose roots date back—according to the *waqfiyya*—to the first years of Islam and to a Companion of the Prophet, Khalid ibn al-Walid. The Khalidi family exercised a vital role in the public and intellectual life of Palestine and Jerusalem in the Ottoman period, and its members have held many important positions, particularly in later Ottoman times.²

The Waqf Document

Two original *waqfiyyas* of relevance are found in the Jerusalem *sijills*; the first (Sijill 208:105) concerns the *sabil*, where its date is given as the beginning of Rajab 1125/24 July 1713. The second document relates to the estates of Muhammad San'allah al-Khalidi which he made a *waqf*; it is dated the middle of Dhu 'l-Hijja 1136/4 September 1724. Both *waqfiyyas* are of considerable importance, as they contain the only information relating to the fountain discovered so far. The *waqfiyya* concerning the *sabil* is a short one, consisting of some three hundred and twenty words. It includes all the most essential information, such as a description of the building and its boundaries, the terms of the endowment, details concerning the personnel and their duties, the purpose of the construction and other details. The second *waqfiyya* (Sijill 218: 470) is longer, containing about two thousand five hundred words. As already stated, it is concerned with the whole estate of Muhammad San'allah al-Khalidi. It is necessary here only to report on the information related directly to the *sabil*.

Purpose of Construction

The founder made the *sabil* a *waqf* 'explicitly and sincerely for the countenance of almighty Allah, in his wish for the great rewards. The *sayyids* (gentlemen), and all people (*nas*)—whether arriving early or in a hurry (*al-sayyad wa'l-warid wa'l-ba'dir wa'l-hadir*), resident or non-resident—are permitted to drink from this fountain' (Sijill 208: 105).

Description of the Building

The building is described in the document as 'the whole shop situated in al-Quds al-Sharif in Da'ud Street, bordered by the public road to the south onto which open the two windows of the *sabil*, by a *waqf* shop belonging to the sons of al-Ja'uni to the east, by a stable belonging to Muhammad son of Sa'd al-Din to the north, and by the road which leads to the Gate of Bab al-Qattanin to the west, in which there is the door of the *sabil*.' The description still bears a remarkable similarity to the current position of the *sabil* (see above).

Endowment

Various estates are specified in the *waqfiyya* (Sijill 218: 470) of Muhammad San'allah al-Khalidi as an endowment to provide income for the maintenance of the estates of the *waqf* itself, and

¹ I am deeply grateful to Miss Haifa' al-Khalidi for providing me with a copy of the *waqfiyya* for the *sabil* (Sijill 208: 105) and with another copy of the *waqfiyya* of Shaikh San'allah al-Khalidi (Sijill 218: 470ff).

² For more details of the biography of this family in the late Ottoman period see Manna' (1986: 132–56).

for the running costs of the *sabil*, among many other donations and assignments. The estates were scattered in different parts of the Old City of Jerusalem. The list is made up of twelve houses, five shops, one vegetable garden, and of shares of varying percentages in three houses, two vegetable gardens, a shop, a soap-factory, a bakery, and the vault of the big 'roaster', where nuts and coffee beans were toasted. All these estates were fully described and registered in the *sijills* in seven *waqf* documents of various dates. The first is dated 18 Shawwal 1123/29 November 1711 and the last is dated 12 Shawwal 1136/4 July 1724.

Personnel and maintenance

From the income provided by the *waqf* already mentioned, the caretaker had to allocate the money needed to pay the cost of the water, the copper cups and their tinning (*tabyid*), and the repair of the *sabil* whenever it was in need of restoration (Sijill 218, 470). In addition to this, the caretaker had to appoint two persons, each with specific terms and duties, to maintain the *sabil*. The first was a water-carrier who was to be paid two Egyptian coins per day to provide the *sabil* with water continuously—and if he needed more money the caretaker was to give it to him 'without any hindrance' (Sijill 208: 105). The second employee was given the job of serving and illuminating the *sabil* for seven Egyptian coins per month (Sijill 218: 470). He had to open the *sabil* each morning and close it in the evening (Sijill 208: 105); he also had to illuminate it by hanging oil lanterns outside the building above the recessed niche every night (Sijill 218: 470) between sunset (*maghrib*) and evening (*'isha*). The donor also allocated eight Egyptian coins per month to buy oil for the lighting of the *sabil* (Sijills 208: 105; 218: 470).

Architecture

The southern façade is the main one. It consists of a simple recess measuring 70cm in depth and 1.9m in width, and once contained a trough which is now missing. The recess is surmounted by a pointed arch set in a rectangular stone block. The arch springs from the two sides of the block, and is constructed of red, black, and yellow stones. A moulding frames the extrados of the voussoirs and extends to the point from which the arch springs where it turns to run horizontally to the edge of the *sabil*. The section to the east is missing. The inner face of the moulding is formed of a reel carving of octahedral geometrical shapes. The arch moulding is inlaid with four small square *tesserae* of blue faience at the point of the springing and on the haunch. At the rear of the recess, two identical rectangular windows, each measuring 58cm wide and 1.15m high, are built of *ablaq* masonry. The windows are provided with simple grilles, and surmounted by a slab lintel. The course that is set directly above the lintel is decorated by a carving in relief, with a five-pointed star suspended from the centre. A recessed panel that was presumably intended to hold a monumental inscription is placed at the centre of the tympanum of the arch. The uppermost stone in both the east and the west sides of the upper course of the rectangular wall is decorated by an incised geometrical pattern.

[Editorial note: Although at first sight identical, these two stones vary slightly. In both, the centre is in the form of a star, one with eight points, the other with twelve. In each, the 'points' of the stars are negative spaces, cut between the ribs which are left in reserve to mark the lines of the pattern. These interstices are deeply recessed, the sides of each space being cut at an angle to

derive maximum benefit from the effect of light and shade. From this central motif, the design in each example radiates outwards. The stone with the eight-pointed star develops into an octagon, as might be expected, formed of two intersecting squares; this is set within a circular frame. The space between this circle and the corner of the outer square frame is filled by three ribs, which form another star.

As already explained, the motif of the stone with the twelve-pointed star also develops outwards from the centre. In this pattern, there are three 'layers' of irregular lozenge-shaped spaces between the ribs. The tips of these lozenges touch the framing circular inner frame. In this pattern, the gap between the circumference of the circle and the square outer frame is treated in the same way as the first stone, with ribs forming small subsidiary stars.

The similarities and differences between the two decorated stones, which are probably the work of a single skilled craftsman, produce for the viewer a pleasing exercise in contemplation. SA]

The west elevation faces onto the street called Tariq Daraj al-'Ain. It is an elevation of plain masonry constructed of a different type of stones to those of the recessed arch panel of the southern façade, in that they are large, very roughly dressed, and are irregularly arranged. This indicates firstly that the recessed panel is the principal addition built by Muhammad San'allah al-Khalidi when he converted the shop to a *sabil*, and secondly that it is probable that the stones of the western elevation belong to an earlier structure, for they resemble the fabric of the eastern elevation of al-Turba al-Jaliqiyya which dates to 707/1307 (see Burgoyne 1987: 187). A door opens in the lower part of this elevation. It has been reduced in size at some time recently and now measures 78cm wide and 1.3m high. The uppermost courses of the stones are concealed by a later vault spanning the street of Daraj al-'Ain. The similarity of the masonry between the western elevation of the *sabil* and the rest of the wall that extends to the north points to the fact that both belong to the same structure. This must have been built before the vault and the recessed panel of the *sabil* and probably dates to the late Mamluk period.

The interior of Sabil al-Khalidi is a rectangular room measuring 1.75m wide by 2.8m long, and is flanked to the north and east by unrecorded structures described briefly in the *waqf* document and probably constructed at the same time. The room is covered by a cross vault and it is now filled with unused belongings.

Features

Sabil al-Khalidi is of the double-window type, identical in most of its architectural features to Sabil al-Shurbaji which dates to 1097/1685 (cat. no. 40). It is also similar from the point of view of the way it was run and its location in a main thoroughfare for the majority of people coming and going in the Old City. As already shown, two main phases of construction contributed to the building. The first was the establishment of the shop and the building adjoining it; this probably took place in the Mamluk period. The second is the erection of the recessed arch panel which was undertaken by the donor Muhammad San'allah al-Khalidi in 1125/1713 or shortly before; between these two phases the vault spanning the street of Daraj al-'Ain must have been constructed.

45 SABIL AL-HUSAINI

Name: Sabil al-Husaini

Date: 1137/1724-5

Endowment: None known

Variant of name: None is known, but the fountain may once have been called 'Sabil al-Qubba al-Nahawiyya'

Modern name: None known

Location

The *sabil* was formerly located on the northern façade of al-Qubba al-Nahawiyya (The Dome of the Grammarian), dated 604/1207-8, on the south-western corner of the terrace of the Dome of the Rock.

Site and brief description (pls. 45.1-45.4)

The fountain was to be found at the corner where the eastern side of the dome chamber of al-Qubba al-Nahawiyya meets the western side of the *riwaq* of al-Qubba al-Nahawiyya. The monument is no longer standing but architectural traces allow a plausible reconstruction.

History

Identification

A terracotta plaque identifies the former *sabil* and dates it to the Ottoman period.

Date

The foundation inscription measures 60cm wide by 50cm and contains two verses of Arabic poetry. It gives the date of construction as 1137/1724-5, both in numerical form—contained within a small cartouche in the centre of the bottom line of the plaque—and by way of a chronogram, in the second hemistich of the last verse. The inscription was published by van Berchem (1925: 66-7), and was listed by Walls and Abu'l-Hajj (1980: 16), under the title 'Construction of a cistern'. The inscription panel is attached to the upper section of the northern side of al-Qubba al-Nahawiyya. The elegant script is a type of Ottoman *naskh*—it is well written, slender and interspersed with diacritical and auxiliary points. The script itself is surrounded by four rectangular cartouches with lobed ends that surround a central medallion with a five-petalled rosette, and the plaque has a border of triangles which also surround small empty cartouches to each side of the central date. The translation runs as follows:

1. Hasan, son of al-Dani al-Husaini, has constructed it (the *sabil*)

For the repose of the soul of al-Husain, Oh you who descend to the water!

2. Ibrahim has said, in order to date it (the chronogram) 'Would that healing should show itself vigorously to those who come to drink of it' In the year 1137 (1724-5).

The name 'al-Dani' contained within the first line was read by van Berchem as 'al-Day', but he noted its peculiarity, and he proposed an alternative reading of either 'al-Da'y' or 'al-Dani'. On the basis of a *siyill* (see Founder below) it can now be confirmed that 'al-Dani' is indeed the correct form. The 'Husain' mentioned in the second hemistich is the son of 'Ali ibn 'Abi Talib, the martyr of Karbala.

The final problem is the identity of the 'Ibrahim' who appears in the first hemistich of the second line. There are three possibilities—first that it was a name chosen at random to conform to the requirements of the verse; secondly, that he was the person who composed the verses; or thirdly, that the name has another, as yet unrecognised, implication.

Founder

Nothing has been published about the donor, but while examining the proceedings recorded in the *siyill* for the year of construction (1137/1724-5), many records bearing the name of the founder came to light. Two of these records have a direct bearing on the activities of the founder in Jerusalem, and the others mention his name in his capacity as *qadi* of Jerusalem. The first relevant record is registered on the binding of *Sijill* 220:1 dated the beginning of Safar 1137/20 October 1724. It concerns the inauguration of the donor as the new *qadi* of Jerusalem. The second record (220:145-6) is a *waqfiyya* for the renovation of nine *kanafat* (singular *kanif*, latrine) and a water basin for ablutions. These were for the benefit of the Haram and the Malikiyya mosque attendants, together with the *mujawirun* (students) on the Haram. They were located outside the precinct, in the vicinity of al-Madrasa (al-Khanqah) al-Fakhariyya to the west of the Haram. The full name of the donor appears in the records as '*al-sayyid* (the gentleman, the title given to the direct descendants of the Prophet Muhammad) Hasan Efendi Dani Zada al-Husaini', with many long and distinguished epithets, in particular those connecting him to the Family of the Prophet, such as *al-shajara al-tahira al-zakiyya* (the chaste, the pure of lineage).

Purpose of Building

The primary purpose of the structure was to provide visitors to the Haram with water, an act of piety recognised as a form of *sadaqat jariyya* (a permanent charity). It is also, however, the implication of the foundation inscription that the provision of water was of secondary importance, and that the *sabil* was constructed in the first place for the benefit of the soul of al-Husain. That would mean that whoever drank from the fountain had to recite the Fatiha (Qur'an I) or other prayers for al-Husain. Al-Husain is considered by all Muslims, Sunnis in general and the Shi'a in particular, as the greatest example of bravery and self-discipline. Thus the monument, although it fulfilled a practical function, also acted both as a memorial and as a monument to the lineage of the Prophet Muhammad and his descendants through al-Husaini, and it was therefore unique among the *sabils* on the Haram.

Architecture

Although the *sabil* has now been demolished, it is possible to see a groove in the paving stones showing the position of the wall, as well as the location of a possible impost that once supported the springing of two of the four arches on the north-western corner. In addition, above the inscription panel on the northern wall and on the adjoining eastern wall of al-Qubba al-Nahawiyya, there are traces of two pointed arches. These clues point to the original form of the structure of the *sabil* from which it is possible to reconstruct its original appearance. The fountain was a small one-unit building, square in plan, and built of stone. It probably consisted of a stone base, which held a trough for the water, and which was surrounded by four columns which in turn supported four pointed arches. Another possibility would be a structure with two columns in the front or north side and imbedded columns on

the back wall, for there seems to be evidence of an incorporated column in the corner. Two of these arches would have been arranged to span the northern and eastern sides respectively. The arches to south and west were presumably integrated into the western and southern walls, for some traces can still be seen there.

Pl. 45.1 Sabil al-Husain, traces of arches on the site of the vanished *sabil*.

A small shallow hemispherical dome or cross vault was probably built over the four walls of the *sabil*. If this reconstruction is correct it means that to some extent the Sabil al-Husaini resembled the Sabil Mustafa Agha (cat. no. 48).

Pl. 45.4 Sabil al-Husain, grooves in pavement on site of vanished *sabil* indicating where it stood.

Pl. 45.2 Sabil al-Husain, inscription.

46 KHALWAT AL-DAJANI

Name: Khalwat al-Dajani

Date: 1138/1725-6

Endowment: None known

Variant of name: None known

Modern name: Al-‘Iyada al-Tibbiyya (the Health Clinic).

Location

Khalwat al-Dajani is located to the west of the Dome of the Rock terrace on the level of the Haram esplanade, between the west colonnade (340/951-2) and the south-western colonnade (877/1472).

Function

The foundation inscription calls the site a *makan* (place); this general term applies to sites with different uses. Perhaps the main aim of the sponsor, al-Dajani, was to set a building—any building—on this coveted site. But its simple layout, the existence of a *mihrab*, and its location within the Haram all suggest that the main purpose of the *makan* was as a place of religious teaching or to serve the Sufi community. Although its size is relatively large with respect to other *khalwas* on the Haram, this function is the one opted for here; hence the reference to it in what follows as a *khalwa*. Even its form is unusual compared to other examples, for it is rectangular rather than square, and it consists of a single level, while the other *khalwas* in the sanctuary comprise two levels. Above all, the decorative elements are very modest.

Site and brief description (figs. 46.1–46.2, pls. 46.1–46.6)

The *khalwa*, which is on the lower level of the esplanade, is bordered by the west side of the Dome of the Rock terrace to the east, and by the south wall of Sihrij al-Malik al-Mu‘azzam ‘Isa (607/1210–11) to the north. A photograph published by Gauthier-van Berchem and Ory (1982; a copy of the photograph is reproduced) shows that a building, which is now no longer in existence, was then abutting the south elevation. It was probably dismantled by the Supreme Muslim Council in the 1920s, although this hypothesis is not supported by any documentation. The main façade of the *khalwa* faces west towards Sabil Qa’itbai (887/1482) while the southern elevation is opposite the South-West Khalwa (cat. no. 53).

Khalwat al-Dajani consists of a single rectangular prayer-chamber, covered by two simple cross vaults, each with a small saucer dome in the centre. A simple *mihrab* niche is set in the middle of the south wall. Since 1988 the *khalwa* has been used as a first aid clinic for visitors to the Haram.

History

Identification

An inscription plaque above the door of the *khalwa* identifies the building as dating to the Ottoman period. Although Khalwat al-Dajani is one of the five *khalwas* out of the total of fifteen on the Haram to have a foundation inscription, surprisingly it does not feature either in contemporary or in more recent references. Its absence from the careful records of van Berchem is particularly difficult to understand, particularly in view of his inclusion of a more difficult—because hidden—inscription in the vicinity, that is the inscription on the cistern of al-Malik al-Mu‘azzam ‘Isa (van Berchem 1925: 68–70). Van Berchem took a photograph of a general view of the whole façade of the area located between the

western and south-western colonnades. It is just possible to see the outline of the recessed panel which now encloses the inscription plaque in the photograph, which was published by Gauthier-van Berchem and Ory (1982: 70). However, the view was taken from some distance and the results are unfortunately not clear enough to be sure that the panel then included the inscription or if it was merely a blank recess.

Al-Saddiqi (cited by al-‘Asali 1992: 294), recording the diary of his journey to Jerusalem in 1122/1710, writes that ‘during the second night and the night after it we met in al-Khalwa al-Dajani in the Haram where we held a discussion ...’ The fact that this was fifteen years before the date of its foundation as recorded by the inscription causes some confusion. The question is whether al-Saddiqi, who visited Jerusalem many times between 1122/1710 and 1152/1739 and stayed for a long time (al-‘Asali 1992: 109), made a mistake about the date, or perhaps confused his notes. Another possibility may be that a *khalwa* of the same name existed previously and was later rebuilt in 1138/1725–6.

Date

The date of the *khalwa* (*makan*) is given in two ways—first, by a chronogram which is included at the end of the last line of the foundation inscription and has a numerical value of 1138; and second, by way of numbers written in a special cartouche below the last line of the inscription. The unpublished inscription plaque is set into the west façade, two courses above the door lintel. It is of stone and measures 36cm wide and 48cm high. It consists of three lines of Arabic written in a fine, compressed Ottoman *naskhi* script contained within six rectangular cartouches divided by fillet borders. There are both diacritical and auxiliary points. The complete Arabic text is to be found in Cat. Appendix 2 (no. 46), and the translation runs as follows:

1. ‘Abd al-Hayy whose grandfather is al-Dajani came to be the builder of this place.
2. It has been founded on devoutness ... and it is erected without hesitation for the sake of God.
3. Give a date for it (the chronogram)—what a fine construction! Its reward is the heights of Paradise.
4. Year 1138 (1725–6).

Founder

The Dajani family are among the leading families of Jerusalem and Palestine as a whole; they were entrusted with various offices and positions in the Maqam al-Nabi Da‘ud (Tomb of David) among others (see cat. no. 1). ‘Abd al-Hayy al-Dajani seems to have been a prominent figure in Jerusalem in the early 18th century. A document dated 19 Rajab 1137/3 April 1725 in Sijill 220: 73 states that the *qadi* had appointed Fathallah, Muhammad, and Salih, the sons of ‘Abd al-Hayy Efendi al-Dajani, respectively to the positions of caretaker, inspector, and *mashyakha* of the Madrasa al-Muzhiriyya.¹ They were to share the income from these positions equally. From his titles, *mafkar al-sadat al-‘ulama* (the pride of the extolled scholars) and *efendi*, it is obvious that at the time ‘Abd al-Hayy was a famous scholar in Jerusalem, as were perhaps his sons.

Architecture

A stone buttress measuring 67cm wide by 1.06m long by 2.6m

¹ For details of al-Madrasa al-Muzhiriyya, see Burgoyne (1987: 579–89).

high divides the main western façade into two sections. The stones of the buttress, although all are white, are of differing quality and they are bigger in size than those of the *khawwa* itself. One of the stones of the buttress carries a mason's mark which would suggest that it is in secondary use. The only entrance to the Khalwat al-Dajani is in the northern part of the west façade. It is a simple door measuring 80cm wide by 1.6m high and it is surmounted by a simple arch made up of three voussoirs. A rectangular window measuring 79cm wide and 1.2m high is placed to the south of the door; it is surmounted by a slab lintel, and is fitted with a wire mesh grille. The masonry courses in this part are finely dressed with a very smooth surface. Four courses above, there is a small slit window opening measuring 22cm by 50cm. It is to its north above the arch of the door that the inscription plaque mentioned above is located. The courses of masonry above the level of the arches of the door and the window show a different type of dressing. The surface of the stone here is roughly faceted, for it has been dressed with a pointed sharp-headed chisel. The contrast of the dressing suggests that the upper part was either rebuilt at some time or that the stone is in secondary use. If the former alternative is correct, it raises the question of whether the inscription plaque is in its original site, or whether it too is in secondary use like the rest of the stone at this level. It would seem that this second suggestion is the more likely as an explanation for its otherwise inexplicable absence from the records of van Berchem, discussed above, especially as its present position is in no sense hidden.

Two rectangular windows are placed in the south part of the west façade, each window measuring 83cm in width by 1.35cm in height. They are fitted with a simple iron grille, covered today by a wire mesh grille. The windows are surmounted by lintels, and the course that is set directly above them has a pseudo-arch which takes the shape of an eye-brow. The southern elevation is a solid undecorated wall using different types and sizes of stone which have been dressed with varied techniques; this probably means that they were assembled rather than quarried. The upper two courses to the west and south serve as a parapet for the building instead of the usual cornice.

Interior

The interior of Khalwat al-Dajani consists of a rectangular prayer-chamber with an internal measurement of 6m wide by 7.7m long. The floor of the chamber is raised 50cm above the level of the Haram, for it is at the same level as the platform that precedes it. The chamber was paved in 1988 with modern stone slabs 30cm square. The depth of the west wall is 80cm, and, as described above, the door and the window are placed in its north part, both being expressed on the inside by a semicircular arch and scallop at their summit. Each opening of the double window is surmounted on the interior by a triple arch which springs from an impost decorated with a frame moulding, and from the wall. A square blind recessed niche (40cm by 40cm) is centred above the two arches.

A simple undecorated *mihrab* is situated in the centre of the south wall. It is built of stone but has been recently plastered, and it has a shallow semicircular arch and scallop. The *mihrab* measures 58cm in width, 41cm in depth and 1.53m in height. It is surmounted by a piece of stone *cyma recta* moulding that measures 13cm in width and 60cm in length. The *mihrab* is flanked on either side by a blind recess. The one to the west measures 14cm in depth, 60cm in width and 1m in height, whereas the eastern niche measures 50cm in depth, 65cm in

width and 1.05m in height. Both recesses begin 26cm above ground level. The east and north faces are unbroken walls apart from a blind recess in each; the eastern one measures 72cm in depth, 1m in height and 1.1m in length, while the northern recess measures 55cm in depth, 1.35m in width and 77cm in height. The interior of the prayer-chamber is made up of two parts; each part is covered by a simple cross vault with a very shallow saucer dome in the centre. The vault and the dome are clumsily finished, probably as a result of a recent replastering in 1988 when the building was repaired to house the Health Clinic, and both are whitewashed.

Conclusion

The evidence presented above suggests that the date and the correct identification of this monument depend in the main on the inscription plaque situated above the door. The authenticity of the plaque itself and the identity of the founder are beyond doubt, but the problems raised relate to its position. Is the plaque in its original site or is it here in re-use? The layout and the simplicity of the building would both tend to point to a belief that it is *in situ*, but it is very difficult to understand why, if this is so, it was not published by van Berchem. If the assumption that the plaque can be believed is correct, this would make the *khawwa* the first to be built by a local Jerusalem scholar—for all the others were constructed by Ottoman officials. In any case, the building clearly demonstrates a decline in both quantity and quality in the formal building work by the Ottomans, particularly when it is compared to the work done in the city in the 16th and 17th centuries. The simplicity and the very limited dated examples² of 18th-century buildings which have survived or have so far been identified in Jerusalem make it impossible to produce a proper analysis of symptomatic architectural features.

² To date six public buildings have been identified as belonging to the 18th century. These are: al-Zawiya al-Muhammadiyya (cat. no. 43), Sabil al-Khalidi (cat. no. 44), Sabil al-Husaini (cat. no. 45), Mihrab Ahmad Qullari (cat. no. 47), Sabil Mustafa Agha (cat. no. 48), and the building under discussion. If one considers the simplicity and the small size of the three *sabils* and of the Mihrab of Ahmad Qullari, this means that what remains is only a single building of any importance—namely al-Zawiya al-Muhammadiyya. This makes it hard to establish the features of local 18th-century buildings; the lack of material scarcity permits it. It is hoped that in the near future research into the *siyills* will allow an identification and dating of 18th-century buildings that still survive in Jerusalem.

47 MIHRAB AHMAD QULLARI

Name: Mihrab Ahmad Qullari ('The soldier')

Date: 1174 /1760-1

Endowment: None known

Variants of name: The monument has been known by several different names over the years. The foundation inscription (see below) defines it as al-Maqam al-Sharif ('The Noble Station'), but this name seems to be obscure and does not appear elsewhere in any of the known references. An alternative name is Mastabat al-Tin ('the Platform of Figs') which, according to van Berchem (1925: 198), was first given to the site by Sauvaire, apparently after a fig tree which gave it shade. In support of this theory, Landau (1979: 45) published a photograph from the collection of the University Library of Istanbul which shows what seems to be a fig tree growing to the north of the site.¹ A third name, used most recently, is Mastabat al-Tin ('the Mud Platform'); this is a misnomer which doubtless is the result of replacing the Arabic letter *tā'* with *ṭā'* when it was transliterated from English to Arabic (al-Husaini 1977: 21). Other names that have been given the monument are Mihrab Mastabat al-Tin ('the Prayer Niche of the Platform of Figs'), and Mihrab Ahmad, cited by van Berchem (1925: 197), and Walls and Abu'l-Hajj (1980: 18).

The definition *musalla*, meaning a raised platform with a *mihrab*, is given by van Berchem (1925: 197).

Recent scholars have alluded to the monument as Mastabat al-Tin ('Mud Platform') (al-Husaini 1977: 21; Najm *et al.* 1983: 381, and Taha 1988: 59). Van Berchem (1925: 198), Burgoyne (1976: no.147), Walls and Abu'l-Hajj (1980: 18), Drory (1980 10: 64), Bahat (1989: 112), Bieberstein and Burgoyne (1992: no.198), and Bieberstein and Bloedhorn (1994 3: 65) all refer to the site as Mastabat al-Tin ('Platform of Figs').

Location

The *mihrab* or *musalla* is to be found between Sabil Qasim Pasha (cat. no. 2) and Qubbat Musa, almost opposite Bab al-Silsila and the Ashrafiyya Madrasa to the west, and the south-western *qanair* (colonnade) to the east. The *mihrab* is surrounded on all sides by paved footpaths at the level of the Haram esplanade and consists of a square *mastaba* of dressed stone with the *mihrab* placed at the centre of the southern side.

History

Identification

The *mihrab* is identified by inscription, and since the *mihrab* is integral to the *mastaba* itself, it seems feasible to view them as a single structure and to see the inscription as serving as a means of identification for both the *mastaba* and the *mihrab*.

Date

A handsome marble plaque measuring 32cm by 35cm is placed above the arch of the *mihrab* and provides the date 1174/1760-1.

The inscription is written in a fine *naskhi* script in old Ottoman Turkish. It is arranged in four lines, each set in a cartouche that terminates in a single cusp. Each line of script is separated by a plain narrow fillet carved in relief. The letters are written in correct proportion to each other. On occasion, the elegant curve of a *ra* or *waw*, as well as the slant-cut terminals to some of the *hastae*, break into the raised divisions between the cartouches, adding to the feel of opulent generosity of the script. Diacritical and auxiliary points as well as decorative calligraphic flourishes fill the spaces between the words. There can be no doubt that a master craftsman both designed and carved the inscription.²

Founder

Ahmad Qullari was one of the militia of Sultan Mustafa III (1171-88/1757-74) and it was he who undertook the repair of the monument. Van Berchem (1925: 198) is certainly correct in his opinion that the use of the word *ta'miri* (repair) in the foundation inscription indicates that Ahmad Qullari's contribution was merely one of restoration. Unfortunately, no clue as to the origins of the monument, presumed to have been built during the Mamluk period, is to be found in the writings of Mujir al-Din (1973).

Architecture

The *mastaba*, which is square in plan, measures 8.8m by 8.5m. It is raised some 30-40cm above the level of the Haram esplanade. It is both built of, and paved with, the same dressed, white stone slabs. These vary in size and have weathered to grey or black. The majority of the slabs are medium sized (50cm by 40cm), but the largest is 50cm by 1.8m whereas the smallest measures 13 cm by 20 cm. Access to the *mastaba* is possible from the east, north and west, but the most convenient approach is by way of the centre of the western side where there is a small step (85cm by 40cm by 40cm). The southern side is marked by an additional course of stonework which rises above the level of the dais and is finished with a dressed, rounded summit. This course serves as a decorative frame to add emphasis to the *mihrab* and extends to the corners at the southeast (3m) and southwest (3.4m) of the *mastaba*.

The form of the *mihrab* is concave (*mujawwaf*) surrounded by a rectangular block measuring 1.12m by 2m built of dressed white stone, some of which has now weathered to black. The apex of the *mihrab* is in the form of a scallop and is surmounted by a pointed arch; the upper voussoirs of this arch are somewhat clumsily finished. The foundation inscription already described is found above the keystone of the arch, and immediately over it there is a framing cornice that projects forward to surround the *mihrab* on all four sides. The cornice is conceived in two sections; the lower section is chamfered to match the niche's scallop and is separated from the vertical upper section by a thin incised moulding. The block of the *mihrab* is undecorated and off-centre; the sides and back of the block are built of the same quality of stone as the façade and are equally undecorated, being simple, solid walls.

¹ Travellers refer to different species of trees that grew in the Haram during the Ottoman period. The most common of these were olives, figs and grapevines. Fig trees are mentioned in particular by al-'Ayyashi and al-Madani, both of whom were cited by al-'Asali 1992: 210, 220. These continued to grow in the Haram until 1950 according to one eye-witness (Fahmi al-Ansari). Both olives and figs are mentioned in the Qur'an (Sura XCV, *al-Tin*, the chapter that is named after the fig tree).

² Dr Christine Woodhead translates the inscription:

The repair of this noble place
The humble Ahmed wrote the inscription of it
[May God grant the wishes of the one who remembers Him in prayer]
Amin. Year 1174.

48 SABIL MUSTAFA AGHA

Name: Sabil Mustafa Agha

Date: 1153/1740-1

Endowment: 10 Jumada II 1153/2 September 1740

Variants of name: The *sabil* is widely known as 'Sabil al-Shaikh Budair' (1160-1220/1747-1805); it is therefore generally listed under this name (van Berchem 1925: 195-6; al-'Arif 1947: 97; Burgoyne 1976: no.146; Walls and Abu'l-Hajj 1980: 18; Drory 1980 10: 66; al-'Asali 1982: 284-9; Najm *et al.* 1983: 380; Bieberstein and Burgoyne 1992; Bieberstein and Bloedhorn 1994 2: 434). To judge from the biography of al-Shaikh Budair (Manna' 1986: 51-2; Salameh 1987: 6-10), there is no link between the *sabil* and al-Shaikh Budair himself. It is probable that it acquired its name because al-Shaikh Budair lived in and owned al-Wafa'iyya Zawiya (Burgoyne 1987: 456) which is located opposite the *sabil* in the western area of the Haram near Bab al-Nazir. 'Sabil 'Uthman Beg al-Fiqari' is another name given to the monument by van Berchem (1925: 195) and Walls and Abu'l-Hajj (1980: 18), for an inscription (see below) includes the statement that the *sabil* was rebuilt by order (*bi-rasm*) of 'Uthman Beg al-Fiqari. Here the preferred name is that of Mustafa Agha, because he was the founder of the *sabil*, and because he endowed a *waqf* for it (see below).

Modern name: Sabil al-Shaikh Budair

Location (figs. 48.1-48.3, pls. 48.1-48.7, col. pls. LVIII, LIX)

The *sabil* is to be found within the Haram precinct, some 20m southeast of Bab al-Nazir, at the north-western corner of an unnamed *mastaba* with a free-standing *mihrab* at the southern end.

Site and brief description

The *sabil*, which measures 1.5m by 1.5m, is a beautiful, small one-unit structure, square in plan, and, except for the dome, built with occasional insets of coloured stone. It consists of a stone base which supports four small columns which in turn carry three horse-shoe arches. These open towards the south, west, and north respectively. The elevation to the east is a solid wall. A small hemispherical dome is raised above the *sabil*, which has fallen into disuse probably since the beginning of this century.

History

Identification

The building is identified as belonging to the Ottoman period by a foundation inscription which indicates that it was built by Mustafa Agha, the governor of Jerusalem district. The *waqfiyya* (Sijill 230: 210) states that 'al-Hajj Mustafa Agha has donated 40 *zangirlis* (gold coins) for the benefit of the *sabil* which he constructed in the Noble Haram on the edge of the platform (*suffa*) facing al-Bab al-Nazir.'

Date

The inscription (40cm by 62cm) is cut into a recessed limestone plaque with chamfered edges and is displayed on the exterior of the east wall of the *sabil*. It was published by van Berchem (1925: 196), and it gives the date of the foundation as 1153/1740-1 in two ways. The first is by way of numerals enclosed within an ogival fillet frame in the middle of the last line of the inscription, and the second is by the numerical value computed from the phrase *fi qadah min al-rahiq yashrabu*. The inscription is made up

of seven lines in all, each line containing two verses; each verse is set in a cartouche with rounded terminals. Additional ornamental motifs appear at the middle and the corners of the cartouches, made up of different flowers such as a four-petalled rosette, a small whirling knop or rosette, a pear-shaped fruit and leaves of various species. All of these decorative elements, in addition to the capitals (see below), are a direct reflection of the sentiments contained within the inscription. The text is written in a fine *naskhi* script, slightly interspersed with diacritical points and auxiliary signs. It is composed in poetic style, and the Arabic wording is transcribed in Cat. Appendix 2 (no. 47). The translation runs as follows:

This *sabil* was built by him who has the utmost sovereignty, who has excelled by means of his donations, the most generous Mustafa, Governor of Jerusalem. Its water is similar to that of Paradise, it is sweet, it is a cure, it deserves to be drunk. His Highness 'Uthman Beg al-Fiqari ordered the building of this *sabil*, opting for reward on the Day of Judgment, and hoping to be considered among those who are blessed. Both Mustafa and 'Uthman hope to drink from the basin of Taha (i.e. the Prophet Muhammad).

How lucky they are to fulfil such a wish! Both are lucky, for both shall drink from a cup of nectar. In the year 1153.

The word '*amara*' has two meanings. The first is 'built anew' and the second is 'restored'. From the architectural features of the *sabil* it is used in the first sense, for it is obvious that the building must have been a new construction. Hence its consistency in building materials and its harmony in style and design. It is worth noting that there is a change in the titulature of the governor. Instead of the more usual Turkish *mir liwa'* (governor), it utilises the Arabic term *qa'im maqam*. Al-'Arif (1947: 98) read the family name of 'Uthman as 'al-Ghifari' instead of 'al-Fiqari'.

Founder

The founder of the *sabil* was the governor of Jerusalem (*qa'im maqam*) in 1153/1740-1. His full name appears in the two foundation inscriptions (van Berchem 1922: 156, 1925: 196, and cat. no. 33) as 'Mustafa Agha Parwana Zade'. In the *sijill* (see below) he is called al-Hajj Mustafa Agha Qa'im Maqam al-Quds al-Sharif (the governor of Jerusalem the Noble). According to al-'Arif (1961: 318), Mustafa ruled Jerusalem for twenty years between 1144-65/1731-51, and negotiated an undertaking by the people of the villages of al-Bira, Bait Hanina, and Bait Iksa (all north of Jerusalem) that they would not attack travellers to the Holy City. Mustafa Agha contributed to other building projects, patronising a small domed structure in al-Zawiya al-Naqshbandiyya (cat. no. 33), and rebuilding the moat of the Citadel following a *firman* from Sultan Mahmud Khan in 1144/1731-2 (van Berchem 1922: 156).

The inscription makes it clear that this small *sabil* was built by order of 'Uthman Beg al-Fiqari, which means that two people were involved in its construction; and this is somewhat curious. It is not clear what relationship there was between 'Uthman Beg and Mustafa Agha and nothing has so far come to light in the *sijills* or in other contemporary references. It could be that both belonged to the same unit or division in the army, for it is known that there was a Mamluk unit in Egypt in the 17th

century named 'al-Fiqariyya', after its leader Ridwan Beg al-Fiqari. Ridwan Beg was *amir* for the Egyptian pilgrimage caravan, and he ordered that a lineage¹ be compiled for himself (Rafeq 1969: 123, 128; Rafeq 1968: 267-79). The *waqfiyya* is, however, quite clear in stating that Mustafa was the sole donor of both the *sabil* and its endowment (see below).

Purpose of construction

The *sijill* (see below) and the foundation inscription described above are both explicit in revealing the principal purpose of the building. It was the wish to perform a philanthropic act of mercy, which would be duly rewarded by Allah on the Day of Judgment. The reward to which every Muslim aspires is to join the blessed in Paradise and to drink there from the famous basin of the Prophet Muhammad which is named 'Haud (fountain) Taha'.

Endowment

Sijill 230: 210 contains a short *waqfiyya* of almost 650 words written in a small fine script. The document is dated 10 Jumada II 1153/2 September 1740 and was drawn up by al-Hajj Mustafa Agha, governor of Jerusalem the Noble. The wording and the structure of the language of the *waqfiyya* is similar to that of other such documents studied before and reflects the religious teaching which encourages people to offer good deeds. As already noted, Mustafa Agha endowed 40 *zangirlis* (gold coins) for the benefit of his *sabil*. He stipulated that the caretaker was to receive a wage of 4 gold *zangirlis* annually. In the presence of Mustafa Agha, Muhammad al-Kurdi the caretaker summoned the representative of the Greek community who was in charge of their convent (*wa'l-mutakallim 'ala dairhum*) and gave him the 40 gold coins after a document had been prepared in Greek. Muhammad al-Kurdi agreed to pay out 4 gold coins each year as a wage providing the capital sum remained intact.

The document further states that Mustafa Agha had assigned Muhammad son of 'Isa al-Kurdi as caretaker for the *sabil* during his lifetime, and after him the position was to be retained for his sons and the sons of his sons in order of maturity and competence. He was allotted 4 gold *zangirlis* per year for the office of the caretaker. If the line of the caretaker became extinct, the position was to be given to the administrator of the *waqf* of al-Masjid al-Aqsa the Noble. The donor had appointed a water-carrier to provide the *sabil* with water, who was to be given 24 *raghifs* (loaves of bread) to be bought by the founder from al-'Imara al-'Amira of Khassaki Khurrem. The water-carrier was required to clean the *sabil* weekly, and if he neglected his duty he was to be replaced. The *qadi* of Jerusalem was to be the inspector in charge of the caretaker.

Architecture

Exterior—Elevations

The *sabil* is raised about 35cm above the level of the Haram precinct by means of two steps of good-quality stone. These steps also function as a surround to the base of the *sabil* on the southern, western, and northern sides only, although al-'Asali (1982: 28) included the eastern side. The east wall of the *sabil* adjoins the north-western corner of the anonymous *mastaba*, now known by the name of the *sabil*, that is 'Mastabat Sabil Mustafa Agha' or 'Mastabat Sabil al-Shaikh Budair', even though it

predates the fountain (Sijill 230: 210).

The *sabil* consists of three parts: a square base, four façades, and a small dome. A second step engulfs the first stone course of the base at 16cm from the platform; over this are four courses of stone reaching a height of 1m, again on the southern, western, and northern sides, while the east side of the base is integrated into the eastern wall. The top course uses *ablaq* masonry of white and red.

Although the three façades to south, west, and north are broadly symmetrical, the fourth façade, which faces east, is asymmetrical. It consists of a solid wall of the same quality stone as the rest of the *sabil*. The panel with the foundation inscription is on the upper part of this façade. Two courses above it there is a stone cavetto moulding which projects slightly and runs round all four sides of the building. Each of the three similar façades has a small horse-shoe arch, which rests on two of four small marble columns which are hexagonal in form, although al-'Asali (1982: 284) and Drory (1980 10: 66) stated that they were octagonal. An iron grille of a later date, probably the work of the Supreme Muslim Council in the early 1920s, fills the arch space on all three of the open sides. The columns at the south east and the north east are engaged to the east façade in the form of pilasters. Only four of the six sides are thus decorated, the others being left plain. A similar arrangement is to be found in the columns of the *mihrab* of the Iwan Sultan Mahmud (cat. no. 50). However, although the columns of the *sabil* have a good deal in common with regard to their size, shape, and different parts—that is, each has a square plinth and a *muqarnas* capital—they do in fact differ in their decorative elements. These have been carved around the shafts of the column. For example, while the south-west and the south-east columns are representational—they are decorated with a vase from which issue flowering branches which carry pear-shaped fruits—the north-west and the north-east columns are decorated with a repeated geometrical design. The vegetal arabesque is on the *qibla* side of the *sabil* and it is possible that the fruit may represent a pomegranate, which is mentioned three times in the Qur'an (VI: 99; VI: 141; and LV: 68) as a fruit found in Paradise.

[Editorial note: The geometric design of the northern column and pilaster of the *sabil* is the same for all faces. The angular joint between each face is marked by a narrow frame. From this emerge counterpoint faceted triangles somewhat similar in appearance to a simplified version of the detailed decoration of individual *muqarnas* elements in, for example, the capitals of the North-Western Khalwa of Ahmad Pasha (cat. no. 22). The faces of the south-eastern and south-western hexagonal columns vary. The angles are marked by the same framing device of a twisted 'rope' but the designs are of two sorts. One (A) consists of a goblet on a double-knopped stem with a flaring rim from which emerges a single straight branch drawn as a double fillet. Symmetrically arranged on either side there are alternate fruits and flowers. The fruits are probably intended as pomegranates; they are rounded and topped by a small circular protuberance. The flowers are full-faced daisy-like blooms of six or seven petals. At the top of the branch there is a finial of five curved petals derived ultimately from a lotus blossom. The appearance of this design is static and formal. The second design (B), on the other hand, is flowing and more naturalistic. A branch undulates the length of the column face. In each case it bears four flower heads. They are full-face and larger than on design (A); they also have two or more layers of petals and are reminiscent of a Chinese chrysanthemum head, which was popular in ceramic decoration (see, for example, a 16th-century dish, BM. OA

¹ On his lineage, see P M Holt, 'The exalted lineage of Ridwan Bey', *BSOAS* 22, 2 1959: 221-30.

1969.7-21.1 from the Brooke Sewell bequest in the British Museum, illustrated in Rogers and Ward 1988: 194 cat. no. 134. The centre of this dish is, incidentally, marked by a lotus blossom). Between the individual blossoms, the stem carries undulating leaves and trefoil buds. The exuberance of design (B) brings to mind the brilliant ceramic tile panels of the Rüstem Pasha Mosque of 1564 in Istanbul (Goodwin 1971: 249-52, Seherr-Thoss 1968: pls. 129-31), albeit in a much more simplified version. The reference to Paradise is explicit in the use of the cup, repeated in the inscription, and in the *qibla* position. It should be remembered, too, that similar references to Paradise are found in the mosaic decoration of the Dome of the Rock. SA]

The third part of the *sabil* consists of the small distorted hemispherical dome which rests directly on the walls of the four façades, above intervening triangular pendentives. It is built of small-scale rubble masonry, rendered with mortar and lime both inside and out, in contrast to the rest of the fabric of the *sabil* itself. Al-'Asali (1982: 284) was mistaken in his statement that it

was built of (dressed) stone, although early in 1998 the Aqsa Restoration Committee covered the dome with white and some red stone to protect it against rain. The covering gives the dome a slightly different appearance than it had previously. Previously the final course of masonry was slightly recessed to give a hemispherical appearance; now the last course continues the outward flare.

Interior

The upper section of the base of *sabil* forms a square plastered basin, 85cm in length and 40cm in depth. The basin once held water drawn by the water-carrier from a nearby source (probably a cistern) as the *waqfiyya* states, but in 1998 it was filled with rubble and covered with stone slabs by the Aqsa Restoration Committee, to prevent the accumulation of dirt in the basin. The inner face of the eastern wall, like that of the dome, has been constructed from small rubble-stone masonry coated with lime.

49 DAR AL-‘IZZ

Name: Dar al-‘Izz (The House of Glory)

Date: 1205/1790-1

Endowment: Not known (see below)

Variant of name: Dar al-Khastakhana (Hastahane), the hospital

Modern name: It is currently known by the names of the resident families, i.e., ‘Dar al-Baraghithi wa Dar Abu Sulb’.

Location

The house is on the east side of Tariq al-Wad, between the Via Dolorosa to the north and the road leading to Bab al-Nazir to the south.

Site and brief description (pl. 49.1)

Dar al-‘Izz is situated in the central section of al-Wad Road, one of the two main streets crossing the Old City of Jerusalem from north to south. It is bordered to the north, the east and the south by adjoining structures, all of which have the marks of domestic architecture; and to the west it is bounded by the road. The site is close to the Haram area, and is in the middle of a section of the Old City which saw the greatest amount of, as well as the most important, architectural activity in the Ottoman period outside the enclosure of the Haram itself (for more details see cat. no. 11).

History

The only available means of identification is the foundation inscription, which was published by van Berchem (1923: 455). Apart from this, very little is known about the building. The inscription is on a marble panel, measuring 40cm wide and 40cm high. It consists of six stanzas of Arabic verse. The stanzas are separated by fillets and are set within a rectangular cartouche. The script is a slender rounded *naskh*, with both diacritical and auxiliary points. The last line of the foundation inscription takes the form of a chronogram, which has a numerical value of 1205/1790-1. The number ‘1205’ is inscribed vertically at the end of the fifth and sixth lines and thus confirms the chronogram. The inscription is marked by its repetitious and flowery style, and the chronogram itself is odd. Both of these factors make the translation difficult, and the text almost nonsensical. However, an attempt at translation has been made, as follows:

A house was highly ranked, filled with happiness,
Known for ever as the ‘House of Glory’ (*dar al-‘izz*).

The house is high up in the sky, where its guest can
be served

Delighted, and highly respected.

The completion of its construction (is) the
chronogram (= I have dated)

‘Muhammad will remain in it forever.’ (In the) year
1205 (1790-1).

(For the Arabic text see Cat. Appendix 2, no. 49.)

The inscription leaves no clue as to the identity of the founder. But to judge from the wording, with its emphasis on the honour to be paid to any guest (the client) and the happiness he

will feel in the house, and because there is no religious content in the way of the customary prayers or phrases, it would appear that the Dar al-‘Izz was built to serve as a private, commercial guesthouse rather than as a public, charitable hospice. Thus Dar al-‘Izz can be seen to be another of the rare dated, secular private buildings of Ottoman Jerusalem. According to van Berchem (1923: 455) the edifice was used as a military hospital in 1892; this would explain why it appears in the Auqaf files as the ‘Dar al-Khastakhana’, or hospital.

Architecture

According to the foundation inscription (see above), Dar al-‘Izz, completed in 1205/1790-1, was the last major construction in the Old City during the Ottoman period. As it appears today, the site has problems similar to those of the Khalwat al-Dajani (cat. no. 46), although here at least the inscription seems to be in its original location. There are, however, many difficulties relating to both the façade and the interior. The façade has suffered many changes and additions, with the various phases of construction indicated by multiple long break lines in the masonry. The interior too has been dramatically changed, for it has been used as a residential house for a long time. As a result, it is now devoid of both architectural and decorative features. The monument is included here, however, because of the interesting context of the inscription.

The only façade of the building is the main, west frontage, but its upper part is obscured by an archway (*qantara*) that must have been built some time after the house, i.e., after 1205/1790-1. The *qantara* is now called ‘Dar al-Sharaf’ after the resident family. Dar al-‘Izz consists of two storeys; the first, at ground level, is made up of the main entrance, a long vestibule, a staircase, and other structures which are now inaccessible. The second storey is made up of a courtyard, a planted garden, and a collection of chambers and cells built with no notable architectural feature. These represent the local domestic architectural style in the Ottoman city rather than that of the more monumental public buildings.

Pl. 49.1 Dar al-‘Izz, inscription.

50 IWAN AL-SULTAN MAHMUD II

Name: Iwan al-Sultan Mahmud II

Endowment: None known

Date: 1233/1817-18

Variants of name: Qubbat ‘Ushshaq al-Nabi (Dome of the Lovers of the Prophet), and Iwan Qubbat Sulaiman Pasha (van Berchem 1925: 208).

Modern name: Iwan al-Sultan Mahmud II

Location

The *iwan* is to be found at the northern end of the Haram precinct, about 20m south of Bab al-‘Atm,¹ and opposite Sabil Bab al-‘Atm (cat. no. 8).

Function

The word *iwan*, which was originally Persian, in Arabic denotes an architectural unit comprising either a rectangular or square area with three walls, the fourth side usually left open. The floor level is higher by a few centimetres than the floor of the adjoining buildings. The plan of the building under discussion, which is given the name *iwan* in its foundation inscription (see below under Date), does not conform to this definition, because all four sides are open. Furthermore, it differs from the plan of Mamluk and Ottoman *iwans* built in Jerusalem which were constructed as part of a larger building. A more accurate reflection of the plan of this building would be conveyed by the Turkish term of ‘kiosk’, or pavilion.

Despite the fact that pavilions were popular in Turkish architecture, as Eldem has indicated (1986 2: 159), perhaps surprisingly this is the only example still extant in Jerusalem. The foundation inscription unfortunately does not include any reference to its original function, but kiosk-pavilions were used widely in Turkey to decorate gardens and palaces. When the area of the Haram, planted as it is with trees, is taken into account, it is possible to conclude that the function of this small building was purely ornamental, to adorn the sacred precinct. It is fortunate that the Islamic Museum of al-Aqsa Mosque contains a foundation inscription for an *iwan* that no longer exists but which was built by Mustafa the Vizier (for details, see Chapter 36 under Commemorative Buildings). This inscription states unequivocally that the Iwan of Mustafa was constructed to provide a place for the recitation of the Holy Qur’an, and for the purpose of prayer. In all probability the Iwan al-Sultan Mahmud II was constructed for a similar purpose.

Site and brief description (figs. 50.1-50.7, pls. 50.1-50.6, col. pl. LI)

The *iwan* is situated almost at the centre of the northern section of the Haram al-Sharif. It is flanked to the north by the *sabil*, to the west by a paved passageway leading from Bab al-‘Atm to the Dome of the Rock esplanade, and to the south and east by an open space planted with olive trees.

The *iwan* is a single-unit structure, built entirely of good

quality stone. It has a simple square plan² and consists of a dais (*dikkah*) which is raised above the level of the Haram. Four piers situated at the corners support four tall pointed arches, which in turn support a dome. There is a free-standing *mihrab* on the southern side.

History

The identification³ of the *iwan* as Ottoman is confirmed by the foundation inscription.

Date

An important inscription panel, the only source of information as to the date and the name of the founder of the monument, is to be found at the top of the western side of the north façade, one course below the beginning of the transitional zone of the dome. The panel is still in as good condition as it was when it was recorded by van Berchem (1925: 204) in the early years of this century. It is marble, rectangular in form, and consists of two sections, A and B. Both sections have diacritical and auxiliary points. The first part measures 45cm by 45cm and contains six lines of Ottoman *naskhi* script. The lines are set in cartouches separated by a fillet border. The second part measures 45cm by 12cm and contains a single line of condensed Ottoman *naskhi* script. Part B must have been a later addition, for it appears after the date, which is usually the final part of a text. The script is highly condensed. For the full Arabic text, see Cat. Appendix 2, no. 50. The translation runs as follows:

A. In the name of Allah, the Compassionate, the Merciful, this elegant *iwan* was founded in this noble place by the exalted king, the splendid *khaqan*, the warrior, the fighter, Sultan Mahmud Khan, may God eternalise his sovereignty throughout all times. This was done in the year two hundred and thirty-three by the charitable, the executive, the dignified Dustur al-Hajj Sulaiman Pasha, the Governor of Saida (Sidon) and Tarabulis (Tripoli), the famous *wazir*. Allah helped him in whatever endeavours he attempted.

B. This was performed in answer to the orders of the *dustur*, by him who wrote it, the weak slave, Mustafa ‘Ali Efendi.

It is interesting to note that the figure 1 for one thousand has been omitted, which is not the case in other similar inscriptions.

Founder

The founder of the *iwan* was Sultan Mahmud II (1223-55/1801-39).⁴ The order to build the *iwan* coincided with a major

² Although the Iwan al-Sultan Mahmud II was built in the early years of the 19th century, its plan resembles the much earlier examples which were built in Turkey during the 15th and 16th centuries. As simple in form as the *iwan* of Sultan Mahmud II, the Anatolian examples were rarely built in isolation but were instead integrated into palaces or gardens. For further details on the pavilion in Turkish architecture, see Eldem 1986: 159.

³ Schick (1989: 84) identified the early Kursi Sulaiman with Qubbat Iwan al-Sultan Mahmud. See too van Berchem (1925: 208) and Elad (1995: 91-2).

⁴ For the history of the Ottoman empire in this period, see Palmer (1992: 77ff). On the main events in Jerusalem in the period, see al-‘Asali (1989: 223, 228 ff).

¹ This gate is known by different names—Bab al-Malik Faisal, Bab al-Mu‘azzamiyya, Bab al-Duwaidariyya, Bab al-Anbiyya. More recently, Burgoyne proposed naming the gate after Dame Kathleen Kenyon (Burgoyne 1992: 113).

programme of restoration to the Dome of the Rock. Al-'Asali (1989: 219-20) states that these restorations continued for twenty-one months at a cost of 4,000 bags (*sic*—of coins). The work was undertaken by the *wazir*, governor of Sidon and Tripoli, Sulaiman Pasha, on the orders of Sultan Mahmud II in 1223-4/1817-18 (see van Berchem 1925: 210-11). Mustafa 'Ali Efendi, who is recorded in the inscription as the man who actually built the *iwan*, played a major role in the restoration of the ceramic tiles of the Dome of the Rock. Van Berchem (1927: 353-5) has published nine panels from the Dome of the Rock which bear the name of Mustafa 'Ali Efendi. An inscription plaque published by al-'Arif (1961: 504), to be found above the entrance door of Maqam al-Nabi Da'ud, proclaims that Sultan Mahmud II renewed the restoration of the *maqam*. The work was undertaken by the same people—the same *wazir* Sulaiman Pasha, and the same builder Mustafa 'Ali Efendi. Even the date is the same, that is 1233/1817-18.

Other periods

There is no file in the Auqaf Administration specifically related to this monument. It is not possible, therefore, to trace its history during the last four decades.⁵ Even if such a file did exist, it does not necessarily mean that all the work relevant to the development of the building would have been recorded. At any rate, it is possible to state that repointing and replastering were undertaken on the site recently. In 1994 the Auqaf Administration rejected a proposal to enclose the open sides of the building with sheets of aluminium and glass to make it suitable for use as an office for the *zakat* (alms) committee.

Architecture

Since the northern façade, on which the foundation inscription occurs, faces anyone approaching the Dome of the Rock and al-Aqsa Mosque—with which the *iwan* is aligned—and has a second decorative panel, it can safely be seen as the main façade. It is otherwise indistinguishable from the façades to the south, west and east, apart from the addition of a *mihrab* to the south, to be discussed below. The elevation is composed mainly of a tall pointed arch set between piers to the north-west and the north-east. The panel inscription mentioned above is located at the top of the western part of the façade to the right of the arch. It is balanced to the left of the arch at the same level by a decorated panel. The decorative stone panel is square, and encloses an engraved geometrical ornament in the form of a star pattern. At the centre there is a rosette.

[Editorial note: The central space of the panel contains an eight-petalled 'daisy' in reserve. Between each point, a lozenge or diamond shape is formed by a fillet border; these make an eight-pointed star polygon. At the cardinal points, the tips of the lozenges develop into trefoils, the tops of which touch the outer frame of the panel. The outlines of each motif are formed from a narrow fillet, as are the lozenges. Between the trefoils, in order to fill the corners of the square panel, the alternate tips of the lozenges carry the stem of a split palmette. Half-way along each

of these stems, a trefoil emerges to right and left. The points of the split palmettes and the trefoils meet at the side tips of the trefoil motifs at the cardinal points. The motif is a development of the familiar Timurid motif found, for example, on a jug probably made in Herat in 871/1467 signed by Husain al-Din Shihab al-Din al-Birjandi, now in Istanbul, in the Türk ve Islam Eserleri Müzezi, no. 2962 (Lentz and Lowry 1989: 161, 341, cat. no. 57). The motif, which recalls somewhat similar motifs in the 16th-century tiles on the Dome of the Rock, proved popular and long-lasting, as its presence on the 19th-century *iwan* demonstrates, although in all probability the panel was formerly in use elsewhere.

The motif on the octagonal columns is equally long-lasting, and can also be found in metalwork. The basic shape of the medallions are, for example, found on a torch-stand (*mash'al*) dating to the late 16th or early 17th century (London, Victoria and Albert Museum inv. no. 44-1870; Melikian-Chirvani 1982: 310, no. 138). This mesh of medallions in relief overlays the underlying pattern of split palmettes, which emerge from trefoils and form lozenges at the centre of each medallion. Although not identical, the treatment of the columns recalls the carved decoration on the columns of the Sabil Qa'itbai (Burgoyne 1987: 606-12, pls. 64.4a, b; 64.5a, b) although the motif itself is closer to that decorating the dome of the *sabil* (Burgoyne 1987: 611, pl. 64.7). If it is right to see these decorative details on the Iwan al-Sultan Mahmud II as *spolia* from an earlier site, it is possible that they represent fragments from the Ashrafiyya, the Madrasa of Sultan Qa'itbai, dating to 887/1482, which has suffered from multiple rebuildings and earthquake damage (see Burgoyne 1987: 589). SA]

The transitional zone below the dome begins one course above these two panels. Its method of construction is simple, and is found in most of the buildings in Ottoman Jerusalem that are not public monuments. A projecting *cavetto* moulding extends around the top of the eight sides of the octagonal zone of transition. There is no drum and the dome sits directly on the octagonal area. The shape of the dome is odd and it is clumsily finished, giving the overall impression of an incomplete half-oval. It is built of rubble and mortar in contrast to most of the domes in Jerusalem of the period, and has no external cladding of stone slabs. The stone finial that caps the apex is made up of three parts, the uppermost one being broken.

Apart from the *mihrab* in the southern elevation, the other elevations to the west, south and east are identical, as already stated. Access to the interior of the *iwan* is by way of stone steps situated at the centre of the dais to east, north, and west. The steps lead to the square dais (*dikkah*) (each side 3.4m), which is paved in stone slabs, and is raised above the ground level of the Haram. The height of the four sides shows a slight variation, which could be the result of differences in the existing bedrock. At the four corners of the dais, the integration of the four piers, the arches, and the transition zone—which is made up of four triangular pendentives—is clearly visible. There are four shafts of columns that have been reused here to provide barriers to the north, to the north-western corner of the western side, and to the north-eastern corner of the eastern side of the dais floor in order to prevent anyone from falling off it to the level of the esplanade below.

The *mihrab* has a concave form (*mujawwaf*) and projects beyond the line of the southern façade. It is rectangular in shape, and is built of alternating red and white stone blocks (*ablaq*). The main scheme of its ornamentation consists of a semicircular arch

⁵ Most of the files of the recent Auqaf Administration begin in 1368/1948-9, when the responsibility for the Auqaf was given to the Department of the Chief Judge (*Qadi al-Qudah*) in Amman. Before that, the Supreme Muslim Council administered the Auqaf's affairs and properties. Most of the Supreme Muslim Council files are today preserved in the Department of the Heritage Revival, which is part of the Auqaf Administration.

resting on a pair of columns. The columns are octagonal, and their capitals typically Ottoman, being ornamented with three bands of small *muqarnas* niches. There is a plain abacus block between the capitals and the springing of the semicircular arch. The bases of the columns are plain, apart from a chamfered edge at the corners. The shafts of the columns have densely incised ornament in relief; this consists of repeated lobed medallions that enclose a similar pattern of palmettes and arabesque motifs. The arch of the *mihrab* is capped by three stones which are placed precisely over the key-stone. A moulded stone frame separates the hood of the

niche from the rest of the stone concave structure. The semi-dome is made from a single piece of stone and is coated with a mortar mixture. On the exterior it is expressed as a scalloped half-dome with seven rib.

The *mihrab* is not dated. It is built with a different type of masonry to that of the main structure of the *ivan*, which might suggest that it is either earlier or later in date. It is, however, equally plausible to see the *mihrab* as contemporary with the building, and the difference in the fabric between the *ivan* and the niche as being due to the latter's greater importance.

51 KHALWAT SADANAT AL-HARAM

Name: Khalwat Sadanat al-Haram (The Cell of the Custodian of the Sanctuary)

Date: Undated. (A) The upper part—probably after 1222/1807
(B) The lower part—probably early Ottoman

Endowment: None known

Variant of name: None known

Modern name: The upper section is used as a residence for the Custodian of the Holy Sanctuary (*Ghurfat al-Sadana*). The lower section is used as a ticket office for visitors to the Haram.

Location (figs. 51.1-51.3, pls.51.1-51.13)

The *khalwa* is situated to the west of the Dome of the Rock, its upper part facing the Dome itself, while its lower section faces Bab al-Qattanin (736/1335-6). The lower storey abuts the lower range of the staircase that leads from the esplanade through the western colonnade (340/951-2) onto the terrace.

Site and brief description

Khalwat Sadanat al-Haram is a single-unit structure made up of two parts. The upper level is square in plan and covered by a domical vault, while the lower is rectangular with a portico roofed by a cross vault. Both levels are built of stone; a difference in chiselling technique is apparent between the two storeys and probably reflects a chronological divide.

History

Unfortunately, apart from the material contained in the *sijills*, only sparse information of a general historical nature exists about most of the *khalwas* located in the Haram al-Sharif. In the present instance, however, there is a specific remark regarding the western area of the upper terrace made by a European calling himself 'Ali Beg al-'Abbassi¹ who visited the Haram in 1222/1807. He was accused of being a Napoleonic spy—or so he claims—an accusation he vehemently denied. The interest here is the rarity of a Western visitor to the Haram in the early 19th century who left a written account of the buildings that attracted his attention there. 'Ali Beg (Leyblisch 1816 2: 233) records that 'to the west of the Dome of the Rock platform there are two small chambers in which the two persons most prominent in *fatwa* (legal opinion) used to sit to give legal advice'. 'Ali Beg probably did not intend to catalogue every building on the Haram, and this creates a problem. But at the very least this statement might give a clue that three of the five *khalwas* now situated to the west of the upper esplanade were built after his visit, and this was the reasoning adopted by al-'Asali (1981: 44-5). Al-'Asali did not attempt to identify which were the later cells. If this inference—that the three *khalwas* mentioned above postdate 1807—is correct, and it seems to this author too that it probably is, then Hujrat Islam Beg (cat. no. 21) and Khalwat Bairam Pasha (cat. no. 34) are on stylistic criteria the two *khalwas* most likely to be those seen by 'Ali Beg al-'Abbassi, for their layout and architectural features are more elaborate and thus closer to traditional public Ottoman architecture. It is fortunate that the *sijills* (see above cat. nos. 21,

and 34) have provided us with detailed evidence on the name and the date of these two *khalwas*, and this is enough to remove any further question as to their attribution or date.

With regard to the date of the other three cells—Khalwat Sadanat al-Haram, the South-West Khalwa (cat. no. 52), and the Khalwat al-Mu'adhdhinin (cat. no. 53)—their non-appearance in the account by 'Ali Beg al-'Abbassi is the only clue to emerge so far in an attempt to date the upper parts of the buildings, for it may provide a *terminus post quem* for the upper part of the *khalwa* under discussion here. By implication, it was built after 1222/1807. It does not help with the lower part, however, which would appear to be earlier because of the size and the type of masonry used in its construction.

Architecture

The four external walls of the upper storey are built directly above a chamfered course marking the transition between the two levels of the *khalwa*. The stones of this upper level are finely cut and the courses are arranged systematically and without interruption. The only exception occurs in the eastern façade, where the masonry, which appears to be from a single quarry, displays at least eight different chiselling techniques—smooth, clawed, striated, pitted to a greater or lesser extent (there are four distinct categories here), and cross-hatched. Perhaps this indicates that the stones are in re-use. A less likely possibility is that several stonecutters worked on the building at the same time. It seems likely that the unevenness of the wall's surface means that it was once disguised in some way—perhaps it was clad in marble or was plastered. The walls are plain and measure 53cm in thickness. There are three windows in the north, the west and the south walls respectively, and there is a door in the eastern façade. This door measures 69cm wide by 1.45m high and it is surmounted by a lintel that has been clumsily finished. The building ends with a slightly protruding stone course which serves as a parapet. The saucer dome is invisible from the outside owing to the extreme shallowness of its profile.

The lower part of the building is formed from a single-bay portico delineated by a pointed arch on each of the west, north and south sides. The span of the arches was originally open but has recently in each case been closed, and glass and aluminium sheets have been used to make the bay suitable for a ticket office. The three arches spring from four square piers each measuring 1.16m by 1.16m. The lower courses of the stones are large, some measuring as much as 1.16m long by 51cm wide. They are finely cut and are similar to the stones of the piers of the western *riwaq*. This resemblance suggests either that the stones are in secondary use or that the bay was originally Mamluk.

The type and size of the stones used in the upper courses, in addition to the fact that the arch is built with two courses of voussoirs, which has no parallel in the Mamluk period but is a well-known feature of Ottoman architecture, make it unlikely that the *khalwa* as a whole is a Mamluk building. An alternative suggestion is that the lower levels were originally a different structure, which was used as the base for a later rebuilding. This is the preferred solution—it seems most likely that the lower storey was constructed in the Ottoman period with stones in secondary use from the Mamluk period.

Interior

The interior of the upper storey is a small chamber, square in plan, paved with flagstones and covered by a small folded vault

¹ He was a Spanish traveller named Baida y Leyblisch Domingo, who, in his own view, was the first to write a 'correct' description of the Haram. His diary was originally published in France and later was translated into English.

with a saucer dome which has eight ribs at the centre. The three windows already described are fitted with a simple iron grille and differ only slightly in their measurements. The biggest window faces south and measures 1.16m high by 79cm wide by 54cm deep. The north window measures 96cm high by 60cm wide by 17cm deep, while that to the west measures 95cm high by 49cm wide by 44cm deep. The difference in depth is due to the different

Fig.51.1 Khalwat Sadanat al-Haram, ground floor plan.

thickness of the walls. There are two blind niches in the interior. The first, to the south of the door in the eastern wall, measures 1.6m high by 75cm wide by 31cm deep. The second is in the north wall, measuring 70 cm wide by 30 cm deep. The interior to the lower bay has recently been paved with flagstones and the roof here is covered by a cross vault. The interior of both the walls and the vault has been plastered.

52 KHALWAT AL-MU'ADHDHININ

Name: Khalwat al-Mu'adhdhinin

Date: Undated. Probably after 1222/1807

Endowment: None known

Variant of name: None known

Modern name: It is now known as the 'Cell of the Muezzins' because it is used as a residence by the men employed by the authorities of al-Aqsa mosque to call the faithful to prayer. It is conceivable that this was also its original purpose.

Location

The cell is situated on the western edge of the divide between the two levels of the esplanade of the Dome of the Rock, above the cistern of al-Malik al-Mu'azzam 'Isa (607/1210-11) and Khalwat al-Dajani (cat. no. 46). It occupies a favoured location beside the south-western stairs leading to the platform and close to the *sabil* of Qa'itbai.

Site and brief description (figs. 52.1-52.3, pls. 52.1-52.4)

The Khalwat al-Mu'adhdhinin differs from the other cells in the Haram in that it consists of a single rectangular chamber divided into two, and it is located on the Dome of the Rock terrace only, rather than spanning both levels of the Haram esplanade. A small room with a cupola has recently been built in front of the north-eastern corner of the *khalwa*.

History

The *khalwa* is undated. The record left by 'Ali Beg al-'Abbassi (Leyblisch 1861 2: 223; see cat. no. 51 for full details), which seems to indicate that only two cells to the west of the upper terrace (Khalwat Islam Beg, cat. no. 21 and Khalwat Bairam, cat. no. 34) existed at the time of his visit, leads the author to a belief that it was built after 1222/1807. It would, however, perhaps be unwise to rely too much on the observations of 'Ali Beg.

Architecture

The four external walls of the cell are featureless, and are built of successive courses of dressed stone. There is a door, 89cm by 1.64m, in the eastern façade giving access to the chamber; it is

surmounted by a huge slab lintel. Four courses above this, the building is terminated without any form of framing device or parapet. A hemispherical dome, finished with flagstones, covers the northern part of the building. A small cell of recent construction, which has a cupola, is now used to store rugs and mats for the mosque. This obscures the northern part of the east wall. It has an engaged column with a *muqarnas* capital, probably re-used, at its south-eastern corner.

[Editorial note: The capital is, however, cut from stone very similar in appearance to that used for the walls of the cell, as is its supporting column. A clear break is visible between the capital and the column which is accentuated by damage. The lower level of the *muqarnas*, which is effective in its simplicity, consists of one central curved lancet-shaped panel, with another one at an angle to each side of it. Each is emphasised by a secondary groove running round its profile. The interstices are cut away at a sharp, deep angle. Two larger lancet-shaped niches which, although shallower, are also curved, are set above the negative spaces between the niches below. The absence of another, single lancet which would, as it were, complete the pattern on a third level may indicate that the capital has been cut from an earlier complete one. The style, when compared with capitals on other buildings on the upper esplanade of the Haram (see cat. nos. 23, 24, and 38 for example) is, however, typically Ottoman. SAJ.]

The southern wall is as solidly built of dressed stone as the rest of the *khalwa*. The west and north sides are also solid walls with the exception of a window in each side. The first of these measures 90cm by 1.45m and the second 80cm by 1.2m; both are fitted with a recent iron grille and are surmounted by a slab lintel with a string course forming a relieving arch above.

Interior

The interior is made up of two sections. The first is square and is covered by a hemispherical dome. The second is rectangular and this section is barrel-vaulted. There are five blind niches—two are placed to the north of the door on the eastern side, and two are to the south of the western wall. The fifth one is in the south wall. The floor is paved with flagstones, and the walls have been newly replastered. They are partly painted in green.

53 SOUTH-WESTERN KHALWA

Name: South-Western Khalwa

Date: Undated. (A) The upper part—probably after 1222/1807
(B) The lower part—probably pre- or early Ottoman

Endowment: None known

Variant of name: None known

Modern name: The lower section of the building is now known as 'Ghurfat Samma'at al-Haram' (The room of the loudspeakers for the Haram). The upper part is also used as storage space by the Haram electricians.

Location

The cell is located at the south-western angle of the terrace of the Dome of the Rock. To the south, it abuts the South-West Colonnade (877/1472).

Site and brief description (fig. 53.1)

The South-Western Khalwa is situated between the south-west colonnade to the south and the Mastabat Khalwat al-Dajani to the north, opposite al-Madrasa al-Ashrafiyya (887/1482). The cell is constructed in two storeys, each of which consists of a single chamber. The lower room is cross-vaulted, and the upper one has a flat roof.

History

Once again, the only clue that has come to light so far regarding the construction of the upper storey is the statement by 'Ali Beg al-'Abbassi (Leyblisch 1861 2: 223; for details see cat. no. 51). An account of the Ottoman emphasis on the *khalwa* type and its prevalence in Jerusalem is to be found in Chapter 36 under "Development of the Haram al-Sharif" and under "*Khalwas*". In this building at least, however, there are two other sources of information that give some help with identification for the lower storey, although not with a precise date or location. Sijill 86: 293 reveals that the *qadi* on 11 Jumada 2 1015/14 October 1606 decided that al-Shaikh Ishaq ibn al-Shaikh 'Ali al-Masri should reside in a chamber (*hujra*) after the death of his father. It further states that 'this chamber is located in the Noble Sanctuary of Jerusalem (*bi-Haram al-Quds al-Sharif*) below the stairway of the Dome of the Rock terrace on the west side ... It used to house the records (*daftars*) of the *waqf* of the Haram.' There are three stairways to the west of the terrace but the most obvious choice for the identification of this chamber is the South-Western Khalwa, for it is the only *hujra* that extends *below* the stairway of the upper esplanade. However, if this reference in the *sijill* does relate to the South-Western Khalwa, as seems to be the case, it is possible to infer that the lower part of the *khalwa* was built at the same time as the rebuilding of the south-west colonnade, that is in 877/1472. Later, some time before 1015/1606 but certainly during the Ottoman period, the arch of the western elevation was blocked, and it was after this that the second storey must have been added. Al-Luqaimi (Ms. 915642: 4) cited by al-'Asali (1992: 304) reported that 'thus his Presence (*hadrat*) al-Saddiqi had assigned to myself (al-Luqaimi) a sublime *khalwa* on the edge of the Sakhra facing the Sultaniyya (al-Ashrafiyya) Madrasa ...' Unfortunately al-Luqaimi—who visited Jerusalem in 1143/1731—made no further comment beyond this that could confirm an identification of this 'sublime *khalwa*' with the South-Western Khalwa, but the description of the location is

straightforward and would thus appear to give a clear enough indication.

Architecture

A large pointed arch—now blocked—dominates the western elevation of the lower section of the cell. The aim of the infill was probably to adapt the cell for use as a storage place or a dwelling fit for meditation and retreat. Both aims accord with the information provided by the *sijill* and al-Luqaimi alike. A rectangular door measuring 90cm by 2.14m is contained within the span of the arch and has been fitted with a recent iron door. To the north of it there is a rectangular window. The northern elevation of the lower storey is a solid wall. A string course in the form of a fillet moulding marks the transition between the two sections of the *khalwa*.

The four external walls of the upper section share a similar masonry fabric. They are all solid, apart from a door in the eastern façade and two windows in the south and north elevations. The door measures 83cm by 1.66m, and is surmounted by a slit window (22cm by 36cm), the apex of which is decorated with a tripartite leaf, apparently in imitation of the one on the Khalwat Parwiz (cat. no. 17). It is tempting to consider this decorative feature as a control to allow the South-Western Khalwa to be given a date the same as—or at least very close to—that of Khalwat Parwiz, namely 967/1559-60. The other architectural features of the cell, however, make this argument untrustworthy. For example, the stones of the four uppermost courses of the *khalwa* are larger than the rest, and this practice is not common elsewhere among the other *khalwas* of the Haram. This would suggest either a rebuilding or a restoration phase to the upper storey, particularly in view of the fact that the chamber is covered by a flat roof. A slightly protruding course marks the top of the building and immediately above it there is a stone parapet.

Interior

The interiors of both the upper and lower storeys are used as storage space, and are now filled with electrical equipment. The floor of the lower chamber is covered with cement and the room is cross-vaulted. There is a stone dais measuring 90cm by 62cm by 92cm in the southern corner of the chamber, and an irregular as-yet-unrecorded area extends below the steps of the south-west colonnade. The interior of the upper chamber is rectangular in plan and is floored with a modern pavement of different colours of a type widely used in Jerusalem in the Mandate period until the early 1950s. The walls have been recently painted green and the roof, as already stated, is flat, which would indicate a rebuilding after the use of cement became commonplace.

54 MIHRAB AND MASTABAT AL-SANAUBAR

Name: Mihrab and Mastabat al-Sanaubar (the Niche and Prayer Platform of the Pine)

Date: Undated

Endowment: None known

Variant of name: None known

Modern name: The name 'al-Sanaubar' has recently been used to describe the *mihrab* because it was shaded by a pine-tree. Any earlier name—if there was one—is unknown.

Location

The Mastaba and Mihrab al-Sanaubar are to be found 36m east of Bab al-Maghariba, facing the Qubbat Yusuf Agha (cat. no. 39).

Site and brief description (figs. 54.1-54.3, pls. 54.1-54.14)

The *mastaba* and *mihrab* are free-standing, unconnected to any neighbouring building. The *mastaba* is surrounded on the east, north and west by an open space planted with trees. The south side is bordered by a paved path leading from Bab al-Maghariba into the Haram al-Sharif. The *mihrab* is in two parts; the lower section consists of a niche and the upper is a three-course *muqarnas* panel. Both parts were partly destroyed when the eponymous pine-tree fell on the *mihrab* in the severe winter of 1985, but it has been rebuilt in the same form by the Department of Islamic Archaeology.

History

Nothing has been written or published about this site in the Haram; it is even rare to find it listed in recent indices. The reason it is included in the present study is to try to cast some light on it. Not only is it unique, it is also odd. As to its attribution to the Ottoman period, this is not confirmed by any evidence as yet, but the decorative elements are in all probability not Mamluk, and it is not mentioned in the Mamluk sources. Some of the floral elements of the decoration are however similar, if not identical, to Ottoman Turkish ceramics.

Architecture

The *mastaba*, which is rectangular in plan, measures 16.13m long by 12.65m wide and is raised 88cm above the level of the Haram esplanade. It is both built of and paved in the dressed, white stone slabs which are of different sizes, some of which have weathered to grey or black. Access to the *mastaba* is possible from the north where there is a small stone flight (50cm by 40cm) of two steps.

The form of the *mihrab* is a concave (*mujawwaf*) niche set within a rectangular block 1.52m by 2.2m built of dressed white stone. The niche is 75cm wide by 40cm deep and 2m high. Its simple concave wall is broken only by a rectangular slit window in the middle of the recess; this measures 20cm wide by 55cm high and is surmounted by a semicircular arch. The apex of the *mihrab* niche is finished with a pointed horse-shoe arch, the key-stone of which is decorated by a central roundel cut into the stone. The roundel contains a whirling rosette of seventeen spokes. A narrow moulding projects slightly to frame the apex of the arch and continues to the edges of both sides of the block, marking the exterior springing of the arch. The furthest stones to the east and west of the course into which the apex of the arch cuts are decorated by a roundel. The decoration is described in detail below. Above this course, the *mihrab* niche is crowned by

three heavy tiers of *muqarnas* moulding. This too is described in detail below.

The east and west sides of the *mihrab* are identical; each measures 30cm in width. The lower part is a solid undecorated wall but in the upper section there is a masonry bracket with a complex moulding, and one course above this the side of the *muqarnas* cornice begins. The bracket is probably purely decorative, for it is unrelated to the architecture above or below it. The south-facing rear of the *mihrab* is supported by a rectangular masonry dais and it is constructed of regular courses of dressed white stones. An elegant roll moulding cuts across horizontally to separate the back of the niche from the hood above. The feature consists of two elements, the lower being a roll moulding, and the upper splay-faced. A curious relief finial carved in stone has been positioned directly above the apex of the hood. The finial is integrated into the panel that crowns the *mihrab* and is made up of three sections. The lowest is in the form of a stirrup, a semicircle resting on a flat base; the middle section is a tall bar with a roll moulding at the centre and the upper part is a closed circle to denote the full moon. This is, therefore, a version of the standard finial found on domes; the decision to banish it out of sight at the back of the *mihrab* is somewhat strange. It is almost as if the semicircular, domed back part of the niche is treated as a separate, independent, building.

[Editorial note: The decoration of the north, west and east faces of the *muqarnas* cornice is equally unusual. The closest comparison in the Haram al-Sharif is the ornamentation of the *qibla* piers of Sabil Mustafa Agha (Sabil Budair, cat. no. 48). The concentration on 'naturalistic' flowers in the individual lancet niches seems to indicate a similar 18th-century date for this part of the *mihrab* at least, although it is probable, because of its ugly proportions, that it has been much altered since its original conception.

The decorative elements begin at the level of the apex of the hood. A whirling rosette of seventeen spokes crowns the apex and to each side in the spandrels there is an identical carved stone medallion. The centre of the motif is an eight-petalled rosette, the middle section of which stands proud from the gently concave 'petals'. In this it resembles certain of the 16th-century stone roundels decorating the gates and walls of the city. Emerging from the tips of the 'petals' and spiralling anticlockwise to fill the interstices between them, split-palmette leaf tendrils create whorls, each with a small triangular leaf between them, to fill the remaining space.

The *muqarnas* is in three tiers. It is clear from the way some of the niches have been curtailed at their apex that the cornice was considerably damaged in 1985. To take the northern façade first: the three central niches are broader than the two outer ones. The decoration of these two external elements is treated identically; both of them have a trefoil at the top of the niche, with spiralling tendrils, similar in concept to those already described in the rosettes, completing the motif. The three central niches, which are in effect ogival in shape for their lancet-shaped apices cut into the next tier, are treated individually. The central one is filled with a series of the spiralling tendrils—the lowest level has five whorls, the next has four, the next two, and finally a single whorl fills the lancet-shaped upper part. The niche to the left (east) of the centre is filled with a plant form. The central stem of this extends into the next tier to terminate in a single leaf. Others are arranged symmetrically up the stem; the top and bottom pairs spiral back on themselves to form the now familiar whorls. The balancing niche to the right (west) has a plant which resembles a

Classical acanthus, except that it terminates in a tulip-like head. Here the apex that cuts into the tier above does not seem to be related to the main, lower section, for it contains a six-petalled 'daisy' or star-polygon. All the individual elements of these designs have been carefully carved, each with a concave groove running along its length to take advantage of the accents created by sun and shadow.

Each niche of the middle tier is subdivided into three lancet elements. Reading from left (east) to right (west) these contain: (a) a plant bearing a six-petalled flower; (b) blank; (c) a plant with three tulip-like heads (perhaps a lily); (d) as (a); (e) the foliate top of the eastern niche described above; (f) a tulip (?); (g) blank; (h) a carnation (?); (i) the star-polygon or 'daisy' already described; (j) a carnation (?); (k) blank; (l) a plant with three tulip-like heads.

The top level of the *muqarnas* is made up of a series of five ogival niches. The heads of these are ribbed. The main element of each niche is subdivided by an extension of the ribs of the apex. Only one element has an additional decoration; the central lancet niche in the element right of centre (west) has a tulip plant.

The carving on the sides of the cornice has suffered less from weathering. Both the western and eastern side elevations have, as expected, three tiers of ornament. To take the western façade first: the left-hand (northern) niche of the lowest level has a plant with a trefoil head above split-palmette whorls similar to that described on the lower level of the main façade. The next element, a narrow lancet-shaped 'rib', has a series of v-shaped ribs arranged like the paired spines of, say, a spruce but upside down. The final niche to the south has a single tulip. Above, the middle section has (a) two triple-headed 'tulips' (or lilies); (b) a narrow lancet-shaped 'rib' with a lily-of-the-valley (*convallaria majalis*), scilla or hyacinth head; a tulip (or lily) with three heads (this is badly weathered). As on the main façade, the uppermost level has no floral decoration, but is cut by a series of intersecting arched ribs.

The eastern side elevation is arranged in a similar way to the opposite side. The lower level has the same plant form with a trefoil head above two whorls to the north and the lancet-shaped central 'rib' is similarly decorated by v-shaped ribbing. The southern element is here, however, filled by a pair of tulip plants. In the tier above, the northern niche has two sub-elements, each filled with a plant bearing paired fleshy leaves and topped by a trefoil. The lancet-shaped central 'rib' has a similar lily-of-the-valley, hyacinth or scilla stem as the opposite side, and the southern niche has a carnation. The topmost layer is undecorated, as on the western elevation.

Although an attempt has been made to identify the plants depicted in stone, the absence of colour and comparative scale, coupled with the stylisation of the forms, makes it a hazardous enterprise. The main point to the attempt is to stress how unusual is the naturalistic detailing. The parallels in Ottoman art are to be found in ceramic tiles and vessels, in manuscript illumination and textiles. The ceramic tiles on the northwest wall of the Rüstem Pasha Mosque in Istanbul, for example, have many of the same species—hyacinth, carnation, spotted fritillary, daisy-like heads and split palmettes. Identification is here, of course,

greatly helped by the brilliant colour. The concept of the ceramic tiles at the head of the *minbar* in the same mosque is perhaps even closer to the stone *muqarnas* elements of the Mihrab al-Sanaubar, for the plant forms have been arranged in a stylised, symmetrical way to conform to the lancet-shape of the panel.¹ However, although the *waqfiyya* of the Rüstem Pasha Mosque dates to 1561, the Mihrab al-Sanaubar probably dates to the following century, when 'tulipomania' reached its zenith. Whatever its date, it is the links with the court art of Istanbul that make it outstanding. It also illustrates in a vivid way—and it would have been even more vivid if the *muqarnas* cornice were originally gilded or painted—that the concept of linking the Sanctuary with Paradise continued into the Ottoman period. (For a discussion of this concept, see among others, Schimmel 1976, Hanaway 1976 and Moynihan 1979. For a similar interpretation of the decoration of the Dome of the Rock, see Rosen-Ayalon 1989.) SA]

Features

The *mihrab* of al-Sanaubar, built entirely of high quality white stone, is the most sophisticated and elaborate of all the examples on the Haram. It is quite unique. The construction is made peculiar by reason of three unfamiliar architectural features. The first is the slit window in the back wall of the niche. It is hard to propose a function for this window and also to explain why it is placed there in particular. Was it for decoration—or did it serve a specific purpose? The second feature is the exterior engaged stone finial placed directly above the apex of the hood. Usually finials in the buildings of Jerusalem are to be found on the top of minarets or domes; they are either a decorative feature or a religious symbol affiliating the site to Islam. But to find a finial on a *mihrab* is to the best of our knowledge unprecedented in Jerusalem, and it is hard to speculate what point it is making, other than decoration. It is possible, though unlikely because it is carved in relief, that the finial originally crowned the *mihrab* and was only later placed in this secondary position.

The third aspect of this curious building that is worth special notice is not only the shape of the upper part of the *mihrab*, the *muqarnas* panel, but also its decorative scheme. This panel makes the *mihrab* look like a *minbar*, as Taha (1988: 58) already noted. In this sense too the Mihrab al-Sanaubar is unique among those of the Haram. The questions raised by the decorative scheme remain at present without answers—who was the patron of the *mihrab*? when was it first built? was it originally built as a *mihrab* at all? and was it always a single unit? The extraordinary proportions of the heavy *muqarnas* cornice give it a top-heavy appearance which is so extreme that the structure looks unstable. Since this particular form of decoration is not found elsewhere on the *mihrabs* or on the other Ottoman buildings on the Haram or, indeed, anywhere in Jerusalem, this raises the question of whether the craftsman was local or whether he was brought in from abroad. It seems most probable, however, that Mihrab al-Sanaubar is an example of the initiative of a local *mi'mar*.

¹ The ceramic panels are well illustrated in colour in Seherr-Thoss 1968: 282-85, pls. 130, 131.

55 **MASTABAS AND MIHRABS**

Name: *Mastabas* and *mihrabs*

Date: The majority of the *mastabas* (places of prayer) and *mihrabs* (prayer niches) on the Haram al-Sharif are undated, but a few carry foundation inscriptions (see below).

Endowment: None is known. It might well be expected that no *waqfiyya* would be found for the upkeep of the *mastabas* and *mihrabs* as their function is straightforward and there are no maintenance expenses of any significance. The very fact that they are located within the Haram precinct on the one hand, and that they were built by anonymous patrons on the other, reduces the likelihood of any *waqfiyya* having been established. Their upkeep—such as it is—falls under the overall endowment of al-Aqsa Mosque for buildings on the Haram, and so no specific sum would be set aside either for the employment of a caretaker or for repairs.

Variants of name: The majority of the *mastabas* on the Haram have no name; to be more specific, they no longer retain any original name they may once have possessed. Despite this fact, various names have traditionally been associated with the *mastabas* and the niches scattered within the Haram area. Some of these relate to the founder, but most are taken from their location or are named after a neighbouring monument. As usual, exceptions can be found. The list of the *mastabas* and *mihrabs* as they are currently defined is as follows:

A. Dated Ottoman *mastabas* and niches

Mihrab wa mastabat Sabil Bab al-'Atm (cat. no. 8)

Mihrab wa mastabat 'Ali Pasha (cat. no. 37)

Mihrab wa mastabat Sabil Sha'lan (cat. no. 36)

Mihrab wa mastabat Ahmad Qullari (cat. no. 47)

B. Pre-Ottoman (Mamluk) *mastabas*

55/1. Mihrab wa mastabat al-Fakhriyya

55/2. Mihrab wa mastabat al-Karak

55/3. Mihrab wa mastabat Qubbat Musa

55/4. Mihrab wa mastabat Sabil Qa'itbai

55/5. Mihrab wa mastabat Jarkas al-Nasiri

55/6. Mastabat al-Zahir (see Mastabat Sabil Sha'lan cat. no. 36)

C. Probable Ottoman *mastabas* with *mihrabs*

55/7. Mihrab wa mastabat al-Zuhur ('Prayer niche and place of the flowers')

55/8. Mihrab wa mastabat Bab al-Maghariba

55/9. Mihrab wa mastabat Khalwat al-Dajani

55/10. Mihrab wa mastabat Bab al-Ghawanim al-Gharbiyya

55/11. Mihrab wa mastabat Bab al-Ghawanim al-Sharqiyya

55/12. The Western Mastaba

55/13. Mihrab wa mastabat Sabil Mustafa Agha (al-Shaikh Budair)

D. Probable Ottoman *mastabas* without a *mihrab*

55/14. Mastabat Bab al-Hadid

55/15. Mastabat Bab al-Qattanin

55/16. The double Mastaba of the Ablutions

55/17. Mastabat al-Qas al-Sharqiyya

55/18. The Mastaba to the north east of al-Aqsa mosque

55/19. The Mastaba of the Islamic Museum

55/20. The Mastaba south of Mastabat al-Karak

E. Recent *mastabas*

55/21. Mastabat Sabra and Shatila

55/22. The Mastaba to the west of the Golden Gate

55/23. The Mastaba to the south of the Golden Gate

55/24. The Mastaba of the eastern colonnade

55/25. The South-Eastern Mastaba

55/26. The South-Western Mastaba

55/27. The Eastern Mastaba

Modern names: See above.

Location

With the exception of one example (Mastabat al-Karak no. 55/2) which is located at the south-east corner of the upper terrace of the Dome of the Rock), all the *mastabas* are situated within the esplanade of the Haram. The majority were constructed to the west of the Haram, with only a few built in the northern or the southern sections of the enclosure. Until the early years of 1970, there were no *mastabas* in the eastern area.

Function

The principal function for building *mastabas* in the Haram was to enable believers to perform their daily prayer in a convenient open-air site within the sacred precinct. The fact that most of the *mastabas* are equipped with a *mihrab*—though it is not vital—emphasises this purpose and even explains why the word *mastaba* is translated into English as 'a place of prayer'. The large number of these *mastabas* and *mihrabs* seems to be intended to reinforce the fact that the whole area of the Haram is holy and blessed by Allah in His Holy Qur'an (Sura XVII: 1). Furthermore, the *mastabas* serve a secondary aim for they are also places for religious guidance, teaching, and Qur'anic recitation. They provide a convenient site for meditation, and a shelter from the heat of the sun; and of course they also give the Haram a beautiful and quite distinct landscape.

Site and brief description (figs. 55.1-55.5, pls. 55.1-55.12)

The term *mastaba*, which appears in most medieval Arabic dictionaries and in many Mamluk documents as well as in some historical sources, means a raised structure where people can sit. It is written either with *sin* or *sad*. Usually it is constructed of masonry, but if timber is used instead of stone it is called a *dikka*. *Mastabas* (benches) are also found on both sides of the entrances of monuments and of shops, although there is a secondary use in the second case, where they are also used to display goods for sale. The *mastaba* appears in Mamluk documents described in various ways such as 'a *mastaba* built with coloured marble' (*mastaba bi-l-rukham al-mulaun*), 'a big *mastaba* paved with marble' (*mastaba kubra mafrusha bi-l-rukham*), and 'a *mastaba* built with masonry' (*mastaba mabniyya bi-l-hajar*). For further details and especially for entries in the relevant dictionaries see Amin and Ibrahim 1990: 106.

The type of bench *mastaba* discussed above is found in many Jerusalem monuments, especially those dating to the Mamluk and Ottoman periods. In addition a different type of *mastaba* was popular in the Haram. These, which are the subject of this catalogue entry, are free-standing and single-unit structures, although some surround a monument or adjoin a wall, but none of them is built as part of an entrance or porch. The plan of the Haram *mastabas* is always rectangular but rarely square. They are built and paved with masonry, and are raised about 70 cm above ground level. A stone block with a niche (*mihrab*) is

usually built at the south side to indicate the direction of prayer towards Mecca, although some are constructed without a niche.

History

Identification

Very few of the *mastabas* can be firmly assigned to a specific period or date, for most have no foundation inscription and are not mentioned in detail in the historical sources. Some accounts contain brief references, but these are generalised and refer to them in a collective way. The early Muslim sources and travellers, especially before the Crusader period, make no mention of the *mastabas* of the Haram. Al-'Umari (1924) refers to many *mastabas* in the Haram enclosure, a few of which are still extant and can be safely attributed to the Mamluk period, but most of the descriptions are now out of date, for much has been changed and added since al-'Umari's account. Unfortunately, Mujir al-Din (1973 2: 164), the most authoritative and comprehensive author for the Haram, reports on only one *mastaba*, although others probably existed at the time. Visitors and travellers to Jerusalem in the Ottoman period reveal that a great many examples were to be found in the Haram. Al-'Ayyashi (al-'Asali 1992: 210), when he visited the Haram in 1074/1663, noticed that 'in the Haram there were many huge trees; below each a masonry platform was built with fine stones. It extends the length of the branches of the tree and it houses a *mihrab*.' Evliya Çelebi, reporting on the situation in the year 1083/1672 (Stephan 1980: 89), says that 'On eighty-three sites small platforms are to be met for prayers in the open, established in the shadow of the lofty trees. Each of them has a prayer-niche, each being the abode of a saint of Allah.' In another place Evliya Çelebi writes 'As to the Shrines to ... these are on separate daises situated in the Haram enclosure' (Stephan 1980: 94).

According to this information, it appears probable that it was a deliberate policy at some time in the Ottoman period to increase or at least to restore the *mastabas* within the Haram precinct. This partly explains why the *mastabas* form part of the present study, for they do not have any real architectural significance, nor is their identification to the Ottoman period completely confirmed. The reasons behind this increase in building or restoring *mastabas* and niches seems to correlate with the pattern of overall architectural activity in Jerusalem from the second half of the 17th century until 1831. An examination of this activity through an analysis of the list of buildings in the catalogue will show that no major project took place in Jerusalem after the building of al-Zawiyya al-Qadiriyya (cat. no. 35). It would seem that the minor building projects in the Haram and in Jerusalem as a whole provide a clear mirror image of the general decline of the later Ottoman empire.

There is another factor to take into account, and that is the possibility that the increase in the construction of *mastabas* coincided with the growth of the importance of the *ziyara* of the Haram in the Ottoman period. *Mastabas* and *mihrabs* should, then, be seen in the context of other monumental projects, such as the construction of Kursi Sulaiman (cat. no. 42) or Qubbat al-Khadr (cat. no. 31), which were built specifically to encourage *ziyara* to Jerusalem.

Date

As noted above, while a handful can be assigned a specific date, the majority of *mastabas* are undated. The dated examples are either Mamluk or Ottoman, and the means of dating is either by foundation inscription or by literary reference. Those it is possible

to assign to the Ottoman period are:

- (1) Mihrab and Mastaba of Sabil Bab al-'Atm (cat. no. 8);
- (2) Mastaba and Mihrab of 'Ali Pasha (cat. no. 37);
- (3) Mihrab and Mastaba of Sabil Sha'lan (cat. no. 36);
- (4) Mastaba and Mihrab of Ahmad Qullari (cat. no. 47).

Each of these appears in a reference as an independent entry, and in this study too they are so treated. It is also possible to attribute or date more firmly some of the Haram *mastabas* and niches to the pre-Ottoman period, whether Ayyubid or Mamluk,¹ although it is possible they have been restored later, during the Ottoman period. Recently, early in the 1980s, the Aqsa Restoration Committee constructed seven *mastabas* in the eastern part of the Haram.² Besides these dated examples, there are a number of undated *mastabas* and niches (see below). Although the dates of the *mastabas* and *mihrabs* within the Haram still cannot be precisely established, they are studied here because

¹ The means of identification rely mainly on literary references or architectural observation. The *mastabas* that date back to the Mamluk period are: (1) the *mastaba* and *mihrab* of al-Fakhriyya (no. 55/1). Although Taha (1988: 62) knew that it was mentioned by al-'Umari (1924: 154, 164), he thought it was Ottoman but gave no evidence for this, and in fact it has an inscription above the *mihrab* inscribed in a style that shows it is Mamluk rather than Ottoman. This led van Berchem (1925: 133) to publish it under the inscriptions of the Bahri Mamluks. Its translation runs as follows 'There is no God but Allah, Muhammad is the messenger of Allah'. (2) The *mastabat wa mihrab* al-Karak (no. 55/2), mentioned in the 9th/14th century by al-Zahiri (Marmarji 1948: 283). Taha (1988: 60) omitted al-Zahiri and mistakenly dated the *mastaba* to the Turkish (Ottoman) period. (3) The *mastaba wa mihrab* Qubbat Musa (no. 55/3) described by al-'Umari, although without the *mihrab*, which was added later. (4) The *mastaba* of Sabil Qa'itbai, probably built by Sultan Inal (who reigned 857/1453 to 865/1461) at the time he erected a *sabil* which was later rebuilt by Qa'itbai (van Berchem 1925: 159-62; Burgoyne 1987: 606).

² These are: (1) The *mastaba* of Sabra and Shatila (no. 55/21), built in 1981 to commemorate the massacre of Palestinians in Beirut. It measures 14.97m long by 10.04m wide by 85cm high. There is no *mihrab* but an inscription has been cut on the chamfered edge of a cylindrical shaft. (2) The *mastaba* to the south west of the Golden Gate (no. 55/22), measuring 8.8m wide by 9.3m long. A low simple *mihrab* block is built on the *qibla* side, 85cm wide by 91cm high by 40cm deep. The upper edge of the *mihrab* block is planted with flowers. (3) The *mastaba* to the south east of the Golden Gate (no. 55/23), close to the eastern wall of the Haram. It measures 8.45m wide by 11m long and 65cm high. It has no *mihrab* and is approached by way of three steps on the east. (4) The *mastaba* of the eastern colonnade (no. 55/24), access to which is through three large rectangular steps to the north; it measures 9m wide by 13m long by 70cm high. An undecorated *mihrab* of white dressed stone is built at the centre of the southern side, measuring 1.3m long by 1.83m high by 71cm wide. The *mihrab* niche is 70cm wide by 35cm deep and is surmounted by a semicircular arch. The roof of the block slopes towards the south to prevent water collecting. (5) The South-Eastern *mastaba* (no. 55/25), 28.4m long by 12.8m wide by 78cm high; this is the largest of the new examples and has no *mihrab*. (6) The South-Western *mastaba* (no. 55/26) measuring 12.25m wide by 17.08m long by 59cm high. It is surrounded by a stone parapet reaching 59cm in height and three trees are enclosed within it. A very simple *mihrab* niche is placed at the south side, expressed by means of a semicircular curve within the wall itself, 1.07m wide by 68cm deep by 59cm high. (7) the Eastern *mastaba* (no. 55/27).

they have not featured in any published work apart from that of Taha (1988), and they have not been mentioned by any mediaeval sources from the pre-Mamluk period.

Founder

The founders of the dated *mastabas* and niches, whether they were Mamluk or Ottoman, were high-ranking officials (such as sultans, *amirs*, governors and *pashas*) as was the custom for most of the Islamic monuments in Jerusalem and elsewhere. This raises the question of who built the undated prayer platforms and niches in the Haram. The lack of information makes it safer to consider the builders as anonymous. It is possible to speculate, however, whether concealing their name was a deliberate policy on the part of the patron in order to receive a higher reward as expressed in the religious teaching of the Prophet Muhammad, or whether these structures were financed from the income of the Haram *waqf*.

Architecture

The so-called *mastabat* and *mihrab* al-Zuhur ('the Flowers') no. 55/7 is located at the south end of the paved walkway leading from Bab al-Silsila to the Aqsa Mosque. The *mastaba* is nearly square in plan, measuring 6.5m wide by 7.7m long by 0.75m high. It is paved and constructed of white masonry of medium size, and it is approached through two rectangular steps placed at the north-eastern corner. The *mihrab* abuts the eastern side of the *mastaba*, and is built on the level of the Haram esplanade. The location of the *mihrab* is unique among other Haram examples which are usually built at the middle of the south wall of their related *mastaba*. The 'Flowers' niche is constructed to form a simple rectangular area which measures 1.7m long by 1.6m wide, and it is paved with old white stone blocks that are different to the slabs forming the pavement of the Haram which abuts the *mihrab*. This area is enclosed by a low wall reaching a height of 56cm on the eastern, northern and southern sides, while the western wall is formed by the eastern wall of the *mastaba*. The northern wall is cut to form an entrance 98cm across which allows easy access into the paved floor area to pray. The niche of the *mihrab* proper is located in the southern (*qibla*) wall. It is semicircular in profile, measuring 45cm deep by 110cm wide by 56cm high. The principle behind this layout is to some extent similar to that behind the first and second *mihrahs* of Qubbat al-Nabi (cat. no. 10), which may indicate that it was built at some time during the Ottoman period.

The *mastaba* and *mihrab* of Bab al-Maghariba (cat. no. 55/8) lies 3.5m west of the southern end of the western *riwaq* (707-37/1307-37). It is rectangular in form and measures 18.65m long by 10.2m wide. Although the surrounding ground has been paved, it is not level. The platform of the *mastaba* has been both constructed and paved with slabs of good-quality white and red stone of various sizes, some of them as large as 2.15m by 90cm. The north-western and north-eastern corners, and the edges, are constructed of larger stone slabs than the rest. Access to the *mastaba* is possible from every direction, for there are steps on each of the four sides. The step on the east side measures 1.65m long by 50cm wide and 19cm high. As for the north side, there are two steps, the first measuring 1.56m long by 24cm wide by 25cm high, while the second is 1.56m long by 94cm wide and 17cm high. The west side also has two steps, the first 1.61m long by 36cm wide by 20cm high and the second 1.61m long by 42cm wide by 20cm in height. At the south side two stone blocks measuring 93cm long by 50cm wide by 82cm high are chiselled

to form three small steps. In the centre of the north wall, there is an undecorated concave niche measuring 74cm wide by 40cm deep by 1.49m high. The apex of this *mihrab* is in the form of a scallop and is surmounted by a pointed arch. The block is topped by two courses, the first built directly above the arch. This is a stone course with a *cyma recta* moulding. The second course is plain masonry and serves as a sloping roof to allow for immediate drainage of rainwater. The east, the west and the south sides of the *mihrab* are solid walls built of small white undecorated stones. It is hard to date the structure owing to the lack of any evidence; to rely solely on architectural observation is not enough because most of these *mastabas* are built in a similar style and technique, and in any case are of very simple design.

The *mastaba* and *mihrab* of Khalwat al-Dajani (cat. no. 55/9) is located to the east of Sabil Qasim Pasha (cat. no. 2). It runs from north to south, occupying the space between the south-west and the west colonnade. The *mastaba* was built in front of Khalwat al-Dajani (cat. no. 46) and the cistern of al-Malik al-Mu'azzam 'Isa, and its location provides its name. The *mastaba* is rectangular in plan, measuring 31.4m long by 11.75m wide by 45cm high. It is approached either from the north or from the west. There are two small steps to the west which give easy access to the platform. The east side of the *mastaba* adjoins the western border of the Dome of the Rock terrace, and the southern side is marked by an additional course of stonework which rises above the level of the dais and is finished by a dressed course with a rounded profile. A large olive tree grows in the southern section of the *mastaba*, its branches shadowing the *mihrab*, and this accords with the descriptions left by some travellers of the prayer platforms on the Haram (see above). A low rectangular stone parapet surrounds the tree, some 2m wide by 4m long, and there is another walled area measuring 2.6m wide by 2.85m long in the centre of the *mastaba*, now empty but apparently once containing another tree. This *mastaba*, like the rest of those on the Haram, is built and paved with stone slabs of varying size. The *mihrab* niche, as usual, is located on the *qibla* (south) side. It is centred and built of nine courses of *ablaq* masonry of red and white which have weathered to a uniform grey. The niche measures 38cm deep by 75cm wide, terminating in the form of a scallop surmounted by a pointed arch. The uppermost course is set directly above the arch, projecting slightly and with a chamfered edge. The east, west, and south walls of the *mihrab* are of solid, undecorated masonry. Altogether, the *mihrab* is handsome and, although undecorated, it appears that it was built with care and skill. The high quality is reminiscent of the technique employed in Mamluk *mihrahs*, but as there is no evidence with which to date the *mihrab* or even the *mastaba* itself, the date must remain a mere supposition. Because the *mihrab* block is not integrated into the fabric of the *mastaba*, it must have been constructed later.

Two *mastabas* are to be found in the north-western section of the Haram. The first is located near Bab al-Ghawanima and therefore named here the 'Western Mastaba of Bab al-Ghawanima' (no. 55/10); the second lies to the east of this and is thus called here the 'Eastern Mastaba of Bab al-Ghawanima' (no. 55/11). The date of the Western Mastaba and Mihrab of Bab al-Ghawanima (fig. 52/10.1; pl. 55/10.1, 55/10.2) was mistakenly given by Taha (1988: 57) as Mamluk and as having been built by the Amir Balwi al-Zahiri,³ Inspector of the two Sacred Precincts

³ Mujir al-Din (1973 2: 273) states that 'Amir Balwi al-Zahiri built the *mihrab* and the *mastaba* opposite Bab al-Nazir in Dhu 'l-Hijja 795/October-November 1393.'

(*nazir al-haramain al-sharifain*, i.e., Jerusalem and Hebron⁴) during the second reign of Sultan Barquq (792-801/1390-9). Although it is true that the *mihrab* is elegant, and its slender form and to some extent rich decoration might imply that it was constructed in the Mamluk period, there is no proof to support this proposition, and even dating the *mihrab* to the Ottoman period is not straightforward. The *mastaba* is rectangular in plan. It runs from east to west and measures 17.7m long by 9.6m wide, its height from ground level being irregular. It is reached by way of a recently paved walkway to the north, which terminates in a low stone step. The *mastaba* is paved and constructed of white masonry slabs now weathered to grey. The paving scheme of the *mastaba* is divided into six rectangular sections by an axial line of paving stones which lead from the walkway at the northern end of the *mastaba* to terminate in front of the *mihrab*, and by three lines of paving stones running from east to west.

The associated *mihrab* is constructed of dressed, white stone that has weathered to grey. It is rectangular, measuring 2.56m in height and 1.25m in width. The recessed niche is also rectangular and contains the main decorative scheme of the *mihrab*. The niche is framed by a very narrow roll moulding, which takes the form of a semicircular arch at its summit. The niche of the *mihrab*, which has no parallel in Jerusalem, measures 70cm wide by 14cm deep by 1.58m high; it is surmounted by a carved shell with seven ribs, surrounded by a bold roll moulding with an incised groove. The shell niche is carried on two brackets incorporated into the fabric of the panel, and both have a frame moulding. A marble panel is to be found two courses below the shell. It projects slightly and has a relatively wide chamfered frame in the form of a semicircular arch. The centre of the panel is slightly recessed, the recess following the profile of the panel at the top and terminating in a waisted stem. The niche ends two courses below the marble panel; its outer corners are decorated by a chamfered cut surmounted by a small bifurcating organic shape reminiscent of a tulip head or leaf.

The Eastern Mastaba of Bab al-Ghawanim was called by Taha (1988: 59) 'the Mastaba of Qubbat Sulaiman' (of c. 600/1200) because of its location close to the *qubba*. However, because Qubbat Sulaiman has its own associated *mastaba*, it is preferable to avoid any danger of misunderstanding and to call it the 'Eastern Mastaba of Bab al-Ghawanim', as explained above. Taha (1988: 59) believes that the *mastaba* was probably built in the Ottoman period, though his account speculates that it was below ground level, the *mihrab* appearing as if it were planted in the ground. In fact, it seems that there was no Ottoman *mastaba* on the site, for the map of the Ordnance Survey of Jerusalem (Wilson 1865) only shows a *mihrab* niche built on natural rock. In fact, the Eastern Mastaba of Bab al-Ghawanim turns out to be a new construction—it was built as recently as 1988 by the Aqsa Restoration Committee. The *mastaba* is rectangular in plan, measuring 17.35m long by 8.46m wide and 50cm high at its highest point from the ground at the north-eastern side. The *mastaba* is both constructed and paved with new white stone slabs that still retain their colour. The *mihrab* is a heavy masonry block measuring 1.35m long by 95cm wide by 1.6m high, projecting

45cm from the south side of the *mastaba*. Its roof slopes 16cm towards the south. The construction is of white and yellow stones of rectangular shape. The niche of the *mihrab* measures 42cm deep by 73cm wide, with a concave scallop forming its apex. The scallop is surmounted by a simple pointed arch made up of six voussoirs. The building terminates one course above the arch.

The Western Mastaba is situated opposite that of 'Ali Pasha (cat. no. 37), between the Hujrat Islam Beg (cat. no. 21) and the Khalwa of Bairam Pasha (cat. no. 34), with its eastern side adjacent to the western border of the Dome of the Rock terrace. It is the usual rectangle in plan, measuring 11m wide by 10.6m long by 85cm high, and it is reached by way of a flight of three steps built on the north side in 1977. The rectangular mouth of a cistern, constructed of masonry and numbered 31 in the map of the Ordnance Survey of Jerusalem (Wilson 1865), is built on the west side of the *mastaba*. It measures 90cm wide by 80cm long and 70cm high. The *mastaba* is constructed of, and paved with, masonry slabs of different sizes, some measuring 1.9m long by 50cm wide. They are varied in colour—red, yellow, black, and white weathered to grey. It is obvious that part of the pavement at the eastern part has been recently replaced. The *mihrab* (fig. 55/12.2), which is slightly concave, is remarkably squat and small, and it is not incorporated into the fabric of the *mastaba*. It lies on the south side and it is made up of three blocks of stone measuring 65cm wide by 25cm deep by 1.1m high. The niche of the *mihrab* measures 42cm wide by 20cm deep, and its apex is surmounted by a shallow scallop. The scallop is decorated with a simple shell of eleven ribs. This is quite the smallest and shortest *mihrab* in the Haram, and appears to have been added to the *mastaba* some time after 1865, for the *mihrab* does not appear on the map of the Ordnance Survey of Jerusalem (Wilson 1865).

Another undated Mastaba and Mihrab in the Haram is the so-called Mastaba and Mihrab of Sabil al-Shaikh Budair. The *mastaba*'s original name—if one ever existed—has been lost and it is now called after the Sabil Mustafa Agha Baraunah, or Sabil al-Shaikh Budair (see above cat. no. 48), for it is situated next to that *sabil*. The *mastaba* is an irregular pentagon in plan, with part of its north-east corner sliced off to allow for the paved walkway which leads from Bab al-Nazir to the Dome of the Rock terrace. The maximum length of the *mastaba* is 20.5m and its maximum width 16.2m. It is easily reached by means of six single steps of different shapes and sizes placed on the west and north-eastern sides. The *mastaba* is built of white stone slabs of varying size, and its south side is protected by a stone parapet. The *mihrab* block, measuring 2.56m long by 2.78m high by 1.25m wide, is in the centre of the south side facing north. It is the biggest *mihrab* niche in the Haram; it is named after Da'ud (David) and dated 696-8/1297-9. The *mihrab* consists of a recessed niche with a pointed arch with the extrados of the arch framed by a bold roll moulding. The arch is supported by two columns. These are cylindrical in form and are made of white marble, each with an identical base and capital. The base is a square undecorated plinth, with torus moulding and an apophyge. The capitals, also of marble, are debased Corinthian with volutes and acanthus leaves. They are in secondary use, for the west and south sides have been cut both in order to fit them in place and to make them correspond with the size of the shafts. The decoration of the east capital is better preserved than that of the west, and both abaci are undecorated and are not original. The niche is a concave recess that begins 22cm from the columns; it measures 75cm in depth and 1.08m in width. It is undecorated, built entirely of white masonry arranged in regular courses. The apex is in the form of a scallop and is surmounted by a pointed

⁴ *Al-Haramain*, the two holy places, as Lewis (1979: 175) says 'usually referring to Mecca and Medina, occasionally, in both Mamluk and Ottoman usage, to Jerusalem and Hebron'. According to Mujir al-Din (1973 *passim*), it would seem that if the term *nazir* (inspector) preceded *al-haramain*, the reference was probably to Jerusalem and Hebron.

arch. A concave moulding marks the end of the building, built directly above the bold frame that surrounds the extrados of the outer pointed arch. The west, south and east walls of the *mihrab* block are undecorated solid walls, and the roof slopes towards the south to prevent water from gathering. The layout, the size, the columns and their capitals may imply that the *mihrab* was built in the Mamluk period and this seems to have led Taha (1988: 58) to so date the *mihrab*, but again without providing any documentary proof or further discussion. In our opinion, it is safer to leave the matter of date open.

Additional *mastabas* are to be found in various sites on the Haram; they have a similar layout and are constructed with the same building materials as those already described above. All of them are without special features, are undated, and nothing has been published about them apart from Taha's article of 1988. Nor do any of them have a masonry *mihrab*, although some have been recently provided with a very simple modern iron niche. These examples are listed below:

- (1) The Mastaba of Bab al-Hadid (no. 55/14), which takes its name from the Iron Gate (restored 755-8/1354-7); it lies just few metres east of this gate. The Mastaba is relatively small, 8.1m by 7.08m.
- (2) The Mastaba of Bab al-Qattanin (no. 55/15) located a few metres east of the Cotton Gate (736/1335-6). It measures 16.43m by 8.25m by 64cm in height, and has an iron niche.

Fig. 55.1 Sketch drawing of *mihrab* of Western Mastaba.

- (3) The double Mastaba of the Ablutions (no. 55/16). Both these platforms are situated to the west of al-Qas and both have a *mihrab* made up of simple iron bars. The eastern one measures 18.45m by 7.45m, and the western one 18.45m by 5.2m.

- (4) The Eastern Mastaba of al-Qas (no. 55/17) to the east of al-Qas measures 18.36m by 7.5m and is also provided with an iron *mihrab*.

- (5) The Mastaba to the north east of al-Aqsa mosque (no. 55/18) was named by Taha (1988: 62) 'the funerary Mastaba' because it is near the dais used for funeral prayers. It measures 7.7m by 6.55m and it too has an iron *mihrab*.

- (6) The Museum Mastaba (no. 55/19) is the largest, measuring 57.2m by 20.5m. Today it is without a *mihrab*, though according to the map of the Ordnance Survey of Jerusalem (Wilson 1865) there was formerly one at its centre. It is located in front of the entrance of the Islamic Museum inside the Haram. Al-'Umari (1924: 152-3) described this area as having two *mastabas*, but much has changed and his descriptions of course predate the building of the Islamic Museum.

- (7) The last *mastaba* is located to the south of Mastabat al-Karak (no. 55/20) on the level of the Haram esplanade; it measures 5.8m by 6.05m and its *mihrab* measures 1.05m wide by 74cm deep by 1.34m high. The niche of the *mihrab* measures 53cm wide by 27cm deep by 1.42m high. The shell hood is surrounded by a pointed arch.

Pl. 55.12 Mastaba to west of the Golden Gate (cat. no. 55/22).

PART ONE

Texts

The complete text of unpublished documents from various *sijills* of the Jerusalem Shari'a Court is given below, with a brief summary of the contents in English. The information is listed under the related monument or a specific subject regardless of date, although it appears in chronological order under the entry for each monument. Each document carries the number of the monument, followed by the date, *sijill* number and page reference. An asterisk immediately after the page number of the *sijill* indicates that the complete text in Arabic is to be found in Part 2 of Appendix 1. If there is more than one document relating to a particular monument, a subsidiary number is added to that of the monument.

The documents cover a wide range of subjects, including appointments to different offices and positions, estimates for restoration, repair and construction work compiled by inspectors, sale and purchase of construction materials, *fatwas* for leasing and constructing parts of al-Aqsa mosque, orders from Istanbul, and so on. However, unpublished *waqfiyyas*—some of them not previously listed—together with endowment records, constitute the greater part. These documents (Part 1 of Appendix 1), form only a small part of the information cited in the study. They are transcribed here both because of their importance and in order to place a proper emphasis on their vital role in the research carried out for this book.

1. Endowments for the benefit of Maqam al-Nabi Da'ud

16 Rajab 977/25 December 1569

Sijill 53: 54

The document refers to frequent orders sent from Istanbul to the Governor of Syria and to the *deftardar* (the official in charge of finance) of the District of Syria and Aleppo, specifying certain estates as *waqf* for Maqam al-Nabi Da'ud. The descriptions of the estates are provided in cat. no.1 under endowments; they were made *waqf* by means of variously dated orders. The income was allocated to provide food for visitors and the poor, for the maintenance of the site, and for providing the wherewithal to light the lamps of the Maqam. The documents end with a confirmation of legal authorisation issued by the *qadi* to Shaikh Yunus to continue in the position of *al-mashyakha* (Head) of the *waqf* of the Maqam al-Nabi Da'ud, as his grandfather and his father had been before him.

3/1. Confirmation of endowments by Hajji Beg for the benefit of al-Zawiya al-Khalwatiyya (al-Hamra')

15 Dhu'l-Qa'da 964/9 September 1557

Sijill 39: 516*

In the presence of the *deftardar* of al-Sham District in the council of the *qadi* 'Abd al-Rahman, it was confirmed by legal means that Hajji Beg, the ex-governor of Safad and Nablus, had donated various estates in the interest of al-Zawiya al-Khalwatiyya. The *zawiya* had been constructed by Shaikh 'Ala' al-Din ibn 'Ali al-Khalwati and was located in the Bani Zaid district of Jerusalem. Specific estates were listed in the document, among other data.

3/2. Confirmation of endowments by Qasim Beg for the benefit of al-Zawiya al-Khalwatiyya (al-Hamra')

15 Dhu'l-Qa'da 964/9 September 1557

Sijill 39: 517*

The document is similar to no. 3/1, apart from the name of the donor and the estates.

3/3. Contract to rebuild Bab al-Asbat Minaret

18 Dhu 'l-Qa'da 1007/12 June 1599

Sijill 80: 100*

The document informs us that Sultan Muhammad Khan 1003-1012/1595-1603 (the complete list of his titles is provided) had sent 300 *sultani* to the inspector of al-Aqsa mosque to fund the rebuilding of the Bab al-Asbat Minaret. 'Abd al-Baqi Beg had accordingly entered into a contract in the presence of Ahmad Pasha, the governor of Gaza, with three architects (names provided) to rebuild the minaret. The architects were to receive 200 *sultani* in payment for rebuilding the minaret and providing all the materials needed for the repairs (such as stone, lime, gypsum, water, workers and so on), apart from the lead which was to be provided by the inspector. The document specifies in detail the parts of the minaret which were to be rebuilt.

10/1. Appointment to the position of 'Sha'al' for the lamp of the Mihrab al-Nabi

12 Dhu'l-Qa'da 1037/14 July 1628

Sijill 113: 786*

Muhammad Amin Efendi, the *qadi* of Jerusalem, had appointed Fakhr al-Din, the son of Shaikh Zakariyya, the ex-*mufti* of Jerusalem the Noble, to the half-post of *sha'al* (the man in charge of lighting) for the lamp of the *mihrab* of the Prophet. He had been allocated 1 *'uthmani* per day from the income of the *waqf* of al-Aqsa mosque.

10/2. Farrukh Beg, Governor of Nablus

10 Rabi' 'l-Thani 1014/25 August 1605

Sijill 85: 1*

This concise note, most likely inscribed by the *qadi*, recorded the journey of Farrukh Beg, the governor of Nablus, from Jerusalem to Nablus on the specified date.

10/3. Hasan Pasha records the responsibility of Muhammad ibn Farrukh Beg

16 Safar 1036/6 November 1626

Sijill 112: 469*

The document, which was issued at the Court of Damascus and copied in the *sijills* of the Court of Jerusalem, is an official declaration from Hasan Pasha, the governor of Jerusalem District (and son of Ahmad Pasha, the governor of Gaza) that he had received all that was in the care of Muhammad Beg, the son of Farrukh Pasha, the ex-governor of Jerusalem District. This instrument provides—among other information—three names of the governors of Jerusalem, one of whom—Farrukh Beg—was patron of one phase of the construction of Qubbat al-Nabi.

11/1. The first endowment by Bairam Jawish for his Ribat

14 Ramadan 953/8 November 1546

Sijill 17: 407, 408*

Bairam Jawish had purchased 6 *qirat* of 24 of the village of Bani Na'im (the boundaries of which were specified) for 50 *sultani*. Bairam attested in the Religious Court of Jerusalem that the money was paid from the original capital (50,000 *'uthmani dirhams*) which he had already made a *waqf* at a previous date for the benefit of the Ribat. The Ribat had been constructed by Bairam himself and was located in Jerusalem the Noble. The donor informed the court that the income of the land should follow his general stipulations as mentioned in his earlier *waqf* dated 15 Jumada 'l-Awwal 952/27 May 1545.

11/2. Authorisation of Muhammad Jawish on behalf of Bairam's wife and daughter

14 Dhu'l-Qa'da 982/25 February 1575

Sijill 56: 646*

The document was issued in the Court of Damascus in 19 Shawwal 982/1 February 1575 and registered in the Court of Jerusalem on 14 Dhu'l-Qa'da 982/25 February 1575. It gave to Muhammad Jawish, the husband of Bairam's daughter Khadija, full lawful authority to sell property that belonged to Bairam's estates in Jerusalem, Nablus, Ramla, and Gaza, to claim any monies owing to Bairam, to demand all the rent payable on Bairam's estates, and to represent both Khadija and her mother in any court. It ended with the ratification of Fakhr al-Din al-'Alami, the *qadi* of Jerusalem.

11/3. Stipulations of Bairam's waqf on the Ribat and the Maktab

Dhu'l-Hijja 967/August-September 1560

Sijill 56: 646-47*

The record begins with the phrase 'this is a copy transcribed from the original report brought to the court by Muhammad Jawish'. It includes information about the location of the Ribat and the Maktab, and detailed stipulations of Bairam's *waqf*, in addition to the different endowed estates (with their borders) located in various parts of Palestine. Both the stipulations and the endowments were repeated in the *waqfiyya*, and a full translation is provided in cat. no.11 under Endowments and Stipulations.

11/4. Bairam's waqfiyya for the Ribat and the Maktab

Beginning of Dhu'l-Hijja 967/23 August 1560

Sijill 56: 647-50*

This unpublished *waqfiyya* is without doubt the most important Ottoman document in Jerusalem after the *waqfiyya* of al-'Imara al-'Amira. It reveals that Bairam attested in the religious Court of Jerusalem that he had donated 150,000 *'uthmani dirhams* for the benefit of his Ribat and Maktab, the former of which he had constructed and the latter of which he had renovated. The *waqfiyya* specified in full detail all the estates endowed by Bairam, which were located throughout Jerusalem, Bethlehem, Bait Sahur, Ramla and Gaza. It provides vital information not to be found in any other source regarding the terms and stipulations for the administration of the *waqf* personnel, as well as financial arrangements. It ends with a summary regarding the durability of the *waqf* and the punishment to be meted out to anyone who tried to change, substitute, or diminish it in any way. Large parts of the *waqfiyya* are fully translated in cat. no.11 under the following headings: Endowments, Purpose of Construction, Description of the buildings, Terms of the Endowments, Financial Arrangements, and Duties of the Personnel.

11/5. Appointment of a clerk for Bairam's Waqf

18 Rabi' 'l-Awwal 970/15 November 1562

Sijill 56: 650*

'Abdi Khalifa ibn Musa, the legal representative of Bairam Jawish, appointed in the council of Muslih al-Din, the *qadi* of Jerusalem the Noble, 'Abd al-Qadir Çelebi ibn 'Ala' Din al-Khalwati as clerk for Bairam's *waqf* during his lifetime. He was allocated one *'uthmani* per day, and the position after him was to be reserved for his sons and the sons of his sons. Muslih al-Din confirmed the appointment by putting his signature above the document.

11/6. 'Ala' al-Sukari ratifies the selling of estates by his father to Bairam

End of Rabi' 'l-Thani 970/26 December 1562

Sijill 56: 651*

This document was registered in the presence of Safar ibn Mustafa, Bairam's brother, and 'Abdi ibn Qubat, the legal guardian of Bairam's orphans. The document is in fact a declaration from 'Ala' al-Din ibn 'Abd al-Wahhab al-Sukari. 'Ala' al-Din declared himself willing, being of sound body and mind and under no duress or constraint, to ratify the sale by his father of the soap-factory and the *haush* to Bairam, and that Bairam in his lifetime had paid his father all the money previously agreed for the transaction.

11/7. Testimony of the Qadi Muslih al-Din ibn 'Awad

End of Rabi' 'l-Thani 970/26 December 1562

Sijill 56: 651*

Qadi Muslih al-Din ibn 'Awad testified that it was proven in his presence by those who were permitted to attest at the end of the *waqfiyya*, that this *waqf* (of Bairam) was lawful and legal.

11/8. Testimony of the Qadi Muhyi al-Din 'Abd al-Qadir

29 Dhu'l-Qa'da 982/12 March 1575

Sijill 56: 651*

The contents of the document are the same as those of the preceding document apart from the date and the name of the *qadi*.

11/9. Revision of the waqfiyya

29 Dhu'l-Qa'da 982/12 March 1575

Sijill 56: 651*

This document is the final testimony which declares that the copy of *waqf* had been revised and compared with the original version, and that it had been found correct and lawful. The signatures of five persons (the names are provided) end the short document. Two out of the five were *qadis*, and two were scribes in the religious court.

11/10. Inspection of workers and construction materials

5 Rabi' 'l-Awwal 967/5 December 1559

Sijill 39: 62*

Muhyi al-Din Khalifa ibn al-Hajj Husain, the legal representative of Bairam Jawish, who was in charge of Auqaf al-Misriyyin in Jerusalem the Noble, had come to the court and had asked 'Abd al-Rahman Efendi, the *qadi* of Jerusalem, to inspect the workers and the materials used in Khan Bab al-Qattanin. The *qadi* commissioned his clerk Isma'il al-Shafi'i, who had duly gone to the site and had reported the following: on Tuesday there were seven workers (*fu'l*), one master builder, one *majarifi* (a man who used a shovel), and on Wednesday the same had been found as on Tuesday. The materials used during these two days were:

Item	Cost in para
50 <i>quffas</i> (leather baskets) of lime	35
50 <i>quffas</i> of <i>qusurmil</i>	10
Ropes and sweepers (<i>makanis</i>)	14
Six donkeys to transfer the lime and the <i>qusurmil</i>	12
Four <i>quffas</i>	4
Food for the workers	10
Total	85

11/11. Waqf of Bairam Jawish on al-Zawiya al-Yunusiyya

16 Safar 947/22 June 1540

Sijill 12: 264

Bairam Jawish had come to the court of Salih ibn al-Qudwa with 150 gold *qubrusi* and attested that he had made over this sum as *waqf* for the benefit of al-Zawiya al-Yunusiyya, which was located in Jerusalem the Noble next to the fountain in Wadi al-Tawahin. He stipulated that 50 *qubrusi* were to be spent on the *zawiya*, and the rest was to be used to construct a stone building for 'Ala' al-Din ibn al-Mujarrad, the administrator of the *waqf*.

11/12. Bairam Jawish assigns Asiya ibn Habib as an elementary-school teacher

16 Safar 947/22 June 1540

Sijill 12: 264

Bairam Jawish, as inspector and donor of the *waqf* of al-Zawiya al-Yunusiyya, had assigned Asiya ibn Habib as an elementary-school teacher in the *zawiya*. Asiya had been allocated two '*uthmani*' per day provided that he refrained from taking any (money) from the children. He was to teach them the Holy Qur'an each day.

12. An orchard endowed by Bairam Jawish in the village of Bait Sahur for the benefit of his *kuttab*

7 Shawwal 948/24 January 1542

Sijill 14: 155*

Bairam Jawish had appeared in the court of the *qadi* Salih ibn al-Qudwa and had attested while he was sound in body and mind, that he had made as a *waqf* the whole share (18 *qirats* out of 24) of the orchard (*ghiras*) that was planted with grapes and figs and other fruit trees. The orchard was located in the village of Bait Sahur al-Nasara. It was bordered on four sides by open space. For details of the conditions contained in the *waqf*, which was later partly altered by the donor, see cat. no.12 under Endowment.

13. Architectural description of the house of Bairam Jawish in 'Aqabat al-Sitt ('Aqabat al-Takiyya)

12 Dhu'l-Qa'da 982/23 February 1575

Sijill 56: 652*

This lengthy and most interesting document was originally a legal case presented to the *qadi*. The contents of the document provide information about a previously anonymous building which allows its inclusion in the list of Ottoman monuments in Jerusalem. The contents of the document include information on the exact location of the house, its architectural components, and the limits of its boundaries, as well as other data.

According to the document the house was—as indeed it still is—situated in the lowest part of 'Aqabat al-Sitt at the junction of the roads opposite the *sabil*. The house is built over the Street of the Sultan, also known as Khatt Wadi al-Tawahin, which is known today as al-Wad Road. The property consisted of an open courtyard, two halls, a western *ivan*, an eastern kitchen and a bathhouse. The house was reached through the entrance of the *ribat*. A full translation of the document is given in cat. no.13.

15/1. Expansion of the kitchen of al-'Imara al-'Amira (Khassaki Sultan)

6 Rabi' 'l-Awwal 967/6 December 1559

Sijill 39: 30-31*

The Sultan's order had been received in Jerusalem to expand the kitchen of al-'Imara al-'Amira, for it was too small and had no chimneys. This situation was considered harmful for the attendants.

Husain ibn Nammar, Chief Architect of Jerusalem the Noble, had constructed two fireplaces (*mauqid*) together with two chimneys (*shawarikh*). Qitas Beg (the Governor of Jerusalem), the *qadi*, Sinan Khalifa (the *shaikh* of al-'Imara al-'Amira [Khassaki Sultan]), and the representative of Turghud Agha (the administrator of al-'Imara al-'Amira), as well as many other Muslim dignitaries, had investigated the additions and noted that an increase of 5 *rital* of wood was needed.

15/2. The closure of al-'Imara al-'Amira

16 Rabi' 'l-Awwal 993/18 March 1585

Sijill 64: 367

Shaikh Muhammad ibn Mustafa, the *shaikh* of al-'Imara al-'Amira, together with a group of the staff who worked there, and many impoverished people, came to the Council of the Shari'a Court and informed the *qadi* that they (the *shaikh* and his companions) had closed al-'Imara al-'Amira. They claimed that it was in complete chaos and had run out of supplies because too many caretakers had been appointed for short periods, to the extent that every six months there was a new appointment. They further informed the Court that there was no rice, oil or even salt; in consequence they were delivering the key to the *qadi*, and asked him to raise the issue with those whose concern it was.

15/3. Construction of a mill inside al-'Imara al-'Amira

10 Rajab 1007/6 February 1599

Sijill 79: 475*

Ghadanfar Agha had dispatched an order to the *qadi* of Jerusalem, asking him to order the administrator of al-'Imara al-'Amira to construct a mill inside the complex. The cost was to be met from the *waqf* revenue and a detailed report was to be sent to Istanbul. The *qadi* himself, with Wali Beg (the administrator), and many Muslims, visited the site and noted that the *qabu* (vaulted hall, for details see cat. no.15 under 'Subsequent History') of the Khan inside al-'Imara al-'Amira was a suitable place for the construction of the mill. Among the witnesses of the report was 'Abd al-Muhsin ibn Mahmud ibn Nammar, the Chief Architect.

15/4. An allocation of bread from al-'Imara al-'Amira

15 Dhu'l-Hijja 1011/26 May 1603

Sijill 84: 18*

The *qadi* assigned for the use of 'A'isha, the daughter of 'Ali al-Antaki, a loaf of bread every morning and evening from the bread of al-'Imara al-'Amira in Jerusalem the Noble. The allocation to 'A'isha replaced that to Baranah ibn 'Abd al-Mu'izz after he had voluntarily sold his right to her (*tafarraḡha*).

15/5. The suspension of the supply of food and bread from al-'Imara al-'Amira

8 Safar 1036/29 October 1626

Sijill 112: 476*

This short entry in the *sijill* records the interruption in the supply of food from al-'Imara al-'Amira on the specified date. The reason given was that the administrator had travelled to Tarabulus (Tripoli) without leaving any replacement. It was reported that great harm had been done to the poor of Jerusalem.

15/6. A new administrator for al-'Imara al-'Amira

15 Safar 1036/5 November 1626

Sijill 112: 476*

Muhammad Agha, the *subahi* in Istanbul, had been appointed as Administrator for al-'Imara al-'Amira in Jerusalem. His licence (*bar'at*) was registered in the *sijill* by his representative, 'Ali Agha.

15/7. The re-opening of al-‘Imara al-‘Amira

3 Ramadan 1036/18 May 1627

Sijill 112: 476*

In the presence of Ahmad Efendi, the *qadi* of Jerusalem, and in the time of the administrator ‘Ali Agha, al-‘Imara al-‘Amira was reopened and its food was distributed to the poor.

19/1. The *waqfiyya* of Khudawirdi Abu Saifain for the Khanqah al-Maulawiyya

Beginning of Rajab 995/ 7 June 1587

Sijill 66: 551-52*

Khudawirdi Beg, the Governor of Jerusalem District, acknowledged in the Council of the Shari‘a Court on this date, while sound in body and mind, that he had donated a sum of 500 *sultani* for the benefit of the Khanqah al-Maulawiyya. The *khanqah* was located in Jerusalem the Noble in the Bani Zaid neighbourhood, and had been constructed by the donor. He stipulated that the lawful interest on the money should be allocated for use by: the administrator, the *shaikh*, two *mu‘adhdhins*, the *sha‘al* (the man who was in charge of lighting the lamp), and the door-keeper. Certain duties and conditions were specified for each of the personnel. For more details see cat. no.19 under the Endowment of Abu Saifain.

19/2. *Waqf* of Muhammad Pasha for the Maulawiyya

2 Rabi‘ ‘l-Thani 1036/21 December 1626

Sijill 107: 303-03

Muhammad Pasha, the Governor of Jerusalem district, made as *waqf* the whole *hakura* (vegetable garden), planted with almond, fig, and rose trees, for the benefit of the Maulawiyya order in Jerusalem the Noble. The *hakura* was located in the Damascus Gate neighbourhood in Jerusalem, and details of its boundaries were provided. The *shaikh* of the Maulawiyya order in Jerusalem was to be the Administrator of the *waqf*. The income and the expenditure were not further categorised. The donor stipulated that in the event of there being no Maulawi Sufis in Jerusalem, the *waqf* was to be for the benefit of the Muslim poor in the city of Jerusalem.

19/3. Permit to restore the *sama‘ khana* in the Khanqah al-Maulawiyya

19 Dhu‘l-Hijja 1137/29 August 1725

Sijill 220: 143

Muhibb al-Din Efendi, *naqib al-ashraf* (head of the descendants of the Prophet Muhammad), had come to the court and asked the *qadi*’s permission to repair the *sama‘ khana* (the hall where Sufis perform their invocation) as well as other parts of the Maulawiyya. The *qadi* had agreed to arrange an inspection of the premises, and had sent his clerk along with other dignitaries to estimate the costs. Muhibb al-Din, the donor, had undertaken the repairs, spending 35 *sultani* less than the estimated sum. Details of the expenditure and the construction materials are given.

20. Appointment to the Hujrat Muhammad Agha

7 Jumada ‘l-Awwal 1038/2 January 1629

Sijill 115: 166*

Muhammad Amin Efendi, the *qadi*, appointed ‘Ali Efendi the son of Husain to the position Qur’an reader. He was granted twelve *sultani* per year, and allowed to live in the lower part of the *hujra*. ‘Ali had to recite Sura 36 (*Ya-Sin*) every morning in the *hujra*.

21. *Waqfiyya* of Islam Beg

8 Shawwal 1002/27 June 1594

Sijill 76: 129, 30*

Islam Beg attested in the Council of the Religious Court of

Jerusalem, that while still alive and fully legally competent, he had made a *waqf* of 500 *sultani* for the benefit of his *hujra*. The *hujra* was located in al-Masjid al-Aqsa, and Islam Beg had just started its construction. The total profit per year was to be 75 *sultani*, which was to be distributed among the following: the administrator of the *waqf*, the chief reciter, 7 subordinate reciters, the attendance clerk, the *da‘i* (the man who performs the prayers of petition) and distributor (*mufarriq*) of the Qur’an volumes. He also allocated certain money for the oil to illuminate the rooms, and fees (*rasm*) for accounting documents and signatures.

22/1. *Fatwa* to lease parts of al-Aqsa Mosque to Ahmad Pasha

End of Muharram 1007/2 September 1598

Sijill 79: 312*

The record is a legal contract regarding a lease between Nassuh Jawish, the representative of Ahmad Pasha, and ‘Abd al-Qadir ibn Muhammad, the Deputy Inspector of the *waqf* of al-Masjid al-Aqsa. ‘Abd al-Qadir (supported by a *fatwa*) had leased two plots of land belonging to al-Masjid al-Aqsa, situated next to the northern side of the platform of the Noble Rock. They were separated by the *mawazin* (the north-eastern colonnade) located opposite Bab al-Hitta. The two sites were to be leased for a period of sixty years to allow Ahmad Pasha to take advantage of his lease by building on each two cells for the purpose of recitation of prayers, conducting the invocation of Allah, and studying religious science. The document is important, for it enables previously anonymous monuments to be identified.

22/2. Ahmad Pasha lends oil to al-Aqsa Mosque against future income of the *waqf*

14 Sha‘ban 1007/12 March 1599

Sijill 80: 38*

This entry shows that when the *waqf* of al-Masjid al-Aqsa and the Great Mosque of Hebron ran out of olive oil for illumination—a situation that caused the Custodian and worshippers considerable anxiety—Ahmad Pasha was able to help. Through his legal agent, he lent the Inspector of the *masjid* ten *qintars* of oil against the promise of future repayment from the *waqf*. The price of the oil was specified as 600 *sultani*, which is equal to 24,000 *fidda misriyya*.

22/3. An appointment and transcription from original *waqfiyya*

27 Dhu‘l-Hijja 1077/20 June 1667

Sijill 167: 422

This short document is divided into two parts. The first is an appointment of Shaikh Nusrat al-Islam to a post in the North-Western Khalwa of Ahmad Pasha. The appointment was undertaken by the *qadi* after the position had fallen vacant. The second part of the document is an order to edit a legal summary taken from the *waqf* instrument of the deceased Ahmad Pasha, the Governor of Gaza. The order was also executed by the *qadi*, and it consists of a quotation from the *waqfiyya* itself, which specifies among other details that Ahmad Pasha had assigned the western cell and the cell below it to ‘our master, Shaikh Abu al-Su‘ud al-Gazzi’, for the whole of his lifetime, and that after him the position should be given to whoever was then the *shaikh* of the Qadiriyya order in Jerusalem.

23/1. Hasan Pasha appoints Shaikh Abu‘l-Lutf to the North-Eastern Khalwa

Beginning of Rabi‘ ‘l-Awwal 1036/20 November 1626

Sijill 112: 469*

This record shows that Hasan Pasha, the ex-governor of Gaza

District, was the inspector of his father's *waqf* in Jerusalem. He appointed on the specified date Shaikh Abu'l-Lutf to the *khalwa*, the position having been left vacant after the death of Shaikh Kamal al-Din.

23/2. Ahmad Pasha assigns the North-Eastern Khalwa for Shaikh Radi al-Din al-Lutfi and for his sons

10 Ramadan 1096/10 August 1685

Sijill 187: 127*

The document is the record of an appointment which includes a summary of fundamental information about the endowment of the *khalwa*. It was registered at the Council of Qadi Sulaiman Efendi and it informs us that the *khalwa* was made *waqf* by Ahmad Pasha for the use of the *Shaikh al-Islam*, Radi al-Din al-Lutfi, and after him for his sons and his descendants. A sum of 1000 *qit'a misriyya* was allotted every year for its benefit. The document includes the names of the descendants of Radi al-Din who occupied the position until it records the voluntary sale of rights (*tafarrugh*) of the position of reader by Shaikh 'Abd al-Qadir Zain al-'Arab in favour of his brother, Shaikh 'Abd al-Razzaq Zain al-'Arab.

24/1. Contract to rebuild the Junbalatiyya

End of Jumada 'l-Awwal 1010/26 November 1601

Sijill 83: 51

'Abd al-Muhsin ibn Mahmud ibn Nammar, the master builder in Jerusalem the Noble, being fully competent, declared in the Council of the Religious court of Jerusalem that Ahmad Pasha had already contracted him to rebuild the Khalwa Junbalatiyya. The location of the *khalwa*, together with the cost and the work required, is specified in the document.

24/2. Permission to reside in the Junbalatiyya

8 Muharram 1037/19 September 1627

Sijill 113: 112*

The document is a permit issued by the *qadi* allowing Muhammad Agha, *za'im* (holder of a fief) in the Noble City of Jerusalem, to reside in a chamber situated on the upper platform of the Noble Rock, the *waqf* for which had been set up by the son of Junbalat.

25/1. The *waqf* document of the al-Madrassa al-Ahmadiyya

15 Ramadan 1013/4 February 1605

Sijill 85: 41-2*

This lengthy *waqfiyya* is unique with respect to its subject, for it is dedicated to the only *madrassa* established in Jerusalem in the Ottoman period. It is divided into three main sections. The first is a foreword that makes up almost half of the document. The second section is the most important, both historically and for the architectural information it contains. It provides us with vital data concerning the identity of the donor, the endowments which he had made as well as details of their features and boundaries, the financial arrangements and the stipulations of the *waqf*. The third section contains the debate after the donor had sought to withdraw the *waqfiyya* and to reclaim the property on theological grounds, as well as the verdict of the judge that the *waqf* was sound and binding. It ends with a long list of witnesses and certification as to the legality of the *waqf*. The second part is translated in full under cat. no.25.

25/2. Sale of old stones to build a cell on the platform of the Dome of the Rock

13 Dhu'l-Hijja 1011/24 May 1603

Sijill 84: 18*

This short record is interesting, for it implies that the stones of al-Madrassa al-Ahmadiyya may be in secondary use. It reveals that Ibrahim ibn al-Hajj Muhammad al-Fakhuri had attested at the Council of the Religious Court, while he was fully legally competent, that he had sold to Farrukh Beg, the Governor of Jerusalem District, one thousand (blocks) of stone. The stones had belonged to the *dirka* under his responsibility located in Jerusalem the Noble. He acknowledged that he had received six large (*kibar*) *ghirsh* in return for the stones. This implies that there were two values of *ghirsh*—a greater and a smaller. It is not clear from the record what was the value of the greater *ghirsh* with respect to the smaller or normal denomination.

28/1. Bairam Jawish restores al-Madrassa al-Mawardiyya

5 Shawwal 948/22 January 1542

Sijill 14: 151*

The document, which is written in a most careless script, shows that al-Mawardiyya had deteriorated to such an extent that a sum of 2,000 *'uthmani* spent by al-Sughanji was not enough to repair it. Bairam Jawish, who had become the *mutakallim* of the Mawardiyya, asked the *qadi* for permission to renovate the dome and the vault. Bairam had paid 1,600 *'uthmani* in accordance with the estimate made by Muslih al-Din al-*mi'mar*. In addition 2,000 *'uthmani* had been spent by al-Sughanji. The *qadi* allowed Bairam to recover part of the money from the future income of the endowments.

28/2. Inspection to repair the Mawardiyya

End of Rabi' 'l-Thani 1005/20 December 1596

Sijill 77: 537

This document reveals that Mahmud Zain al-Wafa'i, the *mutakallim* of the Mawardiyya, had come to the Council of Shuja' al-Din Efendi, the *qadi* of Jerusalem the Noble, to inform the court that the *madrassa* was in need of repair, and that there were no funds to restore the building. The situation was so serious that if no urgent action was taken, the *madrassa* was in danger of collapse. He had asked the *qadi* to allow a court inspection of the building in order to estimate the costs before repair work began, and to be allowed to pay the expenses from his own money against future income. The inspection and the estimated cost contains detailed information on the architectural elements of the building.

29. Contract to lease al-Zawiya al-Muhammadiyya

End of Ramadan 947/28 January 1541

Sijill 12: 697

The document is a four-year contract to lease the building of al-Zawiya al-Muhammadiyya. Taj al-Din Khalifa (the inspector) had leased to Mustafa ibn 'Abdullah of the Yeniceri (Janissary) the whole of al-Zawiya al-Muhammadiyya, which was situated in Jerusalem the Noble at the lowest part (*suffl*) of 'Aqabat al-Sitt near al-Madrassa al-Mawardiyya. The record says that it was so well-known in the neighbourhood that there was no need to give details either of its description or of its boundaries.

30. *Waqf* on Qubbat al-Arwah

15 Sha'ban 1037/11 April 1628

Sijill 113: 639*

This three-line record is an extract from a long *waqfiyya* bearing the name of Muhammad Agha the Administrator (*mutawalli*) of the *waqfs* of al-'Imara al-'Amira (cat. no.15). Muhammad Agha

had made a *waqf* in the sum of 300 *ghirsh asadi*. The expenditure of the income was specified, and among the amounts listed were: (1) 3 *ghirsh asadi* each year for the cost of oil to light the lamp that hangs each night in the Qubbat al-Arwah, located on the north-western side of the platform of the Noble Rock; 2 *ghirsh asadi* were to be allocated annually to pay a man to light the lamp and to serve it.

34/1. Bairam Pasha buys a cell on the platform of the Dome of the Rock

21 Rabi' 'l-Awwal 1038/18 November 1628

Sijill 115: 721*

The record is a copy of a document of sale registered originally at the religious court in Damascus. Although the transaction was carried out in Damascus, it relates to one of the cells on the terrace of the Dome of the Rock. The document gives the names of the vendor (Mustafa Agha) and the purchaser (Bairam, the vizier of Egypt), details of the sale and specifications of the site, including the price, terms and—above all—the name of the architect.

34/2. Bairam Pasha, Vizier of Egypt, donates money for charitable acts

1 Rabi' 'l-Awwal 1037/10 November 1627

Sijill 113: 248*

The record reports that Bairam sent a donation of 1,700 *ghirsh* (gold coins) to Jerusalem to undertake charitable acts for the Dome of the Rock and Masjid al-Aqsa, and for the *maqam* of Ibrahim (Abraham). The document specifies that the donor allocated 1,000 *ghirsh* to al-Aqsa mosque, and that the rest of the money—that is 700 *ghirsh*—was to be used for the restoration of the Great Mosque of Hebron. The money was delivered to the *qadi* by a merchant named as *al-khwaja* (the gentleman) Taha ibn al-Shaikh Musa al-'Asali, in the presence of Muhammad Pasha (the Governor of Jerusalem), Husain Efendi (the *shaikh* of the Haram al-Sharif), and Ahmad Agha.

36. A *tafarrugh* document in respect of Sabil Sha'lan

8 Jumada 'l-Thani 1098/21 April 1687

Sijill 168: 5

For the sum of 8 *ghirsh*, Shaikh Ibrahim ibn Sulaiman ibn Sha'lan had sold his rights to the position of *al-Siqaya* (the office of water supplier) of Sabil Bairam Pasha, the vizier to Shaikh Muhammad ibn Mustafa. Shaikh Muhammad was allocated two '*uthmani*' per day, one in recompense for his position, and the second to buy buckets and ropes. It is interesting to see that the *sabil* today is attributed to Shaikh Sha'lan rather than to Bairam or to one of the previous builders or restorers of the *sabil*.

42. A *tafarrugh* document on the tomb of Sulaiman

End of Dhu'l-Qa'da 1017/7 March 1609

Sijill 89: 84

The document reveals that 'Abd al-Qadir ibn al-Shaikh al-Samin had sold voluntarily to Musa ibn Abu al-Nasr al-Barq his right to the half position of serving the tomb of Sulaiman. The tomb is specified as being located inside the walls of al-Masjid al-Aqsa. Musa was allocated one half '*uthmani*' per day from the money which come from Istanbul every year.

43. *Waqfiyya* of Mahmud ibn Husain ibn Nammar the Master Builder in Jerusalem

13 Rabi' 'l-Awwal 1012/21 August 1603

Sijill 84: 111*

Mahmud ibn Husain ibn Nammar had come to the Council of

the Religious Court, and attested voluntarily that—while sound in body and mind and fully competent legally—he had made as a *waqf* certain of his legal possessions (the details are given in Ch. 36). The *waqf* was to be for the benefit of his three sons and two daughters. The sons, 'Abd al-Muhsin, Karim al-Din, and Hasan, were experts builders in Jerusalem the Noble. The document shows the wealth of Mahmud and it further gives details of his estates in various parts of the city.

44. Inspection of a demolished building and a permit to rebuild it

Beginning of Dhu'l-Hijja 1007/25 June 1599

Sijill 80: 106*

Yunus al-Turjaman, commissioned by Farrukh Katkhuda, had come to the court with two brothers, Ibrahim and Ilyas (sons of Jirjis, the Coptic Christian), both builders in Jerusalem. Yunus informed the court that Darwish Biyallah had already reported to the *subashi* of Jerusalem on the collapse of part of the kitchen of the brothers' house in his *hakura*, and that he had drawn their attention to the rebuilding of that part that had taken place. Yunus asked that an inspection be arranged, and the *qadi* accordingly sent his clerk with 'Abd al-Muhsin ibn Nammar, the master builder, to undertake it. While they were reporting their findings back to the court, Sulaiman ibn Ishaq al-Hadad came and informed the court that there was a large crack in the wall of his house, which was built above the vestibule overlooking the house. There was another inspection of the site, and it was recommended that two *dhira'* should be removed from the wall of Sulaiman's house, and that the wall should be supported by two corbel stones. The *qadi* approved the rebuilding of the wall of the kitchen, the recommended reduction and the reinforcement of Sulaiman's house.

45. Re-use of old Roman stones

4 Dhu'l-Hijja 1007/28 June 1599

Sijill 80: 106*

Jamshid Agha, responsible to *al-khass al-sharif* (The Revenues of the Imperial Domain), had come to the court with Ibrahim ibn Jirjis al-Nasrani, bringing four beasts bearing loads of stones. Jamshid accused Ibrahim of stealing the stones from the lands of *al-khass al-sharif*, and from *qasrs* belonging to a Muslim, which were located outside Jerusalem the Noble. Ibrahim rejected the accusation, saying that the source of his stone was from Wadi al-Qattamun (west of Jerusalem). An inspection of this site was ordered, and it was reported to the court that the stones were indeed brought from an ancient Roman wall located near the Wadi Qattamun.

46. An inspection of a water-channel suffering from a leakage of sewage

14 Shawwal 1007/10 May 1599

Sijill 80: 72*

Jamshid, the *subashi* of the city of Jerusalem the Noble, had reported to the *qadi* that the water from the channel which provided Hammam al-Sultan (which was administered under the *waqf* of al-'Imara al-'Amira) with water was contaminated with sewage from Madrasa al-Qastumriyya. He requested that the *qadi* investigate the matter. The *qadi* commissioned a group of people (their names and positions are provided) together with 'Abd al-Muhsin ibn Nammar, the Chief Architect of Jerusalem the Noble, to undertake the inspection. They reported their findings back to the court, saying that some of the *qawadis* (pottery pipes) of the latrines were broken; in consequence 'Abd al-Muhsin recommended that the channel above the latrine pipes be rebuilt.

28/2. كشف لزيم المدرسة الماوردية

محكمة القدس الشرعية

اواخر ربيع الثاني ١٠٠٥ / ٢٠ كانون أول ١٥٩٦

سجل ٧٧ : صفحة ٥٣٧

سبب تحرير الحروف بمجلس الشرع الانور
بالقدس الشريف المطهر اجله الله تعالى هو انه حضر
لدى مولانا وسيدنا افتخار قضاة الاسلام (١) سيد
الموالي العظام صدر اساطين العلماء الاعلام معدن
العلم والفضل والكلام حسنة الليالي والايام وارث
علوم الانبياء الكرام (٢) حجة الله تعالى على الايام
خادم شريعة سيد الانام عليه الصلاة والسلام الحاكم
الشرعي شجاع الدين افندي الموقع خطه الكريم
اعلاه نظيره (٣) دام علاه مولانا العلامة العمدة
الفهامة زبدة الصالحين المدققين مفيد الطالبين فخر
المصدرين السيد شرف الدين ابن مولانا وسيدنا (٤)
شيخ الاسلام والمسلمين عين اعيان العلماء العاملين
حجة المتناظرين لسان المتعلمين امام النحاة
والاصوليين شيخ القرا والمحدثين بقية السلف الكرام
(٥) السيد محمود زين الدين الوفائي ادام الله تعالى
ايامه ورفع في بروج السعادة اعلامه وهو المتكلم على
وقف المدرسة الماوردية الكاينة (٦) بالقدس الشريف
الحمية وانهى ان المدرسة المزبورة محتاجة الى التعمير
والزيم وان بها بعض اماكن متشقة ومتداعية الى
السقوط (٧) وان تركت على حالها تهدم ويفوت
غرض الواقف وانه لا وقف لها ليعمرها من محموله
وطلب مولانا الافندي المشار اليه الكشف (٨) على
ذلك وتحريره والاذن بعمارته من ماله وصلب حاله
ليكون ديناً له برقة المدرسة المزبورة فتدب من قبله
لطف الله كاتب (٩) الاصل مولانا القاضي زكريا
المقري والاوستة محمود بن المرحوم المعلم حسين بن

لشاه (٤) حسين بن عبد الله الينكرجي بقلعة القدس
الشريف ودفع شاه حسين للحاج سنان المزبور القدر
الذي اصرف في عمارة المدرسة المزبورة (٥) بموجب
سجل صدر سابق على تاريخه مسورخ في سادس
عشرين شوال سنة اربع واربعين وتسعمائة ثم ان شاه
حسين المزبور نا (٦) وتفرغ عن التكلم على المدرسة
المزبورة لفخر الجاوشية بيرام بن مصطفى الجاويش
زيد قدره وقبض منه القدر المزبور (٧) اعلاه القبض
الشرعي حسب اعترافه بذلك بشهادة شهوده
الاعتراف الشرعي وقرر في التكلم على المدرسة
بموجب تذكرة شريفة بيده (٨) تشهد له بذلك ثم ان
بيرام جاويش المزبور استاذن من مولانا الافندي صالح
بن القدوة زيني مولى محروسة قدس شريف ومدينة
(٩) سيدنا الخليل عليه السلام زيد فضله في العمارة
بالمدرسة فاذن له في العمارة فصرف من ماله وصلب
حاله في عمارة المدرسة والقبو (١٠) في ثمن قصرمل
وشيد واجرة معلمين وفحول ومون وغير ذلك الف
وستماية عثمانية [سياقت] الصرف الشرعي بشواهد
شرعية فصار جملة ما هو متجمد (١١) لبيرام المزبور
على ذمة الوقف ثلاثة الاف وستماية عثمانية
[سياقت] ليرجع بذلك على رقة الوقف وعلى هذا
اوقع التحرير وجرى ٠٠٠ يكون ٠٠٠ العمارة (١٢)
السابقة من الحاج سنان ومن الجاويش المزبور الماذون
في العمارة من قبل الحاكم المشار اليه اعلاه ضرورية
وعلى هذا (١٣) وقع التحرير وحرر في خامس شهر
شوال سنة ثمان واربعين وتسعمائة (١٤) شهود الحال
- كاتبه - خداوردي - رجب التزجان - علي الديري
٠(١٥)

سجل ٨٥ : صفحة ٤١ - ٤٢

باسمه تعالى يستفتح كل امر ذي بال
وبذكره يستنتج كل مرام على وجه الكمال لمحمد
حمدا به تتزايد انواع النوال وتنزل البركات واصناف
الافضال فسبحان من (١) تقدس ذاته عن ادراك
العقول والاذهان وتنزه عن مشابهة سكان بقعة
الاسكان وخلق ادم عليه السلام من طين ثم جعل
نسله من سلالة من ماء مهين وعلمه (٢) الاسماء كلها
في مكتب التكوين وجعله خليفة في الارض بالعز
والتمكن واسس ببيان قبول الخيرات على صفاء
الطويات وخلوص النيات ونور بصائر (٣) اولي
الالباب بنور الانتباه ورفع درجات الذين انفقوا في
سبيل الله وكثر اجر حسنة صدرت عن وفور الرغبة
وخلوص الحجة كمثّل حبة انبت سبع سنابل (٤) في
كل سنبل مائة حبة وعمر العامة الواقفين ببابه وما
غيب سايلا مد يديه الى جنبه وصير بنا المساجد
والمدارس اولى الوسائل النامية الى وصول (٥)
الدرجات العالية في جنة عالية قطوفها دانية ووفر اجر
من تقرب اليه باصناف الحسنات بغير حساب واعد
لهم جنات مفتحة لهم الابواب وجعل كل (٦) امرء
جائبا لكل رزق مقسوم تمتد الى اجل معلوم ووفق من
ارتضاه لسلوك مسلك المبرة ٠٠٠ توفيقا ووقف الجنة
على المتولين لاستكمال (٧) الحسنات وقفا انيقا ذلك
فضل الله يوتييه من يشا والله ذو الفضل العظيم
والصلاة والسلام الايمان الاكملان ما دام الملوان
ودار القران (٨) على سيد سيد اساس جده ابراهيم
وبني نبي على ذلك الاساس القويم القديم فصير

اسلام قصر عز اقصر سلافة قصد كل كفار اثم
فصار قصرا مشيدا (٩) بل حصنا حصينا من دخله
كان امنا من عذاب يوم اليم وعلى اله الاشراف
 واصحابه الذين هم ذوو اللطاف المتولون لكتابة
الوحي (١٠) ودراسته ورعاية الشرع وحراسته ما
قطعت الدفاتر بلسان الاقلام واستحكمت الاوقاف
بقضا والولاة والحكام اما بعد (١١) فهذا كتاب
مبناه صواب وذا خطاب معناه مستطاب معرب معربه
ومبنيه ويفصح صريحه ومكنيه عن ذكر ما هو انه لما
كانت دار الدنيا الدنية (١٢) مدار كل الرزية والبلية
لا بقا فيها لاحد من البرية اذ محالب المنية تنشب كل
حي بالسوية كل من عليها فان وان كان ذا انصار
واعوان (١٣) لا يبقى فيها سلطان ولا وزير ولا يخلد
فيها قاض ولا امير عرضوها في معرض زوال ونفوذها
على شرف الافتعال محبتها مع محتتها متداخلة (١٤)
ورحمتها مع زحمتها متشاكلة لا يفيد العيش عيشها ولا
ينفع ذا الجيش جبشها كم من ملك ملك الارض
بمشارقتها ومغاربتها وزعم انه يستوفي (١٥) مطالب
النفس وماربها اذ فاجاه المنون فلم يذل شيئا من ذلك
فان كل شيء سوى وجه الله هالك وكم من طالب
جاه جاءه الاجل فابطل الامل (١٦) ومسا امهل فقد
من بين الاقران والاتراب وما حواه ما حواه من
الخزائن عز دفنه تحت التراب اين الملوك الماضية في
القرون الخالية (١٧) لم تنجهم الحصون الحصينة ولا
الابنية العالية فامست باجمعها فايته فانية وهم امسوا
برمتهم رمية بالية فهل ترى هم من باقية الا اين
قيصر وايوانه (١٨) ثم الا اين كسرى وديوانه اما
كانت دار دارا صرحا ممددا اما كان قصر قصر
قصرا مشيدا فاذا اختلسهم المنون صارت هباء منثورا
بل صارت (١٩) كان لم يكن شيئا مذكورا اذ جائهم
الموت وهم عنه غافلون وحيل بينهم وبين ما يشتهون
من بقي في هذا العالم ولم يبق فيه النبي صلى الله عليه

اوائل رجب ٩٩٥ / ٧ حزيران ١٥٨٧

سجل ٦٦ : صفحة ٥٥١ - ٥٥٢

الحمد لله الذي من وقف على باب كرمه
وجوده سبل له الهداية واطلع سعوده ومن حبس
نفسه عن الشهوات قابله بجزيل الثوابات وقبول
الصدقات (١) ومن حرم عليه الركون الى هذه الدنيا
الدنية ابدله الخلود في غرف جنانه العلية احمده حمد
من وقف للاعمال الصالحة فاضحت تجارته في
الدارين رائجة (٢) واشهد ان لا اله الا الله وحده
لاشريك له الهاد عن كل منفق خلفا وكل ممسك تلفا
واشهد ان محمدا عبده ورسوله الهادي الى طريق
الفلاح والمرشد الى (٣) سبل النجاة والتجاح الذي
انزل عليه ذو الفضل والمنة ان الله اشترى من المؤمنين
انفسهم واموالهم بان هم الجنة وعلى اله واصحابه ما
وقف بعرفات (٤) محرم وكبر وهلل ووقف ملكه
واوقف وحبس وسبل وسلم تسليما وبعد فان اولي ما
ادخره العبد ليوم تشخص فيه الابصار الصدقة الجارية

على عمر (٥) الاعصار لاسيما صدقات الاوقاف
الذي يعدل كل قيراط من ثوابها جبل قاف ولما علم
الجناب الكبير العالي والكوكب المضي المتلالي حازر
(٦) المائر والمفاخر والفائق بالاجتهاد في طلب
الثوابات على الاول والاخر احد اركان الدولة
والمشهور بشدة العزم والرجولة الاسد الاسيد (٧)
والبطل الاشد حامل رايات الجهد والافتخار ملك
الامرا الكبار مولانا خداوردي بك الشهير بسابي
سيفين مير لوا القدس الشريف (٨) ادام الله دولته
الزاهرة وجمع له بين خيري الدنيا والاخرة ما وعد
الله به المتصدقين من جزيل الثواب ومجازاتهم على ما
قدموه الى انفسهم (٩) من العمل يوم يقوم الحساب
رغب قبل ارتحاله الى الدار الاخرة في عمل صالح
يلبسه في الجنة الحلل الفاخرة ورهب من هيب النار
الحررة اعتمادا (١٠) على قوله صلى الله عليه وسلم
اتقوا النار ولو بشق ثمرة امر باحكام هذا الوقف
الموبد والحبس المحرم المخلد الذي لاينسخ حكمه ولا
يندرس رسمه (١١) ولا ينقطع بره ولا يضيع عند الله
اجره ابتغا لمرضاته وثوابه وطلبا للزلفى يوم رجوعه
الى الله ومابه يوم يجزى المتصدقين ولا يضيع (١٢)
اجر المحسنين واشهد على نفسه الزكية في حال صحته
وسلامته المرضية انه وقف وحبس وايد وتصدق من
خالص ماله تقبل الله صالح اعماله (١٣) جميع المبلغ
النقد الفضة السالم من الغش وقدره اربعمائة غرش
تعديل خمسمائة سلطاني كاملة بالنقد الجاري يومئذ في
المعاملة (١٤) نصف ذلك تحقيقا لاصله مايتا غرش
وقفا صحيحا شرعيا وحسبا موبدا مرعيا اخرج ذلك
من ماله وطيب حاله وسلمه لتولي (١٥) وقفه الاتي
ذكره فيه ليصرف ريعه في مصارف البر التي عينها
بالشروط التي بينها الواقف المذكور اعظم الله له
الاجور وقفه (١٦) هذا على جهات بر عينها وشرط
العمل بها وبينها على ان المتولي الاتي ذكره فيه يعامل

بحسن اختياره ورضاه تحريرا في خامس عشر شهر ذي
الحجة سنة احدى عشر [والف] (٢) المزبورون (٣)

قفل العمارة العامرة 15/5.

محكمة القدس الشرعية

٨ صفر ١٠٣٦ / ٢٩ تشرين اول ١٦٢٦

سجل ١١٢ : صفحة ٤٧٦

لا حول ولا قوة الا بالله العلي العظيم وانا
لله وانا اليه راجعون (١) كان تعطيل طعام العمارة
الكائنة بالقدس الشريف وقطع خبزها المعتاد (٢) في
يوم الخميس ثامن شهر صفر سنة ست وثلاثين والف
وحصل (٣) للفقراء والمجاورين بالقدس غاية الضرر
وسبب ذلك ان متوليها (٤) المدعو اصلان اغا توجه
مسافرا الى جهة طرابلس ولم يترك (٥) وكيلا يعتمد
عليه ولم يظهر احدا على شي من مال الوقف (٦)
شهد - الفقير خير الدين - الفقير صالح الدهان -
الفقير محمد بن احمد نايب الشرع بالقدس (٧) .

15/6. تعيين متولي جديد للعمارة العامرة

محكمة القدس الشرعية

١٥ صفر ١٠٣٦ / ٥ تشرين ثاني ١٦٢٦

سجل ١١٢ : صفحة ٤٧٦

وفي يوم الخميس خامس عشر صفر (١)
ورد الخبر بتولية محمد علي (٢) السباهي بالبواب
العالي (٣) على ٠٠٠ بالقدس (٤) وقيدت صور
براته (٥) مورخة بتاسع محرم (٦) سنة ست وثلاثين
والف (٦) ٠٠٠ عن يد وكيله (٧) فخر الاعيان علي
اغا (٧) .

العمارة بمضور قدوة الاماجد والاكارم ولي بيك
المتولي (١٢) على وقف العمارة المذكورة وجم غفير
من المسلمين التقاة الموحدين فوجد القبو الكبير
المستطيل قبلي بشام المعد (١٣) لربط السدواب
الكائن داخل الخان المذكور يصلح ان يكون طاحونا
ويسد البابان الذي احدهما من الجهة (١٤) القبلية
والثاني من الجهة الشمالية ويفتح له باب من الجهة
الشرقية من داخل العمارة العامرة ويحصل بذلك
(١٥) نفع كلي لجهة الوقف فلما اتفقت الاراء على
ذلك اذن مولانا الافندي المومي اليه لولي بيك المتولي
المذكور (١٦) ان يعمر القبو المذكور طاحونا كما
شرح اعلاه امثالا للامر الشريف السلطاني فقبل
ذلك ولي بيك المتولي (١٧) المذكور قبولا مرعيا
وعلى ما هو الواقع سطر وجرى ذلك وحرر في عاشر
شهر رجب الفرد (١٨) شهود الحال - مولانا القاضي
غشم بن مكية - الشيخ عبد القادر نايب الناظر -
رضوان عبد الله وكيل الخرج - صالح بن معين

12. وقف قرية بيت ساحور على كتاببرام جاويش

محكمة القدس الشرعية

٧ شوال ٩٤٨ / ٢٤ كانون ثاني ١٥٤٢

سجل ١٤ : صفحة ١٥٥

بين يدي مولانا الافندي صالح بن القدوة
 زيني مولى محروسة قدس شريف ومدينة سيدنا الخليل
 عليه السلام زيد فضله اشهد عليه فخر الجاوشية بريم
 (١) بن مصطفى الجاوش زيد قدره اشهادا شرعيا
 وهو بحال الصحة والسلامة والطوعية والاختيار من
 غير اكراه ولا اجبار وعارفا بمعنى الاشهاد (٢) وما
 يترتب عليه شرعا انه وقف وحبس وابد وحرم
 وتصدق ما هو له وجار في ملكه وشاهد له بذلك
 مستند شرعي بخط كاتبه ثابت لدى مولانا وسيدنا
 (٣) اقضى القضاة العون العلمي المالكي مورخ في
 عشري الحجة سنة سبع واربعين وتسعمائة ويده
 واضحة على ذلك الى حين صدور هذا الوقف وذلك
 جميع (٤) الحصة الشائعة وقدرها النصف والربع ثمانية
 عشر قيراطا من جميع الغراس العنب والتين وغير ذلك
 القايم اصوله بارض قرية بيت ساحور النصارى (٥)
 المعروف في محلة بدير الرعوات [الرعاة] وحده بتمامه
 وكماله من القبلة ارض كشف ومن الشرق خلا ومن
 الشمال خلا كذلك ومن الغرب خلا كذلك (٦)
 شركة عباد بحق الربع الباقي بجميع حقوق ذلك كله
 وطرقه وما يعرف به وينسب اليه وبكل حق هو
 لذلك شرعا على الكتاب الكاين به مدفن الوقف
 (٧) الكاين بخط وادي الطواحين الذي حده من
 القبلة الدرب السالك ومن الشرق الدرب وفيه بابها
 ومن الشمال دار وقف الشركسية ومن الغرب دار
 سكن (٨) اولاد المرحوم الشيخ محب الدين بن ابي

الوفا وجعل الناظر المزبور النظر في ذلك كله لنفسه
 مدة حياته ثم من بعده يكون النظر في ذلك لددردار
 القلعة (٩) بالقدس الشريف كاينا من كان ثم من
 بعد الدردار بالقلعة يكون النظر في ذلك لمولانا
 الحاكم الحنفي بالقدس الشريف كاينا من كان (١٠)
 ورفع الوقف عن ذلك يد ملكه ووضع يد ولايته
 وقفا صحيحا شرعيا ٠٠٠ الوصف المنسوب اعلاه
 وعلى الناظر المزبور [٠٠٠] ان يبدأ في عمارته
 وممرته (١١) وما فيه بقا عينه ونموه ومهما فضل بعد
 ذلك يصرف في عمارة المكتب ومهما فضل بعد
 ذلك ٠٠٠ يصرف لفقير الاطفال المتصدي لتعليم
 الايتام وان المكتب (١٢) المزبور الموقوف عليه اعلاه
 وقفا على الايتام وثبت جريان الوقف بشهادة شهوده
 لدى مولانا الافندي المشار اليه اعلام دام (١٣) علاه
 ثبوتا شرعيا بوجه الوقف واعذاره في ذلك الاعذار
 الشرعي وحكم بموجب ما ثبت عنده ومن موجه
 صحة الوقف المشروح اعلاه ونفوذه (١٤) ولزومه
 حكما شرعيا بالطريق الشرعي تحريرا في سابعة شهر
 شوال سنة ثمان واربعين وتسعمائة (١٥) شهود الحال

ذلك وحرر في ثامن شهر ربيع (١٤) الاول الانور

من شهور سنة سبعين وتسعمائة احسن الله تعالى

ختامها وما بعدها بخير امين (١٥) شهود الحال - يحيى

الديري - اسماعيل ابي بكر الشافعي - الفقير ابو

النصر الديري - الفقير ابو العون الديري (١٦) ٠

فضل بعد المصاريف المعينة اعلاه يصرف لاولاد
الواقف المزبور وذريته للذكر مثل حظ الانثيين ومنها
ان الواقف (٩٩) المشار اليه اعلاه تقبل الله تعالى
وقفه هذا يقرر بالرباط شيخا بعد شيخ وفتيها بعد
فتيها وبوابا بعد بواب وكاتب بعد كاتب وهلمنا جرا
[وبعد] (١٠٠) وفاته يقرر الحاكم الحنفي اصالة
بمدينة القدس الشريف ارباب الوظائف المزبورين
اعلاه واحدا بعد واحد بمعرفة الناظر على
الوقف ٠٠٠ (١٠١) اعلاه كاينا من كان ومنها ان
بواب الرباط المزبور اعلاه يفرش بالجمع الشمالي
ثلاثة بسط من البسط الموقوفة اعلاه اثنان منها
بالجمع المزبور (١٠٢) البراني والبساط الثالث يفرش
بالمخدع الكاين بالجمع المزبور ويفرش بالجمع الغربي
بساطا واحدا وفي الايوان البساط الخامس [ويتولى]
(١٠٣) حفظها في حرز مثلها شرعا ومنها ان الواقف
المشار اليه اعلاه شرط لنفسه الادخال والاخراج
والزيادة [والنقصان] (١٠٤) وليس لغيره من بعده
فعل ذلك ولا شي من ذلك وقد رفع الواقف المشار
اليه عن وقفه هذا يد ملكه وحيازته وابان عن ملكه
(١٠٥) وحيازته ووضع عليه يد نظره وولايته وصار
وقفا محرما بخرمات الله الاكيدة مدفوعا عنه بقوته
السديدة فلا يحل لا [حد] (١٠٦) يومن بالله واليوم
الاخر ويعلم انه الى ربه الكريم صاير ان ينقض هذا
الوقف ولا يغيره ولا يبدله ولا يعطله ولا يسعى في
[ابطاله] (١٠٧) ولا في ابطال شي منه بوجه من
الوجوه ولا بسبب من الاسباب الشرعية مطلقا فمن
بدل ذلك او شي منه فالله تعالى حسيبه و [خصيمه]
(١٠٨) ومجازيه بفعله يوم التناد يوم عطش الاكباد
يوم يكون الله سبحانه وتعالى هو الحاكم بين العباد
يوم لا ينفع مال ولا بنون (١٠٩) الا من اتى الله
بقلب سليم ومن سعى في تقريره وابقائه في يد
مستحقه برد الله تعالى مضجعه واقال عثرته وجعله

من (١١٠) الفرحين المستبشرين الذين لاخوف
عليهم ولا هم يحزنون فقد تم هذا الوقف المبرور ولزم
ونفذ حكمه ووقع موقع القبول (١١١) بشرط
الصحة واللزوم فمن بدله بعدما سمعه فانما اثمه على
الذين يدلونه ان الله سمع عليهم وثبت مضمون
[ذلك] (١١٢) كله لدى مولانا وسيدنا قدوة قضاء
الاسلام زبدة ولاية الانام عمدة القضاة والحكام موبد
شريعة سيد الانام محمد عليه افضل (١١٣) الصلاة
واتم السلام المحفوف بصنوف عناية الملك المنان افندي
عبد الرحمن المولى بقضاء القدس الشريف ومدينة
سيدنا [خليل] (١١٤) الرحمن عليه السلام الموقع
خطه الكريم اعلى اصله المتوقع رضى مولاه دام
فضله وعلاه وبلغه ما يتمناه ثبوتا صحيحا شرعيا بعد
تقديم دعوى (١١٥) شرعية صدرت في ذلك
بالطريق الشرعي بوجه الواقف المشار اليه اعلاه
واعذاره في ذلك الاعذار الشرعي وانه ادام الله تعالى
ايامه واعزز افضيته (١١٦) واحكامه حكم بصحة
ذلك حكما شرعيا مسولا فيه مستوفيا شرايطه
الشرعية وواجهه المعتبرة المرضية بعد اعتبار ما
(١١٧) وجب اعتباره شرعا وجرى ذلك وحرر في
اوايل شهر ذي الحجة الحرام من شهور سنة سبع
وستين وتسعمائة احسن الله تعالى ختامها
٠٠٠ (١١٨) بخير امين والحمد لله وحده (١١٩)

اندرج بالوفاة الى رحمة الله تعالى وتولى مشيخة المقام
الشريف ولده المرحوم قدوة الصالحين الناسكين

CATALOGUE APPENDIX 2

**TEXT OF THE ARABIC AND THE TURKISH
FOUNDATION INSCRIPTIONS**

This appendix includes the Arabic and the Ottoman Turkish wording of the foundation inscriptions found on the monuments. Each entry carries the number of the monument as it appears in the catalogue description. If there is more than one plaque on the monument, a slash with subdivision numbers appears after the original number.

Van Berchem published the inscription numbers 1 (1923: 403-4), 2 (1925: 167), 4 (1923: 413), 5 (1923: 414), 6 (1923:415), 7 (1923: 417), 8/1, 8/2, (1923: 416), 8/3 (1925: 169), 9 (1923: 418), 10/1 (1925: 169), 10/2, 10/3, (1925: 172-73), 11 (1923: 430), 12 (1923:431), 16 (1925: 187-8), 17/1 (1925: 188), 20 (1925:189-90), 26 (1922: 165), 27/2 (1922: 149), 36/1, 36/2, 36/3, 36/4 (1925: 99-102), 37 (1925: 191), 38/1, 38/2, 38/3

(1925: 23-36), 39/1, 39/2 (1925: 192), 43 (1925: 194), 45 (1925: 66-7), 47 (1925: 198), 48(1925: 196), 49 (1923: 455), and 50 (1922: 204). A different reading for some of the texts—numbers 2, 10, 16, 17, 20, and 36—is offered here (for details see the catalogue entries).

The texts of inscriptions number 19 and 35 were published by al-'Arif (1961: 500); however, text number 19 included many errors. Stephan (1933: 132-33) also published inscription number 27/1, and al-'Asali (1981:36) published inscription no. 33/1.

Inscriptions 13, 14, 15/1, 15/2, 17/2, 33/2, 33/3, 40, 42, 46 and 50/2 have not been published, although the date and the founder of number 14 is mentioned by van Berchem (1925: 187 no.199), and 17/2 is listed by Walls and Abu'l-Hajj (1980: 29).

All the inscriptions are in Arabic apart from numbers 8/2, 26, 27/1, 38/2 and 47, which are written in Ottoman Turkish.
